MEETING, NOVEMBER 5, 2010

A meeting of the South Coast Air Quality Management District Board will be held at 9:00 a.m., in the Auditorium at AQMD Headquarters, 21865 Copley Drive, Diamond Bar, California.

The agenda and documents in the agenda packet will be made available upon request in appropriate alternative formats to assist persons with a disability. Disability-related accommodations will also be made available to allow participation in the Board meeting. Any accommodations must be requested as soon as practicable. Requests will be accommodated to the extent feasible. Please telephone the Clerk of the Boards Office at (909) 396-2500 from 7:00 a.m. to 5:30 p.m. Tuesday through Friday.

All documents (i) constituting non-exempt public records, (ii) relating to an item on the agenda, and (iii) having been distributed to at least a majority of the Governing Board after the agenda is posted, are available prior to the meeting for public review at the South Coast Air Quality Management District Clerk of the Boards Office, 21865 Copley Drive, Diamond Bar, CA 91765.

CALL TO ORDER

- Pledge of Allegiance
- Opening Comments: William A. Burke, Ed.D., Chair
  Other Board Members
  Barry R. Wallerstein, D. Env., Executive Officer
- Presentation of Retirement Award to Martha Lucero **Burke**

Staff/Phone (909) 396-

CONSENT CALENDAR (Items 1 through 23)

Note: Consent Calendar items held for discussion will be moved to Item No. 24

1. Minutes of October 1, 2010 Board Meeting and Minutes of October 29, 2010 Special Board Meeting **McDaniel/2500**

2. Set Public Hearings December 3, 2010 to Consider Amendments and/or Adoption to AQMD Rules and Regulations **Wallerstein/3131**

   (A). Amend Rule 1415 – Reduction of Refrigerant Emissions from Stationary Refrigeration and Air Conditioning Systems, and Adopt Rule 1415.1 - Reduction of Refrigerant Emissions from Stationary Refrigeration Systems **Tisopulos/3123**

   The proposed amendments to Rule 1415 expand the scope of the rule to include provisions for reducing emissions of high global warming potential refrigerants utilized in stationary air conditioning systems and other administrative changes. Staff is also proposing a new rule, Rule 1415.1, to incorporate provisions for reducing emissions of certain high global warming potential refrigerants that will be consistent with CARB's statewide rule for stationary refrigeration systems. The proposed new rule will consolidate all other emission control requirements for stationary refrigeration systems currently in Rule 1415. (Review: Stationary Source Committee, November 19, 2010)

(B). Amend Rule 1143 - Consumer Paint Thinners & Multi-Purpose Solvents **Tisopulos/3123**

The amendment will propose an exemption for artist solvents and thinners that will make the rule more consistent with the state consumer products regulation by: (1) exempting artist solvents and thinners that are properly labeled and sold in containers that are one liter or less from applicable VOC limits; (2) defining artist solvents and thinners; (3) making changes to the rule to clarify that all exempt products shall be subject to recordkeeping and reporting; and (4) making changes to the rule to clarify that the sell-through provisions for the final VOC limit do not apply to products that do not meet the interim VOC limit. The proposed amendment will result in 114 pounds of VOC emission reductions foregone per day. (Review: Stationary Source Committee, October 15, 2010)

Budget/Fiscal Impact

3. Advertising and Public Outreach Initiative to Chinese-American Communities to Increase Awareness of Impacts of Air Pollution **Atwood/3687**

Staff has developed a proposal for an advertising and public outreach program focused on Chinese-American communities in the South Coast Air Basin. The goals of the program include raising awareness of the health impacts of poor air quality; demonstrating how AQMD is protecting public health by improving air quality; and urging residents to be more involved in efforts to improve air quality. The 26-week initiative will include paid advertising in print, TV, radio and online media at a cost not to exceed $400,000. (Review: Administrative Committee, October 8, 2010)

4. Execute Contract for Security Guard Services at Diamond Bar Headquarters **Johnson/3018**

The current contract for Diamond Bar headquarters security guard services expires on November 30, 2010. On July 9, 2010 the Board approved release of an RFP to solicit proposals from firms interested in providing these services. This action is to execute a two-year contract with Contact Security Inc., for a total amount not to exceed $887,245. Funding has been included in the FY 2010-11 Budget and will be requested in successive fiscal years. (Review: Administrative Committee, October 8, 2010)

5. Authorize Executive Officer to Waive Late Fees Incurred by State Agencies Due to Delay in Adoption of State Budget **O'Kelly/2828**

As the result of the late approval of the State budget, approximately 40 State agencies are subject to late fees related to permit renewal and emissions fees. As the result of operation of the District's fee rules, the State agencies now owe a total of approximately $10,000 in late fees. This action is to authorize the Executive Officer to waive those fees.

6. Execute Contract for Biennial Audit of Motor Vehicle Registration Revenues for FYs 2007-08 and 2008-09 **O'Kelly/2828**

Health and Safety Code Section 44244.1 requires any agency receiving fee revenues pursuant to Section 44243 or 44244 to be subject to an audit of each program or project funded at least once every two years. On July 9, 2010, the Board approved release of an RFP to select an auditor to perform the biennial audit for FYs 2007-08 and 2008-09. An evaluation panel of representatives from the MSRC and AQMD staff evaluated the proposals. This action is to award a contract to the firm of Thompson, Cobb, Bazilio and Associates, PC. Local governments, the MSRC and AQMD will pay the cost of their own audits in the amounts of $71,393, $10,450, and $6,626 respectively. (Review: Administrative Committee, October 8, 2010)

7. Appropriate Funds for PAMS and Lead Monitoring Programs from U.S. EPA Section 105, Recognize and Appropriate Funds for Section 103 Monitoring Programs, and Authorize Purchases and Release of RFQ Under These Programs **Liu/2105**

U.S. EPA has allocated Section 105 funding for the 19th Year PAMS Program and the Lead Monitoring Program. Section 105 revenue for these two programs has been included in the FY 2010-11 Budget. Supplemental Section 103 PM2.5 funding from U.S. EPA is also being provided for fixed assets to meet the NCore Program monitoring requirements and an ultrafine monitor testing project. This action is to: (1) appropriate funds to the FY 2010-11 Budget for the 19th year PAMS Program; (2) appropriate funds to the FY 2010-11 Budget for the Lead Monitoring Program; (3) recognize revenue and appropriate funds for Section 103 monitoring programs; and (4) authorize purchases and the release of an RFQ. (Review: Administrative Committee, October 8, 2010)

8. Execute Contracts to Conduct Conceptual Feasibility Studies for Reduction of Near Roadway Pollutant Exposures **Liu/2105**

Numerous air monitoring and health studies document elevated pollution levels and health risks in areas immediately adjacent to busy roadways and freeways. In addition to reducing on-road tailpipe emissions, other mitigation measures may be effective in reducing the pollution exposure of those living, working or playing in these affected areas. On March 5, 2010, an RFP was released for conceptual research studies to assess the feasibility and cost-effectiveness of roadside pollution mitigation measures, and six proposals were received. Based on the results of the technical evaluation process, this action is to execute three contracts in a total amount not to exceed $250,000 to study the reduction of pollutant exposures using near roadway mitigation measures. (Review: Technology Committee, October 15, 2010)

9. Execute Contract To Provide Technical Assistance for Alternative-Fueled Trucks Funded Under AQMD's Heavy-Duty Diesel Truck Replacement Program **Liu/2105**

The AQMD has received grant awards from the Department of Energy and Environmental Protection Agency for LNG truck projects approved under AQMD's Heavy-Duty Diesel Truck Replacement Program, including administrative funds. AQMD's administration of the program consists of project outreach and solicitation, project evaluation, inspections, contracting, invoice processing, project monitoring and other activities to comply with all program requirements. AQMD is required to monitor the operation of each LNG truck on a quarterly basis for a period of two years. This action is to execute a contract with Clean Fuel Connection to provide technical assistance for quarterly reporting and other program administrative activities in an amount not to exceed $80,000. (Review: Technology Committee, October 15, 2010)

10. Execute Sole Source Contract for Buy-Down Incentive Program for CNG Home Refueling Appliance **Hogo/3184**

Since May 6, 2005, the AQMD has implemented a buy-down incentive program for the Phill natural gas home refueling appliance (HRA) manufactured by FuelMaker Corporation to broaden the consumer base of light-duty natural gas vehicles. In April 2009, FuelMaker Corporation filed bankruptcy and was acquired by Fuel Systems Solutions, Inc. In July 2010, sale of the HRA in California resumed through an exclusive distributor, Gas Equipment Systems, Inc. (GESI). This action is to execute a sole source contract with GESI for an amount not to exceed $60,000 from the Clean Fuels Fund to provide a buy-down incentive of $1,000 per HRA. (Review: Technology Committee, October 15, 2010)

11. Execute Contracts to Support Electric Charging Infrastructure **Miyasato/3249**

Southern California has an established but obsolete network of public charging for electric vehicles. State and federal funds are being invested in our region to support the deployment of plug-in electric vehicles including charging infrastructure. This action is to execute contracts with Clipper Creek, Coulomb Chargepoint and ETEC ECOtality to cofund the upgrade of existing chargers and install new chargers in high priority locations for a total cost not to exceed $210,000 from the Clean Fuels Fund. (Review: Technology Committee, October 15, 2010)

12. Authorize Purchase of Desktop Computer Hardware Upgrades **Marlia/3148**

AQMD operational efficiency is dependent on staffs' desktop computer systems, and many software applications (both off-the-shelf and in-house developed applications) are exceeding the capacity of the present desktop systems. This action is to authorize purchase of new desktop computer systems, with adequate capacity to support current software applications, to replace older desktop systems. These replacements are in accord with AQMD's Information Management Strategic Plan. Funds ($150,000) for this purchase are included in the FY 2010-11 Budget. (Review: Administrative Committee, October 8, 2010)

13. Authorize Purchase of Ingres Relational Database Management System Software Support **Marlia/3148**

The Ingres Relational Database Management System is used for the implementation of the Central Information Repository database. This database is used by most enterprise-level software applications at the AQMD and currently supports a suite of client/server and web-based applications known collectively as the Clean Air Support System (CLASS). The CLASS applications are used to support all of the AQMD core activities. Maintenance support for this software expires November 29, 2010. This action is to obtain approval for the purchase of Ingres Database software maintenance support for another year. Funds in the amount of $115,831 for this expense are included in the FY 2010-11 Budget. (Review: Administrative Committee, October 8, 2010)

14. Issue RFP for Greenhouse Gas Reduction Projects **Whynot/3104**

This action is to issue an RFP to solicit a qualified third party to develop certified greenhouse gas emission reductions through undertaking a carbon reduction project through approved protocols. Funding for this project in an amount not to exceed $300,000 is from Chevron’s CEQA mitigation fees. (Review: Climate Change Committee, October 13, 2010)

15. Appropriate Funds from Designation for Litigation and Enforcement and Authorize Amending/Initiating Contracts with Outside Counsel **Wiese/3460**

AQMD District Counsel is currently being assisted in several environmental lawsuits by outside law firms and in other matters requiring specialized legal counsel. This action is to appropriate $425,000 from the Designation for Litigation and Enforcement to the Legal Budget, Professional and Special Services account, and to authorize the Chairman or the Executive Officer, as appropriate, to amend or initiate contracts to expend these funds with prequalified counsel approved by the Board as well as specialized legal counsel with monies to be appropriated as the need arises. (Review: Administrative Committee, October 8, 2010)

16. Approve Contract Modifications and Award under FYs 2003-04, 2008-09 and 2010-11 AB 2766 Discretionary Fund Work Programs — **Winterbottom/**

The MSRC approved a replacement contract for regional rideshare database enhancements as part of the FY 2003-04 AB 2766 Discretionary Fund Work Program, as well as a contract modification for BusWest providing additional funds for alternative fuel school buses as part of the FY 2008-09 Work Program. As the initial elements of their FY 2010-11 Work Program, the MSRC approved a $1,500 contract increase for upgrades to their existing website, a $100,000 set aside for development of a new website, and a $2,250,000 allocation for an off-road diesel exhaust after-treatment demonstration program. The MSRC seeks AQMD Board approval of the FY 2010-11 Work Program elements as well as the contract modifications and award under the FYs 2003-04, 2008-09 and 2010-11 AB 2766 Discretionary Fund Work Programs. (Review: Mobile Source Air Pollution Reduction Review Committee, October 21, 2010)

Action Item/No Fiscal Impact

17. Establish Board Meeting Schedule for Calendar Year 2011 — **Burke**

The proposed Board Meeting Schedule for Calendar Year 2011 (includes January 2012) is submitted for Board consideration. The Administrative Committee meeting schedule (second Friday of the month) is included for information only. (Review: Administrative Committee, October 8, 2010)

Information Only/Receive and File

18. Legislative & Public Affairs Report — **Abarca/3242**

This report highlights the September 2010 outreach activities of Legislative & Public Affairs, which include Environmental Justice Update, Community Events/Public Meetings, Business Assistance, and Outreach to Business and Federal, State and Local Government.

19. Hearing Board Report — **Camarena/2500**

This reports the action taken by the Hearing Board during the period of September 1 through September 30, 2010.

20. Civil Filings and Civil Penalties Report **Wiese/3460**

This reports the monthly penalties from July 1 through August 31, 2010, and legal actions filed by the District Prosecutor during September 1 through September 30, 2010. An Index of District Rules is attached with the penalty reports.

21. Rule and Control Measure Forecast **Chang/3186**

This report highlights AQMD rulemaking activity and public workshops potentially scheduled for the year 2010 and portions of 2011.

22. Lead Agency Projects and Environmental Documents Received by AQMD **Chang/3186**

This report provides, for the Board's consideration, a listing of CEQA documents received by the AQMD between September 1, 2010 and September 30, 2010, and those projects for which the AQMD is acting as lead agency pursuant to CEQA. (Review: Mobile Source Committee, October 15, 2010)

23. Status Report on Major Projects for Information Management Scheduled to Start During First Six Months of FY 2010-11 **Marlia/3148**

Information Management is responsible for data systems management services in support of all AQMD operations. This action is to provide the monthly status report on major automation contracts and projects to be initiated by Information Management during the first six months of FY 2010-11.

24. Items Deferred from Consent Calendar

BOARD CALENDAR

25. Administrative Committee **Chair: Burke** **Wallerstein/3131**

26. Climate Change Committee **Chair: Burke** **Whynot/3104**

27. Legislative Committee **Chair: Carney** **Abarca/3242**

The Committee deliberated on agenda items for Board consideration and recommended the following position:

Bill/Title	**Recommended Position**
H.R. 6291 (Richardson) Freight FOCUS Act of 2010	Support with Amendments

28. Mobile Source Committee **Chair: Loveridge** **Chang/3186**

29. Refinery Committee **Chair: Carney** **Tisopulos/3123**

30. Stationary Source Committee **Chair: Yates** **Nazemi/2662**

31. Technology Committee **Chair: Gonzales** **Liu/2105**

32. Mobile Source Air Pollution Reduction Review Committee **Board Liaison: Antonovich** **Hogo/3184**

33. California Air Resources Board Monthly Report **Board Rep: Loveridge** **McDaniel/2500**

PUBLIC HEARINGS

34. Adopt Proposed Rule 1420.1 - Emissions Standard for Lead From Large Lead-acid Battery Recycling Facilities **Chang/3186**

(Continued from October 1, 2010 Board Meeting)

On October 15, 2008, the U.S. EPA amended the National Ambient Air Quality Standard (NAAQS) for Lead. The standard has been lowered from 1.5 µg/m3 to 0.15 µg/m3 in order to provide an adequate margin of safety that would ensure the protection of public health. Based on current monitoring data, large lead-acid battery recycling facilities are one of the largest sources of lead. Proposed Rule 1420.1 establishes additional requirements for large lead-acid battery recycling facilities to meet attainment of the new NAAQS for Lead. (Review: Stationary Source Committee, April 16, May 21, June 18, September 24, and October 15, 2010)

35. 2010 Clean Communities Plan **Chang/3186**

The 2010 Clean Communities Plan builds from existing traditional toxic regulatory approaches and includes 23 measures designed to address cumulative air toxics exposure in communities and neighborhoods throughout the South Coast Air Quality Management District. The 2010 Clean Communities Plan includes measures to address reductions of air toxics and air related nuisance issues at the community level. Increased community participation, communication and outreach, agency coordination, enhanced monitoring and compliance programs as well as traditional source-specific measures. (Review: Stationary Source Committee, September 19, 2008, April 16 and September 24, 2010)

36. Adopt Proposed Rule 1714 - Prevention of Significant Deterioration for Greenhouse Gases, and Amend Regulation XXX – Title V Permits **Tisopulos/3123**

On June 3, 2010, U.S. EPA promulgated a "tailoring rule" establishing BACT and permitting requirements for GHG emissions under Prevention of Significant Deterioration (PSD), and Title V programs. U.S. EPA proposed a phased approach to the regulation and permitting of GHG sources. Staff is proposing amendments to the AQMD's existing PSD - Regulation XVII, and Title V - Regulation XXX programs to implement the federal provisions. (Review: Stationary Source Committee, September 24, 2010)

37. Amend Regulation XX - RECLAIM Program **Tisopulos/3123**

Proposed Amendments to Regulation XX – RECLAIM will achieve additional SOx reductions pursuant to the 2007 AQMP Control Measure #2007CMB-02. The proposed amendments also address requirements for demonstrating Best Available Retrofit Control Technology equivalency in accordance with California Health and Safety Code §40440. (Review: Stationary Source Committee, June 20, 2008, June 19, 2009, November 20, 2009, May 21, 2010, July 23, 2010 and September 24, 2010; Refinery Committee, December 11, 2009, August 18, 2010, and September 22, 2010)

38. Amend Rule 1175 – Control of Emissions from the Manufacture of Polymeric Cellular (Foam) Products **Tisopulos/3123**

Proposed Amended Rule 1175 will address the concerns expressed by the U.S. EPA in their disapproval of the September 2007 amendment. As requested by the U.S. EPA, the proposed amended rule will require source testing to demonstrate compliance, require all operational parameters necessary for compliance to be contained in a federally enforceable permit and recordkeeping to verify operational techniques and parameters. The proposed rule will also clarify the prohibition of use for chlorofluorocarbons to be consistent with U.S. EPA Significant New Alternatives Policy Program, correct typographical errors and make minor clarifications and editorial corrections to the rule. The proposed changes are administrative in nature and are not expected to impact emissions or costs. (Review: Stationary Source Committee, September 24, 2010)

OTHER BUSINESS

39. Overview of CARB's Recently Released Cap and Trade Regulation with Staff's Preliminary Comments and Recommendations *(No Written Material)* **Whynot/3104**

Staff is providing an overview of CARB's recently released Cap and Trade Regulation with preliminary comments and recommendations to the Board.

PUBLIC COMMENT PERIOD – (Public Comment on Non-Agenda Items, Pursuant to Government Code Section 54954.3)

BOARD MEMBER TRAVEL – (*No Written Material*)

Board member travel reports have been filed with the Clerk of the Boards, and copies are available upon request.

CLOSED SESSION - (*No Written Material*) **Wiese/3460**

It is necessary for the Board to recess to closed session pursuant to Government Code section 54956.9(a) to confer with its counsel regarding pending litigation which has been initiated formally and to which the District is a party. The actions are:

- NRDC, et al. v. SCAQMD, et al., U.S. District Court Case No. CV08-05403 GW (PLAx) and United States Court of Appeals, 9th Circuit, Case No. 09-57064;

- CCAT, et al. v. State of California; SCAQMD, et al., Los Angeles Superior Court Case No. BS124264 and California Court of Appeal, Second District, Case No. B226692;

- Petition Before the Administrator of the U.S. Environment Protection Agency In the Matter of Alleged Failure of California to Comply with Mandatory Procedures to Amend SIP Regarding Internal Bank Offset Credits Held by the South Coast Air Quality Management District (filed December 10, 2009);

- NPCA v. SCAQMD, Court of Appeal, 4th Appellate District, Division Three, Case No. G040122 and Supreme Court of California Case No. S177823;

- Association of American Railroads, et al. v. SCAQMD, et al., U. S. District Court Case No. CV06-1416 JFW (PLAx) and United States Court of Appeals, 9th Circuit, Case No. 07-55804;

- W.M. Barr & Company, Inc. v. SCAQMD, Los Angeles Superior Court Case No. BS127359;

- Southern California Gas Company v. SCAQMD, Los Angeles Superior Court Case No. BS122004;

- Communities for a Better Environment v. South Coast Air Quality Management District, et al., Los Angeles Superior Court Case No. BS091275, and Carlos Valdez, et al. v. South Coast Air Quality Management District, et al., Los Angeles Superior Court Case No. BS091276, Court of Appeal of the State of California Case No. B193500, and Supreme Court of California Case No. S161190;

- Voices of the Wetlands v. California State Water Resources Control Board, et al., California Supreme Court, Case No. S160211;

- Robert Sarvey v. North Coast Unified Air Quality Management District, et al., Humboldt Superior Court, Case No. CV 100303;

- South Coast Air Quality Management District v. Rimpo & Associates, Los Angeles Superior Court Case No. BC432208; and

- Natural Resources Defense Council, et al. v. EPA, United States Court of Appeals, 9th Circuit, Case No. 08-72288.

It is also necessary for the Board to recess to closed session under Government Code section 54956.9(c) to consider initiation of litigation (two cases).

ADJOURNMENT

PUBLIC COMMENTS

Members of the public are afforded an opportunity to speak on any listed item before or during consideration of that item. Please notify the Clerk of the Board, (909) 396-2500, if you wish to do so. All agendas are posted at AQMD Headquarters, 21865 Copley Drive, Diamond Bar, California, at least 72 hours in advance of the meeting. At the end of the agenda, an opportunity is also provided for the public to speak on any subject within the AQMD's authority. Speakers may be limited to three (3) minutes each.

Note that on items listed on the Consent Calendar and the balance of the agenda any motion, including action, can be taken (consideration is not limited to listed recommended actions). Additional matters can be added and action taken by two-thirds vote, or in the case of an emergency, by a majority vote. Matters raised under Public Comments may not be acted upon at that meeting other than as provided above.

Written comments will be accepted by the Board and made part of the record, provided 25 copies are presented to the Clerk of the Board. Electronic submittals to cob@aqmd.gov of 10 pages or less including attachment, in MS WORD, plain or HTML format will also be accepted by the Board and made part of the record if received no later than 5:00 p.m., on the Tuesday prior to the Board meeting.

ACRONYMS

AQIP = Air Quality Investment Program
AVR = Average Vehicle Ridership
BACT = Best Available Control Technology
Cal/EPA = California Environmental Protection Agency
CARB = California Air Resources Board
CEMS = Continuous Emissions Monitoring Systems
CEQA = California Environmental Quality Act
CE-CERT =College of Engineering-Center for Environmental Research and Technology
CNG = Compressed Natural Gas
CO = Carbon Monoxide
CPI = Consumer Price Index
CTG = Control Techniques Guideline
DERA = Diesel Emissions Reduction Act
EV = Electric Vehicle
FY = Fiscal Year
GHG = Greenhouse Gas
HRA = Health Risk Assessment
IAIC = Interagency AQMP Implementation Committee
IGA = Intergovernmental Affairs
LEV = Low Emission Vehicle
LNG = Liquefied Natural Gas
MATES = Multiple Air Toxics Exposure Study
MOU = Memorandum of Understanding
MSERCs = Mobile Source Emission Reduction Credits
MSRC = Mobile Source (Air Pollution Reduction) Review Committee
NESHAPS = National Emission Standards for Hazardous Air Pollutants
NGV = Natural Gas Vehicle
NO_x = Oxides of Nitrogen
NSPS = New Source Performance Standards
NSR = New Source Review
PAMS = Photochemical Assessment Monitoring Stations
PAR = Proposed Amended Rule
PM_{10} = Particulate Matter $\leq$ 10 microns
$PM_{2.5}$ = Particulate Matter $\leq$ 2.5 microns
PR = Proposed Rule
RFP = Request for Proposals
RFQ = Request for Quotations
SCAG = Southern California Association of Governments
SIP = State Implementation Plan
SO_x = Oxides of Sulfur
SULEV = Super Ultra Low Emission Vehicle
TCM = Transportation Control Measure
ULEV = Ultra Low Emission Vehicle
U.S. EPA = United States Environmental Protection Agency
VMT = Vehicle Miles Traveled
VOC = Volatile Organic Compound
ZEV = Zero Emission Vehicle

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 1

MINUTES: Governing Board Monthly Meeting

SYNOPSIS: Attached are the Minutes of the October 1, 2010 meeting and Minutes of the October 29, 2010 special meeting.

RECOMMENDED ACTION:
Approve Minutes of the October 1, 2010 Board Meeting and the October 29, 2010 Special Board Meeting.

Saundra McDaniel,
Clerk of the Boards

sm:dp

FRIDAY, OCTOBER 1, 2010

Notice having been duly given, the special meeting of the South Coast Air Quality Management District Board was held at the Millennium Biltmore Hotel Los Angeles, 506 South Grand Avenue, Los Angeles, California. Members present:

William A. Burke, Ed.D., Chairman
Speaker of the Assembly Appointee

Mayor Dennis R. Yates, Vice Chairman
Cities of San Bernardino County

Councilmember Michael A. Cacciotti
Cities of Los Angeles County – Eastern Region

Ms. Jane W. Carney
Senate Rules Committee Appointee

Supervisor Josie Gonzales
County of San Bernardino

Mayor Ronald O. Loveridge
Cities of Riverside County

Dr. Joseph K. Lyou
Governor's Appointee

Councilmember Judith Mitchell
Cities of Los Angeles County – Western Region

Councilmember Jan Perry (arrived at 9:25 a.m.)
City of Los Angeles

Mayor Miguel A. Pulido (arrived at 9:20 a.m.)
Cities of Orange County

Members Absent:

Supervisor Michael D. Antonovich
County of Los Angeles

Supervisor John J. Benoit
County of Riverside

Supervisor Bill Campbell
County of Orange

CALL TO ORDER: Chairman Burke called the meeting to order at 9:05 a.m.

- Pledge of Allegiance: Led by Councilwoman Mitchell.

- Opening Comments

  Dr. Wallerstein. Alerted the Board to a letter the District received regarding Agenda Item No. 3 from two of the firms that submitted proposals and did not get selected, suggesting that the firm that was selected is not qualified and that their bid is too low, as well as highlighting the negative aspects of the selected firm being located in Colorado.

- Presentation in Recognition of Alan K. Stazer, Public Member Alternate, AQMD Hearing Board, July 2004 – August 2009

  Chairman Burke presented a plaque to Joseph Arnold on behalf of the late Alan K. Stazer in recognition and appreciation of 5 years of service as Public Member Alternate on the AQMD Hearing Board.

- Presentation to AQMD on behalf of Los Angeles Sparks

  Mike Levy, President of the Los Angeles Sparks, presented a commemorative display to the Board for the joint effort with the AQMD during their past season. He highlighted various events in which the AQMD was involved in an effort to increase outreach regarding air quality issues including the Downtown Dribble, an outdoor game held in Carson, and the Go Green night held at Staples Center.

CONSENT CALENDAR

1. Minutes of September 10, 2010 Board Meeting

2. Set Public Hearings to Consider Amendments and/or Adoption to AQMD Rules and Regulations

   October 29, 2010

   (A). Adopt Proposed Rule 320 - Automatic Adjustment Based on Consumer Price Index for Regulation III Fees

November 5, 2010

(B). Amend Regulation XX - RECLAIM Program

(C). Adopt Proposed Rule 1714 - Prevention of Significant Deterioration for Greenhouse Gases, and Amend Regulation XXX – Title V Permits

(D). Amend Rule 1175 – Control of Emissions from the Manufacture of Polymeric Cellular (Foam) Products

Budget/Fiscal Impact

3. Execute Contract and Appropriate Funds for Production of Signature AQMD Video

4. Approve Purchase of Gas Chromatograph/Mass Spectrometer/Flame Ionization Detector Instrument

5. Execute Contract to Develop and Demonstrate Electric Drive Conversion for Fleet Vehicles

6. Execute Contract for 2010 Leaf Blower Exchange Program

7. Execute Contracts and Transfer Funds for Voucher Incentive Program

8. Execute Contract to Demonstrate Natural Gas-Powered Refuse Truck

9. Issue RFP for Demonstration of Natural Gas Stationary Fuel Cells at AQMD Headquarters

10. Issue Program Announcements for Electric Lawnmower Vendors, Licensed Scrappers and Support Service Providers

11. Recognize Funds, Approve Additional Truck Projects and Amend Awards under Proposition 1B-Goods Movement Program

12. ***This item was withdrawn by staff.***

13. Execute Contract for Hydrogen Fueling Station and Amend Contracts for Maintenance and Fueling Services for Five Cities Program Vehicles and Stations

14. Execute Contracts for FY 2009-10 "Year 12" Carl Moyer Program and SOON Provision, Amend Carl Moyer Program Awards and Issue Program Announcement for SOON Provision

15. Recognize Funds from San Joaquin Valley Air Pollution Control District to Promote Development of Natural Gas-Fired, Fan-Type Central Furnaces with Reduced NOx Emissions

16. Execute Contract for Sources, Composition, Variability and Toxicological Characteristics of Ultrafine Particles in Southern California

17. ***This item was withdrawn by staff.***

18. Appropriate Funds and Authorize Amending Existing Contract with Special Outside Counsel to Assist with Litigation Regarding SB 827 and AB 1318 and Internal Offset Accounts

19. Approve Contract Modification, New Award and Corrected Award under FYs 2008-09 and 2009-10 AB 2766 Discretionary Fund Work Programs

Information Only/Receive and File

20. Legislative & Public Affairs Report

21. Hearing Board Report

22. Civil Filings and Civil Penalties Report

23. Rule and Control Measure Forecast

24. Lead Agency Projects and Environmental Documents Received by AQMD

25. Annual Report on 457 Deferred Compensation Plan

26. Status Report on Major Projects for Information Management Scheduled to Start During First Six Months of FY 2010-11

Dr. Lyou announced his abstention on Item No. 7 due to Cummins Cal Pacific, LLC being a source of income to his employer, Item No. 8 due to Waste Management being a source of income to his employer, Item 13 due to Air Products and Chemicals, Inc. being a source of income to his employer, and Item No. 18 regarding a Contract for Outside Counsel to assist on a lawsuit that he prefers to abstain on.

Agenda items 3, 11, and 14 were withheld for discussion.

MOVED BY YATES, SECONDED BY CACCIOTTI, AGENDA ITEMS 1, 2, 4 THROUGH 10, 13, AND 15 THROUGH 26 APPROVED AS RECOMMENDED, BY THE FOLLOWING VOTE:

AYES:	Burke, Cacciotti, Carney, Gonzales, Loveridge, Lyou (*except Items #7, #8, #13 and #18*), Mitchell, and Yates.
NOES:	None.
ABSTAIN:	Lyou *(Items #7, #8, #13 and #18 only*).
ABSENT:	Antonovich, Benoit, Campbell, Perry and Pulido.

27. Items Deferred from Consent Calendar

3. Execute Contract and Appropriate Funds for Production of Signature AQMD Video

Dr. Lyou left the meeting after recusing himself from Agenda Item No. 3 because of Makeover Earth Incorporated being a potential source of income.

Ms. Carney commented that she was present at the Administrative Committee meeting when the submitted proposals were reviewed and sample videos from each company were shown. She acknowledged the decision was difficult because of the high caliber of the proposals received; but, in the end, the overwhelming cost savings associated with selecting Cinema Vertige, LLC, coupled with their level of experience filming documentaries, was the determining factor. She recognized the importance of providing the filmmaker with the appropriate material that they will need to successfully complete the video and suggested the Board

entertain a proposal to provide the contractor with individuals with expertise on the issues the Basin faces to provide assistance on the substance of the video.

Dr. Wallerstein expressed staff's belief that the District has sufficient resources in-house to provide the required information. He also explained that staff intended to give the filmmaker an opportunity to talk with some Board Members in order to get their perspective.

Dr. Burke expressed his optimism that Cinema Vertige will bring a fresh, youthful approach to delivering the intended message.

Ms. Carney acknowledged that the company's lack of background in air quality issues was disconcerting; but, overall, the Committee was impressed with their proposal and sample video.

(Mayor Pulido arrived at 9:20 a.m.)

Mayor Yates commented that when the City of Chino awards a contract pursuant to the issuance of an RFP, they receive complaints and letters speaking out against the chosen contractor; and this practice has become more prevalent given the current economic conditions. He expressed his confidence in the ability to produce an effective film with the current contractor.

Councilman Cacciotti raised a concern regarding the great disparity between the budget presented by Cinema Vertige and the other proposals because, it would seem, that certain costs such as creative fees, on-camera talent, technical production personnel, equipment rental, location shooting, and film stock would have fixed costs. He is unsure, therefore, where they were able to cut costs to create such an affordable proposal.

Dr. Burke replied that the company's references were thoroughly checked and all respondents awarded them extraordinarily high marks regarding budgetary matters. In the event that they did go over the allocated budget, there is such a large difference between their budgeted cost and the budgeted cost of the other proposers, the District would still be saving money as opposed to having chosen one of the other proposals.

Councilman Cacciotti expressed the need for the filmmaker to meet with members of the Board in order for them to gain the information and knowledge necessary to make the film a success.

Councilwoman Mitchell raised the concern of the potential for increased production costs due to filming in the Basin that the out-of-state filmmaker would not be familiar with and therefore did not account for in their proposal.

(Councilwoman Perry arrived at 9:25 a.m.)

Dr. Wallerstein responded that the thorough reference checks that were completed included questioning on whether or not the company brought their project in on budget, and the responses from the former clients were all positive.

MOVED BY CACCIOTTI, SECONDED BY GONZALES, AGENDA ITEM 3 APPROVED AS RECOMMENDED BY STAFF, BY THE FOLLOWING VOTE:

AYES: Burke, Cacciotti, Carney, Gonzales, Loveridge, Mitchell, Perry, Pulido and Yates.

NOES: None.

ABSENT: Antonovich, Benoit, Campbell and Lyou.

11. Recognize Funds, Approve Additional Truck Projects and Amend Awards under Proposition 1B-Goods Movement Program

At the request of Kurt Wiese, General Counsel, the Chairman conducted individual votes on four of the contracts contained within Item No. 11; and a vote on the remainder of the contracts.

MOVED BY MITCHELL, SECONDED BY GONZALES, AND UNANIMOUSLY CARRIED (Absent: Antonovich, Benoit, and Campbell), THE BOARD APPROVED THE FOLLOWING ACTIONS ON AGENDA ITEM NO. 11, AS RECOMMENDED BY STAFF:

1.) RECOGNIZING UPON RECEIPT UP TO $2,710,000 IN “YEAR 1” PROPOSITION 1B GOODS MOVEMENT PROGRAM FUNDS FROM CARB COMPRISED OF UP TO $2,610,000 FOR “OTHER TRUCKS” AND UP TO $100,000 FOR “PORTS AND INTERMODAL RAIL YARD TRUCKS” PROJECTS AND PLACE THEM INTO THE AQMD PROPOSITION 1B – GOODS MOVEMENT PROGRAM FUND (81).

2.) AUTHORIZING THE EXECUTIVE OFFICER TO

a. EXECUTE A CONTRACT WITH CASCADE SIERRA SOLUTIONS TO REPLACE TWO TRUCKS SERVING PORTS AND INTERMODAL RAIL YARD FACILITIES AS SHOWN IN TABLE 1, IN AN AMOUNT NOT TO EXCEED $100,000 FROM THE PROPOSITION 1B – GOODS MOVEMENT PROGRAM FUND (81);

b. EXECUTE CONTRACTS FOR UP TO 50 ADDITIONAL "OTHER TRUCKS" REPLACEMENT PROJECTS IN RANK ORDER FROM THE LIST OF BACKUP PROJECTS APPROVED BY THE BOARD ON JUNE 4, 2010, UNDER AGENDA NO. 9, IN AN AMOUNT NOT TO EXCEED $2,500,000 FROM THE PROPOSITION 1B-GOODS MOVEMENT PROGRAM FUND (81), EXCEPT FOR PROJECTS BY MATICH CORPORATION, CARDENAS MARKETS, INC., ECOLOGY AUTO PARTS, ROBERTSON'S READY MIX AND UPS, WHICH WERE VOTED ON SEPARATELY, AS NOTED BELOW; AND

c. AMEND PROPOSITION 1B- GOODS MOVEMENT PROGRAM AWARDS APPROVED BY THE BOARD ON FEBRUARY 5, AND JUNE 4, 2010, TO CHANGE AWARD RECIPIENTS FROM PIER WEST TRANSPORTATION FOR EIGHT TRUCKS, RUDY VERNON GOMEZ FOR ONE TRUCK AND WESTAR TRANSPORT FOR EIGHT TRUCKS TO CASCADE SIERRA SOLUTIONS FOR UNCHANGED AWARD AMOUNTS AS OUTLINED IN TABLE 2.

MOVED BY CARNEY, SECONDED BY YATES, APPROVED ACTION 2B FOR **MATICH CORPORATION**, BY THE FOLLOWING VOTE:

AYES: Burke, Cacciotti, Carney, Loveridge, Lyou, Mitchell, Perry, Pulido and Yates.

NOES: None.

ABSTAIN: Gonzales, due to receipt of a campaign contribution from Matich.

ABSENT: Antonovich, Benoit, and Campbell.

MOVED BY CARNEY, SECONDED BY YATES, APPROVED ACTION 2B FOR **CARDENAS MARKETS, INC.**, BY THE FOLLOWING VOTE:

AYES: Burke, Cacciotti, Carney, Loveridge, Lyou, Mitchell, Perry, Pulido and Yates.

NOES: None.

ABSTAIN: Gonzales, due to receipt of a campaign contribution from Cardenas.

ABSENT: Antonovich, Benoit, and Campbell.

MOVED BY CARNEY, SECONDED BY YATES, APPROVED ACTION 2B FOR **ECOLOGY AUTO PARTS**, BY THE FOLLOWING VOTE:

AYES: Burke, Cacciotti, Carney, Gonzales, Lyou, Mitchell, Perry, Pulido and Yates.

NOES: None.

ABSTAIN: Loveridge, due to receipt of a campaign contribution from Ecology Auto Parts.

ABSENT: Antonovich, Benoit, and Campbell.

MOVED BY YATES, SECONDED BY CACCIOTTI, APPROVED ACTION 2B FOR **ROBERTSON'S READY MIX**, BY THE FOLLOWING VOTE:

AYES: Burke, Cacciotti, Carney, Loveridge, Lyou, Mitchell, Perry, and Yates.

NOES: None.

ABSTAIN: Gonzales and Pulido, due to receipt of a campaign contribution from Robertson's Ready Mix.

ABSENT: Antonovich, Benoit, and Campbell.

MOVED BY CARNEY, SECONDED BY YATES, APPROVED ACTION 2B FOR **UPS**, BY THE FOLLOWING VOTE:

AYES: Burke, Cacciotti, Carney, Gonzales, Loveridge, Mitchell, Perry, Pulido and Yates.

NOES: None.

ABSTAIN: Lyou, due to UPS being a potential source of income.

ABSENT: Antonovich, Benoit, and Campbell.

14. Execute Contracts for FY 2009-10 "Year 12" Carl Moyer Program and SOON Provision, Amend Carl Moyer Program Awards and Issue Program Announcement for SOON Provision

Mr. Wiese announced the abstentions of Supervisor Gonzales on the contract with Burrtec Waste Industries due to a campaign contribution and of Dr. Lyou on the Waste Management Collection and Recycling contract due to Waste Management being a source of income to his employer.

MOVED BY MITCHELL, SECONDED BY PERRY, AGENDA ITEM 14 APPROVED AS RECOMMENDED BY STAFF, BY THE FOLLOWING VOTE:

AYES: Burke, Cacciotti, Carney, Gonzales *(except as to Burrtec Waste contract)*, Loveridge, Lyou *(except as to the Waste Management Contract)*, Mitchell, Perry, Pulido and Yates.

NOES: None.

ABSTAIN: Gonzales *(as to the Burrtec Waste contract only, due to receipt of a campaign contribution from Burrtec),* and Lyou *(as to the Waste Management contract only, due to Waste Management being a potential source of income)*.

ABSENT: Antonovich, Benoit, and Campbell.

BOARD CALENDAR

28. Administrative Committee

29. Legislative Committee

30. Mobile Source Committee

31. Stationary Source Committee

32. Technology Committee

33. Mobile Source Air Pollution Reduction Review Committee

MOVED BY PERRY, SECONDED BY GONZALES, THE BOARD APPROVED AGENDA ITEMS 28 THROUGH 33 AS RECOMMENDED, RECEIVING AND FILING THE COMMITTEE REPORTS, AND ADOPTING THE POSITIONS ON LEGISLATION AS SET FORTH BELOW, BY THE FOLLOWING VOTE:

AYES: Burke, Cacciotti, Carney, Gonzales, Loveridge, Lyou, Mitchell, Perry, Pulido and Yates.

NOES: None.

ABSENT: Antonovich, Benoit and Campbell.

Bill/Title	**Recommended Position**
S. 3495 (Dorgan) Promoting Electric Vehicles Act of 2010	Support with Amendments
S. 3608 (Schumer) Fuel Cell Industrial Vehicle Jobs Act of 2010	Support
H.R. 5174 (Tonko) Fuel Cell Industrial Vehicle Jobs Act of 2010	Support with Clarification
S. 3629/H.R. 5976 (Lautenberg/Sires) Freight Transportation Policy and Strategic Development (companion bills)	Support with Amendments

34. California Air Resources Board Monthly Report

MOVED BY LYOU, DULY SECONDED, AND UNANIMOUSLY CARRIED (Absent: Antonovich, Benoit, and Campbell), THE BOARD APPROVED RECEIPT/FILING OF AGENDA ITEM 34 AS RECOMMENDED.

Staff Presentation

35. Clean Fuels Program Draft Plan Update

Dr. Matt Miyasato, Assistant DEO Science and Technology Advancement gave the staff presentation.

Mayor Loveridge commented that the District should be more invested in the deployment of electric vehicles since the technology advancements in the field warrant a shift in the focus from demonstration to promotion and deployment.

Dr. Miyasato replied that the District wants to ensure that the public and private infrastructure resources being provided by the Department of Energy will be intelligently deployed throughout the Basin, while the original equipment manufacturers consider residential charging the top priority. Staff wants to ensure that public infrastructure is sufficient to have market penetration but not be overbuilt causing a waste of public funds. Staff did not focus on residential charging because the Department of Energy and the vehicle manufacturers are going to ensure that area is sufficiently provided for. He added that the research plan includes staff's findings that infrastructure is going to be important, but the main focus will be to expand investment of medium- and heavy-duty applications, because those technologies will offer significant emissions benefits.

Mayor Loveridge noted that the City of Riverside recently purchased six Zap vehicles, and indicated that local cities and counties are open to these technologies and the District should focus its efforts to further advocate for the utilization of these technologies by other entities.

Dr. Miyasato added that there are different considerations with each of the different types of vehicles including the city electric vehicles such as the Zap, the slightly wider range vehicles such as the Nissan Leaf, as well as the plug-in hybrids with a 300-600 mile range; and staff will need to consider how to best support each of these various applications.

Supervisor Gonzales explained that the District needs to capitalize on the new opportunities that are present as a result of the technologies that are now becoming more of a reality to the public. She emphasized the importance of effectively spreading the message of the benefits and uses of these new applications to ensure they are being deployed in the most effective manner.

Dr. Burke commented that he believes it would be beneficial to work with those companies that will benefit from this technology, including the electrical companies and automobile manufacturers, about a joint-promotion package where they help fund this technology in order to make it more widely available to the public.

Dr. Miyasato confirmed that staff will reach out to those stakeholders as requested.

Councilman Cacciotti expressed his agreement with the previous comments, and suggested that the amount of funds devoted to electric and hybrid technologies be increased to 30 percent. He suggested lessening the percentage of project funds devoted towards engine systems in order to increase the infrastructure and deployment funds to 10 percent. He is encouraged by the possibility of utilizing more electric and hybrid technologies in city and county government fleets, and stressed the importance of having financial assistance available for those conversions to take place.

Dr. Burke asked staff to look into redistribution of the potential project funds in the Draft Plan based on the comments made by Board Members.

Councilwoman Mitchell expressed a concern with the focus on expansion of the use of and infrastructure for CNG, which is a fossil fuel.

Dr. Miyasato responded that CNG is currently the lowest emission option for heavy-duty vehicles and highlighted the benefits of CNG, including reduction of criteria pollutants, GHG emissions, and reliance on petroleum. He added that it can be created renewably which produces a greater reduction in GHG emissions.

In response to Councilwoman Mitchell's inquiry into the negative effects of mining natural gas, Dr. Miyasato responded that most of the natural gas used is from North America and the full life-cycle analyses that are completed account for all of the emissions and the energy associated with extraction. The majority of natural gas used is from reserves and it does not suffer those same types of environmental consequences.

Councilwoman Mitchell asked staff to balance the focus on the need for zero-emission light-duty vehicles with the current technology for heavy-duty vehicles in the District's Clean Fuels Program.

Dr. Wallerstein recommended that staff address the comments that were made by the Board Members and present those at the next meeting of the Technology Committee; a report of the Committee's proceedings will be included on the Board's November 5, 2010 meeting agenda.

Dr. Burke commented that all of the various low-emission technologies are important in different ways because of the various purposes they serve; stressed the importance of the District being able to promote utilization of vehicles which are going to help reduce emissions in the Basin; and suggested that, at the next Board retreat, staff could give a short overview of the strengths of the various fuel systems and technologies available.

RECEIVED AND FILED; NO ACTION NECESSARY.

PUBLIC HEARINGS

36. Adopt Proposed Rule 1420.1 - Emissions Standard for Lead From Large Lead-acid Battery Recycling Facilities

(Continued from September 10, 2010 Board Meeting)

Ms. Carney recused herself from Agenda Item No. 36 because of U.S. Battery being a source of income to her, and left the room.

Mayor Yates reported that all members of the Stationary Source Committee recommended that this item be held over another 30 days in light of new information that has come from one of the manufacturers regarding lower levels of emissions, which may result in a change in staff's recommendation to the Board.

Chairman Burke asked that anyone in the audience who wanted to testify on the item as it is currently drafted, instead of waiting for the November Board meeting, do so at this time. The six individuals who submitted cards to speak on the item waived comments.

Written Comments Submitted by:
Duncan McKee
10 Employees of Rehrig Pacific
Quemetco, Inc.
Sheppard Mullin Richter & Hampton LLP on behalf of Exide Technologies

Dr. Lyou reminded the Board Members that there was still a substantive question that needs to be addressed at either the Stationary Source Committee or the November Board Meeting with regard to the legal context or the purpose of this Rule and whether it had to do with the national ambient air quality standards or whether it was more focused on toxics.

Mr. Wiese alerted the Board to two errata sheets containing alternative language that staff composed in relation to the recommendations of the Stationary Source Committee that was provided to the Board Members and made available to the public.

THE PUBLIC HEARING ON RULE 1420.1 WAS CONTINUED BY UNANIMOUS CONSENT OF THE BOARD TO THE NOVEMBER 5, 2010 BOARD MEETING, AS RECOMMENDED BY THE STATIONARY SOURCE COMMITTEE.

PUBLIC COMMENT PERIOD – (Public Comment on Non-Agenda Items, Pursuant to Government Code Section 54954.3)

There was no public comment on non-agenda items.

CLOSED SESSION

The Board recessed to closed session at 10:05 a.m., pursuant to Government Code section 54956.9(a) to confer with its counsel regarding pending litigation which has been initiated formally and to which the District is a party, as follows:

- NRDC, et al. v. SCAQMD, et al., U.S. District Court Case No. CV08-05403 GW (PLAx) and United States Court of Appeals, 9th Circuit, Case No. 09-57064;
- CCAT, et al. v. State of California; SCAQMD, et al., Los Angeles Superior Court Case No. BS124264 and California Court of Appeal, Second District, Case No. B226692;
- Petition Before the Administrator of the U.S. Environment Protection Agency In the Matter of Alleged Failure of California to Comply with Mandatory Procedures to Amend SIP Regarding Internal Bank Offset Credits Held by the South Coast Air Quality Management District (filed December 10, 2009);
- Association of American Railroads, et al. v. SCAQMD, et al., U. S. District Court Case No. CV06-1416 JFW (PLAx) and United States Court of Appeals, 9th Circuit, Case No. 07-55804; and
- W.M. Barr & Company, Inc. v. SCAQMD, Los Angeles Superior Court Case No. BS127359.

Following closed session, General Counsel Kurt Wiese announced that there were no reportable actions taken in closed session.

ADJOURNMENT

There being no further business, the meeting was adjourned by General Counsel Kurt Wiese at 10:30 a.m.

The foregoing is a true statement of the proceedings held by the South Coast Air Quality Management District Board on October 1, 2010.

Cities of Orange County

Members Absent:

Supervisor Michael D. Antonovich
County of Los Angeles

Mayor Ronald O. Loveridge
Cities of Riverside County

Councilwoman Jan Perry
City of Los Angeles

CALL TO ORDER: Chairman Burke called the meeting to order at 9:40 a.m.

- Pledge of Allegiance: Led by Chairman Burke.

PUBLIC HEARING

1. Adopt Proposed Rule 320—Automatic Adjustment Based on Consumer Price Index for Regulation III Fees

Barbara Baird, District Counsel, gave the staff presentation; and noted the errata sheet containing additional language for the Resolution, which was distributed to Board Members and copies made available to the public.

At the request of Supervisor Campbell, Ms. Baird explained that the Rule provides that the amount of the CPI adjustment would be determined by the calculation performed by the California Division of Labor each year and would be repealed if Proposition 26 does not pass.

Supervisor Campbell expressed his support of Proposition 26 because of the intent to place restrictions on various governmental agencies who have taken advantage by naming something a fee rather than a tax in order to avoid voter approval; and noted he is not able to support the rule.

Supervisor Benoit expressed his agreement with Supervisor Campbell's concerns and raised a concern about the negative view the public may have regarding the Board passing such a Rule in such close proximity to the upcoming election.

Ms. Carney commented that she believes the Rule has merit regardless of the outcome of the vote on Proposition 26; so, the language that repeals Rule 320 in the event that Proposition 26 is not implemented was disconcerting to her. Her concern if Rule 320 is not put in place is that litigation would most likely result, which would require excessive amounts of money be spent to defend the collection of fees by the District, to the detriment of taxpayers and residents of the South Coast Basin.

Mayor Yates and Supervisor Gonzales expressed their concerns with regard to the impact to the business community and acknowledged the difficulty of balancing the District's mission of protecting public health and cleaning the air, with the financial resources needed to continue those efforts. On balance, however, both Board Members noted their support for Proposed Rule 320.

Dr. Burke noted that he agreed with comments made by all of his fellow Board Members and as Chairman believed it is necessary to support adoption of the proposed rule.

Councilwoman Mitchell noted that she supports Rule 320 and believes that it is necessary.

The public hearing was opened and, there being no requests from the public to comment on this item, the public hearing was closed.

Robert McCormick, McCormick & Son
Patty Senecal, Western States Petroleum Association

MOVED BY YATES, SECONDED BY CACCIOTTI, AGENDA ITEM NO. 1 APPROVED, ADOPTING RESOLUTION NO. 10-27, ADOPTING RULE 320 – AUTOMATIC FEE ADJUSTMENT BASED ON CONSUMER PRICE INDEX FOR REGULATION III FEES, AND CERTIFYING THE CEQA EXEMPTION, AS RECOMMENDED BY STAFF, WITH THE MODIFICATION OF THE ADOPTING RESOLUTION TO INCLUDE THE LANGUAGE SET FORTH IN THE ERRATA SHEET AND NOTED BELOW, BY THE FOLLOWING VOTE:

AYES: Burke, Cacciotti, Carney, Gonzales, Lyou, Mitchell, Pulido and Yates.

NOES: Benoit and Campbell.

ABSENT: Antonovich, Loveridge and Perry.

MODIFICATION:

Include the following language in the Resolution:

BE IT FURTHER RESOLVED, that the Executive Officer is directed to annually prepare a socioeconomic impact analysis of the effect of an automatic adjustment based on the California Consumer Price Index, in time for consideration by the Budget Advisory Committee, public consideration by March 15, and the Governing Board's consideration on or before the May Board Meeting; and

BE IT FURTHER RESOLVED, that the Executive Officer is directed to annually schedule a public consultation meeting regarding the automatic fee adjustment established by Rule 320 to receive any public comments, and shall report those comments and any responses, along with any recommendations by the Budget Advisory Committee, to the Governing Board by April 15, together with a recommendation on whether to schedule a public hearing on the fees in Regulation III.

ADJOURNMENT

There being no further business, the meeting was adjourned by Chairman Burke at 10:05 a.m.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 2

PROPOSAL: Set Public Hearings December 3, 2010 to Consider Amendments and/or Adoption to AQMD Rules and Regulations:

(A) Amend Rule 1415 – Reduction of Refrigerant Emissions from Stationary Refrigeration and Air Conditioning Systems, and Adopt Rule 1415.1 - Reduction of Refrigerant Emissions from Stationary Refrigeration Systems. The proposed amendments to Rule 1415 expand the scope of the rule to include provisions for reducing emissions of high global warming potential refrigerants utilized in stationary air conditioning systems and other administrative changes. Staff is also proposing a new rule, Rule 1415.1, to incorporate provisions for reducing emissions of certain high global warming potential refrigerants that will be consistent with CARB's statewide rule for stationary refrigeration systems. The proposed new rule will consolidate all other emission control requirements for stationary refrigeration systems currently in Rule 1415. (Review: Stationary Source Committee, November 19, 2010)

(B) Amend Rule 1143 - Consumer Paint Thinners & Multi-Purpose Solvents. The amendment will propose an exemption for artist solvents and thinners that will make the rule more consistent with the state consumer products regulation by: (1) exempting artist solvents and thinners that are properly labeled and sold in containers that are one liter or less from applicable VOC limits; (2) defining artist solvents and thinners; (3) making changes to the rule to clarify that all exempt products shall be subject to recordkeeping and reporting; and (4) making changes to the rule to clarify that the sell-through provisions for the final VOC limit do not apply to products that do not meet the interim VOC limit. The proposed amendment will result in 114 pounds of VOC emission reductions foregone per day. (Review: Stationary Source Committee, October 15, 2010)

The complete text of the proposed rule and amendments, staff reports, and other supporting documents are available from the District's Public Information Center, (909) 396-2550, and on the Internet (www.aqmd.gov).

RECOMMENDED ACTION:
Set Public Hearings December 3, 2010 to amend Rules 1415 and 1143 and adopt Proposed Rule 1415.1.

TABLE OF CONTENTS

EXECUTIVE SUMMARY

In December 2009, the California Air Resources Board (CARB) approved the Management of High Global Warming Potential Refrigerants for Stationary Sources regulation (commonly called the Refrigerant Management Program) to help reduce the state's greenhouse gas (GHG) emissions to 1990 levels by year 2020, as required by the California Global Warming Solutions Act of 2006 (AB 32). The regulation will go into effect on January 1, 2011.

The Refrigerant Management Program's goal is to reduce emissions of high global warming potential (GWP) refrigerants such as chlorofluorocarbons (CFCs), hydrochlorofluorocarbons (HCFCs), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs) used in commercial and industrial refrigeration systems. The regulation requires registration, leak detection and monitoring, leak repair, retrofit or retirement, reporting, and recordkeeping for the affected industries including owners or operators of refrigeration systems, any person who services a refrigeration system, and distributors, wholesalers, and reclaimers of high GWP refrigerants.

Currently, the AQMD has a similar regulation, Rule 1415 – Reduction of Refrigerant Emissions from Stationary Refrigeration and Air Conditioning Systems (Rule 1415), which covers the reduction of ozone depleting refrigerant (CFC and HCFC) emissions. Rule 1415 requirements, however, apply to both stationary refrigeration and air conditioning systems whereas the Refrigerant Management Program covers only stationary refrigeration systems. In certain aspects, the CARB's regulation is more stringent than Rule 1415 particularly when it comes to leak inspection, leak detection and monitoring, and reporting requirements, while other components are less stringent. In particular, the CARB regulation allows leak repair periods of 45 or 120 days depending on the nature of the refrigeration system, and circumstances surrounding the leak, while the existing Rule 1415 requires completion of leak repairs within 14 days of initial leak detection. Further, the CARB rule has a provision that allows an exemption from the leak repair and retrofit or retirement plan requirements for a period of up to three years if specific exemption criteria are met. Rule 1415 does not provide such exemption. Staff's goal is to ensure that the AQMD refrigerant rule is equivalent in every aspect to the CARB regulation; therefore, a new Rule 1415.1 – Reduction of Refrigerant Emissions from Stationary Refrigeration Systems (Rule 1415.1) is being proposed to reduce refrigerant emissions from stationary refrigeration systems and to align AQMD's program with CARB's Refrigerant Management Program. Proposed Rule (PR) 1415.1 will consolidate all emission control requirements for stationary refrigeration systems currently in Rule 1415, and adopt all provisions in the state regulation pertaining to the control of high GWP refrigerant emissions.

For Rule 1415, which will apply only to air conditioning systems, staff is proposing to expand the scope of the rule to include high GWP refrigerants. In addition, staff's proposed amendments to Rule 1415 would place all emission control requirements solely for air conditioning systems under this Rule. Similar to PR 1415.1, staff's proposal would also allow an extended leak repair period of up to 45 days in situations where a certified technician is not available or the part(s) needed to complete the repair is unavailable within 14 days of initial leak detection.

Staff believes that having separate rules for air conditioning (PAR 1415) and refrigeration systems (PR 1415.1) would minimize confusion with regard to rule applicability, improve clarity, and enhance rule enforceability.

The CARB Refrigerant Management Program will result in an estimated GHG emission reduction for the South Coast Air Basin of approximately 3.5 MMT CO_2E by year 2020. Implementing PR 1415 is not expected to achieve additional GHG emission reductions beyond what is expected from the CARB regulation. Extending the leak repair period to 45 days in PAR 1415 could result in foregone emissions of 497 metric tons per year of CO_2E. For PR 1415.1, extending the time period during which a leak must be repaired from 14 days to 45 or 120 days for refrigeration systems could result in foregone CO_2E emissions of 5,849 metric tons per year. Additionally, the exemption provision in PR 1415.1 could result in foregone emissions of 4,618 metric tons per year of CO_2E. The total emissions impacts of relaxing the leak repair period in PAR 1415 and PR1415.1, including the exemption provision in PR1415.1, translate to foregone CO_2E emissions of 10,964 metric tons per year, which is a small amount when compared to the 3.5 MMT CO_2E emission reductions anticipated from this program.

BACKGROUND

Rule 1415 – Reduction of Refrigerant Emissions from Stationary Refrigeration and Air Conditioning Systems was adopted on June 7, 1991, and later amended on October 14, 1994, to reduce emissions of Class I and Class II ozone-depleting refrigerants from stationary refrigeration and air conditioning systems. Class I refrigerants are typically CFCs, while Class II refrigerants are all HCFCs, and are listed under section 602 of the Clean Air Act.

Production of CFCs and HCFCs were designated for phase out under the Montreal Protocol, primarily due to concerns about stratospheric ozone depletion. The use of these ozone depleting substances (ODS) as refrigerants is also regulated for the same reason. As a result of the Montreal Protocol's phase-out of ODS, the use of CFCs and HCFCs as refrigerants has been replaced with HFCs and PFCs, generally referred to as ODS substitutes. These ODS substitutes are not ozone depleters, but have much higher global warming potential. The use of ODS substitutes are increasing, and will continue to increase as ODS refrigerants are replaced by these high global warming potential ODS substitutes, particularly the HFCs. Consequently, greenhouse gas (GHG) emissions are projected to increase on a CO_2 equivalent basis.

The increase in GHGs in the atmosphere has been attributed to the average rise in the Earth's temperature that has been observed in recent years, which is commonly referred to as global warming. These GHGs make the Earth warmer by trapping heat from the sun in the earth's atmosphere, which increases the temperature. Many chemical compounds found in the Earth's atmosphere, such as methane, carbon dioxide, nitrous oxide, HCFCs, PFCs, and HFCs, act as GHGs. There is strong evidence that significant amounts of GHGs are added to the atmosphere as a result of human activities, thereby, contributing to global warming. Scientists believe that a warmer Earth may lead to changes in weather patterns, a rise in sea level, and may have significant impacts on plants, wildlife, and humans.

In 2006, the State Legislature passed the California Global Warming Solutions Act of 2006 (AB 32), establishing a comprehensive program to reduce the state's GHG emissions to the 1990 level by year 2020. AB 32 directed CARB to begin developing discrete early action measures to reduce greenhouse gases while also preparing a scoping plan to identify the best approach to reach the 2020 target. In addition, AB 32 requires that any GHG emission reduction measures developed be technologically feasible and cost-effective.

In December 2009, the CARB Board approved the Management of High Global Warming Potential Refrigerants for Stationary Sources regulation, commonly referred to as the Refrigerant Management Program. This program is one of the early action measures adopted by CARB under AB32 aimed at reducing the state's GHG emissions. The adopted final regulation and related documents has been submitted to the Office of Administrative Law for final approval and/or action, which is expected sometime in October 2010. This regulation is scheduled to go into effect on January 1, 2011.

The Refrigerant Management Program seeks to reduce emissions of high GWP refrigerants from stationary refrigeration systems. A high-GWP refrigerant is any compound used as a heat transfer fluid or gas, and includes CFCs, HCFCs, HFCs, PFCs, or any compound or blend of compounds with a global warming potential value equal to or greater than 150, or any ozone depleting substance as defined in Title 40 of the Code of Federal Regulation, Part 82, §82.3. These substances are GHGs which are thousands of times more potent than carbon dioxide (CO_2). The CARB regulation addresses stationary commercial and industrial refrigeration systems that can have high leak rates and minimal oversight. Specifically, facilities with refrigeration systems using more than 50 pounds of high GWP refrigerants, or those who service refrigeration systems, or distribute, sell or reclaim high GWP refrigerants, must comply with the regulation.

The CARB regulation requires registration, leak detection and monitoring, leak repair, retrofit or retirement, reporting, and recordkeeping for owners or operators of refrigeration systems subject to the regulation. Reporting and recordkeeping requirements are also applicable to distributors, wholesalers, and reclaimers of high GWP refrigerants. Additionally, required service practices for refrigerant management are applicable to any person who services a refrigeration system that uses a high GWP refrigerant.

The requirements in the CARB Refrigerant Management Program are similar to existing federal regulations under section 608 of the Clean Air Act, particularly in the areas of leak repair, required service practices, and recordkeeping requirements. In addition, the CARB regulation was developed to be as consistent as possible with the current Rule 1415. However, there are certain areas where the existing Rule 1415 differs with the CARB regulation.

While current Rule 1415 applicability is limited to ODS refrigerants, such as CFCs and HCFCs, the CARB Refrigerant Management Program includes both ODS and ODS substitute refrigerants. In addition, Rule 1415 covers both refrigeration and air conditioning systems while the CARB regulation is limited to refrigeration systems only. In certain aspects, the CARB's regulation is more stringent than Rule 1415 particularly when it comes to leak inspection, leak detection and monitoring, and reporting requirements, while other requirements are less stringent. In particular, the CARB regulation allows leak repair periods of 45 or 120 days depending on the nature of the refrigeration system, and circumstances surrounding the leak, while the existing Rule 1415 requires completion of leak repairs within 14 days of initial leak detection. Further, the CARB rule has a provision that allows an exemption from the leak repair and retrofit or retirement plan requirements for a period of up to three years if specific exemption criteria are met. Rule 1415 does not provide such exemption.

Staff's proposal to create a new Rule 1415.1 to control high GWP refrigerant emissions solely from stationary refrigeration systems would align AQMD's regulation with CARB's Refrigerant

Management Program. PR 1415.1 will consolidate all emission control requirements for stationary refrigeration systems currently in Rule 1415, and incorporate all provisions in the state regulation to reduce emissions of high global warming potential refrigerants. By proposing Rule 1415.1, AQMD staff can implement or enforce the state's Refrigerant Management Program, which is expected to be done through a Memorandum of Understanding (MOU) with CARB. The CARB MOU will provide additional guidelines related to the implementation and enforcement of the Refrigerant Management Program, including rule interpretation and training. The CARB regulation is based largely on the AQMD's existing program for controlling refrigerant emissions from stationary refrigeration systems.

In addition, the proposed changes to Rule 1415 would place all emission control requirements for air conditioning systems under this rule. Staff believes that proposing separate rules for air conditioning (PAR 1415) and refrigeration systems (PR 1415.1) would minimize confusion with regard to rule applicability, improve clarity, and enhance rule enforceability.

LEGISLATIVE AUTHORITY

The California Legislature created the South Coast Air Quality Management District (AQMD) in 1977 (The Lewis-Presley Air Quality Management Act, Health and Safety Code section 40400 et seq.) as the agency responsible for developing and enforcing air pollution control rules and regulations in the South Coast Air Basin (Basin). The AQMD obtains its authority to adopt, amend, or rescind rules and regulations from Health and Safety Code sections 39002, 40000, 40001, 40702, 41508, and 41700.

RULE PROPOSAL

Proposed Amended Rule 1415 - Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems

Staff's proposal is to amend Rule 1415 to incorporate all registration, emission control, and recordkeeping requirements in the rule solely for stationary air conditioning systems. Staff's proposal will also expand the scope of the current rule to include all high GWP refrigerants, similar to the CARB regulation for stationary refrigeration systems. Other administrative changes to the rule are also proposed. A summary of the proposed amendments to Rule 1415 is as follows:

1. Amend Rule Title

   Currently, the rule title pertains to stationary refrigeration and air conditioning systems. Staff's proposal revises the rule title solely for the reduction of refrigerant emissions from stationary air conditioning systems, and eliminates reference to refrigeration systems.

2. Modify Rule Purpose and Applicability, subdivisions (a) and (b)

   Staff is proposing to modify the rule purpose to include emission reductions from high global warming potential refrigerants, and limit the applicability of this to stationary air conditioning systems only. Requirements pertaining to stationary refrigeration systems such as refrigerators, freezers, and other refrigeration appliances will be in the Proposed

Rule 1415.1 – Reduction of Refrigerant Emissions from Stationary Refrigeration Systems.

3. Amend the definition section, subdivision (c)

   Staff proposes to add definition for new terms used in the rule and modify existing ones to clarify rule intent, and make the definitions consistent with Proposed Rule 1415.1 as follows:

   - Additional refrigerant charge
   - Air conditioning system
   - Audit
   - Bubble test
   - Certified reclaimer
   - Certified refrigerant recovery or recycling equipment
   - Certified technician
   - Chlorofluorocarbon or CFC
   - Component
   - Global warming potential value
   - High global warming potential refrigerant
   - Hydrochlorofluorocarbon or HCFC
   - Hydrofluorocarbon or HFC
   - Perfluorocarbon
   - Reclaim
   - Recycle
   - Refrigerant leak
   - Self-contained recovery equipment

   In addition, staff is proposing to delete terms that are no longer applicable, as follows:

   - Approved recycling equipment
   - Certified auditor
   - Class I refrigerant
   - Class II refrigerant
   - High-pressure refrigeration system
   - Low-pressure refrigeration system

- Maintenance
- Refrigeration system
- Very high pressure refrigeration system

4. Move registration and leak inspection requirements in paragraph (d)(2) to paragraph (d)(1), and clarify requirements that pertain to owners or operators of air conditioning systems as follows:
   a) Registration Plan requirement in subparagraph (d)(2)(C) is moved to subparagraph (d)(1)(A). Further, staff has added new information to be included during submission of the Registration Plan, consistent with existing data reported in the current Rule 1415 Registration Form.
   b) The annual audit requirements in subparagraphs (d)(2)(A) and (d)(2)(B) are moved to and consolidated under subparagraph (d)(1)(B). Language pertaining to leak detection methods has been modified to reflect current industry practices, such as the use of refrigerant leak detection device, a bubble test, or observation of oil residue. Further, the rule provision in clause (d)(2)(B)(i) requiring a certified technician to conduct leak inspection is removed to make it consistent with state and federal leak inspection requirement.
   c) Delete redundant recordkeeping requirement in clause (d)(2)(B)(ii). This requirement is included in the Recordkeeping section, paragraph (e)(1).

5. Move leak repair requirements in paragraph (d)(3) to paragraph (d)(2).

6. Add a provision in paragraph (d)(3) to allow leak repair period of up to 45 days.

   Staff's proposing a longer repair period of up to 45 days to fix a refrigerant leak only in situations where a certified technician is not available, or the part(s) needed to complete the repair is unavailable within 14 days of initial leak detection. The owner or operator of the affected refrigeration system shall keep a written record to prove that a certified technician or the required parts are not available.

7. Move requirements in paragraph (d)(1) to paragraph (d)(4). In addition, language is proposed in (d)(4)(A) to clarify the U.S. EPA certified technician requirement.

8. Move language in paragraph (e)(5), under Recordkeeping section, to subparagraph (d)(5)(B) under Requirements section, which allows an authorized representative of a person employing at least one certified technician to purchase refrigerant. Consequently, similar language in paragraph (e)(5) is proposed for deletion.

9. Modify language by deleting the words "Class I or Class II" and replacing them with "high global warming" in paragraph (d)(6) to clarify rule intent and enhance rule enforceability.

10. Modify certain languages in subdivision (e), Recordkeeping.
    Staff is proposing to add clarifying language in paragraphs (e)(1), (e)(4) and (e)(5), as well as delete obsolete rule language in (e)(1)(iv) and (e)(8)(D) pertaining to permit number requirement for refrigerant recovery and recycling equipment. Such equipment is

now exempt from permit requirements pursuant to Rule 219 (d)(11). Facilities are expected to continue using the Rule 1415 Recordkeeping Forms when documenting annual audits and leak repair activities for each air conditioning system pursuant to the recordkeeping provisions of paragraph (e)(1). Such records shall be kept at the facility for a minimum of 5 years, and shall be made available to the Executive Officer upon request.

Proposed Rule 1415.1 - Reduction of Refrigerant Emissions from Stationary Refrigeration Systems

As stated in the previous section, Proposed Rule 1415.1 mirrors CARB's Refrigerant Management Program, and will implement all provisions in the state regulation to reduce emissions of high GWP refrigerants. Staff is proposing to incorporate the following provisions pertaining to stationary refrigeration systems in Rule 1415.1:

1. Rule Title

   Staff's proposed rule title is specific to the reduction of refrigerant emissions from stationary refrigeration systems only.

2. Purpose and Applicability

   The scope and applicability is for high GWP refrigerants used in stationary refrigeration systems.

3. Definitions

   Staff is proposing 56 definitions for terms used in the rule in order to clarify rule intent and enhance rule enforceability. These definitions are consistent with those found in the CARB Refrigerant Management Program.

4. Registration Requirements, paragraph (d)(1)

   Staff is proposing that owners and operators of refrigeration systems with full charge greater than 50 lbs of high GWP refrigerant submit annually a Registration Plan to the District. However, registration with the District ceases once the CARB registration requirements for the refrigeration system begins. Registration of the refrigeration system with CARB will be required in 2012 for large refrigeration systems (full charge greater than or equal to 2,000 lbs refrigerant); 2014 for medium-size refrigeration systems (full charge equal to or greater than 200 lbs but less than 2,000 lbs refrigerant); and 2016 for small refrigeration systems (full charge greater than 50 lbs but less than 200 lbs refrigerant). For facilities with multi-size systems, e.g. large and medium-size refrigeration systems operating at the facility, the owner or operator has the option of registering the medium-size refrigeration system at the same time as the registration for the large system is due in 2012, even though registration of a medium-size refrigeration system would not be due until year 2014 if it was the largest or only system operating at the facility.

The proposed registration provision also includes information that facilities need to provide about the refrigeration systems during registration, and a provision requiring initial and annual implementation fees to cover the costs of administering and enforcing the rule based on fee guidelines established by CARB.

Currently, CARB's initial and annual implementation fees for large refrigeration systems (full charge greater than or equal to 2,000 lbs refrigerant) are both set at $370 per facility, and $170 per facility for medium-size refrigeration systems (full charge greater than or equal to 200 lbs but less than 2,000 lbs refrigerant). Fees paid are based on the largest system operating at the facility; therefore, a facility with both large and medium-size refrigeration systems operating will pay an initial and annual implementation fee of $370. There is no implementation fee for small refrigeration systems. Additionally, the proposal includes change of ownership requirements for refrigeration systems previously registered with CARB.

5. Leak Detection and Monitoring Requirements, paragraph (d)(2)

   The proposed requirements incorporate existing Rule 1415 and CARB's regulation on leak inspection and monitoring. Prior to January 1, 2011, owners or operators of refrigeration systems, with full charge capacity greater than 50 pounds of high GWP refrigerants, are required to conduct annual leak inspection of their refrigeration system to ensure that the system does not have refrigerant leaks. Annual leak inspection is already being done by owners or operators of refrigeration systems, and the proposed provision is a continuation of an existing leak inspection requirement in Rule 1415 for refrigeration systems.

   Beginning January 1, 2011, owners or operators of large refrigeration systems (full charge greater than or equal to 2,000 lbs refrigerant) are required to conduct monthly leak inspections. Quarterly leak inspections are required for medium-size refrigeration systems (full charge greater than or equal to 200 lbs but less than 2,000 lbs refrigerant), while small refrigeration systems (full charge greater than 50 lbs but less than 200 lbs refrigerant) will continue to conduct annual leak inspections. These leak inspection requirements do not apply if the refrigeration system has an automatic leak detection system. In comparison, current Rule 1415 requires an annual leak inspection regardless of the size of the refrigeration system, considered to be less stringent for large and medium-size refrigeration systems.

   In addition, the proposal will require the installation of an automatic leak detection system for large refrigeration systems beginning in year 2012. The automatic leak detection system has to be calibrated annually, i.e., within one year of installation and every year thereafter, using the manufacturer's recommended procedures to ensure that the system accurately detects a vapor concentration level of 10 parts per million (ppm) of the specific refrigerant used in the refrigeration systems, and alerts the operator when 100 ppm of vapor concentration is reached. In addition, sensors or intakes of the automatic leak detection system shall be placed in the proximity of the compressor, evaporator, condenser, and other areas with a high potential for a refrigerant leak. Based on discussions with CARB, the specific placement of sensors was not defined in the

regulation in order to allow flexibility in accommodating the different application-specific designs of refrigeration systems and refrigerant monitoring systems. The proximity of sensors to the refrigeration system parts with high potential for refrigerant leaks would be dependent on each installation, but need to be close enough to the refrigeration system's principal components to detect a leak. Leak inspection methods consistent with industry practices, e.g. refrigerant leak detection device, bubble test, observation of oil residue, are also being proposed.

6. Leak Repair Requirements, paragraph (d)(3)

   Consistent with Rule 1415, the proposal will require the repair of a refrigerant leak within 14 days of initial leak detection. In order to be consistent with the CARB regulation, however, PR 1415.1 will allow longer repair periods of 45 days and 120 days depending on the nature of the refrigeration system, and the circumstances surrounding the leak. For example, if a certified technician or a part needed to repair the refrigerant leak is not available within 14 days of initial leak detection, or the leak repair requires an industrial shutdown, then additional time to complete the repair may be allowed up to 45 days from initial leak detection. Further, facilities that are subject to the Mandatory Greenhouse Gas Emissions Reporting requirements under section 101 of the California Code of Regulations may qualify for a 120-day repair period. Such facilities include cement plants, electrical generating facilities, electricity retail providers and power marketers, oil refineries, hydrogen plants, cogeneration facilities, and industrial sources that emit more than 25,000 MT CO_2 per year.

   The proposal will also require the owner or operator to prepare and implement a retrofit and retirement plan if the refrigerant leak cannot be repaired within the allowable repair period of 14, 45, or 120 days.

7. Retrofit or Retirement Plan Requirements, paragraph (d)(4)

   The proposed provision will require the owners or operators of refrigeration systems that continue to leak to establish a schedule to retrofit or retire the system within six months of initial leak detection. All work shall be completed during this six-month period. This section also includes specific information that needs to be included in the plan pertaining to the facility and to the retrofitted or newly installed refrigeration system.

   The retrofit or retirement plan is not required to be submitted to the Executive Officer, but needs to be maintained and kept at the facility.

8. Approval of Exemptions, paragraph (d)(5)

   This rule provision outlines specific conditions upon which a facility may be exempted from the leak repair and retrofit/retirement plan requirements for up to three years. Such provision allows flexibility in rule implementation to address significant hardship as a result of complying with the leak repair and retrofit/retirement plan requirements in the rule. Facility owners or operators need to submit a written application to the Executive Officer demonstrating that one or more of the exemption criteria have been met.

Any exemption granted may be extended for additional periods of up to three years (maximum of six years exemption) if the Executive Officer determines that the demonstrations made to satisfy the exemption remain valid. Based on additional guidance from CARB staff, any exemption and extension granted may not necessarily be for the full three years as a facility has to submit documentation to justify the exemption, including any mitigation and compliance plans. For any extensions, a facility must document that the criteria for granting the exemption remain valid, including reasons why the mitigation and compliance plans have not been effective.

9. Required Service Practices and Prohibitions, subdivision (e)

   Staff is proposing specific required service practices for a person who installs, services, maintains, repairs or disposes of any refrigeration systems, regardless of its charge size. The proposed rule also includes provisions for operating a certified refrigerant recovery or recycling equipment, and prohibitions pertaining to the sale, use and disposal of refrigerants. Some of the requirements include the mandatory use of U.S. EPA certified technician for service or repair of refrigeration systems; recovery and recycling of refrigerant and the use of certified refrigerant recovery and recycling equipment during leak repair; and restrictions on the sale of refrigerants.

   The proposed provisions, expanded to include high GWP refrigerants, are modeled from Title 40, Part 82 of the Code of Federal regulations, Subpart F requirements specific to ODS refrigerants. In addition, most of these provisions are already part of the requirements in the current Rule 1415, but limited to ODS refrigerants.

10. Reporting Requirements, subdivision (f)

    Staff's proposal includes reporting requirements for owners or operators of refrigeration systems, including refrigerant distributors, wholesalers, and reclaimers. Specifically, owners or operators of large and medium-size systems are required to submit annually to CARB a Facility Stationary Refrigeration Report (Annual Report). There is no reporting requirement for facilities with small refrigeration systems.

    Submission of the Annual Report begins in year 2012 for an owner or operator of a facility with a large refrigeration system, and year 2014 for an owner or operator of a facility with a medium-size refrigeration system. The Annual Report contains information about the refrigeration system such as equipment type and model, specific data on refrigeration system service and leak repairs, as well as refrigerant purchases and use information.

    Refrigerant distributors or wholesalers are also required to report annually to CARB specific information for the previous calendar year on each type of high GWP refrigerant that was purchased or received for the purpose of subsequent resale; high GWP refrigerants sold or distributed, excluding sales to facilities outside of California or to a refrigerant distributor or wholesaler for eventual resale; or high GWP refrigerants shipped to a certified reclaimer. In addition, certified reclaimers are required to submit an annual report on the amount of high GWP refrigerants received for reclamation or destruction,

the amount of high GWP refrigerant reclaimed in California, or the amount of high GWP refrigerant shipped outside of California for reclamation or destruction.

CARB is developing a web-based reporting system that facilities will be able to use for the reporting requirements.

11. Recordkeeping Requirements, subdivision (g)

    This section describes recordkeeping requirements for facilities with stationary refrigeration systems, refrigerant wholesalers or distributors, refrigerant reclaimers, and persons owning and operating a certified refrigerant recovery or recycling equipment. CARB clarified that documentation of leak detection system may include the type of leak detection method used at the facility such as automatic leak detection system, leak detection device, bubble test, etc, and any records generated by the leak detection system used. These may be strip charts, hand filled out forms, computer records, etc.

12. Exemption Section, subdivision (h)

    Staff is proposing to add exemption provisions in the rule as follows:

    a. Exemption for tactical support equipment, as defined in paragraph (c)(55);

    b. Criteria for fee exemption;

    c. Conditions for exemption from leak repair and retrofit/retirement plan requirements; and

    d. Exemption from the contractor's license requirements.

13. Section Pertaining to Violations, subdivision (i)

    This subdivision clarifies enforcement actions for failure to comply with the provisions of the rule.

14. Severability Section, subdivision (j)

    This section is added to clarify that in the event any provision of the rule is invalidated by judicial order, the remainder of the rule shall remain in effect.

EMISSIONS INVENTORY AND REDUCTIONS

The emissions inventory for high GWP refrigerants used in stationary refrigeration system was developed by CARB using several models. First, CARB utilized the United States Environmental Protection Agency (U.S. EPA) Vintage Model in determining national GHG emissions estimates for years 2010-2020. This model was developed to estimate nationwide patterns of GHG emissions of HFCs, PFCs, CFCs, and HCFCs from all major emission sources, including refrigerant usage.

In order to get a rough estimate of statewide GHG emissions from stationary refrigeration and air conditioning units, CARB scaled down the national estimates from the U.S. EPA Vintage Model to California's proportion of the U.S. population of 12.5%. In addition, CARB used additional California-specific data sources to further refine the emissions estimates and establish a more

accurate year 2010 baseline emissions for California, with year 2020 as the initial target date for AB 32 measures. Details of CARB's methodology for estimating statewide GHG emissions inventory are discussed in Appendix B of CARB's Initial Statement of Reasons for Proposed Regulation for the Management of High Global Warming Potential Refrigerants for Stationary Sources, dated October 23, 2009.

The following table shows the number of facilities statewide with stationary refrigeration systems with refrigerant full charge of at least 50 pounds, including year 2010 baseline GHG emissions and projected pre-rule emissions for year 2020. The total statewide GHG emission reduction by year 2020 from implementing the Refrigerant Management Program is about 8.1 MMT CO_2E per year.

Table 1 – Emissions Inventory for High GWP Refrigerants in Refrigeration Systems

[1]Statewide Commercial Refrigeration Systems with Full Charge Greater Than or Equal to 50 lbs.					
		Emissions in Million Metric Tons CO_2 Equivalent ($MMTCO_2E$)			
Equipment Size	Number of Facilities	2010 Baseline Emissions	2020 Pre-Rule Emissions	2020 Total GHG Emission Reductions	2020 Post-Rule Emissions
Small Commercial (50 to <200)	15,500	1.2	1.4	0.9	0.5
Medium Commercial (200 to <2000)	8,500	5.7	7.9	3.3	4.6
Large Commercial	2,000	5.0	6.5	3.9	2.6
Total	26,000	11.9	15.8	8.1	7.7

[1] Appendix B of CARB's Initial Statement of Reasons for Proposed Regulation for the Management of High Global Warming Potential Refrigerants for Stationary Sources, dated October 23, 2009

Following CARB's methodology, the statewide emissions inventory is scaled down to South Coast Air Basin's proportion of the state population of 43% to determine GHG emissions for the South Coast Air Basin. As a result, the year 2010 baseline GHG emissions for the South Coast Air Basin is estimated at 5.1 $MMTCO_2E$, and year 2020 pre-rule GHG emissions is about 6.8 $MMTCO_2E$. The total GHG emission reduction for the South Coast Air Basin portion is approximately 3.5 $MMTCO_2E$ by year 2020. However, this is not an incremental emission reduction from Proposed Rule 1415.1, but rather reflects the projected GHG emission reductions as a result of implementing the CARB's Refrigerant Management Program that focuses on best management practices to minimize the emissions of refrigerants.

PAR 1415 does not result in additional GHG reductions since the proposed changes are administrative in nature.

However, staff estimates that extending the repair period from 14 days to 45 days in PAR 1415 for air conditioning systems could result in 497 metric tons per year of CO_2E emissions foregone. For PR 1415.1, extending the time period during which a leak must be repaired from 14 days to 45 or 120 days for refrigeration systems could result in 5,849 metric tons per year of foregone CO_2E emissions. In addition, PR1415.1 would include certain exemptions from leak repair and retrofit or retirement plan requirements for up to three years. Approximately 4,618 metric tons per year of CO_2E emissions foregone could result from these exemptions. The total emissions impacts of the slightly relaxed leak repair requirements in PAR 1415 and PR1415.1 are estimated to be 10,964 metric tons per year of foregone CO_2E emissions. However, an estimated 3.5 million metric tons of CO_2E emission reductions are expected from fully implementing the proposed regulation.

COST

Beginning January 1, 2011, facilities with refrigeration systems with full charge greater than 50 pounds of high GWP refrigerants have to comply with CARB's regulation for the Management of High Global Warming Potential Refrigerants or generally referred to as the Refrigerant Management Program, and would incur additional cost to comply with the CARB regulation. Staff's proposal is administrative in nature and is designed to make the District's refrigerant rule equivalent to and consistent with the CARB regulation. Compliance with PR 1415.1 will require facilities to register their refrigeration systems annually with the AQMD until CARB registration begins in 2012 for large systems, 2014 for medium-size systems, and 2016 for small refrigeration systems. The total cost of complying with PR 1415.1 from registering refrigeration systems with the AQMD is estimated to be $1.28M in 2011, $745K in 2012, $1.18M in 2013, $516K in 2014, and $764K in 2015.

It is worthwhile to note that CARB's cost evaluation of the Refrigerant Management Program indicates that owners or operators of refrigeration systems can benefit financially through implementation of the refrigerant best management practices required in the regulation. Such practices would reduce refrigerant purchases needed to replenish the refrigerant that had leaked and, thus, result in cost savings to the owners or operators of refrigeration systems. Details of the Refrigerant Management Program's cost analysis are contained in Appendix C of CARB's Initial Statement of Reasons for Proposed Regulation for the Management of High Global Warming Potential Refrigerants for Stationary Sources, dated October 23, 2009. (http://www.arb.ca.gov/regact/2009/gwprmp09/refappc.pdf)

For PAR 1415, staff's proposal will also require registration of air conditioning systems using high GWP refrigerants other than CFCs and HCFCs, such as HFCs and PFCs. Based on CARB's inventory, it is estimated that about 2,000 facilities with stationary air conditioning units using HFCs and PFCs in the South Coast Air Basin will be affected by the registration requirements in PAR 1415. Based on the current fee schedule for Rule 1415 Registration Plan, the estimated compliance cost industry-wide will be $115,000 annually.

SOCIOECONOMIC ASSESSMENT

The proposed amendments to Rule 1415 and Proposed Rule 1415.1 align the AQMD's requirements for GHG reductions with CARB's Refrigerant Management Program (RMP). The proposed amendments to Rule 1415 would require that facilities with air conditioning (AC) systems that use high global warming potential (GWP) refrigerants such as HFC and PFC register with AQMD every two years. Currently, only facilities with AC and refrigeration units using ODS refrigerants are required to register. All the references relating to refrigeration systems in the existing Rule 1415 would be removed and instead codified in PR 1415.1, which would adopt all the provisions in the state RMP regarding the control of high GWP and ODS emissions used in stationary refrigeration systems. PR 1415.1 would implement an annual registration through the AQMD until these systems are required to register with CARB in 2012, 2014, or 2016, depending on the size of the refrigeration system.

Based on estimates from CARB, the registration requirement for PAR 1415 is expected to affect approximately 2,000 facilities in the basin, using HFC and PFC refrigerants for AC systems. These facilities are spread in nearly every sector of the local economy. CARB estimated that over 11,100 facilities would be affected by PR 1415.1. Facilities with refrigeration systems are mostly in the sectors of manufacturing (NAICS 31-33), retail trade (44-45), transportation and warehousing (NAICS 48-49), educational services (NAICS 61), health care and social assistance (NAICS 62), and other services (NAICS 81).

The proposed amendments to Rule 1415 would add a $114.66 registration fee (based on the fee rate in Rule 306) on facilities with AC systems that use HFC and PFC refrigerants. The estimated total additional cost to these facilities for PAR 1415 is $229,000, payable to the AQMD every two years, beginning in 2012.

The registration fee under PR 1415.1 would be $114.66 every year as well. Upon adoption, PR 1415.1 would require an affected facility to register at the start of its operation, and every year thereafter, until CARB registration begins. Since the last registration for refrigeration systems under the existing Rule 1415 occurred in February 2010, the next registration under PR 1415.1 is expected to be in February 2011. The registration deadlines in the CARB regulation will be 2012 for large systems, 2014 for medium systems, and 2016 for small systems of ODS and high GWP refrigerant users, respectively. CARB does not charge a fee to small systems.

The impact of PR 1415.1 herein is assessed relative to the CARB's RMP and the existing Rule 1415 on refrigeration. As such, the impact of PR 1415.1 would be an additional registration fee payment by HFC and PFC users to the AQMD before the CARB's RMP becomes effective as well as the additional payment resulting from the more frequent registration by ODS users (from biennial to annual). Table 2 shows the impact of PR 1415.1 on users of refrigerants. Since a facility may own refrigeration systems with more than one size, it is further assumed that a facility owning multiple sizes of systems would register all systems at the earliest deadline because the fee is assessed at the facility level.

Table 2 - Impact of PR1415.1 Registration Requirements by Type of Refrigerant and Year

Refrigerant		2011	2012	2013	2014	2015
ODS	Large	X				
	Medium	X		X		
	Small	X		X		X
HFC & PFC	Large	X				
	Medium	X	X	X		
	Small	X	X	X	X	X

Table 3 shows the additional payment for ODS, and HFC and PFC users by year. The total registration fees range from $516,000 in 2014 to $1,279,000 in 2011. There will be no fees paid to the District by users after 2015 since the CARB's RMP will be fully implemented in 2016.

Table 3 – PR1415.1 Registration Cost by Refrigerant by Year (in thousands of dollars)

Refrigerant	2011	2012	2013	2014	2015
ODS	$488		$433		$248
HFC & PFC	$791	$745	$745	$516	$516
Total	$1,279	$745	$1,178	$516	$764

CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

PAR 1415/PR 1415.1 is considered a "project" as defined by the California Environmental Quality Act (CEQA), and the AQMD is the designated lead agency. Pursuant to CEQA and AQMD Rule 110, AQMD staff has prepared a Draft Environmental Assessment (EA) to analyze potential adverse environmental impacts that could be generated from the proposed project. The Draft EA has been circulated for a 30-day public review and comment period. Comments received from the public will be addressed in the Final EA.

COMPARATIVE ANALYSIS

Health and Safety Code section 40727.2 requires a written analysis to identify and compare any other AQMD or federal regulations that apply to the same equipment or source type.

The only federal requirement applicable to similar sources is the Protection of Stratospheric Ozone – Recycling and Emissions Reduction (40 CFR Part 82 Subpart F) for stationary air conditioning and refrigeration systems. The existing Rule 1415, the Proposed Amended Rule 1415, and Proposed Rule 1415.1 are not in conflict with this federal requirement.

The existing federal regulation, promulgated under section 608 of the Clean Air Act, establishes requirements for controlling ODS refrigerant emissions from stationary refrigeration and air

conditioning systems. Specific rule provisions pertain to refrigerant venting, the use of certified equipment, technician training and certification, recordkeeping, and sales restrictions.

The current Rule 1415 goal is to reduce ODS emissions from stationary air conditioning and refrigeration systems. The rule requirements are similar to the federal regulation except that Rule 1415 is more stringent in the area of leak repair. Proposed Amended Rule 1415 expands the scope to include high GWP refrigerants but limits the rule applicability to air conditioning systems.

As discussed in an earlier section of this staff report, the CARB Board approved a statewide regulation (Refrigerant Management Program or RMP) for controlling high GWP emissions from stationary refrigeration systems. The RMP is modeled from 40 CFR Part 82, Subpart F requirements specific to ODS refrigerants, but is expanded to include high GWP refrigerants. In addition, the RMP contains stricter leak testing requirements than the federal regulation.

Proposed Rule 1415.1 incorporates provisions that are consistent with the RMP and consolidates emission control requirements for stationary refrigeration systems currently in Rule 1415. Table 2 below has been prepared to show a comparison among Proposed Amended Rule 1415, Proposed Rule 1415.1, and 40 CFR Part 82 Subpart F.

Table 2 – Comparison of Regulations for Stationary Refrigeration Systems

Category	Proposed Amended Rule 1415	Proposed Rule 1415.1	40 CFR 82 Subpart F
Purpose	Reduce emissions of high GWP refrigerants	Reduce emissions of high GWP refrigerants	Reduce emissions of Class I/II refrigerants and their substitutes
Applicability	Applies to owners or operators of air conditioning systems; to persons who install, repair, services a/c systems; to persons who recycle and/or sell high GWP refrigerants	Applies to owners or operators of refrigeration systems; to persons who install, repair, services refrigeration systems; to persons who recycle and/or sell high GWP refrigerants	Applies to persons servicing, maintaining, or repairing any a/c and refrigeration systems; to refrigerant reclaimers, appliance owners or operators, and equipment manufacturers
Leak Detection/Repair	Annual leak inspection Repair leak within 14 calendar days from initial leak detection; 45 day repair period allowed in certain situations	Leak inspection frequency (monthly, quarterly, annual) depends on charge size of refrigeration system Repair leak within 14 calendar days from initial leak detection; 45/120 day repair period allowed in certain situations	Repair leak within 30 days if refrigerant loss will exceed 35% of full charge for commercial and industrial refrigeration, and 15% of full charge for other refrigeration systems during a 12-month period

Category	Proposed Amended Rule 1415	Proposed Rule 1415.1	40 CFR 82 Subpart F
Service Practices and Prohibitions	Repairs conducted by US EPA certified technician Recovery and recycling of refrigerant using certified equipment during service or repair of refrigeration system Restrict sale of refrigerants to certified technicians	Repairs conducted by US EPA certified technician Recover, recycle refrigerant using certified recovery equipment before repairing refrigeration system Sale of refrigerants to certified technicians only Sale of approved refrigerants only	No venting of refrigerants during servicing or repair Repairs conducted by US EPA certified technician Recovers, recycles refrigerant during repair using certified equipment Sale of refrigerants to certified technicians only
Reporting	None	Owners or operators to submit Annual Report to include leak inspections and repair data, refrigerant purchases Refrigerant wholesaler, distributors, reclaimers to submit annual report on refrigerants sold, reclaimed	Approved testing organization to report list of certified equipment to EPA
Recordkeeping	Owners or operators to keep records of leak inspections, repair activities, refrigerant purchases Distributors, wholesaler, reclaimers to keep records of refrigerants sold or reclaimed Records kept for 5 years	Owners or operators to keep records of annual reports, registration information, leak inspections, repair activities,, refrigerant purchases Distributors, wholesaler, reclaimers to keep records of annual reports, refrigerant sales invoices, amount and sources of refrigerants reclaimed Records kept for 5 years	Owners or operators to keep leak repair records and amount of refrigerant added Refrigerant distributors or wholesalers to retain invoices of refrigerants sold Refrigerant reclaimers must maintain records of refrigerants received for reclamation, including amount reclaimed and waste products Records kept for 3 years

DRAFT FINDINGS UNDER THE CALIFORNIA HEALTH AND SAFETY CODE

The California Health and Safety Code Section 40727 requires that prior to adopting, amending or repealing rules, the AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication and reference, based on relevant information presented at the hearing. The draft findings are as follows:

Necessity - The AQMD Governing Board has determined that a need exists to amend Rule 1415 – Reduction of Refrigerant Emissions from Stationary Refrigeration and Air Conditioning Systems to expand the scope of the rule to include provisions for reducing emissions of high global warming potential refrigerants used in stationary air conditioning systems, and to adopt Proposed Rule 1415 - Reduction of Refrigerant Emissions from Stationary Refrigeration Systems to incorporate provisions for reducing emissions of certain high global warming potential refrigerants that will be consistent with CARB's statewide rule for stationary refrigeration systems.

Authority - The AQMD Governing Board obtains its authority to adopt, amend, or rescind rules and regulations from the California Health and Safety Code sections 39002, 40000, 40001, 40702, and 41508.

Clarity - The AQMD Governing Board has determined that Proposed Amended Rule 1415 - Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems and Proposed Rule 1415 - Reduction of Refrigerant Emissions from Stationary Refrigeration Systems are written or displayed so that their meaning can be easily understood by persons directly affected by them.

Consistency - The AQMD Governing Board has determined that Proposed Amended Rule 1415 - Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems and Proposed Rule 1415 - Reduction of Refrigerant Emissions from Stationary Refrigeration Systems are in harmony with, and not in conflict with or contradictory to, existing federal or state statutes, court decisions, or regulations. The proposed new rule is consistent with the state regulation for stationary refrigeration systems.

Non-Duplication - The AQMD Governing Board has determined that Proposed Amended Rule 1415 - Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems and Proposed Rule 1415 - Reduction of Refrigerant Emissions from Stationary Refrigeration Systems do not impose the same requirement as any existing state or federal regulation, and the proposed rules are necessary and proper to execute the powers and duties granted to, and imposed upon, the AQMD. Since AQMD will be implementing the state requirements, there will not be duplication.

Reference - In adopting this regulation, the AQMD Governing Board references the following statutes which the AQMD hereby implements, interprets or makes specific: Health and Safety Code sections 40001 and 40702.

COMMENTS AND RESPONSES

A public workshop was held on September 21, 2010 in which 52 people attended. The following summarizes the comments received and staff's responses.

COMMENT: Proposed Rule 1415.1 allows longer periods to repair a refrigerant leak in refrigeration systems. The same provision should be included in PAR 1415 to allow the same flexibility to owners or operators of air conditioning systems.

RESPONSE: Staff agrees. The leak repair requirement in PAR 1415 is modified to allow longer repair periods of up to 45 calendar days after initial leak detection only in situations where a certified technician is not available to complete the repair, or the parts necessary to repair the refrigerant leak are unavailable within 14 days of initial leak detection. This is expected to impact total GHG reductions of 3.5 million metric tons of CO_2E per year by 497 metric tons of CO_2E per year. The owner or operator is responsible for keeping records documenting that the condition(s) for allowing longer repair period exists.

COMMENT: The annual energy usage data requirement in PAR 1415 and PR 1415.1 should be removed as it serves no useful purpose, and is not relevant to the refrigerant rules. Most facilities do not have separate meters to record energy used for refrigeration or air conditioning systems.

RESPONSE: Staff reviewed the need to report energy usage and agreed to remove such reporting requirement during registration.

COMMENT: The rule should specify what method to use when detecting leaks.

RESPONSE: The provisions in PAR 1415 (d)(1)(B) and PR 1415.1 (d)(2)(E) identify approved methods that may be used when conducting refrigerant leak inspection in air conditioning and refrigeration systems, respectively. Approved leak detection methods include the use of a refrigerant leak detection device, a bubble test, observation of oil residue, or any alternate method approved by the Executive Officer.

COMMENT: State and federal regulations do not require refrigerant leak inspections to be conducted by a U.S. EPA certified technician. PAR 1415 and PR1415.1 should be consistent with the state and federal regulations.

RESPONSE: Staff agrees and has removed this rule provision in PAR 1415 and PR1415.1 requiring leak inspections by a U.S. EPA certified technician. However, all service or repair of refrigeration and air conditioning systems have to be made by a U.S. EPA certified technician.

COMMENT: Are facilities with both refrigeration and air conditioning systems subject to registration, reporting, and fees with AQMD and CARB?

RESPONSE: Separate registrations are required for facilities with air conditioning and refrigeration systems that meet the applicability of PAR 1415 and PR 1415.1. Facilities with air conditioning systems, with full charge capacity > 50 lbs of high GWP refrigerant, are required to submit a registration plan

for the air conditioning system to AQMD at the time of operation, and every two years thereafter. There is no requirement to register air conditioning systems with CARB. Other provisions pertaining to the operation of an air conditioning system are included in PAR 1415.

For refrigeration systems with full charge capacity > 50 lbs of high GWP refrigerants, registration with the AQMD is required until CARB registration begins in 2012 for large systems, 2014 for medium-size systems, and 2016 for small systems. When CARB registration begins for a size class, i.e. large, medium-size, or small systems, the facility will have to register the refrigeration system(s), pay fees, and submit reports only to CARB.

COMMENT: What rule would apply for a single system that is used for both refrigeration and air conditioning?

RESPONSE: A refrigeration system used for two or more applications, e.g., refrigeration and air conditioning, is considered as "other refrigeration system," and will have to comply with the requirements of PR 1415.1 only. This is consistent with CARB staff guidance for multi-use refrigeration systems.

COMMENT: The definition of air conditioning system in PAR 1415 should add reference to cooling of equipment since it indicates that computer room air conditioners are included in the definition.

RESPONSE: The definition already includes reference to the cooling of objects.

COMMENT: The definition of high global warming potential refrigerants should reference commonly used names such as R-123, R-407, R-22, and R-134, in addition to the chemical names.

RESPONSE: It is not practical to list all trade names of commonly used refrigerants. Facilities can always refer to the MSDS to determine the chemical name of the refrigerant.

COMMENT: It is important to keep the common definitions in PR 1415.1 and CARB's RMP rule the same. This will provide consistency and minimize confusion caused by misinterpretation of two different definitions.

RESPONSE: Staff referenced the RMP in defining terms used in PR 1415.1.

COMMENT: The definition of "High Global Warming Potential Refrigerant" does not include hydrofluorocarbon (HFC) in the list of refrigerant gases.

RESPONSE: Staff has added hydrofluorocarbon to the refrigerant list in PAR 1415 and PR 1415.1.

COMMENT: The rule does not specify the amount of initial and annual implementation fees to be paid to CARB for registering refrigeration systems.

RESPONSE: Staff intentionally omitted the amount of implementation fees assessed by CARB for medium-size and large systems. By doing this, staff does not have to amend the AQMD rule every time CARB changes their fee schedule. Currently, the CARB fee is $370 for large systems, and $170 for medium size systems. No fee is assessed by CARB on small refrigeration systems.

COMMENT: The proposed provisions in subparagraph (e)(1)(G) and paragraphs (e)(5) and (g)(3) of PR 1415.1 are not part of the CARB rule.

RESPONSE: Staff's intent is to retain provisions that are in the current Rule 1415; thus, Proposed Rule 1415.1 includes provisions from both the CARB regulation and Rule 1415.

(Adopted June 7, 1991)(Amended October 14, 1994)(Amended December 3, 2010)

PROPOSED AMENDED RULE 1415. REDUCTION OF REFRIGERANT EMISSIONS FROM STATIONARY AIR CONDITIONING SYSTEMS

(a) Purpose

The purpose of this rule is to reduce emissions of high-global warming potential refrigerants from stationary air conditioning systems by requiring persons subject to this rule to reclaim, recover, or recycle refrigerant and to minimize refrigerant leakage.

(b) Applicability

This rule is applicable to any person who owns or operates an air conditioning system, as defined in this rule. This rule is also applicable to any person who installs, repairs, maintains, services, relocates, or disposes of an air conditioning system; to any person who services or maintains recycling and recovery equipment; and to any person who recycles, recovers, reclaims, or sells high-global warming potential refrigerant.

(c) Definitions

For purposes of this rule, the following definitions shall apply:

(1) ADDITIONAL REFRIGERANT CHARGE means the quantity, in pounds, of refrigerant added to an air conditioning system in order to bring the system to a full charge Additional refrigerant charge does not include an initial refrigerant charge.

(2) AIR CONDITIONING SYSTEM means any stationary, non-residential appliance, which holds more than 50 pounds of high global warming potential refrigerant, and provides cooling to a space to an intended temperature of not less than 68°F for the purpose of cooling objects or occupants. Computer-room air conditioner is included in this definition.

(3) AUDIT means inspection and maintenance of an air conditioning system conducted to identify leaks and ensure proper operation pursuant to manufacturer's specification.

(4) BUBBLE TEST means applying a soap solution or spraying on with an aerosol around a potential leak source, and observing for bubbles.

(5) CERTIFIED RECLAIMER is a person who holds a current, valid, and applicable reclaimer certificate in accordance with Title 40 of the Code of Federal Regulations, Part 82, Subpart F, §82.164.

(6) CERTIFIED REFRIGERANT RECOVERY OR RECYCLING EQUIPMENT is equipment for refrigerant recovery or recycling that meets the definition by the U.S. Environmental Protection Agency pursuant to Title 40 of the Code of Federal Regulations, Part 82, Subpart F, §82.152.

1

(7) CERTIFIED TECHNICIAN is a person who has a current, valid, and applicable U.S. Environmental Protection Agency technician certificate issued in accordance with Title 40 of the Code of Federal Regulations, Part 82, §82.40 or §82.161.

(8) CHLOROFLUOROCARBON or CFC is a class of compounds primarily used as refrigerants, consisting of only chlorine, fluorine, and carbon.

(9) COMPONENT is a part of an air conditioning system or appliance (including condensing units, compressors, condensers, evaporators, receivers) and all of its connections and subassemblies, without which the air conditioning system or appliance will not properly function or will be subject to failures.

(10) DISPOSE is to discard refrigerant in any manner, except destruction by incineration or by a treatment method specifically approved by the U.S. Environmental Protection Agency for handling such refrigerant without releasing it to the atmosphere.

(11) GLOBAL WARMING POTENTIAL VALUE or GWP VALUE means the 100-yr GWP value first published by the Intergovernmental Panel on Climate Change (IPCC) in its Second Assessment Report (SAR) (IPCC,

1995); or if a 100-yr GWP value was not specified in the IPCC SAR, it means the GWP value published by the IPCC in its Fourth Assessment A-3 Report (AR4) (IPCC, 2007); or if a 100-yr GWP value was not specified in the IPCC AR4, then the GWP value will be determined by the Executive Officer based on data, studies and/or good engineering or scientific judgment. Both the 1995 IPCC SAR values and the 2007 IPCC AR4 values are published in Table 2.14 of the 2007 IPCC AR4. The SAR GWP values are found in column "SAR (100-yr)" of Table 2.14.; the AR4 GWP values are found in column "100 yr" of Table 2.14.

(12) HIGH GLOBAL WARMING POTENTIAL REFRIGERANT means any compound used as a heat transfer fluid or gas that is:

(A) a chlorofluorocarbon; or

(B) a hydrochlorofluorocarbon; or

(C) a hydrofluorocarbon; or

(D) a perfluorocarbon; or

(E) any compound or blend of compounds, with a global warming potential value equal to or greater than 150; or

(F) any ozone depleting substance as defined in Title 40 of the Code of Federal Regulation, Part 82, §82.3

(13) HYDROCHLOROFLUOROCARBON or HCFC is a class of compounds primarily used as refrigerants, consisting of only hydrogen, chlorine, fluorine, and carbon.

(14) HYDROFLUOROCARBON or HFC is a class of compounds primarily used as refrigerants, consisting of only hydrogen, fluorine, and carbon.

(15) PERFLUOROCARBON or PFC is a class of compounds consisting only of carbon and fluorine.

(16) PERSON is any individual, firm, association, organization, partnership, business trust, corporation, company, contractor, supplier, installer, user or owner, or any state or local government agency or public district or any other officer or employee thereof. PERSON also means the United States or its agencies to the extent authorized by Federal law.

(17) RECLAIM is to reprocess refrigerant to a level equivalent to new product specifications in accordance with applicable requirements of the U.S. Environmental Protection Agency contained in Title 40, Code of Federal Regulations, Part 82, Subpart F, §82.152.

(18) RECOVER is to remove refrigerant in any condition from a system and to store it in an external container without necessarily testing or processing it in any way.

(19) RECYCLE is to extract refrigerant from an appliance and to clean the refrigerant for reuse by oil separation and single or multiple passes through moisture-absorption devices, such as replaceable core filter-driers which reduce moisture, acidity, and particulate matter, without meeting all of the requirements for reclamation.

(20) REFRIGERANT LEAK is any discharge of refrigerant into the atmosphere from an air conditioning system, refrigerant recovery or recycling equipment, refrigerant cylinder, or other container.

(21) SELF-CONTAINED RECOVERY EQUIPMENT is any refrigerant recovery equipment that is capable of removing the refrigerant from an air conditioning system without the assistance of components contained in the air conditioning system.

(d) Requirements

(1) A person shall not operate an air conditioning system subject to this rule unless all of the following requirements are met:

(A) A Registration Plan for the entire facility is submitted to the Executive Officer at start of operation, and every two years thereafter. Such plan shall contain the following information:

(i) facility name and address;

(ii) name and title of contact person;

(iii) type of business;

(iv) number of air conditioning systems in operation;

(v) manufacturer name, model and serial number for each of the air conditioning systems;

(vi) type of refrigerant in each air conditioning system;

(vii) full charge of refrigerant in each air conditioning system, in pounds;

(viii) date of last audit and/or maintenance performed for each air conditioning system; and

(ix) amount of additional refrigerant charge every year for each system, in pounds.

(B) The owner or operator shall conduct an audit of the air conditioning system no later than one year after beginning operation, and every year thereafter, to determine whether such system is operating pursuant to manufacturer's specifications and does not have refrigerant leaks. At a minimum, the annual audit shall include the following:

(i) A leak inspection using one or more of the following methods:

(I) Refrigerant leak detection device used in accordance with the manufacturer's specifications;

(II) A bubble test;

(III) Observation of oil residue; or

(IV) An alternate method approved by the Executive Officer.

(ii) A determination of the amount of refrigerant leak for each air conditioning system by recording the total capacity of refrigerant charge in each air conditioning system, the quantity of any additional refrigerant charge for each air conditioning system, and the date of each charge. The quantity of additional refrigerant charge shall be determined by weighing the refrigerant charging container before and after each charge, using equipment that is accurate to the nearest pound.

(iii) An examination for deficiencies which may cause refrigerant leakage.

(2) Any person who owns or operates an air conditioning system that has a refrigerant leak shall ensure that the leak is repaired no later than 14 calendar days after the leak has been discovered or should have been discovered. The owner or operator shall maintain a log of repair activities beginning at the time the leak is discovered and ending at the time when the leak has been repaired. The air conditioning system shall be verified by a certified technician to be leak free before any refrigerant is added to the system.

(3) The owner or operator of an air conditioning system has 45 days after initial leak detection to repair a refrigerant leak if one or more of the following conditions exist:

(A) A certified technician is not available to complete the repair. A written record shall be kept to document that no certified technician is available within 14 days of the initial leak detection; or

(B) The parts necessary to repair a refrigerant leak are unavailable within 14 days of the initial leak detection. A written statement verifying that the parts are unavailable from the air conditioning system or component manufacturer or distributor shall be obtained.

(4) No person shall install, service, repair, modify, or dispose of any air conditioning system that may cause the release of high-global warming potential refrigerants unless that person meets all of the following requirements:

(A) The person has a current, valid, and applicable U.S. Environmental Protection Agency technician certificate issued in accordance with Title 40 of the Code of Federal Regulations, Part 82, Subpart F, §82.161.

(B) Recovers, recycles, or reclaims the refrigerant, using certified refrigerant recovery or recycling equipment for that type of air conditioning unit, and employs procedures for which the certified refrigerant recovery or recycling equipment was approved by the

U.S. Environmental Protection Agency. Such equipment shall be used as specified by the certified refrigerant recovery or recycling equipment manufacturer, unless the manufacturer's specifications are in conflict with the procedures approved by the U.S. Environmental Protection Agency for the certified refrigerant recovery or recycling equipment. Refrigerant may be returned to the air conditioning system from which it is recovered, or to another air conditioning system owned by the same person, without being recycled or reclaimed.

(C) Satisfies job site evacuation of high global warming potential refrigerants during recycling, recovering, reclaiming, or disposing in accordance with Title 40 of the Code of Federal Regulations, Part 82, Subpart F, §82.156. De minimis refrigerant releases associated with a good faith attempt to recycle or recover refrigerants are allowed. Refrigerant releases shall be considered de minimis only if they occur when the required practices or requirements in Part 82, Subpart F, §§82.156 and 82.158, and Part 82, Subpart B of Title 40 of the Code of Federal Regulations, are followed;

(D) Has at least one piece of certified, self-contained recovery equipment available at their place of business;

(E) Any person who owns or operates a certified refrigerant recovery or recycling equipment:

(i) Shall not operate any certified refrigerant recycling or recovering equipment, except for the maintenance or repair of such equipment, unless the equipment has been tested for and been determined to have no leaks within the past six months as determined by a method approved by the Executive Officer. Leaks in recycling, recovering, or charging equipment shall be repaired within 2 working days after the leak is first detected, unless its use is promptly discontinued and the equipment does not leak after its use is discontinued;

(ii) Shall not alter the design of a certified recovery and recycling equipment in a manner that would affect the equipment's ability to meet the certification standards set by the U.S. Environmental Protection Agency without resubmitting the altered design to an approved equipment testing facility for certification testing. Until such altered equipment is tested by a U.S. Environmental Protection Agency approved equipment testing facility, and is shown to meet the certification standards set forth by the U.S. Environmental Protection Agency, the equipment so altered shall not be considered certified, and shall not be used; and

(iii) Shall provide proof of certification for the recovery and recycling equipment from the U.S. Environmental Protection Agency to the Executive Officer upon request.

(5) No person shall sell, distribute, offer for sale or distribution any high-global warming potential refrigerant for use as a refrigerant to any person unless:

(A) The buyer is a certified technician pursuant to Part 82 of Title 40 of the Code of Federal Regulations; or

(B) The buyer is an authorized representative of a person employing at least one certified technician, and the buyer has provided evidence that at least one technician is properly certified; or

(C) The refrigerant is sold only for eventual resale to certified technicians or to air conditioning system manufacturers; or

(D) The refrigerant is contained in an air conditioning system.

(6) No person shall sell, offer for sale, supply, or distribute, any high-global warming refrigerant consisting wholly or in part of used refrigerant unless the refrigerant has been reclaimed by a certified reclaimer.

(7) No person reclaiming refrigerants shall release into the atmosphere more than 1.5 percent of the refrigerant received for reclamation.

(e) Recordkeeping

(1) Any person owning or operating any air conditioning system is required to maintain the following records for each air conditioning system:

(A) Documents demonstrating compliance with paragraphs (d)(1) and (d)(2), which includes the following information:

(i) Date of annual audit;

(ii) All work completed for each air conditioning system to prevent or repair leaks, including results of leak testing and leak determinations;

(iii) Name(s) of the person who completed the inspection and repair, including the name, address, and telephone number of the company the person is representing;

(iv) The log of repair activities; and

(v) Technician certificate number.

(B) A log of the quantity of each additional refrigerant charged to the air conditioning system and the date of each charge.

(C) A log of malfunctions of the air conditioning system, other than that determined in paragraphs (d)(1) and (d)(2), including the following:

(i) The cause of the malfunction; and

(ii) The type of repairs required and the date the repairs were completed.

(D) If refrigerant is recycled off-site, a transportation bill-of-lading (or other transportation document as approved by the Executive Officer) indicating the name and location of the facility from which the refrigerant is shipped, the quantity of refrigerant transported, destination (company name, phone number, and location) and date of transportation.

(E) The quantity (in pounds) of high-global warming refrigerants purchased or used in the District in a calendar year and the name and address of the refrigerant supplier.

(2) Any person who receives refrigerant for recycling or reclaiming from off-site locations shall maintain copies of all transportation documents as required in subparagraph (e)(1)(D) for each shipment of refrigerant received.

(3) Records and reports required under subparagraphs (e)(1)(A), (e)(1)(B), and (e)(1)(C) shall be generated by a certified technician. Annual audits and maintenance records shall be in a format approved in writing by the Executive Officer.

(4) All persons who sell or distribute any high-global warming refrigerant shall retain invoices, pursuant to paragraph (e)(9), that indicate the name of the purchaser, the date of sale, and the quantity of refrigerant purchased.

(5) A refrigerant distributor or wholesaler selling high-global warming potential refrigerant to a purchaser who employs a certified technician shall obtain written documentation that the purchaser employs at least one certified technician. The distributor or wholesaler shall keep this information on file for a minimum of five years.

(6) Reclaimers shall maintain records of the names and addresses of persons sending them material for reclamation and the quantity of the material (the combined mass in pounds of refrigerant and contaminants) sent to them for reclamation.

(7) Reclaimers shall maintain records of the quantity of material sent to them for reclamation, the mass in pounds of refrigerant reclaimed, and the mass in pounds of waste product.

(8) Any person owning and operating a certified refrigerant recovery or recycling equipment shall maintain records to determine compliance with clause (d)(4)(E)(i), which includes the following information:

(A) Date of semi-annual inspection;

(B) All work completed for each recycling or recovery system to prevent or repair leaks, including results of leak testing and leak determinations; and

(C) Name(s) of the person who completed the inspection and repair, including the name, address, and telephone number of the company the person is representing.

(9) Records and reports as required under paragraphs (e)(1), (e)(2), (e)(4), (e)(5), (e)(6), (e)(7), and (e)(8) shall be maintained for a minimum of 5 years, shall be kept at the facility where the air conditioning system is in operation, and shall be made available to the Executive Officer upon request.

(Adopted December 3, 2010)

PROPOSED RULE 1415.1 REDUCTION OF REFRIGERANT EMISSIONS FROM STATIONARY REFRIGERATION SYSTEMS

(a) Purpose

The purpose of this rule is to reduce emissions of high global warming potential refrigerants from stationary refrigeration systems by requiring persons subject to this rule to recover, recycle, or reclaim refrigerant and to minimize refrigerant leaks.

(b) Applicability

This rule applies to any person who owns or operates a refrigeration system, as defined in this rule. This rule also applies to any person who installs, repairs, maintains, services, relocates, or disposes of any refrigeration system, regardless of charge size; to any person who services or maintains recycling and recovery equipment; and to any person who recycles, recovers, reclaims, distributes or sells high global warming potential refrigerant.

(c) Definitions

For purposes of this rule, the following definitions shall apply:

(1) ADDITIONAL REFRIGERANT CHARGE means or is the quantity, in pounds, of refrigerant added to a refrigeration system in order to bring the system to a full charge. Additional refrigerant charge does not include an initial refrigerant charge.

(2) AUTOMATIC LEAK DETECTION SYSTEM means or is a calibrated device that uses continuous monitoring for detecting leakage of refrigerants, and alerts the operator when a refrigerant leak is detected. An automatic leak detection system may be either:

(A) A direct system that automatically detects the presence in air of refrigerant leaked from a refrigeration system; or

(B) An indirect system that automatically interprets measurements (e.g. temperature or pressure) within a refrigeration system that indicate a refrigerant leak and alerts the operator to the presence of a refrigerant leak.

(3) BUBBLE TEST means applying a soap solution or spraying on with an aerosol around a potential leak source, and observing for bubbles.

(4) CERTIFIED RECLAIMER means or is a person who holds a current, valid, and applicable reclaimer certificate in accordance with Title 40 of the Code of Federal Regulations, Part 82, Subpart F, §82.164.

(5) CERTIFIED REFRIGERANT RECOVERY OR RECYCLING EQUIPMENT means or is equipment for refrigerant recovery or recycling that meets the definition by the U.S. Environmental Protection Agency pursuant to Title 40 of the Code of Federal Regulations, Part 82, Subpart F, §82.152.

(6) CERTIFIED TECHNICIAN means or is a person who has a current, valid, and applicable U.S. Environmental Protection Agency technician certificate issued in accordance with Title 40 of the Code of Federal Regulations, Part 82, §82.40 or §82.161.

(7) CHANGE OF OWNERSHIP means or is a transfer of the title of a facility subject to this rule.

(8) CHLOROFLUOROCARBON or CFC means or is a class of compounds primarily used as refrigerants, consisting of only chlorine, fluorine, and carbon.

(9) COMMERCIAL REFRIGERATION means or is a refrigeration appliance typically utilized in the retail food and cold storage warehouse sectors. Retail food refrigeration includes, but is not limited to, the refrigeration equipment found in supermarkets, convenience stores, restaurants and other food service establishments. Cold storage includes, but is not limited to, the equipment used to store meat, produce, dairy products, and other perishable goods.

(10) COMPONENT means or is a part of a refrigeration system or appliance (including condensing units, compressors, condensers, evaporators, receivers) and all of its connections and subassemblies, without which the refrigeration system or appliance will not properly function or will be subject to failures.

(11) CONTINUOUS MONITORING means or is measuring the ambient concentration of refrigerant using electronic or mechanical sensors, or

interpreting measurements (e.g. temperature or pressure) within a refrigeration system that indicate a refrigerant leak in real time.

(12) DIRECT EMISSIONS mean high global warming potential refrigerant emissions from a facility that are emitted by refrigeration systems under the operational control of a facility owner or operator. Direct emissions are calculated as the total weight in pounds of each type of high global warming potential refrigerant that was charged into a refrigeration system minus the total weight in pounds of each type of high global warming potential refrigerant that was recovered from a refrigeration system, as reported in the annual Facility Stationary Refrigeration Report pursuant to paragraphs (f)(1), (f)(2), and (f)(3).

(13) ENCLOSED BUILDING OR STRUCTURE means or is a building or structure with a roof and walls that prevent wind from entering the facility.

(14) EQUIPMENT TYPE means or is commercial refrigeration, industrial process refrigeration, or other refrigeration appliance.

(15) FACILITY for the purpose of this rule means or is any property, plant, building, structure, stationary source, stationary equipment or grouping of stationary equipment or stationary sources located on one or more contiguous or adjacent properties, in actual physical contact or separated solely by a public roadway or other public right-of-way, and under common operational control, that includes one or more refrigeration systems or appliance subject to this rule. Operators of military installations may classify such installations as more than a single facility based on distinct and independent functional groupings within contiguous military properties.

(16) FACILITY IDENTIFICATION NUMBER means or is a unique identification number provided by the Executive Officer for each facility with one or more refrigeration systems in operation.

(17) FOLLOW-UP VERIFICATION TEST means or is a test that involves checking the repairs within 30 days of the refrigeration system returning to normal operating characteristics and conditions. "Follow-up verification test" for a refrigeration system from which the refrigerant charge has been evacuated means a test conducted after the refrigeration system or portion of the refrigeration system has resumed operation at normal operating

characteristics and conditions of temperature and pressure, except in cases where sound professional judgment dictates that these tests will be more meaningful if performed prior to the return to normal operating characteristics and conditions. "Follow-up verification test" for a refrigeration system from which the refrigerant charge has not been evacuated means a reverification test conducted after the initial verification test and usually within 30 days of returning to normal operating characteristics and conditions. Where a refrigeration system is not evacuated, it is only necessary to complete any required changes to return the refrigeration system to normal operating characteristics and conditions.

(18) "FULL CHARGE", "OPTIMAL CHARGE", or "CRITICAL CHARGE" means or is the amount of refrigerant required in the refrigerant circuit for normal operating characteristics and conditions of a refrigeration system, as determined by one of the following methods:

(A) Use of the equipment manufacturer's specifications of the full charge; or

(B) Use of calculations based on component sizes, density of refrigerant, volume of piping, seasonal variances, and other relevant considerations; or

(C) The midpoint of an established range for full charge based on the best available data regarding the normal operating characteristics and conditions for the system.

(19) GLOBAL WARMING POTENTIAL means or is the capacity to heat the atmosphere, calculated as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram (kg) of a substance relative to that of 1 kg of CO_2. Global warming potential shall be calculated according to the factors for a 100-year time horizon.

(20) GLOBAL WARMING POTENTIAL VALUE or GWP VALUE means or is the 100-yr GWP value first published by the Intergovernmental Panel on Climate Change (IPCC) in its Second Assessment Report (SAR) (IPCC, 1995); or if a 100-yr GWP value was not specified in the IPCC SAR, it means the GWP value published by the IPCC in its Fourth Assessment A-3 Report (AR4) (IPCC, 2007); or if a 100-yr GWP value was not specified

in the IPCC AR4, then the GWP value will be determined by the Executive Officer based on data, studies and/or good engineering or scientific judgment. Both the 1995 IPCC SAR values and the 2007 IPCC AR4 values are published in Table 2.14 of the 2007 IPCC AR4. The SAR GWP values are found in column "SAR (100-yr)" of Table 2.14.; the AR4 GWP values are found in column "100 yr" of Table 2.14.

(21) HIGH GLOBAL WARMING POTENTIAL REFRIGERANT means or is any compound used as a heat transfer fluid or gas that is:

(A) A chlorofluorocarbon; or

(B) A hydrochlorofluorocarbon; or

(C) A hydrofluorocarbon; or

(D) A perfluorocarbon; or

(E) Any compound or blend of compounds, with a global warming potential value equal to or greater than 150; or

(F) Any ozone depleting substance as defined in Title 40 of the Code of Federal Regulation, Part 82, §82.3

(22) HYDROCHLOROFLUOROCARBON or HCFC means or is a class of compounds primarily used as refrigerants, consisting of only hydrogen, chlorine, fluorine, and carbon.

(23) HYDROFLUOROCARBON or HFC means or is a class of compounds primarily used as refrigerants, consisting of only hydrogen, fluorine, and carbon.

(24) INDIRECT EMISSIONS are emissions that are a consequence of the activities of a facility, but occur at sources owned or controlled by another person, related to energy consumed for electricity, heat, steam, and cooling.

(25) INDUSTRIAL PROCESS REFRIGERATION means complex customized appliances used in the chemical, pharmaceutical, petrochemical and manufacturing industries that are directly linked to the industrial process. Industrial process refrigeration includes, but is not limited to, industrial ice machines, appliances used directly in the generation of electricity, and ice rinks. Where one appliance is used for both industrial process

refrigeration and other applications, it will be considered industrial process refrigeration equipment if 50 percent or more of its operating capacity is used for industrial process refrigeration.

(26) INDUSTRIAL PROCESS SHUTDOWN means that an industrial process or facility temporarily ceases to operate or manufacture whatever is being produced at that facility.

(27) INITIAL REFRIGERANT CHARGE means or is the quantity, in pounds, of high global warming potential refrigerant added to a refrigeration system or appliance in order to bring the system to a full charge upon initial installation of a refrigeration system or appliance.

(28) INITIAL VERIFICATION TEST means or is a leak test that is conducted as soon as practicable after the repair is completed. Initial verification test, with regard to leak repairs that require the evacuation of the refrigeration system or portion of the refrigeration system, means a test conducted prior to the replacement of the full charge and before the refrigeration system or portion of the refrigeration system has reached normal operating characteristics and conditions of temperature and pressure. Initial verification test, with regard to repairs conducted without the evacuation of the full charge, means a test conducted as soon as practicable after the conclusion of the repair work.

(29) INTENDED TO BE OPERATED YEAR ROUND means a refrigeration system at a facility that is not a seasonal facility.

(30) LEAK INSPECTION means or is an inspection of a refrigeration system to detect a leak of a high global warming potential refrigerant.

(31) LOW TEMPERATURE REFRIGERATION SYSTEM means or is a commercial or industrial refrigeration system used for frozen products.

(32) MEDIUM TEMPERATURE REFRIGERATION SYSTEM means or is a commercial or industrial refrigeration system used for chilled products.

(33) NEWLY CONSTRUCTED means or is a facility that is not yet operational, or that has been operational for less than 6 months.

(34) NON-REFILLABLE CYLINDER means or is a cylinder with a refrigerant capacity of two pounds or greater that is designed not to be refilled and is

used in the servicing, maintenance or filling of a refrigeration system, appliance, motor vehicle air conditioning system, or heat pump equipment.

(35) NORMAL OPERATING CHARACTERISTICS AND CONDITIONS mean or are refrigeration system operating temperatures, pressures, fluid flows, speeds, and other characteristics, including full charge of the refrigeration system that would be expected for a given process load and ambient condition during operation. Normal operating characteristics and conditions are marked by the absence of atypical conditions affecting the operation of the refrigeration system.

(36) OTHER REFRIGERATION means or is any stationary, non-residential appliance that is used for an application other than industrial process refrigeration, commercial refrigeration, or air conditioning, or is used for two or more applications including industrial process refrigeration, commercial refrigeration, or air conditioning.

(37) PERFLUOROCARBON or PFC means or is a class of compounds consisting only of carbon and fluorine.

(38) PERSON means or is any individual, firm, association, organization, partnership, business trust, corporation, company, contractor, supplier, installer, user or owner, or any state or local governmental agency or public district or any other officer or employee thereof. PERSON also means the United States or its agencies to the extent authorized by Federal law.

(39) RECLAIM means or is to reprocess refrigerant to a level equivalent to new product specifications in accordance with applicable requirements of the U.S. Environmental Protection Agency contained in Title 40, Code of Federal Regulations, Part 82, Subpart F, §82.152.

(40) RECOVER means or is to remove refrigerant in any condition from a system and to store it in an external container without necessarily testing or processing it in any way.

(41) RECYCLE means or is to extract refrigerant from an appliance and to clean the refrigerant for reuse by oil separation and single or multiple passes through moisture-absorption devices, such as replaceable core

filter-driers which reduce moisture, acidity, and particulate matter, without meeting all of the requirements for reclamation.

(42) REFRIGERANT CIRCUIT means the parts of a refrigeration system that are normally connected to each other (or are separated by isolation valves) and are designed to contain a high global warming potential refrigerant. A single refrigerant circuit is defined by all piping and components that use refrigerant from a common reservoir of a high global warming potential refrigerant.

(43) REFRIGERANT DISTRIBUTOR OR WHOLESALER means or is a person to whom a product is delivered or sold for purposes of export, subsequent resale, or delivery to a certified technician, employer of a certified technician, appliance manufacturer, or another refrigerant distributor or wholesaler. Refrigerant distributor or wholesaler includes any person who imports refrigerant from outside of this state to distribute or sell refrigerant to a certified technician, employer of a certified technician, appliance manufacturer, or another refrigerant distributor or wholesaler, or who acts as an agent or broker in buying refrigerant.

(44) REFRIGERANT LEAK means or is any discharge of refrigerant into the atmosphere from a refrigeration system, refrigerant recovery or recycling equipment, refrigerant cylinder, or other container.

(45) REFRIGERANT LEAK DETECTION DEVICE means or is a device that can be calibrated to accurately detect and measure the ambient concentration of refrigerant at a minimum concentration level of 10 parts per million of vapor of a specific refrigerant or selection of refrigerants.

(46) REFRIGERATION SYSTEM means or is a stationary, non-residential equipment that is an industrial process refrigeration, a commercial refrigeration, or other refrigeration appliance with a single refrigerant circuit that requires more than 50 pounds of any combination of high global warming potential refrigerant to maintain normal operating characteristics and conditions. Refrigeration system does not include an air-conditioning appliance. A single refrigeration system is defined by a single refrigerant circuit.

(47) RESIDENTIAL means or is a residential dwelling containing four or fewer dwelling units on one lot or parcel.

(48) RETIRE means or is the permanent removal from service of a refrigeration system or component rendering it unfit for use by the current or any future owner or operator.

(49) RETROFIT means or is the replacement of the refrigerant used in a refrigeration system with a refrigerant approved under the SNAP program pursuant to Title 40 of the Code of Federal Regulation, Part 82, Subpart G, §82.170, or a refrigerant approved by the Executive Officer, and related refrigeration system changes required to maintain the refrigeration system operation and reliability following refrigerant replacement.

(50) SEASONAL ADJUSTMENT means or is the need to add refrigerant to a refrigeration system due to a change in ambient conditions caused by a change in season, followed by the subsequent removal of refrigerant in the corresponding change in season, where both the addition and removal of refrigerant occurs within one consecutive 12-month period after the initial installation of a refrigeration system or a repair of a refrigeration system requiring evacuation or partial evacuation of the refrigerant circuit.

(51) SEASONAL FACILITY means or is a facility where the purpose of the refrigeration system(s) at a facility ceases to be required during certain seasons of the year.

(52) STATIONARY means or is meeting at least one of the following conditions:

(A) Is installed in a building, structure, or facility.

(B) Is attached to a foundation, or if not so attached, will reside at the same location for more than 12 consecutive months.

(C) Is located at the same single location on a permanent basis (at least two consecutive years) and that operates at that single location at three months each year.

(53) SYSTEM IDENTIFICATION NUMBER means or is a unique identification number for each refrigeration system at a facility. It is comprised of the facility identification number followed by a hyphen, followed by a three digit number starting at 001 sequentially assigned to each unique refrigeration system at a facility. For example, if a facility has a facility identification number of ARB000001, then the system

identification number for the first refrigeration system would be ARB000001-001.

(54) SYSTEM MOTHBALLING means or is the intentional shutting down of a refrigeration system for a period of time greater than 60 days by the owners or operators of that facility, where the refrigerant has been evacuated from the refrigeration system or the affected component of the refrigeration system, at least to atmospheric pressure.

(55) TACTICAL SUPPORT EQUIPMENT means or is equipment that meets military specifications, owned by the U.S. Department of Defense, the U.S. military services, or its allies, and used in combat, combat support, combat service support, tactical or relief operations, or training for such operations.

(56) TOPPING OFF means or is adding refrigerant to a refrigeration system or appliance in order to bring the system to a full charge.

(d) Requirements

(1) Registration

(A) The owner or operator of a refrigeration system subject to this rule shall submit to the Executive Officer, at start of operation and every year thereafter, a Registration Plan for the entire facility. Such plan shall contain the following information:

(i) facility name and address;

(ii) name and title of contact person;

(iii) type of business;

(iv) number of refrigeration systems in operation;

(v) manufacturer name, model and serial number for the refrigeration system;

(vi) type of refrigerant in each refrigeration system;

(vii) full charge of refrigerant in each refrigeration system, in pounds;

(viii) date of last annual audit or maintenance performed for each refrigeration system; and

(ix) amount of additional refrigerant charge every year, in pounds.

(B) The owner or operator of a refrigeration system shall comply with the provision in (d)(1)(A) until such time that registration of the refrigeration system with the California Air Resources Board (CARB) is required pursuant to the CARB Refrigerant Management Program registration schedule as follows:

(i) Refrigeration System with a Full Charge Greater Than or Equal to 2000 Pounds.

Beginning January 1, 2012, the owner or operator of such refrigeration system shall submit registration to CARB by providing the information specified in subparagraph (d)(1)(C). Refrigeration systems that begin operation before January 1, 2012 shall be registered with the CARB Executive Officer on or before March 1, 2012. Refrigeration systems that begin operation on or after January 1, 2012, shall be registered with the CARB Executive Officer by March 1 of the year following commencement of operation.

(ii) Refrigeration System with a Full Charge Greater Than or Equal to 200 Pounds but Less Than 2,000 Pounds.

Beginning January 1, 2014, the owner or operator of such refrigeration system shall submit registration to CARB by providing the information specified in subparagraph (d)(1)(C). Refrigeration systems that begin operation before January 1, 2014 shall be registered with the CARB Executive Officer on or before March 1, 2014. Refrigeration systems that begin operation on or after January 1, 2014, shall be registered with the CARB Executive Officer by March 1 of the year following commencement of operation.

(iii) Refrigeration System with a Full Charge Greater Than 50 Pounds but Less Than 200 Pounds.

Beginning January 1, 2016, the owner or operator of such refrigeration system shall submit registration to CARB by providing the information specified in subparagraph (d)(1)(C). Refrigeration systems that begin operation before January 1, 2016 shall be registered with the CARB Executive Officer on or before March 1, 2016. Refrigeration systems that begin operation on or after January 1, 2016, shall be registered with the CARB Executive Officer by March 1 of the year following commencement of operation.

(C) A person submitting registration to CARB pursuant to the provisions of subparagraph (d)(1)(B) shall provide the following information:

(i) Facility Information

(I) Name of operator.

(II) Operator Federal Tax Identification Number.

(III) Facility North American Industry Classification System (NAICS) Business Type Code based on the 2007 NAICS United States structure.

(IV) Facility Standard Industrial Classification (SIC) Code.

(V) Name of facility, including a facility identifier such as store number, if applicable.

(VI) Facility mailing address including a street address, city, state, and zip code.

(VII) Facility physical location address including a street address, city, state, and zip code.

(VIII) Facility contact person name, phone number, and e-mail address.

(ii) Refrigeration System Information (provided for each refrigeration system)

(I) System identification number (assigned by the facility owner or operator).

(II) Equipment information such as equipment type, equipment manufacturer, equipment model or description, equipment model year and serial number. The serial number(s) of the affected equipment or component must be recorded when present and accessible. When the affected equipment or component is part of an assembly without a serial number, or does not have an individual serial number, or is not accessible after assembly, the physical location of the affected equipment must be recorded in enough detail to permit positive identification.

(III) Physical location of the refrigeration through schematic or floor plan with equipment locations clearly noted.

(IV) Temperature classification (e.g. low temperature refrigeration system, medium temperature refrigeration system, or other);

(V) Full charge of the refrigeration system, in pounds.

(VI) Type of high global warming potential refrigerant(s) used.

(D) If there is a change of ownership of a facility that is required to be registered pursuant to subparagraph (d)(1)(B), the new owner or operator shall register the refrigeration system with CARB by March 1 of the calendar year after the change of ownership has occurred.

(E) Before any change of ownership, the owner or operator of a refrigeration system subject to subparagraph (d)(1)(B) shall ensure that the refrigeration system is free of refrigerant leaks through a leak inspection performed by a certified technician. In addition, a person selling a refrigeration system that is required to have been

registered with CARB shall inform the buyer of the registration requirements, and submit a change of ownership notification to the CARB Executive Officer. The change of ownership notification shall include the following information:

(i) Seller Information

(I) Facility identification number;

(II) Name of owner or operator; and

(III) Name of facility, including a facility identifier such as store number; and

(ii) Buyer Information

(I) Name of owner or operator;

(II) Name of facility, including a facility identifier such as store number;

(III) Facility mailing address including a street address, city, state, and zip code; and

(IV) Facility contact person including phone number and e-mail address.

(F) The owner or operator of a refrigeration system subject to this rule shall pay a registration fee for the entire facility as follows:

(i) Refrigeration systems that are required to be registered with the District pursuant to (d)(1)(A) shall pay a plan filing fee pursuant to Rule 306 – Plan Fees.

(ii) Refrigeration systems that are required to be registered with CARB pursuant to (d)(1)(B)(i) and (d)(1)(B)(ii) shall pay to CARB an initial implementation fee at time of registration and an annual implementation fee in accordance with the fee schedule established by CARB. If a facility has more than one refrigeration system, the amount of fee shall be based on the refrigeration system with the largest full charge that is operating at the facility.

(2) Leak Detection and Monitoring

(A) Prior to January 1, 2011, the owner or operator of a refrigeration system that operates or is intended to be operated year round shall conduct an annual audit of the refrigeration system to determine whether such system is operating pursuant to manufacturer's specifications and does not have refrigerant leaks. At a minimum, the annual audit shall require a leak inspection conducted by a certified technician.

(B) Beginning January 1, 2011, the owner or operator of a refrigeration system that operates or is intended to be operated year round shall comply with the following requirements:

(i) Refrigeration Systems with a Full Charge Greater Than or Equal to 2,000 Pounds.

(I) A monthly leak inspection of the refrigeration system shall be conducted if the refrigerant circuit is located entirely within an enclosed building or structure, or the compressor, evaporator, condenser, or any other component of the refrigeration system with a high potential for a refrigerant leak is located inside an enclosed building or structure. However, a monthly leak inspection is not required if the refrigeration system is equipped with an automatic leak detection system.

(II) A quarterly leak inspection of the refrigeration system shall be conducted if the refrigerant circuit is not located entirely within an enclosed building or structure and is not monitored for leaks using an automatic leak detection system.

(III) By January 1, 2012, an automatic leak detection system shall be installed for the refrigeration system if the refrigerant circuit is located entirely within an enclosed building or structure, or the compressor, evaporator, condenser, or any other component of the refrigeration system with a high potential for a

refrigerant leak is located inside an enclosed building or structure.

(ii) Refrigeration Systems with a Full Charge Greater Than or Equal to 200 Pounds but Less Than 2,000 Pounds.

A quarterly leak inspection shall be conducted for the refrigeration system. A leak inspection is not required if an automatic leak detection system is used to monitor the refrigeration system.

(iii) Refrigeration Systems with a Full Charge Greater Than 50 Pounds but Less Than 200 Pounds.

An annual leak inspection shall be conducted for the refrigeration system. A leak inspection is not required if an automatic leak detection system is used to monitor the refrigeration system.

(C) Beginning January 1, 2011, the owner or operator of a refrigeration system that does not operate or is not intended to be operated year round shall conduct a leak inspection within 30 days after starting each operation of the refrigeration system, and once every three months thereafter, until the refrigeration system is shut down. A leak inspection is not required after starting operation if there has been a leak inspection of the refrigeration system conducted within the preceding 90 days.

(D) Beginning January 1, 2011, the owner or operator of a refrigeration system subject to this rule shall conduct a leak inspection each time an additional refrigerant charge equal to or greater than 5 pounds or one percent of the refrigeration system full charge, whichever amount is greater, is added to such refrigeration system.

(E) All refrigerant leak inspections shall be conducted using one or more of the following methods:

(i) Refrigerant leak detection device used in accordance with the manufacturer's specifications; or

(ii) A bubble test; or

(iii) Observation of oil residue; or

(iv) An alternate method approved by the Executive Officer.

In addition, any time oil residue is observed indicating a refrigerant leak, a leak inspection shall be conducted using a leak detection device or a bubble test to confirm a refrigerant leak.

(F) The owner or operator of a refrigeration system equipped with an automatic leak detection system that directly detects the presence of high global warming potential refrigerant in the air shall comply with the following requirements:

(i) Sensors or intakes of the automatic leak detection system shall be placed in the proximity of the compressor, evaporator, condenser, and other areas with a high potential for a refrigerant leak.

(ii) An annual audit and calibration of the automatic leak detection system shall be conducted using the manufacturer's recommended procedures to ensure that the system accurately detects a concentration level of 10 parts per million of vapor of the specific refrigerant used in the refrigeration system, and alerts the operator when a refrigerant concentration of 100 parts per million of vapor of the specific refrigerant used in the refrigeration system is reached.

(G) The owner or operator of a refrigeration system equipped with an automatic leak detection system that automatically interprets measurements (e.g. temperature and pressure) within a refrigeration system to indicate a refrigerant leak shall annually audit and calibrate the system, so that it automatically alerts the operator when measurements indicate a loss of refrigerant of 50 pounds or 10 percent of the refrigeration system full charge, whichever is less.

(H) If an automatic leak detection system alerts the owner or operator of a refrigerant leak, the owner or operator shall ensure that a leak

inspection of the refrigeration system is conducted within 24 hours after the system alert.

(3) Leak Repair

(A) Any person who owns or operates a refrigeration system that has a refrigerant leak shall ensure that the leak is repaired no later than 14 calendar days after the leak has been discovered, except in situations when a longer time period is allowed as provided in subparagraphs (d)(3)(B) and (d)(3)(C). The owner or operator shall maintain a log of repair activities beginning at the time the leak is discovered and ending at the time when the leak has been repaired. The refrigeration system shall be verified by a certified technician to be leak free before any refrigerant is added to the system.

(B) The owner or operator of a refrigeration system has 45 days to repair a refrigerant leak if one or more of the following conditions exist:

(i) A certified technician is not available to complete the repair. A written record shall be kept to document that no certified technician is available within 14 days of the initial leak detection; or

(ii) The parts necessary to repair a refrigerant leak are unavailable within 14 days of the initial leak detection. A written statement verifying that the parts are unavailable from the refrigeration system or component manufacturer or distributor shall be obtained; or

(iii) The refrigerant leak repair requires an industrial process shutdown that results in a process temporarily ceasing to manufacture the intermediate or final product that is produced when the industrial process refrigeration appliance is in operation.

(C) The owner or operator of a refrigeration system has 120 days to repair a refrigerant leak if all of the following conditions exist:

(i) The facility owner or operator is an entity subject to Mandatory Greenhouse Gas Emissions Reporting requirements pursuant to section 95101 of the California Code of Regulations; and

(ii) The refrigeration system is an industrial process refrigeration appliance; and

(iii) The refrigerant leak repair requires an industrial process shutdown; and

(iv) Written records are maintained to document that all the conditions in clauses (d)(3)(C)(i) thru (d)(3)(C)(iii) are met.

(D) The owner or operator of a refrigeration system shall ensure that an initial verification test and a follow-up verification test, as defined in subdivision (c), are conducted by a certified technician upon completion of refrigerant repairs. For a refrigeration system that has been evacuated during the refrigerant repair leak, the follow-up verification shall be conducted when the system is operating at normal operating conditions. If the system was not evacuated during leak repair, the follow-up verification test requirement is satisfied once required changes are made to return the refrigeration system to normal operating conditions.

(E) If verification tests indicate that a refrigerant leak has not been successfully repaired within the allowable time period specified in subparagraphs (d)(3)(A), (d)(3)(B), or (d)(3)(C), and no exemption has been granted by the Executive Officer pursuant to paragraph (d)(5), then the owner or operator shall comply with the following applicable requirements:

(i) For refrigeration systems that fail to meet the 14-day leak repair allowance in subparagraph (d)(3)(A), the owner or operator shall successfully repair the refrigerant leak within 45 days of the initial refrigerant leak detection, or prepare a retrofit or retirement plan pursuant to paragraph (d)(4) within 60 days of the initial refrigerant leak detection.

(ii) For refrigeration systems that fail to meet the 45-day leak repair allowance in subparagraph (d)(3)(B), the owner or operator shall prepare a retrofit or retirement plan pursuant to paragraph (d)(4) within 60 days of the initial refrigerant leak detection.

(iii) For refrigeration systems that fail to meet the 120-day leak repair allowance in subparagraph (d)(3)(C), the owner or operator shall prepare a retrofit or retirement plan pursuant to paragraph (d)(4) within 135 days of the initial refrigerant leak detection.

(4) Retrofit or Retirement Plan

(A) The plan shall establish a schedule to retrofit or retire a leaking refrigeration system no later than six months after the initial detection of the refrigerant leak. All work shall be completed during this six-month period.

(B) A retrofit or retirement plan shall include the following information:

(i) The system identification number of the refrigeration system being retired or retrofitted;

(ii) Equipment type, manufacturer, model number or description;

(iii) Physical location of the refrigeration system through schematic or floor plan with locations clearly noted;

(iv) Temperature classification of the refrigeration system;

(v) Full charge of the refrigeration system including the type of high global warming potential refrigerant(s) used;

(vi) A plan to dispose of the retired refrigeration system if the refrigeration system is to be retired and replaced;

(vii) A timetable which includes, at a minimum, the start date and completion date of installation, construction, or retrofit of the refrigeration system; and

(viii) A signature by a representative of the facility, including the date signed.

(5) Approval of Exemptions

(A) The owner or operator of a refrigeration system may submit a request to the Executive Officer for an exemption from the requirements of paragraphs (d)(3) and (d)(4) provided that the owner or operator demonstrates that one or more of the criteria below have been satisfied:

(i) Emissions Life Cycle Exemption

The Executive Officer may allow the continuation of a refrigerant leak for up to three years if the Executive Officer determines that the applicant has provided clear and convincing documentation that the refrigerant leak cannot be repaired, and that allowing the refrigerant leak to continue will result in less combined direct and indirect emissions than replacing the leaking refrigeration system. The documentation shall include information quantifying the lifecycle direct and indirect emissions, including energy use, and must include a calculation of these emissions based on the average lifetime of the refrigeration system or facility. The applicant shall also provide a mitigation plan that includes a list of proposed actions to minimize emissions. The plan shall include an analysis of options to minimize usage, reduce leaks or venting, and recycle or destroy high global warming potential refrigerant.

(ii) Economic Hardship Exemption

The Executive Officer may allow the continuation of a refrigerant leak for a specified time period of no longer than three years if the Executive Officer determines that the applicant has provided clear and convincing documentation that all of the following criteria are met:

(I) Compliance would result in extraordinary economic hardship, such as closure of the entire facility or a

large portion of the facility, or loss of a large portion of the revenue from the facility; and

(II) The applicant has prepared a compliance report that can be implemented and can achieve compliance as expeditiously as possible. The compliance report shall reasonably detail when compliance will be achieved and the method by which compliance will be achieved.

(iii) Natural Disaster Exemption

The Executive Officer may allow the continuation of a refrigerant leak for a specified time period of no longer than three years if the Executive Officer determines that the applicant has provided clear and convincing documentation that failure to repair the refrigerant leak was due to a natural disaster such as an earthquake or flood, an act of war or an act by a public enemy, or a civil disorder or riot.

(B) Any exemption granted may be extended for one or more additional periods of up to three years if the Executive Officer determines that the demonstrations made pursuant to clauses (d)(5)(A)(i), (d)(5)(A)(ii), or (d)(5)(A)(iii) remain valid.

(C) The owner or operator requesting an exemption as provided in subparagraph (d)(5)(A) shall submit a written application demonstrating that one or more of the exemption criteria have been met. Within 30 days of receipt of the exemption application, the Executive Officer shall determine whether the application is complete, and shall notify the applicant of this determination. If the exemption application is determined to be incomplete, the Executive Officer shall notify the applicant and specify the information needed to make the application complete. Within 90 days after an application is determined to be complete, the Executive Officer shall determine whether and under what conditions an exemption will be granted. The applicant and the Executive Officer may agree to a longer time period for the Executive Officer to take action on the exemption application.

(D) The exemption shall cease to be effective upon the failure of the person to whom the exemption was granted to comply with any term or condition of the exemption.

(E) If the Executive Officer determines that an exemption no longer meets the criteria specified in subparagraph (d)(5)(A), the Executive Officer may revoke the exemption or modify it as necessary to insure that the exemption continues to meet the criteria.

(F) If an application for an exemption is denied or an existing exemption is revoked, the owner or operator of a refrigeration system shall comply with the following:

(i) From the time a notice of denial or revocation is issued, the refrigerant leak shall be repaired within the allowable repair period in paragraph (d)(3); or

(ii) Within 30 days of a notice of such denial or revocation, the owner or operator of the facility shall prepare a retrofit or retirement plan pursuant to paragraph (d)(4). The plan shall establish a schedule to retrofit or retire a leaking refrigeration system no later than six months after a notice of denial or revocation, and all work shall be completed during this six-month period.

(e) Required Service Practices and Prohibitions

(1) No person shall install, maintain, service, repair, relocate, or dispose of any refrigeration system, regardless of charge size, that may cause the release of high global warming potential refrigerants unless that person meets all of the following applicable requirements:

(A) The person has a current, valid, and applicable U.S. Environmental Protection Agency technician certificate issued in accordance with Title 40 of the Code of Federal Regulations, Part 82, Subpart F, §82.161.

(B) The certified technician conducting leak repair holds a current and active California contractor's license in the C-38-Refrigeration Contractor licensing classification, or is an employee of a

contractor with the same qualifications. If the refrigeration system requiring service is also used in an air conditioning application, the refrigerant leak may be repaired by a certified technician holding a current and active California contractor's license in the C-20-Warm Air Heating, Ventilating and Refrigeration Contractor licensing classification, or by an employee of a contractor with the same qualifications.

(C) The person recovers, recycles, or reclaims the refrigerant, using certified refrigerant recovery or recycling equipment for that type of refrigeration system, and employs procedures for which the certified refrigerant recovery or recycling equipment was approved by the U.S. Environmental Protection Agency. Attempts to recover refrigerant shall be made even if the person believes that all refrigerant has been removed or has previously leaked from the refrigeration system. Refrigerant may be returned to the refrigeration system from which it is recovered, or to another refrigeration system owned by the same person, without being recycled or reclaimed.

(D) The refrigerant added to a refrigeration system during manufacture or service is:

(i) A Class I or Class II substance, as identified by section 602 of the federal Clean Air Act; or

(ii) An alternative that has been found acceptable under the SNAP program pursuant to Title 40 of the Code of Federal Regulations, Part 82, Subpart G, §82.170; or

(iii) Approved by the Executive Officer for the specific refrigeration end-use in which it is being employed.

(E) No refrigerant charge is added to any refrigeration system known to have a refrigerant leak, except that it is permissible to add additional refrigerant charge required to maintain operations during leak repair.

(F) Job site evacuation of refrigerants during recycling, recovering, reclaiming, or disposing is done in accordance with Title 40 of the

Code of Federal Regulations, Part 82, Subpart F, §82.156. De minimis refrigerant releases associated with a good faith attempt to recycle or recover refrigerants are allowed. Refrigerant releases shall be considered de minimis only if they occur when the required practices or requirements contained in Part 82, Subpart F, §§82.156 and 82.158, and Part 82, Subpart B of Title 40 of the Code of Federal Regulation are followed.

(2) Any person who owns or operates a certified refrigerant recovery or recycling equipment shall:

(A) Ensure the equipment has been tested for and been determined to have no leaks within the past six months. Leaks in recycling, recovering, or charging equipment shall be repaired within 2 working days after the leak is first detected, unless the equipment does not leak if its use is discontinued, and use is discontinued.

(B) Not alter the design of a certified recovery and recycling equipment in a manner that would affect the equipment's ability to meet the certification standards set by the U.S. Environmental Protection Agency without resubmitting the altered design to an approved equipment testing facility for certification testing. Until such altered equipment is tested by a U.S. Environmental Protection Agency approved equipment testing facility, and is shown to meet the certification standards set forth by the U.S. Environmental Protection Agency, the altered equipment shall not be considered approved, and shall not be used.

(C) Use the refrigerant recovery and recycling equipment used as specified by the certified refrigerant recovery or recycling equipment manufacturer, unless the manufacturer's specifications are in conflict with the procedures approved by the U.S. Environmental Protection Agency for the certified refrigerant recovery or recycling equipment.

(D) Provide proof of certification for the recovery and recycling equipment from the U.S. Environmental Protection Agency to the Executive Officer upon request.

(3) No person shall sell, supply, offer for sale or distribute any high global warming potential refrigerant for use as a refrigerant unless:

(A) The buyer is a certified technician; or

(B) The buyer is an authorized representative of a person employing at least one certified technician, and the buyer has provided evidence that at least one technician is properly certified; or

(C) The refrigerant is sold only for eventual resale to a certified technician, an employer of a certified technician, or an refrigeration system manufacturer; or the refrigerant is being sent for reclamation; or

(D) The refrigerant is contained in a refrigeration appliance.

(4) No person shall sell, supply, offer for sale or distribute any high global warming potential refrigerant for use as a refrigerant unless such refrigerant is a Class I or Class II substance identified by section 602 of the federal Clean Air Act; or is an alternative that has been found acceptable under the SNAP program pursuant to Title 40 of the Code of Federal Regulations, Part 82, Subpart G, §82.170; or is approved by the Executive Officer for the specific refrigeration end-use in which it is being employed.

(5) No person shall sell, offer for sale, supply, or distribute, any high-global warming refrigerant consisting wholly or in part of used refrigerant unless the refrigerant has been reclaimed by a certified reclaimer.

(6) No person shall distribute or sell a refrigerant recovery or recycling equipment unless such equipment meets the levels of evacuation to be achieved by recovery or recycling equipment as specified in Title 40 of the Code of Federal Regulations, Part 82, §82.158.

(7) No person reclaiming refrigerants shall release into the atmosphere more than 1.5 percent of the refrigerant received for reclamation.

(8) No person shall recycle or dispose of a non-refillable cylinder unless the refrigerant from such cylinder has been evacuated to a vacuum of 15 inches of mercury, relative to standard atmospheric pressure of 29.9 inches of mercury.

(9) No person shall refill a non-refillable cylinder or use it as a temporary receiver during service.

(10) No person shall repair or modify a non-refillable cylinder in any way that allows the non-refillable cylinder to be refilled.

(f) Reporting

(1) A person operating a refrigeration system with a full charge greater than or equal to 200 pounds of a high global warming potential refrigerant shall submit annually to CARB a Facility Stationary Refrigeration Report (Annual Report) that contains the information specified in paragraph (f)(2). Each Annual Report shall provide this information for the previous calendar year and shall be submitted as follows:

(A) By March 1, 2012, the owner or operator of a facility with a refrigeration system that begins operation before January 1, 2012, and with a full charge greater than or equal to 2,000 pounds of a high global warming potential refrigerant, shall submit an Annual Report for the 2011 calendar year. By March 1, 2013, and each calendar year thereafter, the owner or operator shall submit an Annual Report providing information for the previous calendar year.

(B) The owner or operator of a facility with a refrigeration system that begins operation on or after January 1, 2012, and with a full charge greater than or equal to 2,000 pounds of a high global warming potential refrigerant shall submit an Annual Report for the previous calendar year by March 1 of the year following commencement of operation. Subsequent Annual Reports for the previous calendar year shall be submitted by March 1 of each year thereafter.

(C) By March 1, 2014, the owner or operator of a facility with a refrigeration system that begins operation before January 1, 2014, and with a full charge greater than or equal to 200 pounds but less than 2,000 pounds of a high global warming potential refrigerant, shall submit an Annual Report for the 2013 calendar year. By March 1, 2015, and each calendar year thereafter, the owner or

operator shall submit an Annual Report providing information for the previous calendar year.

(D) The owner or operator of a facility with a refrigeration system that begins operation on or after January 1, 2014, and with a full charge greater than or equal to 200 pounds but less than 2,000 pounds of a high global warming potential refrigerant, shall submit an Annual Report for the previous calendar year by March 1 of the year following commencement of operation. Subsequent Annual Reports for the previous calendar year shall be submitted by March 1 of each year thereafter.

(2) The Annual Report required in paragraph (f)(1) shall include the following information:

(A) Refrigeration System

The following data shall be provided for each refrigeration system:

(i) System identification number;

(ii) Equipment type;

(iii) Equipment manufacturer;

(iv) Equipment model or description, model year, and serial number. The serial number(s) of the affected equipment or component must be recorded when present and accessible. When the affected equipment or component is part of an assembly without a serial number, or does not have an individual serial number, or is not accessible after assembly, the physical location of the affected equipment must be recorded in enough detail to permit positive identification;

(v) Physical location of a refrigeration system through schematic or floor plan with equipment locations clearly noted;

(vi) Temperature classification;

(vii) Full charge of the refrigeration system, in pounds;

(viii) Type of high global warming potential refrigerant used; and

(ix) Date of initial installation.

(B) Refrigeration System Service and Leak Repair

The following information shall be provided for each automatic leak detection system audit, leak inspection, and refrigeration system service or refrigerant leak repair that required an additional refrigerant charge of five pounds or more, or an additional refrigerant charge equal to or greater than one percent of the full charge, whichever amount is greater:

(i) Date leak detected, if applicable;

(ii) Date of service provided or leak repair completed;

(iii) Cause of refrigerant leak, if applicable;

(iv) Description of service provided or leak repair completed;

(v) Date(s) of initial verification test(s), if applicable;

(vi) Date(s) of follow-up verification test(s), if applicable;

(vii) Total additional refrigerant charge (in pounds) of each type of high global warming potential refrigerant, if applicable;

(viii) Purpose for additional refrigerant charge (leak repair, topping off, initial refrigerant charge, or seasonal adjustment), if applicable;

(ix) Name of certified technician completing leak repair, if applicable; and

(x) The certified technician's identification number and certification type issued by an approved technician certification program pursuant to Title 40 of the Code of Federal Regulation, Part 82, §82.161, if applicable.

(C) Refrigerant Purchases and Use Information

The following information shall be provided on refrigerant purchase and use:

(i) The total weight in pounds of each type of high global warming potential refrigerant that was purchased during the calendar year;

(ii) The total weight in pounds of each type of high global warming potential refrigerant that was charged into a refrigeration system during the calendar year;

(iii) The total weight in pounds of each type of high global warming potential refrigerant that was recovered from a refrigeration system during the calendar year;

(iv) The total weight in pounds of each type of high global warming potential refrigerant that was stored in inventory at the facility, or stored at a different location for use by the facility, on the last day of the calendar year; and

(v) The total weight in pounds of high global warming potential refrigerant that was shipped by the owner or operator for reclamation and destruction during the calendar year.

(3) A person operating a refrigeration system with a full charge greater than 50 pounds but less than 200 pounds of a high global warming potential refrigerant is not required to submit annual reports. However, the owner or operator of such refrigeration system shall report the information specified in paragraph (f)(2) within 60 days of receipt of a request from CARB or the District.

(4) By March 1, 2012, and every year thereafter, a refrigerant distributor or wholesaler shall submit an annual report to CARB providing information for the previous calendar year. The annual report shall cover all California facilities under the operational control of the refrigerant distributor or wholesaler, and shall include the following information:

(A) Name and mailing address of the refrigerant distributor or wholesaler;

(B) Contact person name, phone number, and e-mail address for the refrigerant distributor or wholesaler;

(C) The total statewide annual aggregated weight in pounds of each type of high global warming potential refrigerant that was purchased or received for the purpose of subsequent resale or delivery for any purpose other than reclamation or destruction;

(G) The total statewide annual aggregated weight in pounds of each type of high global warming potential refrigerant that was sold or distributed, excluding all sales to facilities outside of California or to a refrigerant distributor or wholesaler for eventual resale;

(H) The total statewide annual aggregated weight in pounds of high global warming potential refrigerant that was shipped to a certified reclaimer;

(I) Name of all refrigerant distributor or wholesaler facilities under the operational control of the refrigerant distributor or wholesaler;

(J) Address of each refrigerant distributor or wholesaler facility under the operational control of the refrigerant distributor or wholesaler; and

(K) Contact person name, phone number, and e-mail address for each refrigerant distributor or wholesaler facility under the operational control of the refrigerant distributor or wholesaler.

(5) By March 1, 2012, and every year thereafter, a person reclaiming any high global warming potential refrigerant in California shall submit an annual report to CARB providing information for the previous calendar year. The annual report shall cover all California facilities under the operational control of the certified reclaimer, and shall include the following information:

(A) Name and mailing address of the certified reclaimer;

(B) Contact person name, phone number, and e-mail address for the certified reclaimer;

(C) The total statewide annual aggregated weight in pounds of high global warming potential refrigerant that was received by the certified reclaimer for reclamation or destruction;

(D) The total statewide annual aggregated weight in pounds of each type of high global warming potential refrigerant that was reclaimed in California;

(E) The total statewide annual aggregated weight in pounds of high global warming potential refrigerant that was shipped out of California for reclamation;

(F) The total statewide annual aggregated weight in pounds of high global warming potential refrigerant that was destroyed or shipped out of California for destruction;

(G) Name and address of all certified reclaimer facilities under the operational control of the certified reclaimer; and

(H) Contact person name, phone number, and e-mail address for each certified reclaimer facility under the operational control of the certified reclaimer.

(g) Recordkeeping

(1) Any person owning or operating any refrigeration system subject to this rule shall maintain records for each refrigeration system for a minimum of five years. The following records shall be kept at the facility where the refrigeration system is in operation, and shall be made available to the Executive Officer upon request:

(A) All registration information for the refrigeration systems;

(B) Documentation of all leak detection systems, leak inspections, annual audit and calibration of automatic leak detection system;

(C) Records of refrigeration system service and leak repairs, including documentation of any conditions allowing leak repair of more than 14 days after leak detection pursuant to subparagraphs (d)(3)(B) and (d)(3)(C);

(D) Any retrofit or retirement plans, or records on application for exemption submitted pursuant to paragraph (d)(4), if applicable;

(E) Name(s) of the person(s) who completed the inspection and repair, including the name, address, and telephone number of the company the person is representing, and technician certificate number;

(F) A log of the quantity of each additional high global warming refrigerant charged to the refrigeration system and the date of each charge;

(G) The quantity (in pounds) of high-global warming refrigerants purchased or used in the District in a calendar year, including invoices of all refrigerant purchases;

(H) Annual Reports submitted pursuant to paragraph (f)(1);

(I) Records of all shipments of refrigerants for reclamation or destruction, which include the following information:

(i) Name and address of refrigerant shipment destination;

(ii) Weight in pounds of refrigerant shipped;

(iii) Date of shipment; and

(iv) Purpose of shipment, e.g. reclamation, destruction, etc.

(J) Records of all refrigeration systems component data, measurements, calculations and assumptions used to determine full charge.

(2) A refrigerant distributor, wholesaler, or certified reclaimer shall maintain records for a minimum of five years. The following records shall be kept at the facility of each distributor, wholesaler, or certified reclaimer, and shall be made available to the Executive Officer upon request, as follows:

(A) Annual reports submitted pursuant to paragraphs (f)(4) and (f)(5);

(B) Invoices of all high-global warming refrigerants received through sale or transfer and all high-global warming refrigerants distributed through sale or transfer. These invoices must indicate the name of the purchaser, the date of sale, and the quantity and the type of high-global warming refrigerant purchased, sold, or transferred;

(C) Documents required pursuant to subparagraph (e)(3)(B); and

(D) Records of all shipments of refrigerant received for reclamation.

(3) Any person owning and operating a certified refrigerant recovery or recycling equipment shall maintain records to determine compliance with the requirements of paragraph (e)(2), which includes the following information:

(A) Date of semi-annual inspection;

(B) All work completed for each recycling or recovery system to prevent or repair leaks, including results of leak testing and leak determinations; and

(C) Name(s) of the person(s) who completed the inspection and repair, including the name, address, and telephone number of the company the person is representing.

(h) Exemption

(1) The provisions of this rule do not apply to tactical support equipment.

(2) An owner or operator shall not pay fees as required in clause (d)(1)(F)(ii) for any calendar year if during the previous calendar year all of the refrigeration systems at the facility have been maintained using the following advanced strategies and practices to reduce refrigerant charges and emissions of ozone-depleting substances and greenhouse gases:

(A) The facility uses only refrigerants with zero ozone-depleting potential; and

(B) The facility uses only refrigerants found acceptable by the U.S EPA SNAP program pursuant to Title 40 of the Code of Federal Regulation, Part 82, Subpart G, §82.170 for the specific end use; and

(C) The facility achieves an average hydrofluorocarbon full charge equal to or less than 1.25 lbs. of refrigerant per 1000 Btu per hour total evaporator cooling load; and

(D) If the facility is not newly constructed, the facility achieves a facility-wide annual refrigerant leak rate, as defined in Title 40 of the Code of Federal Regulation, Part 82, §82.152, of 10% or less; and

(E) The owner or operator swears under penalty of perjury that the criteria specified in subparagraphs (h)(2)(A) thru (h)(2)(D) have been met.

(2) The requirements in paragraphs (d)(3) and (d)(4) shall not apply to the following conditions:

(A) During the time the refrigeration system is undergoing or is in system mothballing, as defined in subdivision (c), and until the refrigeration system resumes operation at a facility; or

(B) The owner or operator of a refrigeration system has received an exemption from the Executive Officer pursuant to paragraph (d)(5); or

(C) The owner or operator of a refrigeration system has submitted a request for an exemption and until a final determination is made by the Executive Officer pursuant to paragraph (d)(5).

Written records must be kept pursuant to subdivision (g) to document that the owner or the operator has requested or received an exemption.

(3) The contractor's license requirements in subparagraph (e)(1)(B) shall not apply if one or more conditions apply:

(A) The refrigeration system service or refrigerant leak repair is performed by the facility owner or operator or its employees with wages as sole compensation; or

(B) The refrigeration system service or refrigerant leak repair is performed by the facility owner or operator through one undertaking or by one or more contracts, and the aggregate contract price for labor, materials, and all other items is less than five hundred dollars ($500); or

(C) The refrigeration system service or refrigerant leak repair is performed pursuant to a contract entered into before January 1, 2011 by any political subdivision of the United States government, or the State of California, or by any incorporated town, city, county, irrigation district, reclamation district, or other municipal or political corporation.

(i) Violations

(1) Each day or portion thereof that any leak inspection or leak repair is not completed after the date such leak inspection or leak repair is required to be completed, or each day or portion thereof that any registration, report, or plan required by this rule remains unsubmitted, is submitted late, or

contains incomplete or inaccurate information, shall constitute a single, separate violation of this rule.

(2) Failure to pay the full amount of any fee required by this rule shall constitute a single, separate rule violation for each day or portion thereof that the fee has not been paid after the date the fee is due.

(j) Severability

If any provision of this rule is held by judicial order to be invalid, or inapplicable to any person or circumstance, such order shall not affect the validity of the remainder of this rule, or the validity or applicability of such provision to other persons or circumstances. In the event any of the exceptions to this rule is held by judicial order to be invalid, the persons or circumstances covered by the exception shall instead be required to comply with the remainder of this rule.

TABLE OF CONTENTS

LIST OF TABLES

I. EXECUTIVE SUMMARY

Rule 1143 - Consumer Paint Thinners & Multi-Purpose Solvents, was adopted on March 6, 2009, to implement Control Measure CTS-04 from the 2007 AQMP ("Air Quality Management Plan") which calls for further Volatile Organic Compound (VOC) emission reductions from categories not regulated by CARB, including paint thinners and multi-purpose solvents. The adopted rule has a two-tier VOC concentration limit beginning with the 300 grams per liter (g/L) VOC limit, effective January 1, 2010, and followed by the final limit of 25 g/L VOC, effective January 1, 2011. The expected emission reduction will be 5.94 tons per day (tpd) by the year 2011, and an additional 3.81 tpd by January 1, 2012, resulting in a total VOC reduction of 9.75 tpd by January 1, 2012, when the rule will be fully implemented.

The rule was amended on June 4, 2010, to rescind the final VOC limit of 25 g/L, to comply with a court order by the Los Angeles County Superior Court.

On July 9, 2010, Rule 1143 was amended to reinstate the final VOC limit of 25 g/L of VOC, effective January 1, 2011 along with a one year sell-through provision allowing consumer paint thinners and multi-purpose solvents to be sold in the AQMD jurisdiction through December 31, 2011, provided that the products were manufactured prior to January 1, 2011. Additionally, Rule 1143 was also amended to allow consumer paint thinners and multi-purpose solvents containing 300 g/L or more of VOC to be sold and used until April 1, 2011, provided that the product container showed product uses that included the thinning of industrial maintenance coatings, and the product was manufactured prior to July 9, 2010.

During the latter part of the July 2010 rule amendment process, staff received comments regarding the need for an exemption relating to the solvents and thinners used by artists. During the July 9, 2010 public hearing, staff committed to explore and evaluate the request and come back with an amendment prior to the end of the year, if necessary. Staff recognizes that Rule 1143 currently does not take into consideration the artist materials industry. Artist solvents and thinners specifically manufactured for artistic uses have been formulated, refined and purified to eliminate impurities, specifically intended for artist applications. These niche products do not fall into the general category of consumer paint thinners and multi-purpose solvents used for architectural coating thinning and clean-up.

The California Air Resources Board (CARB) exempted the artist solvents and thinners, which they call "Artist's Solvent/Thinner," from their Consumer Products Regulations (CPR) provided that they are labeled to meet ASTM D4236-94 (Reapproved 2005) and packaged in containers with a capacity less than or equal to 32 fluid ounces (one quart). At a subsequent public workshop for this project that was held on September 15, 2010, CARB staff stated in those discussions that they would be changing their Consumer Product Regulation language to exempt Artist's Solvent/Thinner sold in containers with a capacity of 32 fluid ounces to accommodate 1 liter containers. On September 29, 2010, CARB posted a proposed modification to their definition of Artist's Solvent/Thinner to replace the 32 (fluid) ounces with 34 (fluid) ounces which will include 1 liter containers (1 liter = 33.8 fluid ounces).

Staff is proposing an amendment to the rule that would provide an exemption to artist solvents and thinners from adhering to the VOC requirements set forth in the rule. Staff believes the amendment is necessary because artist solvent and thinner products are designed to be used specifically with artist solvent-based oil paints. Staff is currently unaware of low-VOC solvents that may be successfully reformulated for artist solvent and thinner products. In order to monitor the usage of the exemptions and minimize rule abuse, staff proposes to clarify that recordkeeping and reporting requirements are applicable to all exempt usage including artist solvents and thinners. Staff is also proposing to clarify that any consumer paint thinner or multi-purpose solvent that is manufactured prior to the effective date, of the applicable limit specified in paragraph (d)(1) in the rule, and that has a VOC content above that limit (but not above the limit in effect on the date of manufacture), may be sold, supplied, offered for sale, or used for up to one year after the specified effective date.

Therefore, staff is proposing the following amendment to Rule 1143:

- Exempting artist solvents and thinners that are properly labeled and sold in containers that are one liter or less from applicable VOC limits
- Defining artist solvents and thinners
- Making changes to the rule to clarify that all exempt products shall be subject to recordkeeping and reporting requirements
- Making changes to the rule to clarify that the sell-through provisions for the final VOC limit do not apply to products that do not meet the interim VOC limit

The proposed amendment will result in 114 pounds per day of VOC emissions foregone, which equates to approximately 18.5 gallons per day. The VOC emissions foregone due to this proposed amendment will represent 0.6% of the total existing VOC emission reductions applied to Rule 1143. No socioeconomic impacts are anticipated from this current proposal.

II. BACKGROUND

Consumer Products are the largest source of VOC emissions in the South Coast Air Basin (Basin). The California Air Resources Board (CARB) estimates that consumer products in the state of California account for approximately 245 tons per day (tpd) of VOC emissions[1]. Approximately forty-five percent (45%) of that estimate or 110.3 tpd of VOC emissions[2] can be attributed to the Basin.

The 2007 AQMP highlights the growing impact of VOC emissions from consumer products. Taking into account population growth and planned VOC reductions by CARB, the AQMP estimates that the annual average VOC emissions for the consumer product category will be 107 tpd by the year 2014, and will likely increase to 112.1 tpd by the year 2020[3]. Rule 1143 implements Control Measure CTS-04 from the 2007 AQMP.

Consumer multi-purpose solvents work very well for cleaning deposits such as grease, oil, paint, carbon deposits, residues from tools, equipment, and general household uses, whereas consumer paint thinners are used to thin traditional solvent-based architectural coatings. However, based on staff's market assessment, traditional high-VOC containing consumer paint thinners and multi-purpose solvents are typically used interchangeably. PAR1143 changes this practice, since both consumer paint thinners and multi-purpose solvents are required to meet similar VOC limits prescribed in the rule.

III. RULE HISTORY

Rule 1143 - Consumer Paint Thinners & Multi-Purpose Solvents, was adopted on March 6, 2009, by the Governing Board and is currently in effect regulating consumer paint thinners and multi-purpose solvent products offered for sale and use within the Basin. Rule 1143 limits the VOC content in a two tier approach for products sold to consumers and these VOC limits apply to suppliers, distributors and retailers of consumer paint thinners and multi-purpose solvents. No public comments pertaining to artist solvents and thinners were received by staff during this nine-month rulemaking process.

On April 1, 2009, W.M. Barr filed a petition for writ of mandate and declaratory relief, challenging Rule 1143, primarily based on alleged inadequacies of the environmental assessment, including its analysis of safety issues, regarding the increased flammability as a result of compliant formulations that use acetone as an exempt solvent.

On September 24, 2009, CARB amended the Consumer Products Regulations (CPR), with virtually the same VOC limits for consumer paint thinners and multi-purpose solvents, but with implementation dates of January 1, 2011 for the interim VOC limit and January 1, 2014 for the final VOC limit. Additionally, CARB also included other provisions with statewide applicability, including the limitation of aromatic content, prohibition of the use of trichloroethylene, and limiting the use of products that exceed the 150 Global Warming Potential

[1] See http://www.arb.ca.gov/consprod/geninfo/cpsmog.htm
[2] This estimate does not reflect additional VOC reductions proposed by CARB
[3] See Final 2007 Air Quality Management Plan, Chapter 3

("GWP"). CARB also included a sell-through provision for 3 years and when combined with implementation dates, the 30% by weight VOC limit will not be fully implemented until January 1, 2014 and the 3% by weight VOC limit will not be fully implemented until January 1, 2017. CARB also provided language in their CPR to exempt artist solvents and thinners provided they were sold in containers with a capacity of 32 fluid ounces (one quart) or less and they were properly labeled to meet the labeling requirements as specified in ASTM D4236-94 (Reapproved 2005).

On December 7, 2009, the court upheld the AQMD's environmental assessment except on the flammability issue. Subsequently, the AQMD filed a motion to limit the court's remedy.

On April 1, 2010, the AQMD's motion was granted in part, but the judgment and writ required the AQMD to vacate the final VOC limits of the 25 g/L VOC limit, and prepare an Environmental Assessment (EA) that considers the fire hazard issue.

On June 4, 2010, the AQMD Governing Board amended Rule 1143 to comply with the court's decision by rescinding the final 25 g/L VOC limit. The rescinding of the final 25 g/L VOC limit resulted in foregoing 3.81 tons per day of VOC emission reductions.

On July 9, 2010, Rule 1143 was amended to readopt the final 25 g/L VOC limit, effective January 1, 2011, and recover the foregone 3.81 tpd of VOC emissions. In addition, a supplemental environmental assessment was completed that focused only on the fire hazard issue, as directed by the court.

During the latter part of the July 2010 rule amendment process, staff received comments regarding the need for an exemption relative to the solvents and thinners used by artists. On July 9, 2010, during the public hearing for the rule, staff committed to explore and evaluate the request and come back with an amendment prior to the end of the year, if necessary. Staff recognizes that Rule 1143 currently does not take into consideration the artist materials industry. Artist solvents and thinners specifically manufactured for artists have been formulated, refined and purified to eliminate impurities specifically for artist applications. These niche products do not fall into the general category of consumer paint thinners and multi-purpose solvents used for architectural coating thinning and clean-up.

On September 15, 2010, a public workshop for this project was held where CARB staff stated, in their discussions, that they would be changing their Consumer Product Regulation language to exempt Artist's Solvents/Thinners sold in containers with a capacity of 34 fluid ounces to accommodate 1 liter containers.

IV. AFFECTED FACILITIES

Artist solvents and thinners have been formulated and refined to eliminate impurities from paint thinners and solvents specifically for artist applications, and do not fall into the general category of consumer paint thinners and multi-purpose solvents. AQMD staff has worked with CARB in

regard to consumer paint thinners and multi-purpose solvents and is aware that CARB surveyed artist solvents and thinners during their 2006 Consumer and Commercial Products Survey (ARB 2007f)[4]. CARB found the emissions from the artist solvents and thinners category had a minuscule effect on VOC reductions. In fact, CARB estimated that consumer artist solvent and thinner products in the state of California accounted for approximately 252.7 pounds per day (ppd) of VOC emissions. Approximately forty-five percent (45%) of that estimate or 114 (113.7) ppd of VOC emissions can be attributed to the Basin. CARB also found that artist solvents and thinners are required to meet the Labeling of Hazardous Art Materials Act (LHAMA) within the Federal Hazardous Substances Act which requires that any art material, including solvents, must meet the requirements in ASTM D4236-94 (Reapproved 2005), the standard Practice for Labeling Art Materials for Chronic Health Hazards, to protect consumers of any age from potential health hazards of these products. CARB exempted the artist solvents and thinners, which they call "Artist's Solvents/Thinners[5]," from the requirements of their CPR, provided said products are labeled to meet ASTM D4236-94 (Reapproved 2005) and packaged in containers with a capacity of 32 fluid ounces or less. At a subsequent public workshop for this project that was held on September 15, 2010, CARB staff stated in those discussions that they would be changing their Consumer Product Regulation language to exempt Artist's Solvents/Thinners sold in containers with a capacity of 32 fluid ounces to accommodate 1 liter containers. On September 29, 2010, CARB posted a proposed modification to their definition of Artist's Solvent/Thinner to replace the 32 (fluid) ounce container capacity limit with a 34 (fluid) ounce container capacity limit which will include 1 liter containers (1 liter = 33.8 fluid ounces).

There are approximately 19 manufacturers of artist solvents and thinners products exclusively for the artist industry. The artist industry also includes support organizations and AQMD staff has had several discussions and correspondences with both the Artist Creative Materials Institute (ACMI) and the National Art Materials and Trade Association (NAMTA) to further understand their specific uses. Artist solvents and thinners are typically sold through hobby, craft, and art material store outlets and through internet sales.

V. DISCUSSION OF TECHNOLOGY TYPES FOR ARTIST SOLVENTS AND THINNERS

Artist solvents and thinners are manufactured specifically for a variety of art-related uses; the most common is oil on canvas painting. Although there are products with a VOC content less than 25 g/L available and in use for consumer paint thinners and multi-purpose solvents, those may not be sufficient replacements for the currently used artist-related materials including turpentine, mineral spirits, odorless mineral spirits, and artist mediums. To meet the VOC limits in Rule 1143, consumer paint thinners and multi-purpose solvents have been reformulated using the following technologies: 1) Aqueous technology which includes formulations made from water, detergents, chelating agents, alkaline builders and various blends of surfactants and is typically used for multi-purpose cleaning agents; 2) Exempt solvents including acetone, PCBTF, and methyl acetate, as well as blends of the three; and; 3) Bio-based technology including methyl

[4] CARB, 2006 Consumer and Commercial Products Survey, 2009, http://www.arb.ca.gov/consprod/regact/2006surv/2006surv.htm
[5] CARB, Consumer Products Regulations, August 7, 2009, http://www.arb.ca.gov/regact/2009/cpmthd310/cpmthdisor.pdf

esters is currently available for a variety of uses, including lowering the volatility of exempt solvents. The artist solvents and thinners are used specifically for arts and crafts and are broken down into the following solvent and thinner variants.

Turpentine

Turpentine is the traditional solvent that is manufactured from tree resins and has been used for oil on canvas painting for many years. Artist quality turpentines are further refined to remove the impurities commonly found in products sold at hardware stores for general consumer use. Turpentine is also known as Spirit of Turpentine, Oil of Turpentine, Genuine Turpentine, English Turpentine, Distilled Turpentine, Double Rectified Turpentine, and simply "Turps".

Mineral Spirits

Mineral Spirits are a commonly used solvent that are manufactured from petroleum products. Mineral Spirits are generally less expensive than turpentine and are a stronger solvent than Odorless Mineral Spirits. Mineral Spirits are used to reduce the viscosity of various acrylic resins to a range needed for application. Mineral Spirits are also used to remove (resolubilize) the varnish in case the artist is unhappy with the outcome of the painting and can be used for periodic cleaning or restoration of the work. Mineral Spirits are also known as White Spirits.

Odorless Mineral Spirits

Odorless Mineral Spirits are also a commonly used solvent that is manufactured from petroleum products. Odorless Mineral Spirits are marginally more expensive than Mineral Spirits but have been manufactured with less of the harmful aromatic solvents found in Mineral Spirits. As in the case of Mineral Spirits, Odorless Mineral Spirits are used to reduce the viscosity of various acrylic resins to a range needed for application. Odorless Mineral Spirits are also used to remove (resolubilize) the varnish in case the artist is unhappy with the outcome of the painting and can be used for periodic cleaning or restoration of the work.

Citrus-Based Thinners

Citrus-based thinners are manufactured from food-grade and technical-grade citrus oils and are nontoxic, nonflammable solvents that are used in some arts and crafts applications. The major component used in citrus-based thinners is d-Limonene, which is the oil extracted from citrus and citrus peels. The oil separated from the juice after the juicing process is the food-grade d-Limonene and the citrus peels that are sent to a steam extractor to extract the oil from the peel becomes the technical-grade d-Limonene. In Technical-grade d-Limonene, the oil is collected after the steam is condensed by capturing the layer of oil floating on the surface of the condensed water. D-Limonene is known to have more than 95% per volume of VOC.

Artist Mediums

Artist mediums are used to modify artist oil paint straight from the tube. The mediums can be used to lengthen the drying time of the paint, make it thinner, or alter the character of the paint from what comes out of the tube. Mediums can also be used to make the paint transparent or opaque and can also be used to alter gloss or matte sheen of the paint. Mediums are used for oil on canvas paintings to influence the color of a pigment.

Brush Cleaners

The most common application technique for an artist using paint is simply to apply the paint with a paint brush. There are several artist brush cleaners that are currently available to clean artist paint brushes after they were used to apply oil-based paint. Artist paint brush bristles are made from animal hair such as hog's bristles, mongoose hair, red sable (weasel hair), and Siberian mink. The hair possesses several important properties for the artist such as maintaining a superfine point, smooth handling, and good memory (where the bristles return to their original point between brush strokes). There are also synthetic brushes available which can offer durability and cost effectiveness. The artist brush cleaners have been formulated specifically for these types of paint brushes.

VI. ARTIST INDUSTRY'S CONCERNS

Staff had a meeting with several members from the artist industry to hear their concerns with Rule 1143 and the need for an exemption for artist solvents and thinners. One of the major concerns is the ability to continue the use of artist solvents and thinners which are specifically formulated, refined, and purified to eliminate impurities for artist applications. Antique oil paintings normally found in the museums are restored by using specially formulated artist solvents designed specifically for painting restoration. These antique paintings are protected by a coating of varnish, however, the varnish ages and must be removed before a new coat of varnish can be applied. This requires specialty artist solvents that will remove the varnish but will not attack the original painting oils. Other artist uses include using turpentine, tinted with paint, to make the special layering effects on an oil painting. Turpentine is also used for dissolving Damar varnish which is an essential solvent for an artist. The Damar resin will only dissolve in Gum Turpentine. The other main concern from the artist industry is that artists use handmade brushes that can cost $50 to $150 per brush. The brush is cleaned with turpentine and then oil, typically vegetable oil, is used to preserve the brush while it's not in use. The brush is cleaned with turpentine to clean the hairs of the oil before it is used again. The artist industry contends that an artist oil painting brush cannot be cleaned using soap and water mainly due to the oil paint chemistry and the soap will dry out the hairs. Cleaning a paint brush using mechanical means will cause the brush hairs to break.

VII. OVERVIEW: PROPOSED AMENDMENT TO RULE

Staff is proposing an amendment to the rule that would provide an exemption for artist solvents and thinners from the VOC requirements set forth in the rule. Staff believes this provision is necessary because artist solvent and thinner products are designed to be used with specific-to-artist solvent-borne paints, and successful low-VOC technology is currently unavailable.

AQMD staff researched the costs of artist solvents and thinners and compared them to equivalent products sold at home improvement, paint and hardware stores. AQMD staff found that for a common quart size, the artist products cost 67.6% more than the general use consumer paint thinners and multi-purpose solvents, whereas for the gallon size, the artist products cost 54.1% more than the general use consumer paint thinners and multi-purpose solvents. CARB exempted the artist solvents and thinners, which they call "Artist's Solvents/Thinners," from their CPR

provided that they are labeled to meet ASTM D4236-94 (Reapproved 2005) and packaged in containers with a capacity less than or equal to 32 fluid ounces (the language in their CPR is expected to change the 32 fluid ounces maximum capacity to accommodate 1 liter maximum capacity).

Staff is proposing a new definition to be added to Rule 1143 for "ARTIST SOLVENTS/THINNERS." This amendment proposes to exclude artist solvents and thinners that meet the above mentioned criteria from adhering to the VOC requirements set forth in the rule for Consumer Paint Thinners & Multi-Purpose Solvents.

Staff is proposing to make changes to the rule that will clarify that recordkeeping and reporting requirements are applicable for the following exempted products:

- Solvents provided that they are labeled and designated exclusively for the clean-up of polyaspartic and polyurea coatings application equipment
- Thinners, provided that they are labeled and designated exclusively for the thinning of Industrial Maintenance coatings, Zinc-Rich IM Primers, and High Temperature Coatings
- Artist solvents and thinners, provided that they are labeled and designated exclusively to reduce the viscosity of, or remove, art coating compositions or components and are individually packaged in containers having a total capacity equal to or less than 1 liter.

AQMD staff believes that these measures will discourage possible circumvention by non-exempted product users and will allow staff to monitor and assess if use of these exempt products has substantially increased, which could imply that they are being purchased for non-labeled non-compliant uses.

Staff is also proposing to clarify that any consumer paint thinner or multi-purpose solvent that is manufactured prior to the effective date, of the applicable limit specified in paragraph (d)(1) in the rule, and that has a VOC content above that limit (but not above the limit in effect on the date of manufacture) may be sold, supplied, offered for sale, or used for up to one year after the specified effective date.

Therefore, staff is proposing to amend Rule 1143 by:

- Exempting artist solvents and thinners that are properly labeled and sold in containers that are one liter or less from applicable VOC limits
- Defining artist solvents and thinners
- Making changes to the rule to clarify that all exempt products shall be subject to recordkeeping and reporting requirements
- Making changes to the rule to clarify that the sell-through provisions for the final VOC limit do not apply to products that do not meet the interim VOC limit

VIII. EMISSION IMPACTS

Rule 1143 was developed to have two different VOC limit reductions. The interim limit, currently in effect, as of January 1, 2010, limits any consumer paint thinner and multi-purpose solvent to 300 g/L VOC but offers a sell-through provision up to December 31, 2010 to allow sales and use of high-VOC traditional solvents provided they were manufactured prior to January 1, 2010. When fully implemented, the interim reduction limit will reduce VOC emissions by 5.94 tons per day. The second reduction, the final limit, will commence on January 1, 2011 and the VOC limit will be reduced to 25 g/L. In addition, any consumer paint thinner and multi-purpose solvent manufactured prior to January 1, 2011 will have a one-year sell-through allowance for products containing up to 300 g/L VOC. Furthermore, any consumer paint thinner and consumer multi-purpose solvent that exceeds 300 g/L VOC but also displays multiple uses on the container label including the thinning of industrial maintenance coatings and was manufactured prior to July 9, 2010, will be allowed a sell-through until April 1, 2011. When fully implemented, the 25 g/L VOC limit will reduce VOC emissions by another 3.81 tons per day thus resulting in a composite VOC emissions reduction of 9.75 tons per day. To recap, CARB's 2006 Consumer and Commercial Products Survey found that the statewide VOC emissions contribution for artist solvent and thinners was 252.7 pounds per day. AQMD staff uses a 45% factor of the statewide emissions inventory based on population distribution to determine the South Coast AQMD jurisdiction emissions contribution,

*252.7 lbs/day * 0.45 = 113.7 lbs/day;*

*113.7 lbs/day * 1 ton/2000 lbs = 0.057 tons per day*

Thus, the emissions foregone in the South Coast AQMD jurisdiction will be 113.7 lbs/day and is summarized in Table VIII-1 below.

TABLE VIII-1: BREAKDOWN OF EMISSIONS

INVENTORY DESCRIPTION	VOC EMISSIONS (tpd)
Rule 1143 Interim VOC Limit (300 g/L)	5.94
Rule 1143 Final VOC Limit (25 g/L)	3.81
Total Existing Emission Reductions Applied to Rule1143	**9.75**
Artist Solvent/Thinner Exemption	-0.057
Total Emission Reduction Applied to Rule 1143	**9.69**

The proposed amendments would result in an increase of 0.62% of VOC emissions foregone.

(9.75 tpd – 9.69 tpd)/9.75 tpd = 0.0062 = 0.62%

IX. COST ANALYSIS

PAR1143 results in a cost savings to the industry, since they will be able to continue business as usual.

X. INCREMENTAL COST-EFFECTIVENESS

Under Health and Safety Code § 40920.6, the AQMD is required to perform an incremental cost analysis when adopting a Best Available Retrofit Control Technology (BARCT) rule or feasible measure required by the California Clean Air Act. To perform this analysis, the AQMD must (1) identify one or more control options achieving the emission reduction objectives for the proposed rule, (2) determine the cost effectiveness for each option, and (3) calculate the incremental cost effectiveness for each option. To determine incremental costs, the AQMD must "calculate the difference in the dollar costs divided by the difference in the emission reduction potentials between each progressively more stringent potential control option as compared to the next less expensive control option."

The proposed amendments to Rule 1143 do not implement a more restrictive BARCT or feasible control measure, and therefore § 40920.6 is inapplicable.

XI. CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

Pursuant to California Environmental Quality Act (CEQA) and AQMD Rule 110, the AQMD staff has prepared a Draft Environmental Assessment (EA) and circulated it for a 45-day public review and comment period from September 30, 2010 to November 16, 2010. The only topic identified in the Draft EA that may be adversely affected by the proposed project is air quality. Comments on the Draft EA received within the public comment period will be included with response to comments in the Final EA. Copies of the Draft EA are available at AQMD Headquarters, by calling the AQMD Public Information Center at (909) 396-2039, or by accessing AQMD's CEQA website at: www.aqmd.gov/ceqa.

XII. SOCIOECONOMIC ASSESSMENT

PAR 1143 allows for an artist solvents and thinners exemption that provides regulatory relief because low-VOC artist solvents and thinners are currently not available on the market. Therefore, no socioeconomic impacts are anticipated from this proposal.

XIII. DRAFT FINDINGS

Health and Safety Code § 40727 requires that prior to adopting, amending or repealing a rule or regulation, the AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the hearing. The draft findings are as follows:

Necessity – The proposed amendment to Rule 1143 is necessary to allow the availability and use of certain types of solvents and thinners that are of vital importance to the artist industry. In addition, an exemption for artist solvents and thinners is required since no low-VOC alternatives have been identified for this niche category.

Authority - The AQMD Governing Board obtains its authority to adopt, amend, or repeal rules and regulations from Health and Safety Code §§ 39002, 40000, 40001, 40440, 40441, 40702, 41508, and 41700.

Clarity - The AQMD Governing Board has determined that Proposed Amended Rule 1143 - Consumer Paint Thinners & Multi-purpose Solvents, is written and displayed so that the meaning can be easily understood by persons directly affected by it.

Consistency - The AQMD Governing Board has determined that Proposed Amended Rule 1143 - Consumer Paint Thinners & Multi-purpose Solvents, is in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, federal or state regulations.

Non-Duplication - The AQMD Governing Board has determined that Proposed Amended Rule 1143 - Consumer Paint Thinners & Multi-purpose Solvents, does not impose the same requirement as any existing state or federal regulation, and the proposed amendments are necessary and proper to execute the powers and duties granted to, and imposed upon, the AQMD.

Reference - In adopting this regulation, the AQMD Governing Board references the following statutes which the AQMD hereby implements, interprets or makes specific: California Health and Safety Code §§ 40001, 40440, and 40702.

XIV. COMPARATIVE ANALYSIS

Health and Safety Code Section 40727.2

As required by Health and Safety Code § 40727.2, the purpose of this analysis is to identify and compare any other AQMD, state, or federal regulations that apply to the same equipment or source type contained in this rule proposal. Staff identified one regulation authored by the California Air Resources Board (CARB) that shares regulatory language with AQMD's Proposed Amended Rule (PAR) 1143 – Consumer Paint Thinners and Multi-Purpose Solvents. CARB's Consumer Products Regulations (CPR) is a multi-faceted regulation that regulates the consumer product industry including standards for multi-purpose solvents and paint thinners. Staff has worked extensively with CARB to make PAR 1143 as consistent as possible with CARB's CPR. This amendment seeks to further align AQMD's PAR 1143 with CARB's CPR by proposing an amendment to include an Artist Solvents/Thinners exemption that are properly labeled and sold in containers that are one liter or less from applicable VOC limits and to clarify that all exempt products shall be subject to recordkeeping and reporting.

Affected sources under CARB's CPR include multiple categories of consumer products, including multi-purpose solvents and paint thinners. The proposed amendment to PAR 1143 will result in minor VOC emissions foregone but do not affect existing VOC limits. Therefore, PAR 1143 does not impose a new emission limit or standard, make an existing emission limit or standard more stringent, or impose new or more stringent monitoring, reporting or recordkeeping requirements [See California Health & Safety Code § 40727.2(g)].

Table XIV.1 immediately follows and shows a comparative analysis between AQMD PAR 1143 and CARB's CPR, for the multi-purpose and paint thinners categories only.

TABLE XIV-1: COMPARISON OF AQMD PAR 1143 TO CARB'S CPR

CATEGORY	SCAQMD PAR 1143 Consumer Paint Thinners & Multi-Purpose Solvents	CARB Consumer Products Regulations Sections: 94508, 94509, 94510, 94512, 94513, and 94515
Adoption Date	March 9, 2009	August 6, 2010
Purpose	Reduce VOC emissions from the use, storage and disposal of consumer paint thinners & multi-purpose solvents commonly used in thinning of coating materials, cleaning of application equipment, or other solvent cleaning operations by limiting their VOC content	Reduce VOC emissions for a wide variety of consumer products including multi-purpose solvent and paint thinner products which will partially fulfill the consumer product reduction commitment contained in the State Strategy for California's 2007 SIP
Applicability (to whom)	Rule 1143 applies to any person who sells, offers for sale, or manufactures, or any person who uses or solicits the use of any consumer paint thinners & multi-purpose solvents in the District	Except as provided in Sections 94509(i) and 95510, this article shall apply to any person who sells, supplies, offers for sale, or manufactures consumer products for use in the State of California.
Applicability (jurisdiction)	South Coast Air Quality Management District Jurisdiction **Statewide Provisions:** SCAQMD will recognize the statewide provisions set forth in the CPR, see "Other Elements" under General Prohibitions, shown in the CARB column, for details	Applicable in all areas of California outside the South Coast Air Quality Management District **Statewide Provisions:** See "Other Elements" under General Prohibitions for details
Averaging Provisions	Not Applicable	Not Applicable
Units	**VOC Limit (Unit: Mass/Volume):** Grams/Liter (g/L) or Pounds/Gallon (lb/G) Tier 1 – 300 g/L (2.50 lb/Gal), {Eff 1/1/10} Tier 2 – 25 g/L (0.21 lb/Gal), {Eff 1/1/11}	**VOC Limit (Unit: %/Wt.):** Percent by Weight VOC Determination Tier 1 – 30% by weight, {Eff 12/31/10} Tier 2 – 3% by weight, {Eff 12/31/13}
Operating Parameters	See Work Practices	See Work Practices
Work Practices	Any solvent container subject to the rule shall be closed when not in use. Solvent containers include: drums, buckets, cans, pails, trays or other application containers	No work practices cited in CPR
Method to Determine VOC	U.S.EPA Method 24 – or – SCAQMD Method 304	CARB Method 310
Monitoring	Not Applicable	Not Applicable

TABLE XIV-1: COMPARISON OF AQMD PAR 1143 TO CARB'S CPR, continued

CATEGORY	SCAQMD PAR 1143 Consumer Paint Thinners & Multi-Purpose Solvents	CARB Consumer Products Regulations Sections: 94508, 94509, 94510, 94512, 94513, and 94515
Reporting	All manufacturers and distributors subject to the rule shall report annually, a list of all their US distributors and on April 1 and each subsequent year thereafter, submit an Annual Quantity and Emissions Report. Proposed Amended Rule 1143 will clarify that all exempt products shall be subject to recordkeeping and reporting requirements	All responsible parties for multi-purpose solvent and paint thinner products shall report data regarding product sales and composition for the year 2011. Additional reporting requirements for Consumer Products that contain perchloroethylene or methylene chloride
Recordkeeping	On or before April 1, 2010 and each subsequent April each manufacturer subject to the rule shall maintain records for 5 years and such records shall be made available to the Executive Officer upon request **Records to include:** Product Formulation Records, Production Records, Distribution Records and Sales Records	On or before June 30, 2012, all responsible parties for multi-purpose solvent and paint thinner products shall submit reports to the Executive Officer **Records to include:** Company name, product name, category, product label, applicable product forms, and California sales

TABLE XIV-1: CONTINUES ON NEXT PAGE

TABLE XIV-1: COMPARISON OF AQMD PAR 1143 TO CARB'S CPR, continued

CATEGORY	SCAQMD PAR 1143 Consumer Paint Thinners & Multi-Purpose Solvents	CARB Consumer Products Regulations Sections: 94508, 94509, 94510, 94512, 94513, and 94515
Exemptions	**General Exemptions:** None	**General Exemptions:** Until December 31, 2013, the VOC limits and the prohibition of Aromatic Compounds shall not apply to paint thinners with a capacity less than or equal to 8 fluid ounces
	VOC Limit Exemptions: Solvents provided that they are labeled and designated exclusively for the clean-up of polyaspartic and polyurea coatings application equipment	**VOC Limit Exemptions:** The CPR does not have a specific exemption for the clean-up of application equipment used for polyaspartic or polyurea coatings however, the definition for Multi-purpose Solvent, paragraph B, has language that states "Multi-purpose solvent does not include solvents used exclusively for the clean-up of polyaspartic and polyurea coatings"
	Thinners provided that they are labeled and designated exclusively for the thinning of Industrial Maintenance (IM) coatings, Zinc-Rich IM primers, and High Temperature IM coatings	The CPR does not have a specific exemption for the thinning of Industrial Maintenance (IM) coatings however, the definition for Paint Thinners has language the states "products that are sold in containers of 5 gallons or more and labeled exclusively for the thinning of Industrial Maintenance Coatings, Zinc-Rich Primers, or High Temperature Coatings" are not included in the definition of "Paint Thinner"
	Artist solvents/thinners provided that they meet and are labeled to meet ASTM D4236-94 and designated exclusively to reduce the viscosity of, or remove, art coating compositions or components and are individually packaged in containers having a total capacity equal to or less than 1 liter	Artist's Solvent/Thinner provided they are labeled to meet ASTM D4236-95 (sic) and packaged in a container equal to or less than 32 fluid ounces (CARB has submitted an amendment to the CPR to increase the capacity to 34 fluid ounces)
	No Small Container Exemption	Temporary exemption for paint thinners sold and packaged in small containers less than or equal to 8 fluid ounces until December 31, 2013
	No Low-Vapor Pressure Provision in Proposed Amended Rule 1143	The VOC limits shall not apply to any Low–Vapor Pressure VOC

TABLE XIV-1: COMPARISON OF AQMD PAR 1143 TO CARB'S CPR, continued

CATEGORY	SCAQMD PAR 1143 Consumer Paint Thinners & Multi-Purpose Solvents	CARB Consumer Products Regulations Sections: 94508, 94509, 94510, 94512, 94513, and 94515
Other Elements	General Prohibition: No person shall supply, sell, offer for sale, manufacture, blend, package, or repackage any Consumer Paint Thinners & Multi-Purpose Solvents subject to Rule 1143 that contain in the excess of 0.1% by weight any Group II exempt compounds listed in Rule 102. Cyclic, branched, or linear methylated siloxanes (VMS) are not subject to this prohibition SCAQMD will recognize the statewide provisions set forth in the CPR, see adjacent column	General Prohibition: The CPR has state-wide requirements that will be effective on December 31, 2010, when no person shall sell, supply, offer for sale, or manufacture for use in California any multi-purpose solvent or paint thinning that contains: Chemical compounds that have a Global Warming Potential (GWP) Value of 150 or greater Methylene Chloride, Perchloroethylene, or trichloroethylene Greater than 1% "Aromatic Compounds" by weight
	Sell-through Provision: Tier 1 – One year (until January 1, 2011), allows sale and use of high–VOC solvents and thinners if manufactured prior to January 1, 2010 Tier 2 – One year (until January 1, 2012), allows sale and use of solvents and thinners that have more than 25 g/L VOC but less than 300 g/L VOC if manufactured prior to January 1, 2011 An additional sell-through provision for consumer paint thinners manufactured prior to July 9, 2010 and labeled for more than one use including industrial maintenance coating thinning, may be sold, supplied, offered for sale, or used up to April 1, 2011	Sell-through Provision: Tier 1 – Three years (until December 31, 2013, allows sale and use of high-VOC solvents and thinners if manufactured prior to December 31, 2010 Tier 2 – Three years (until December 31, 2016, allows sale and use of solvents and thinners that have more than 3 percent by weight VOC but less than 30 g/L percent by weight VOC if manufactured prior to December 31, 2013 Multi-purpose solvents and paint thinners that contain any chemical compound that has a GWP Value of 150 or greater; methylene chloride, perchloroethylene, or trichloroethylene; or greater than 1% aromatic compounds by weight and were manufactured before December 31, 2010, may be sold, supplied, or offered for sale until December 31, 2013

XV. DRAFT CONCLUSIONS AND RECOMMENDATIONS

Staff recommends that Rule 1143 be amended as proposed to align the artist solvents and thinners exemption with CARB's CPR.

XVI. PUBLIC COMMENTS AND RESPONSES

This section presents the comment letter that was received after the Wednesday, September 15, 2010 public workshop. The comment letter shows the paragraphs numbered which will correlate to staff responses following the reproduction of the comment letter. The public commenting period started on September 15, 2010 and continued up to the deadline September 24, 2010.

The following comment letter was received on September 24, 2010 from Charles H. Pomeroy, Partner with McKenna Long and Aldridge, Attorneys at Law, LLP, representing ACMI, the Art & Creative Materials Institute. The letter also included an attachment of a reproduced printed version of ASTM D4236-94 (Reapproved 2005) which is not reproduced in this report due to copyright laws.

Re: Public Workshop: Proposed Rule 1143 Rulemaking for Artists

Dear Mr. Hopps:

Again, my client, the Art & Creative Materials Institute ("ACMI"), wishes to thank you and SCAQMD for holding the September 15, 2010 Public Workshop concerning the proposed amendment of Rule 1143 exempting Artist Solvent/Thinner. As we heard, you believe this amendment will be presented to the SCAQMD Governing Board on December 3rd. ACMI fully endorses the proposed amendment to Rule 1143. We concur with SCAQMD's position that the Rule 1143 modification remain consistent with the language provided by the California Air Resources Board ("CARB") definition of Artist's Solvent/Thinner in its Consumer Product Regulation. We further present this letter in support of the proposed amendment and also to confirm and clarify two issues discussed during the Workshop. **1-1**

Following the SCAQMD Workshop presentation, representatives present from the coatings industry raised a concern regarding potential circumvention of the recently amended Rule 1143 through use of the proposed artist's exemption. One company representative specifically raised the question whether other companies could go through the D4236-94 testing and thereafter sell the product at Home Depot, Lowes or other large commercial hardware stores. In response, both CARB and SCAQMD suggested the container size and cost would preclude use by non-artists of the solvents. CARB also stated that it would be monitoring sales to determine if circumvention was occurring (and would modify the rule in the future if needed).

We agree with the statements made by SCAQMD and CARB, but also believe the proposed Artist Solvent/Thinner definition offers additional protection against **1-2**

LA:17767484.1

circumvention. The D4236-94 protocol that is part of both the proposed Rule 1143 amendment and CARB rule (available on the CARB website and attached hereto), is a labeling practice for chronic health hazards limited to art materials sold exclusively for artist use. *See* D4236-94, sections 2.1.2 and 2.1.12. With this designated labeling, a product sold in a commercial hardware store would have to be sold solely for the purpose of artistic use. Presently, the large retail chains, such as Home Depot and Lowes, do not have an area designated for artistic products. Generally, it would appear unusual for a large commercial hardware store to identify exclusive shelf space for artistic products, which are inconsistent with the company business (i.e., home repair and improvement). Further, to meet D4236-94 and thus be specially identified for artistic use, the product presence at a commercial hardware store should be readily identifiable, thus permitting both SCAQMD and CARB a means to effectively monitor sales. Finally, artists are unlikely to purchase artist solvent at commercial hardware stores since specialty art stores are their traditional source and the quality of the product would potentially be less trustworthy (even if it came with D4236-94 labeling). Thus, the consumer artist acquiring D4236-94-labeled products is unlikely to buy these products at a hardware store, thereby reducing the economic incentive to stock a product that is unlikely to be purchased by the targeted consumer.

1-2

A second issue also discussed at the Workshop concerned the recent ACMI submission to CARB requesting that CARB's Artist's Solvent/Thinner definition be modified to allow for a maximum one liter container rather than a 32 ounce limit. Industry representatives present at the Workshop expressed support with ACMI's proposal, stating that the metric system conversion was consistent with their current business development and noting that the metric system was already used in Rule 1143 for the measurement of VOCs (i.e., grams per liter). Based on the general discussion, we understand that both CARB and the District support the change to a maximum one liter size (or perhaps 34 ounces to accommodate the one liter volume). We appreciate that support and await the final revised language for both CARB and SCAQMD.

1-3

On behalf of ACMI, I wish to thank you again for the opportunity to participate in this important subject. Please contact me should you require further information.

Sincerely,

Charles H. Pomeroy

Response to Comment #1-1

Staff agrees with the comment that an Artist Solvent/Thinner exemption should be included in Rule 1143 but with the criteria of a size requirement, where any individual packaged container having a total capacity less than or equal to 1 liter and is labeled and designated exclusively to reduce the viscosity of, or remove, art coating compositions or components, and meets and is labeled to meet the requirements of ASTM D4236-94 (Reapproved 2005) the Standard Practice for Labeling Art Materials for Chronic Health Hazards. Staff has worked extensively with CARB staff to make the proposed rule language for the Artist Solvents/Thinners as consistent as possible with the language in their Consumer Products Regulation.

Response to Comment #1-2

Staff recalls the comment made during the public workshop regarding potential circumvention of the proposed rule language for Artist Solvents/Thinners and that non-artist companies could go through the ASTM D4236-94 testing and thereafter sell the products at home improvement stores such as Home Depot, Lowes, and other commercial hardware stores. The comment also points out that CARB and AQMD staff both commented at the public workshop that the container size of less than 1 liter and cost of the product would preclude use by the non-artists of the solvents. Staff has had discussions with CARB and was informed that solvents and thinners manufactured exclusively for artists can cost 4 to 5 times the price a similar size (capacity) product commonly found at a Home Depot would cost. Staff verified these costs and found that for a common quart size, the artist products cost 67.6% more than the general use consumer paint thinners and multi-purpose solvents commonly found in Home Depot, Lowes, and other commercial hardware stores, whereas for the gallon size, the artist products cost 54.1% more than the general use consumer paint thinners and multi-purpose solvents. Staff believes that these higher costs, even though much lower than CARB's estimates, and the 1 liter or less capacity requirement, will discourage circumvention by solvent and thinner users that do not use these types of products for non-artistic uses. Further, staff has reinforced the proposed definition by adding the following: "*Artist Solvents/Thinners do not include commercial-grade solvents or thinners*". Finally, staff believes that monitoring sales trends would be a viable tool to detect circumvention. Staff has revised the rule language in Rule 1143 to exempt Artist Solvents/Thinners from the VOC requirements in paragraph (d)(1). This clarification will require recordkeeping for all manufacturing and distribution facilities, artist and non-artist, as described in the rule, which will provide AQMD with data to monitor the sales trends for Artist Solvents/Thinners, in addition to the other exempt products in the rule that are labeled and designated exclusively for the clean-up of polyaspartic and polyurea coatings, and thinners that are labeled and designated exclusively for the thinning of Industrial Maintenance coatings, zinc-rich primers, and high temperature coatings. AQMD believes that all of these measures will discourage circumvention and allow staff to monitor and assess whether the exempt solvents are possibly being used improperly.

Staff also agrees with the comment that ASTM D4236-94 does indeed have language in sections 2.1.2 and 2.1.12 where section 1.2 of the ASTM states "*This practice applies exclusively to art materials packaged in sizes intended for individual users of any age or those participating in a small group.*" This language in ASTM D4236-94 and the language in proposed Rule 1143 paragraph (c)(1) both have language to require solvents and thinners that will be used for artist use shall be labeled and meet the requirements in ASTM D4236-94.

Response to Comment #1-3

Staff agrees. Staff has revised the proposed rule language and replaced 32 fluid ounces with 1 liter. The new language will read "Artist solvents/thinners provided that they are labeled and designated exclusively to reduce the viscosity of, or remove, art coating compositions or components and are individually packaged in containers having a total capacity equal to or less than 1 liter."

(Proposed Amended Rule December 2010)

RULE 1143. CONSUMER PAINT THINNERS & MULTI-PURPOSE SOLVENTS

(a) Purpose

The purpose of this rule is to reduce emissions of volatile organic compounds (VOCs) from the use, storage and disposal of consumer paint thinners and multi-purpose solvents commonly used in thinning of coating materials, cleaning of coating application equipment, and other solvent cleaning operations by limiting their VOC content.

(b) Applicability

This rule is applicable to any person who supplies, sells, offers for sale, or manufactures consumer paint thinners and multi-purpose solvents for sale in the District, as well as any person who uses or solicits the use of any consumer paint thinner and multi-purpose solvent within the District.

(c) Definitions

For the purpose of this rule, the following definitions shall apply:

(1) ARTIST SOLVENTS/THINNERS are any liquid products that meet and are labeled to meet the requirements of ASTM D4236-94 (Reapproved 2005) Standard Practice for Labeling Art Materials for Chronic Health Hazards, which is incorporated by reference herein, and have been refined to remove impurities for artistic use for the purpose of reducing the viscosity of, or removing, art coating compositions or components. Artist Solvents/Thinners do not include commercial-grade solvents or thinners.

(2) CONSUMER MULTI-PURPOSE SOLVENTS are any liquid products designed or labeled to be used for dispersing or dissolving or removing contaminants or other organic materials for personal, family, household, or institutional use including but not limited to the following: (1) products that do not display specific use instructions on the product container or packaging, (2) products that do not specify an end-use function or application on the product container or packaging, (3) solvents used in institutional facilities, except for laboratory reagents used in analytical, educational, research, scientific or other laboratories, (4) “Paint clean-up” products, and (5) products labeled to prepare surfaces for painting. For the purpose of this definition only, “Paint clean-up” means any liquid product labeled

for cleaning oil-based or water-based paint, lacquer, varnish, or related coatings from, but not limited to, painting equipment or tools, plastics or metals.

"Consumer Multi-purpose Solvents" do not include solvents used in cold cleaners, vapor degreasers, conveyorized degreasers or film cleaning machines, or solvents that are incorporated into, or used exclusively in the manufacture or construction of, the goods or commodities at the site of the establishment. "Multi-purpose Solvents" also do not include any products making any representation that the product may be used as, or is suitable for use as a consumer product which qualifies under another definition in California Code of Regulations Title 17, § 94508 as of the date of adoption.

(3) CONSUMER PAINT THINNERS are any liquid products used for reducing the viscosity of coating compositions or components for personal, family, household, or institutional use, including, but not limited to, products that prominently display the term "Paint Thinner," "Lacquer Thinner," "Thinner," or "Reducer" on the front panel of its packaging.

(4) DISTRIBUTOR means any person to whom consumer products are sold or supplied for the purposes of resale or distribution in commerce, except that manufacturers, retailers, and consumers are not distributors.

(5) EXEMPT COMPOUND is as defined in Rule 102.

(6) FORMULATION DATA is the actual product recipe which itemizes all the ingredients contained in a product including VOCs and the quantities thereof used by the manufacturer to create the product. Material Safety Data Sheets (MSDS) are not considered formulation data.

(7) GRAMS OF VOC PER LITER OF MATERIAL is the weight of VOC per volume of material and can be calculated by the following equation:

$$\text{Grams of VOC per Liter of Material} = \frac{W_s - W_w - W_{es}}{V_m}$$

Where:

W_s = weight of volatile compounds in grams

W_w = weight of water in grams

W_{es} = weight of exempt compounds in grams

V_m = volume of the material in liters

(8) INDUSTRIAL MAINTENANCE COATINGS are coatings, including primers, sealers, undercoaters, intermediate coatings and topcoats, formulated for or

applied to substrates, including floors that are exposed to one or more of the following extreme environmental conditions:

(A) immersion in water, wastewater, or chemical solutions (aqueous and non-aqueous solutions), or chronic exposure of interior surfaces to moisture condensation;

(B) acute or chronic exposure to corrosive, caustic or acidic agents, or similar chemicals, chemical fumes, chemical mixtures, or solutions;

(C) repeated exposure to temperatures in excess of 250 degrees Fahrenheit;

(D) repeated heavy abrasion, including mechanical wear and repeated scrubbing with industrial solvents, cleaners, or scouring agents; or

(E) exterior exposure of metal structures.

(9) LACQUER THINNERS are solvents that are manufactured for the purpose of thinning, diluting, dissolving, and for clean-up of lacquer coatings.

(10) MANUFACTURER means any person, company, firm, or establishment who imports, manufactures, blends, assembles, produces, packages, repackages, or re-labels a consumer paint thinner or multi-purpose solvent. The manufacturers listed on the product's label shall be primarily responsible for compliance with applicable provisions of this rule. If the label lists two or more manufacturers, they may mutually designate in writing a manufacturer responsible for compliance with this rule. That writing shall be filed with the Executive Officer.

(11) PERSON means any individual, firm, association, organization, partnership, business trust, corporation, company, contractor, supplier, installer, user or owner, or any state or local governmental agency or public district or any other officer or employee thereof. "Person" also means the United States or its agencies to the extent authorized by Federal law.

(12) RESPONSIBLE PARTY for a corporation is a corporate officer or an authorized representative so delegated by a corporate officer. Delegation of an authorized representative must be made in writing to the Executive Officer. A responsible party for a partnership or sole proprietorship is the general partner or proprietor, respectively.

(13) RETAIL OUTLET means any establishment at which consumer products are sold, supplied, or offered for sale directly to consumers.

(14) SOLICIT is to require for use or to specify, by written or oral contract.

(15) SOLVENTS include diluents and thinners and are defined as organic materials which are liquids at standard conditions and which are used as dissolvers, viscosity reducers or cleaning agents.

(16) SOLVENT CLEANING is the removal of adhesives, inks, coatings, and contaminants which include, but are not limited to, dirt, soil, and grease from parts, products, tools, machinery, equipment, and general work areas.

(17) SOLVENT FLUSHING is the use of a solvent to remove adhesives, inks, coatings, or contaminants from the internal surfaces and passages of the equipment by inducing a rapid flow of solvent through the equipment.

(18) VOC (VOLATILE ORGANIC COMPOUND) is as defined in Rule 102.

(19) VOC CONTENT means the total weight of VOC in a product expressed as a percentage of the product weight or as a mass-based concentration expressed in grams per liter of material (g/L) or pounds per gallon (lb/Gal).

(d) Requirements

(1) Except as provided in paragraph (d)(2), no person shall supply, sell, offer for sale, manufacture, blend, package or repackage any consumer paint thinner or multi-purpose solvent for use in the District unless the consumer paint thinner or multi-purpose solvent complies with the applicable VOC content limits set forth in the table below:

CATEGORY	EFFECTIVE 1/1/2010 VOC Content g/L or (lb/Gal)	EFFECTIVE 1/1/2011 VOC Content g/L or (lb/Gal)
Consumer Paint Thinner	300 (2.50)	25 (0.21)
Consumer Multi-Purpose Solvent	300 (2.50)	25 (0.21)

(2) Sell-Through Provision

(A) Any consumer paint thinner or multi-purpose solvent that is manufactured prior to the effective date of the applicable limit specified in paragraph (d)(1), and that has a VOC content above that limit (but not above the limit in effect on the date of manufacture), may be sold, supplied, offered for sale, or used for up to one year after the specified effective date.

(B) Consumer paint thinners manufactured prior to July 9, 2010 and labeled for more than one use including industrial maintenance coating thinning, may be sold, supplied, offered for sale, or used up to April 1, 2011.

(3) The prohibition of sale specified in paragraphs (d)(1) and (d)(5) shall not apply to any manufacturer of consumer paint thinners or multi-purpose-solvents provided

that the product was sold to an independent distributor that was informed in writing by the manufacturer about the compliance status of the product in the District.

(4) Any solvent container in which the contents therein are applied directly to a surface from said container by pouring, siphoning, brushing, rolling, padding, rag application or other means, shall be closed when not in use. These solvent containers include, but shall not be limited to: drums, buckets, cans, pails, trays or other application containers.

(5) General Prohibition

No person shall supply, sell, offer for sale, manufacture, blend, package, or repackage any consumer paint thinner or multi-purpose solvent for use in the District subject to the provisions of this rule with any materials that contain in the excess of 0.1% by weight any Group II exempt compounds listed in Rule 102. Cyclic, branched, or linear, completely methylated siloxanes (VMS) are not subject to this prohibition.

(e) Administrative Requirements

(1) No person shall sell, supply, offer for sale, manufacture, blend, package, or repackage for use in the District any "Flammable" or "Extremely Flammable" Consumer Paint Thinner or Multi-purpose Solvent named, on the Principal Display Panel as "Paint Thinner", "Multi-purpose Solvent", "Clean-up Solvent", or "Paint Clean-up".

(2) Paragraph (e)(1) does not apply to products that meet any of the following criteria:

(A) Products which include an attached "hang tag" or sticker that displays, at a minimum, the following statement: "Formulated to meet low VOC limits: see warnings on label".

(B) Products which include an attached "hang tag" or sticker that displays, at a minimum, the following statement: "Formulated to meet low VOC limits with [the common name of the chemical compound (e.g., 'Acetone', 'Methyl Acetate', etc.) that results in the product meeting the criteria for 'Flammable' or 'Extremely Flammable']".

(C) Products which include an attached "hang tag" as a second Principal Display Panel that displays, at a minimum, the following statement: "Formulated to meet low VOC limits" placed adjacent to and associated with the required Consumer Product Safety Commission (CPSC) warning.

(D) Products where the Principal Display Panel displays, in a font size as large as, or larger than, the largest font size of any other words on the panel, the following statement: "Formulated to meet low VOC limits" placed adjacent to and associated with the required CPSC warning.

(E) Products where the Principal Display Panel displays, in a font size as large as, or larger than, the largest font size of any other words on the panel, the common name of the chemical compound (e.g., "Acetone," "Methyl Acetate," etc.) that results in the product meeting the criteria for "Flammable" or "Extremely Flammable."

(F) Products that meet the labeling requirements of the CARB Consumer Product Regulation specified in title 17, CCR, section 94512(e) as adopted.

(G) Products that are manufactured on or before July 9, 2010.

None of the above labeling or notice requirements preclude the use of any additional labeling or notice for consumer education.

(3) For the purposes of paragraphs (e)(1) and (e)(2) a product is "Flammable" or "Extremely Flammable" if it is labeled as "Flammable" or "Extremely Flammable" on the product container, or if the product meets the criteria for these specified in title 16, Code of Federal Regulations, section 1500.3 (c)(6).

(4) Each product container shall clearly display the VOC content as determined from the actual product formulation data.

(5) The information required by paragraphs (e)(1) through (e)(3) shall be displayed on the product container such that it is readily observable without removing or disassembling any portion of the product container or packaging.

(6) No person shall remove, alter, conceal, or deface the information required by paragraphs (e)(1) through (e)(3) prior to final sale of the product.

(7) In conjunction with the changes in VOC content limits, the Executive Officer shall develop a public education and outreach program to inform consumers of potential product changes that use more flammable substances by jointly working with the local fire departments to include, but not be limited to: public service announcements in both English and Spanish to be aired on television and radio from October 2010 to January 2012; training retailers, including big box retailers at their corporate headquarters, in November 2010 about these potential changes so that they may alert their consumers; dissemination of 25,000 hardcopy brochures in several languages from November 2010 to January 2012; alerts through Twitter, and placement of electronic brochures and Public Service

Announcements (PSAs) on AQMD, CARB, YouTube, local fire department and local city websites from November 2010 to January 2012. The Executive Officer shall report the status of the public education and outreach program to the Stationary Source Committee in November 2010 and in November 2011. The Executive Officer may extend the public education and outreach program beyond January 2012, if he determines that additional consumer education is needed.

(8) Point of sale containers, for sale or distribution, of any consumer paint thinner or multi-purpose solvent subject to this rule shall display the maximum VOC content, as supplied, and the maximum VOC content after any dilution as recommended by the manufacturer.

(9) Point of sale containers, for sale or distribution, of any consumer paint thinner and multi-purpose solvent subject to this rule shall display the date of manufacture of the contents or a code indicating the date of manufacture. The manufacturers of such consumer paint thinners and multi-purpose solvents shall file with the Executive Officer an explanation of each code.

(10) Any manufacturer that supplies consumer paint thinners and multi-purpose solvents with intent to sell in the District shall submit an application as specified by the Executive Officer to apply for a manufacturer identification (ID) number by the applicable date in subdivision (g). The application form shall be signed by the responsible party for manufacturer certifying that all information submitted (including electronic submittals) is true and correct. The Executive Officer shall be notified in writing within 30 days of any change in the responsible party for the manufacturer.

(11) On or before May 1, 2010, and each subsequent January 1 thereafter, all manufacturers subject to this rule shall provide to the District a list of all their U.S. distributors to whom they supply products subject to this rule, including but not limited to private label and toll manufactured products. The list shall be in a format determined by the Executive Officer and shall include the distributor's name, address, contact person and phone number.

(12) On or before April 1, 2010, and every subsequent April 1 (the official due date), each manufacturer subject to this rule shall submit an annual quantity and emissions report to the Executive Officer.

(f) Recordkeeping

(1) Manufacturers shall maintain a copy of the application receipt from the District. The receipt shall be maintained for five (5) years and made available upon request by the Executive Officer.

(2) Manufacturers shall maintain records to verify data necessary to determine annual consumer paint thinner and multi-purpose solvent sales subject to this rule and VOC emissions in the District, and compliance with applicable rules and regulations. The records shall be maintained for five (5) years and made available upon request by the Executive Officer. Such records shall include but not be limited to:

(A) Product formulation records (to include VOC content):

(i) Laboratory reports [including percent weight of non-volatiles, water, and exempts (if applicable); density of the product; and raw laboratory data] of test methods conducted as specified in paragraph (i)(1), or

(ii) Product formulation data, including physical properties analyses, as applicable, with a VOC content calculation demonstration; and

(B) Production records including batch tickets with the date of manufacture, batch weight and volume; and

(C) Distribution records:

(i) Customer lists or store distribution lists or both (as applicable) and

(ii) Shipping manifests or bills of lading or both (as applicable); and

(D) Sales records consisting of point of sale receipts or invoices to local distributors or both, as applicable.

(g) Compliance Dates

(1) Consumer paint thinner and multi-purpose solvent manufacturers that begin to manufacture, supply, sell or offer for sale consumer paint thinners and multi-purpose solvents subject to this rule and for use in the District after July 1, 2009 shall submit the application required in paragraph (e)(10) no later than thirty (30) calendar days prior to manufacturing, supplying, selling, or offering for sale, any consumer paint thinner and multi-purpose solvent subject to this rule and for use in the District.

(2) Within thirty (30) calendar days after a change of consumer paint thinner and multi-purpose solvent manufacturer, the new consumer paint thinner and multi-purpose solvent manufacturer shall submit the application for a company ID

number as required in paragraph (e)(10). That filing shall include the previous consumer paint thinner and multi-purpose solvent manufacturer's ID number.

(h) Information exempt from Disclosure

Information submitted to the Executive Officer may be designated as exempt from disclosure consistent with District guidelines implementing the California Public Records Act (Govt. Code §§ 6250-6276.48).

(i) Test Methods

For the purpose of this rule, the following test methods shall be used:

(1) Determination of VOC Content

The VOC content of materials subject to the provisions of this rule shall be determined by:

(A) U.S. EPA Reference Test Method 24 (Determination of Volatile Matter Content, Water Content, Density, Volume Solids, and Weight Solids of Surface Coatings, Code of Federal Regulations Title 40, Part 60, Appendix A) with the exempt compound content determined by Method 303 (Determination of Exempt Compounds) in the SCAQMD "Laboratory Methods of Analysis for Enforcement Samples" manual; or

(B) Method 304 [Determination of Volatile Organic Compounds (VOC) in Various Materials] in the SCAQMD "Laboratory Methods of Analysis for Enforcement Samples" manual.

(C) Exempt Perfluorocarbon Compounds

The following classes of compounds:

cyclic, branched, or linear, completely fluorinated alkanes

cyclic, branched, or linear, completely fluorinated ethers with no unsaturations;

cyclic, branched, or linear, completely fluorinated tertiary amines with no unsaturations; and

sulfur-containing perfluorocarbons with no unsaturations and with sulfur bonds only to carbon and fluorine

will be analyzed as exempt compounds for compliance with subdivision (d), only when manufacturers specify which individual compounds are used in the solvent formulations. In addition, the manufacturers must identify the U.S. EPA, CARB, and SCAQMD approved test methods, which can be used to quantify the amount of each exempt compound.

(2) Equivalent Test Methods

Other test methods determined to be equivalent upon approval in writing by the Executive Officer, CARB, and the U.S. EPA may also be used.

(3) Multiple Test Methods

When more than one test method or set of test methods are specified for any testing, a violation of any requirement of this rule established by any one of the specified test methods or set of test methods shall constitute a violation of the rule.

(4) All test methods referenced in this subdivision shall be the version most recently approved by the appropriate governmental entities.

(j) Exemptions

(1) The provisions of this rule shall not apply to:

(A) Solvents sold in this District for shipment outside of this District or for shipment to other manufacturers for repackaging.

(2) Paragraph (d)(1) of this rule shall not apply to:

(A) Solvents provided that they are labeled and designated exclusively for the clean-up of polyaspartic and polyurea coatings application equipment. This exemption does not apply if there are any additional use claims on the label or any other product literature. This exemption does not apply to any person selling or using the otherwise exempt solvent for a non-exempt purpose.

(B) Thinners provided that they are labeled and designated exclusively for the thinning of Industrial Maintenance (IM) coatings, Zinc-Rich IM Primers, and High Temperature IM Coatings. This exemption does not apply if there are any additional use claims on the label or any other product literature. This exemption does not apply to any person selling or using the otherwise exempt thinner for a non-exempt purpose.

(C) Artist solvents/thinners provided that they are labeled and designated exclusively to reduce the viscosity of, or remove, art coating compositions or components and are individually packaged in containers having a total capacity equal to or less than 1 liter.

(k) Severability

If any provision of this rule is held by judicial order to be invalid, or invalid or inapplicable to any person or circumstance, such order shall not affect the validity of the remainder of this rule, or the validity or applicability of such provision to other persons or circumstances. In the event any of the exceptions to this rule is held by judicial order to

be invalid, the persons or circumstances covered by the exception shall instead be required to comply with the remainder of this rule.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 3

PROPOSAL: Advertising and Public Outreach Initiative to Chinese-American Communities to Increase Awareness of the Impacts of Air Pollution

SYNOPSIS: Staff has developed a proposal for an advertising and public outreach program focused on Chinese-American communities in the South Coast Air Basin. The goals of the program include raising awareness of the health impacts of poor air quality; demonstrating how AQMD is protecting public health by improving air quality; and urging residents to be more involved in efforts to improve air quality. The 26-week initiative will include paid advertising in print, TV, radio and online media at a cost not to exceed $400,000.

COMMITTEE: Administrative, October 8, 2010, Recommended for Approval

RECOMMENDED ACTIONS

1. Appropriate $400,000 from the Undesignated Fund Balance to Executive Office, FY 2010-11, Services and Supplies Major Object, Professional and Special Services Account for the Chinese-American advertising initiative.

2. Authorize the Executive Officer to execute contracts with Chinese-American media outlets for advertising initiative.

Barry R. Wallerstein, D.Env.
Executive Officer

SA

Background

AQMD and its partner air quality agencies have made significant strides in recent years in reducing urban smog, fine particulates and toxic air contaminants through regulations and programs, but pollution levels still are unacceptably high. As we continue to push forward to meet clean air goals, public involvement still remains key to the overall effort. Focused outreach to the various communities throughout the Southland,

especially ethnic minorities, can help increase understanding of the air pollution problem, and encourage individual actions to get involved in the clean air goal.

AQMD currently is engaged in a 52-week advertising initiative in African-American newspapers. As a next step in increasing awareness of air quality challenges among ethnic minority communities in the Southland, AQMD staff propose a 26-week advertising and public outreach initiative targeting Chinese-American residents. The goal of this public outreach initiative is to:

1. Increase awareness among Chinese-American communities of the many ways in which air quality impacts public health.

2. Providing information about AQMD programs to reduce air pollution and protect residents' health.

3. Demonstrate AQMD's forward-thinking in the development of technologies that create new "green" jobs.

4. Promote individual decisions and community involvement that help reduce urban air pollution and climate change.

Proposal

A 26-week advertising and public outreach initiative will target the Chinese-American audience in Southern California via TV, radio, and print/online media. AQMD's Media Office will work closely with Nakatomi & Associates, one of its subcontractors specializing in Asian/Pacific Islander public relations, to plan, coordinate and execute the initiative.

The budget of $400,000 to be allocated as follows:

- $350,000 will be split 50% for TV, 30% for print/online, and 20% for radio. This split is based on surveys of Chinese-American media consumption patterns, as well as staff/contractor recommendations.
- $50,000 will be allocated for special supplements and promotions, including newspaper inserts on air quality.

Print/Online advertising will include:

- Quarter-page color ads for 26 weeks in Chinese-language newspapers, and one English-language paper that reaches the Chinese residential population
- Special supplement(s) on air quality

TV advertising will include:

- 30-second commercials five times a week during the prime-time hours for 26 weeks on Chinese-language television station
- Special TV Promotions/Sponsorship such as America's Chinese New Year Celebration

Radio advertising will include:

- A combination of 30- and 60-second commercials every day for 26 weeks on Chinese-language radio stations.

Ad Content

AQMD staff has already developed some proposed content for TV and print ads targeting the Chinese-American market. In addition, some of the newspaper ads developed for the African-American advertising initiative may have messages appropriate for a Chinese-American audience. Staff will build on these ads and concepts to develop all content for the 26-week advertising initiative.

Message Testing

The Media Office and its subcontractor will conduct focus groups or messaging roundtables to test messages and determine which resonate best with the target audience of Chinese Americans. Staff recommends working with a community-based organization, such as Chinatown Service Center, to complete this process in a timely and cost-effective manner. Nakatomi & Associates will develop the discussion guide, manage the process and draft the focus group report and recommendations.

Ad Production

Print/Online Production

AQMD has already translated 12 English-language print ads into Chinese. Staff will select which of the 12 ads are most suitable, test the messages with the target audience, and tailor and produce them for print ad placements.

TV Production

The Media Office and its subcontractor will negotiate with a Chinese TV station for a promotion package that includes TV ad production. AQMD will provide storyboards, scripts and graphics and the TV station will provide Mandarin and/or Cantonese talent and all production. In addition, AQMD will seek to negotiate with the station to waive customary licensing fees when spots are shared with other TV outlets since these spots are PSAs and their message is educational.

Radio Production

Staff will negotiate with a radio station to provide all production, as well as Cantonese/Mandarin voice talent as part of a promotional package.

Assessing AQMD Language Capacity
Before the initiative is launched, staff will assess AQMD's Chinese-language public information capacity to ensure that consumer inquiries and requests can be fulfilled in an efficient, culturally and linguistically efficient manner. Any necessary upgrades to AQMD's website and/or Chinese-language public information capacity will be completed prior to initiative launch.

Sponsorship Recommendation
Following preliminary discussions, Chinese-American media outlets are offering added value, discounts and special rates given the environmental and educational focus and AQMD's mission. To benefit from this added value, $30,000 of the budget will be used for sponsorship and partnership with key outlets for a possible environmental supplement, Chinese New Year events, festivals and other promotional events.

Timeline
Concluding ad negotiations, developing and testing messages and producing ads will take a minimum of 30 days, with a 60-day lead time preferable to ensure that our messages have a maximum impact on Chinese-American communities. In addition, ad costs are higher in December due to the holidays and limited inventory. Staff recommends the following timeline:

- November 2010: Ad content development, testing and refining; final negotiations with media outlets; ad production; and assessment and upgrades if necessary to AQMD's Chinese-language public information capacity.
- December 2010: Initiative "soft" launch
- January 2010: Initiative full-scale launch
- May 2011: Initiative highlights National Clean Air Month and National Asthma Month
- June 2011: Initiative concludes

Resource Impacts
Sufficient funding is available in the Undesignated Reserves account for this program.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 4

TITLE: Execute Contract for Security Guard Services at Diamond Bar Headquarters

SYNOPSIS: The current contract for Diamond Bar headquarters security guard services expires on November 30, 2010. On July 9, 2010 the Board approved release of an RFP to solicit proposals from firms interested in providing these services. This action is to execute a two-year contract with Contact Security Inc., for a total amount not to exceed $887,245. Funding has been included in the FY 2010-11 Budget and will be requested in successive fiscal years.

COMMITTEE Administrative, October 8, 2010, Recommended for Approval

RECOMMENDED ACTION:
Authorize the Chairman to execute a two-year contract with Contact Security Inc., for security guard services, for the period of December 1, 2010 through November 30, 2012; for a total amount not to exceed $887,245.

Barry R. Wallerstein, D.Env.
Executive Officer

WJ:SO

Background
AQMD contracts with a security guard service firm to provide armed and unarmed security guard services at the Diamond Bar headquarters. The contract term with the current contractor, Contact Security Inc., expires November 30, 2010. On July 9, 2010, AQMD released RFP # 2011-03 to solicit proposals from security guard service providers interested in contracting with AQMD for a three-year period. The Administrative Committee, at its October meeting, voted to revise the length of the contract, reducing the term from three years to two years.

In addition to routine guard services, AQMD requires occasional enhanced services to provide adequate coverage for highly attended conferences, certain Board meetings and other types of special events.

While it is difficult to anticipate what these special-need costs will be, experience indicates they typically increase guard costs by about five percent. As a consequence, the costs listed in this Board letter include an added five percent beyond proposal costs submitted, as a contingency amount to meet special-occasion needs.

Outreach
In accordance with AQMD's Procurement Policy and Procedure, a public notice advertising the RFP and inviting bids was published in the Los Angeles Times, the Orange County Register, the San Bernardino Sun, and Riverside County Press Enterprise newspapers to leverage the most cost-effective method of outreach to the entire South Coast Basin.

Additionally, potential bidders may have been notified utilizing AQMD's own electronic listing of certified minority vendors. Notice of the RFP has been mailed to the Black and Latino Legislative Caucuses and various minority chambers of commerce and business associations, and placed on the Internet at AQMD's Web site (http://www.aqmd.gov/). Information was also available on AQMD's bidder's 24-hour telephone message line (909) 396-2724.

Proposal Evaluation
Eighty copies of the RFP were mailed out and 57 vendors attended the mandatory bidders' conference held on July 28, 2010. Twenty-seven proposals were received when final bidding closed at 2:00 p.m., August 11, 2010. Eighteen of the proposals received were complete and met RFP requirements.

The panel evaluating proposals included a retired AQMD Building Maintenance Manager and three AQMD employees—a Business Services Manager, a Risk Manager and a Facilities Services Technician. Of these four panel members, one is Caucasian and three are Hispanic; two are female and two are male.

The panel evaluated the 18 qualified and responsive proposals based on criteria specified in the RFP, which included completeness of response, cost, understanding of the requirements, contractor qualifications, and references regarding past experience. Although the proposals received and scored were based on a three-year contract, per the direction given by the Administrative Committee on October 8, 2010, the contract term has been reduced to two years.

The current contractor, Contact Security Inc., submitted four options, with one including medical insurance for the contractor's full-time employees at the level specified by the Board for receiving additional points (shown as number 4 below, and number 7 on Attachment A).

Contact Security's four options are:
(Note: reference to the third year of the contract is no longer applicable.)

1. Pay increases for guards of $0.50 per hour in both the second and third years of the contract (i.e., guards, whose last increase was December 2009, would have their first pay increase in December 2011).
2. Pay increases of $0.25 per hour at the initiation of the contract and every six months throughout the remainder of the contract.
3. Pay increases of $0.50 per hour in the second and third years of the contract (as in option 1), and one additional week of paid vacation.
4. Pay increases of $0.50 per hour in the second and third years of the contract (as in option 1) and medical insurance coverage that meets criteria specified in AQMD's contracting policy for earning additional points in the evaluation process.

Options 1, 2 and 3 also give the full-time guards the option of participating in the company health insurance plan and provide a one-week paid vacation after one year of employment.

The attachment summarizes scores of the qualified bids. Contact Security Inc., was the firm that submitted the highest-rated qualified bid, which included excellent references for comparable public-sector security guard services. Staff recommends the contract be awarded to Contact Security Inc., for their Option 2 proposal. This option provides the best value to AQMD while providing flexibility to the employed guards.

Resource Impacts
Sufficient funds in the amount of $252,390 are available in the approved FY 2010-11 Budget for the remainder of this fiscal year. Since this will be a two-year contract, continuing funding will need to be included in the budgets for each of the remaining fiscal years of the contract. Annual costs are $445,448 for FY 2011-12, and $189,407 for the five months of the contract that fall within for FY 2012-13.

Attachment
Security Guard Services Bid Evaluation Summary

ATTACHMENT A

SECURITY GUARD SERVICES
BID EVALUATION SUMMARY

Note: Although the proposals received and scored were based on a three-year contract, per the direction given by the Administrative Committee on October 8, 2010, the contract term has been reduced to two years.

NO.	COMPANY NAME	3-Year Cost Plus 5%	Total Points
1	CONTACT SECURITY INC. *Option1*	$1,319,775	109.51
2	**CONTACT SECURITY INC. *Option 2***	**$1,354,710**	**109.13**
3	CONTACT SECURITY INC. *Option 3*	$1,381,383	107.08
4	ABSOLUTE INTERNATIONAL SECURITY INC.	$1,269,308	103.10
5	ALLIED BARTON SECURITY SERVICES LP	$1,295,847	101.80

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 5

PROPOSAL: Authorize Executive Officer to Waive Late Fees Incurred by State Agencies Due to Delay in Adoption of State Budget

SYNOPSIS: As the result of the late approval of the State budget, approximately 40 State agencies are subject to late fees related to permit renewal and emissions fees. As the result of operation of the District's fee rules, the State agencies now owe a total of approximately $10,000 in late fees. This action is to authorize the Executive Officer to waive those fees.

COMMITTEE: Not Applicable

RECOMMENDED ACTION:
Authorize the Executive Officer to waive late fees incurred by state agencies due to the delay in the adoption of the State budget.

Barry R. Wallerstein, D.Env.
Executive Officer

MBO:DP:lg

Background
As the result of the delayed approval of the State budget, approximately 40 State agencies are subject to late fees related to AQMD fees because these agencies have no authority to expend funds until the budget is approved. As the result of operation of the District's fee rules, the State agencies now owe collectively a total of approximately $10,000 in additional fees. This action is to authorize the Executive Officer to waive those additional fees.

The only State agencies affected are those with fees due between July 1 and November 1, 2010.

Resource Impact
Finance has analyzed the data regarding outstanding fees owed by State agencies and determined the amount of late fees assessed or soon to be assessed for failure to pay on time is approximately $10,000.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 6

PROPOSAL: Execute Contract for Biennial Audit of Motor Vehicle Registration Revenues for FYs 2007-08 and 2008-09

SYNOPSIS: Health and Safety Code Section 44244.1 requires any agency receiving fee revenues pursuant to Section 44243 or 44244 to be subject to an audit of each program or project funded at least once every two years. On July 9, 2010, the Board approved release of an RFP to select an auditor to perform the biennial audit for FYs 2007-08 and 2008-09. An evaluation panel of representatives from the MSRC and AQMD staff evaluated the proposals. This action is to award a contract to the firm of Thompson, Cobb, Bazilio and Associates, PC. Local governments, the MSRC and AQMD will pay the cost of their own audits in the amounts of $71,393, $10,450, and $6,626 respectively.

COMMITTEE: Administrative, October 8, 2010, Recommended for Approval

RECOMMENDED ACTION:
Authorize the Chairman to execute a contract with Thompson, Cobb, Bazilio and Associates, PC for performance of the biennial audit of Motor Vehicle Registration revenues for FYs 2007-08 and 2008-09 at a total cost not to exceed $88,469.

Barry R. Wallerstein, D.Env.
Executive Officer

MBO:JK:lg

Background
AB 2766, chaptered into law as Health and Safety Code Sections 44220-44247, was enacted to authorize air pollution control districts to impose fees on motor vehicles. Fees are expended on mobile source air pollution reduction measures pursuant to the California Clean Air Act of 1988 or the AQMD's AQMP pursuant to Article 5 of Chapter 5.5 of Part 3 of the Health and Safety Code. Health and Safety Code Section 44244.1(a)

states that any agency receiving fee revenues pursuant to Section 44243 or 44244 shall, at least once every two years, be subject to an audit of each program or project funded. The audit is to be conducted by an independent auditor selected by the AQMD in accordance with Division 2 (commencing with Section 1100) of the Public Contract Code. Audit program guidelines for local government recipients of fee revenues under Health and Safety Code Sections 44220-44247 were prepared by the AQMD with input from the Technical Advisory Committee Audit Subcommittee of the Interagency AQMP Implementation Committee (IAIC), representatives of the Finance Committee of the League of California Cities and with CPA firms whose clients include local governments. These audit guidelines were approved by the IAIC, MSRC and by the Board on December 4, 1992 and further revised and approved in January 1995, and again in August 2003. This is the eighth biennial audit of these fee revenues and covers FYs 2007-08 and 2008-09.

Proposal

On July 9, 2010, the Board approved an RFP to conduct the biennial audit of recipients of AB 2766 fee revenues. The audit will cover recipients in all three segments of the AB 2766 fee distribution to determine whether the fee revenues collected in FYs 2007-08 and 2008-09 were spent on the reduction of pollution from motor vehicles as described above. The primary purpose of the audit is to set forth an opinion regarding the propriety of the expenditures incurred, not the degree of efficacy in reducing air pollution.

Outreach

In accordance with AQMD's Procurement Policy and Procedure, a public notice advertising the RFP/RFQ and inviting bids was published in the Los Angeles Times, the Orange County Register, the San Bernardino Sun, and Riverside County Press Enterprise newspapers to leverage the most cost-effective method of outreach to the entire South Coast Basin.

Additionally, potential bidders may have been notified utilizing AQMD's own electronic listing of certified minority vendors. Notice of the RFP/RFQ have been mailed to the Black and Latino Legislative Caucuses and various minority chambers of commerce and business associations, and placed on the Internet at AQMD's Web site (http://www.aqmd.gov where it can be viewed by making menu selections "Inside AQMD"/"Employment and Business Opportunities"/"Business Opportunities" or by going directly to http://www.aqmd.gov/rfp/index.html). Information is also available on AQMD's bidder's 24-hour telephone message line (909) 396-2724.

Bid Evaluation

The AQMD received a total of five proposals from CPA firms that are qualified to perform audits in the State of California. All of the proposals were received by the 1:00 p.m., September 10, 2010 deadline. These proposals were evaluated by a technically qualified panel in accordance with criteria contained in the RFP.

Panel Composition
The evaluation panel convened to evaluate the proposals consisted of: MSRC Contract Administrator; Senior Accountant; and two Financial Analysts. Of the four panelists that scored the proposals all four are Caucasian and female.

Of the five proposals received, two had to be rejected due to incomplete submissions and three were rated technically qualified to perform the audit of the AB 2766 program and were scored for cost. The evaluation results for the three proposals are:

BIDDER	TECHNICAL SCORE	BID AMOUNT	COST	SMALL/ LOCAL BUSINESS	TOTAL POINTS	OVERALL RANK
Thompson, Cobb, Bazilio & Associates, PC	65.75	$88,469	30.0	12	107.75	1st
Simpson & Simpson, Certified Public Accountants	60.75	$95,290	27.85	15	103.60	2nd
Zuehls, Legaspi & Company	56.25	$96,266	27.36	15	98.61	3rd

The selection criteria used to rank the proposals included responsiveness to the RFP; technical expertise; qualifications and experience; past performance; cost; and SB/SBJV/DVBE/DVBEJV/DVBE/SB subcontractors/local business designation (non-EPA). Based on the panel's assessment of the criteria, Thompson, Cobb, Bazilio and Associates, PC was selected to be recommended to the full Board.

Resource Impacts:
The maximum audit cost is $88,469. The total audit costs will be borne by the entities being audited as follows:

- The cost of the audit of the AQMD's portion of motor vehicle registration revenues is $6,626. Sufficient funds are included in the FY 2010-11 Budget;
- The cost of the audit of ten projects of the Mobile Source Air Pollution Reduction Trust Fund is $10,450 and shall be deducted from the FY 2010-11 revenues subvened to the Mobile Source Air Pollution Reduction Review Committee; and
- The total cost of the audit of local governments is up to a maximum of $71,393. The average cost for a non-compliant local government is $929 and the average cost for a compliant local government is $650. This cost will be borne by the entities being audited in the manner set forth in the audit program guidelines and will be deducted from quarterly fee revenues prior to distribution.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 7

PROPOSAL: Appropriate Funds for PAMS and Lead Monitoring Programs from U.S. EPA Section 105, Recognize and Appropriate Funds for Section 103 Monitoring Programs, and Authorize Purchases and Release of RFQ Under These Programs

SYNOPSIS: U.S. EPA has allocated Section 105 funding for the 19th Year PAMS Program and the Lead Monitoring Program. Section 105 revenue for these two programs has been included in the FY 2010-11 Budget. Supplemental Section 103 PM2.5 funding from U.S. EPA is also being provided for fixed assets to meet the NCore Program monitoring requirements and an ultrafine monitor testing project. This action is to: (1) appropriate funds to the FY 2010-11 Budget for the 19th year PAMS Program; (2) appropriate funds to the FY 2010-11 Budget for the Lead Monitoring Program; (3) recognize revenue and appropriate funds for Section 103 monitoring programs; and (4) authorize purchases and the release of an RFQ.

COMMITTEE: Administrative, October 8, 2010, Recommended for Approval

RECOMMENDED ACTIONS:

1. Appropriate $882,800 of the total U.S. EPA Section 105 19th year (FY 2010-11) PAMS award of $1,239,542 from the Undesignated Fund balance to the Major Objects in the Science & Technology Advancement and Planning, Rule Development & Area Sources FY 2010-11 Budgets as set forth in Attachment 1. Upon receipt of the grant final award, appropriate the remaining balance. (Expenditure appropriations exclude $216,742 in Salary and Employee Benefits which are already included in the FY 2010-11 Budget.) Revenue associated with this grant has been included in the FY 2010-11 Budget.
2. Appropriate $47,500 of the total U.S. EPA Section 105 FY 2010-11 Lead Monitoring award of $134,542 from the Undesignated Fund balance to the Major Objects in Science & Technology Advancement's FY 2010-11 Budget as set forth in Attachment 2. (Expenditure appropriations exclude $87,042 in Salary and Employee Benefits which is already included in the FY 2010-11 Budget.) The revenue associated with this grant has been included in the FY 2010-11 Budget.

3. Recognize $66,000 in revenue for NCore monitoring and ultrafine monitor testing funded under the U.S. EPA Section 103 PM2.5 Monitoring award in the FY 2010-11 Budget.
4. Upon receipt of award, appropriate from the Undesignated Fund balance $66,000 to the Major Objects in Science & Technology Advancement's FY 2010-11 Budget as set forth in Attachment 3 for NCore monitoring and ultrafine monitor testing funded under the U.S. EPA Section 103 PM2.5 Monitoring Program.
5. Authorize the Procurement Manager to:
    a. Issue a sole source purchase order with Bios International for an amount not to exceed $17,000 for the purchase of one (1) Primary Flow Standard Cell as budgeted in the 19th year PAMS award,
    b. Issue a purchase order with Teledyne Advanced Pollution Instrumentation, Inc. for an amount not to exceed $27,000 for the purchase of four (4) Clean Air Generators as budgeted in the 19th year PAMS award,
    c. Issue a sole source purchase order with Vaisala, Inc. for extended warranty services for five upper air radar profiler systems at a total cost not to exceed $97,000 as budgeted in the 19th year PAMS award,
    d. Issue a sole source purchase order with Atmospheric Systems Corporation for extended warranty services for four upper air Sodar profiling systems at a total cost not to exceed $28,000 as budgeted in the 19th year PAMS award,
    e. Amend an existing contract with Technical & Business Systems, Inc. for an additional amount not to exceed $60,000 to conduct performance audits of upper air and surface meteorological measurements as budgeted in the 19th year PAMS award,
    f. Amend an existing contract with Sonoma Technology, Inc. in an amount not to exceed $150,000 for data management support and air quality data analysis as budgeted in the 19th year PAMS award,
    g. Issue a sole source purchase order with Elemental Scientific, LLC for an amount not to exceed $25,000 for the purchase of one (1) ICP-MS Auto Sampler as budgeted in the Lead Monitoring award,
    h. Issue a sole source purchase order with Met One Instruments for an amount not to exceed $40,700 for the purchase of two (2) Beta Attenuation PM10 Monitors for NCore monitoring as budgeted in the PM2.5 Monitoring award,
    i. Issue a sole source purchase order with TSI, Inc. for an amount not to exceed $25,300 for the purchase of one (1) Model 3783 Water-based Environmental Particle Counter for ultrafine monitor testing as budgeted in the PM2.5 Monitoring award.

6. Release RFQ #Q2011-03 for six (6) Gas Calibration Systems at a cost not to exceed $106,000 as budgeted in the 19th year PAMS award.

Barry R. Wallerstein, D.Env.
Executive Officer

CSL: PMF:cv

Background

PAMS Program

In February 1993, the U.S. EPA promulgated the PAMS regulations for areas classified as serious, severe or extreme nonattainment. These regulations require AQMD to conduct monitoring for ozone precursors with enhanced monitoring equipment at a total of seven sites. The PAMS program is also funding the meteorological upper air profilers sited at LAX and Ontario airports, the upper air site installed at Moreno Valley in Riverside County, and a new upper air site in Orange County. Since the onset of the PAMS program, U.S. EPA has annually allocated Section 105 supplemental grant funds in support of this requirement.

Lead Monitoring Program

AQMD has been awarded U.S. EPA Section 105 funds for the Lead Monitoring Program as required by new federal regulations promulgated in November 2008. Along with tightening the National Ambient Air Quality Standard for lead to 0.15 $\mu g/m^3$, the U.S. EPA requires enhanced source-oriented monitoring as well as the traditional population-oriented monitoring. U.S. EPA is providing funding to state and local agencies to establish this monitoring network, and last year AQMD established near-source monitors at four facilities in the South Coast Air Basin. AQMD already operates a sufficient number of population-oriented lead monitoring sites to meet the new monitoring requirements. The funding will therefore be used primarily for operation and maintenance of the AQMD lead monitoring network.

Supplemental Section 103 Monitoring Program Funding

New federal regulations require a national network of fully instrumented air monitoring stations known as the NCore Network. Two of these sites are to be located at existing AQMD air monitoring stations at Central Los Angeles and Rubidoux. AQMD will be awarded supplemental U.S. EPA Section 103 funding to purchase two continuous PM10 monitors to pair with existing continuous PM2.5 monitors to provide Coarse PM mass measurements as required for NCore sites. Coarse PM is defined as the difference between PM10 and PM2.5. AQMD will also be awarded U.S. EPA Section 103 funding to purchase a newly available ultrafine particle monitor for the purpose of testing in a near-roadway environment. The new instrument is designed to be more robust and

reliable than previous particle monitors and is intended for wide-scale deployment in air monitoring networks. Funding for both the NCore and the ultrafine monitor testing is being provided under the current U.S. EPA Section 103 PM2.5 Monitoring award.

Proposal

PAMS Program

U.S. EPA estimated that the 19th year PAMS Program (FY 2011) will be funded at $1,239,542 and the funds have already been recognized in the FY 2010-11 Budget. The proposed allocation of the 19th year PAMS funds is provided in Attachment 1. The U.S. EPA concurs with staff's proposed allocation. To ensure that the AQMD is able to continue program activities prior to receiving the award, staff is recommending that a portion of the award ($882,800) be appropriated to the specified Major Objects in Science & Technology Advancement's and Planning, Rule Development & Area Sources' FY 2010-11 Budgets. The balance will be appropriated upon receipt of the award.

Lead Monitoring Program

The U.S. EPA has awarded Section 105 funding in the amount of $134,542 for the Lead Monitoring Program and the funds have already been recognized in the FY 2010-11 Budget. The proposed allocation of the funds is provided in Attachment 2, and the U.S. EPA concurs with the staff's proposed allocation. To ensure that the AQMD is able to continue program activities prior to receiving the award, staff is recommending that $47,500 be appropriated to the Major Objects in Science & Technology Advancement's FY 2010-11 Budget.

Supplemental Section 103 Monitoring Program Funding

The U.S. EPA has provided supplemental funding in the amount of $66,000 to purchase equipment for the NCore program as well as an ultrafine monitor testing project. The funding is being provided under the current U.S. EPA Section 103 PM2.5 Monitoring award. This action is to recognize $66,000 in revenue for NCore monitoring and ultrafine monitor testing funded under the PM2.5 Monitoring award in the FY 2010-11 Budget, and appropriate that same amount to the Major Objects in Science & Technology Advancement's FY 2010-11 Budget as set forth in Attachment 3.

Issue a Sole Source Purchase Order for One (1) Primary Flow Standard Cell Under the PAMS Award

A critical part of operating and maintaining air monitoring equipment is measuring air flow through multiple devices reliably and accurately. A primary flow calibration standard is a critical tool for ensuring that all flow measurement devices used by Air Monitoring staff are accurate and correctly calibrated. AQMD currently employs a primary flow standard in the instrument calibration shop. However, the range of flow rates that can be measured by the primary flow standard is limited by the specific range of each particular flow cell, an interchangeable accessory to the primary flow standard.

Newer air quality instrumentation has raised the need to calibrate flow devices within flow ranges not measurable by the current flow cells, and an additional flow cell is available to address this. The cell must be compatible with the existing primary flow standard and thus purchased from the same manufacturer. Therefore, staff is recommending that the Board authorize the Procurement Manager to issue a sole source purchase order with Bios International for an amount not exceed $17,000 for the purchase of one (1) Primary Flow Standard Cell as budgeted in the 19th year PAMS award.

Issue Purchase Order for Four (4) Clean Air Generators Under the PAMS Award

Clean Air Generators, also known as Zero Air Generators, serve an essential function in Monitoring & Analysis. In the AQMD Air Monitoring Stations, Clean Air Generators provide a flow of clean, pollutant-free air to the air quality instruments to check their "zero" readings. The Clean Air Generators also provide clean air to dilute standard gases to their span and precision check levels. Such checks are done automatically on a daily or weekly basis to ensure accurate measurements of gaseous pollutants. Clean Air Generators are similarly used for instrument calibration, for Quality Assurance functions, for instrument testing and repair, and for laboratory analyses requiring clean air dilution. The current AQMD inventory of Clean Air Generators is aging and in need of replacement. Some are no longer supported by the manufacturers. This purchase is part of a longer term plan to replace the older equipment.

The vendor and purchase price for the Clean Air Generators is based on RFQ #Q2010-1 released in June, 2009. In October, 2009, the Board authorized a purchase order based on the proposal evaluation results. The selected vendor, Teledyne Advanced Pollution Instrumentation, Inc., has agreed to honor the pricing in their previous bid. Therefore, staff is recommending that the Board authorize the Procurement Manager to issue a purchase order with Teledyne Advanced Pollution Instrumentation, Inc. for an amount not to exceed $27,000 for the purchase of four (4) Clean Air Generators as budgeted in the 19th year PAMS award.

Issue a Sole Source Purchase Order for Extended Warranty Services for Five Profiler Systems and Four Sodar Systems Under the PAMS Program

Currently, there are five Model LAP-3000 radar wind and temperature profilers manufactured by Vaisala, Inc. in operation in the South Coast Air Basin. In addition, four acoustic profiling systems (Sodars) are also in operation. These instruments reduce the need for balloon-borne soundings and help fulfill upper air monitoring requirements of the PAMS Program and data needs for air quality analysis, modeling and forecasting. After the initial one-year warranty period, annual extended warranty services have been purchased from the instrument manufacturers, Vaisala, Inc. and Atmospherics Systems Corp., to cover repairs and parts replacement. The extended warranties cover contact with Vaisala programmers, engineers and technicians for system analysis and operational advice; priority for response when further testing, part replacement or repairs are needed;

and the cost of all replacement parts and repairs. The warranty service assures that electronics, hardware and software problems will be resolved in a timely manner, without the need to separately obtain funding for individual tests and parts. Therefore, staff is recommending that the Board authorize the Procurement Manager to issue a sole source purchase order with Vaisala, Inc. for an amount not to exceed $97,000 for extended warranty services for five upper air profiler systems as budgeted in the 19th year PAMS award. Furthermore, staff is recommending that the Board authorize the Procurement Manager to issue a sole source purchase order with Atmospheric Systems Corporation for an amount not to exceed $28,000 for extended warranty services for four upper air Sodar systems as budgeted in the 19th year PAMS award.

Amend Existing Contract to Conduct Performance Audits of Meteorological Measurements Under the PAMS Program

New U.S. EPA quality assurance guidelines call for annual audits of all surface meteorological instruments. Furthermore, the upper air meteorology profiler systems also require periodic audits to check their accuracy. The contractor Technical & Business Systems is currently providing these auditing services to the AQMD, but with the new U.S. EPA guidelines, there will be many more audits to perform of the surface meteorological stations. Technical & Business Systems also provides auditing services for the PM samplers throughout the AQMD Monitoring Network, and there are considerable cost savings to be realized if meteorological and PM auditing could be performed concurrently at each site by the same contractor. Therefore, staff recommends that the Board authorize the Procurement Manager to extend and amend an existing contract with Technical & Business Systems, Inc. for an additional amount not to exceed $60,000 to conduct performance audits of upper air and surface meteorological measurements as budgeted in the 19th year PAMS award.

Amend Existing Contract for Data Management Support and Air Quality Data Analysis Under the PAMS Program

Sonoma Technologies, Inc. is currently under contract to develop an enhanced Air Quality Data Management System to store, validate, analyze and archive data from the AQMD monitoring network. As the system is implemented in FY 2010-11, there is a need for continuing technical support as well as some additional tasks related to improving functionality. There is also a need for technical support in the analysis of air quality data, and Sonoma Technologies is uniquely positioned to provide this support given their familiarity with AQMD's data systems as well as their experience with similar analysis efforts on a national scale. Therefore, staff recommends that the Board authorize the Procurement Manager to extend and amend an existing contract with Sonoma Technology, Inc. in an amount not to exceed $150,000 for data management support and air quality data analysis as budgeted in the 19th year PAMS award.

Issue a Sole Source Purchase Order for One (1) ICP-MS Auto Sampler Under the Lead Monitoring Award

The AQMD Laboratory has identified the need to replace the older ICP-MS auto sampler with the Elemental Scientific® microFAST SC-2DX auto sampler. This micro-volume sample analysis system has several unique advantages over other auto samplers. Sample throughput is increased at least two fold due to the fast injection and rinsing cycle of the SC-2DX auto sampler. Potential carry-over contamination from one sample to the next is significantly reduced due to a patented dual rinse station. Furthermore, this auto sampler permits the analysis of samples as small as 3 ml or triplicate analysis from a single 15-ml sampling tube eliminating a time-consuming need to re-dilute samples. The microFast SC-DX is the only auto sampler that is designed to work seamlessly with the existing high-sensitivity APEX® Desolvating sample introduction unit for the ICP-MS. Therefore, staff is recommending that the Board authorize the Procurement Manager to issue a sole source purchase order with Elemental Scientific, LLC for an amount not to exceed $25,000 for the purchase of one (1) ICP-MS Auto Sampler as budgeted in the Lead Monitoring award.

Issue a Sole Source Purchase Order for Two (2) Beta Attenuation PM10 Monitors Under the PM2.5 Monitoring Award

U.S. EPA NCore monitoring requirements call for Coarse PM measurements at all NCore sites. Both AQMD NCore sites at Central Los Angeles and Rubidoux currently include continuous PM2.5 measurements using a Beta Attenuation Monitor manufactured by Met One Instruments. Pairing a Met One Beta Attenuation Monitor for PM10 with a Met One PM2.5 monitor has been designated a federal equivalent method for the measurement of Coarse PM. Thus, the Coarse PM measurement requirement can be cost-effectively satisfied by utilizing the existing PM2.5 monitors and adding the compatible PM10 monitors. This purchase has been specifically funded and approved by U.S. EPA. Therefore, staff is recommending that the Board authorize the Procurement Manager to issue a sole source purchase order with Met One Instruments for an amount not to exceed $40,700 for the purchase of two (2) Beta Attenuation PM10 Monitors for NCore monitoring as budgeted in the PM2.5 Monitoring award.

Issue a Sole Source Purchase Order for One (1) Environmental Particle Counter Under the PM2.5 Monitoring Award

AQMD and U.S EPA have an interest in the issues involving ultrafine particles. Although there is no ambient air quality standard for ultrafine particles, an important issue to be resolved is the reliable and accurate measurement of ultrafine particles in an ambient air quality monitoring network. Although several instruments exist to measure ambient ultrafines by counting particles, these systems have not been reliable enough to deploy in ambient network applications requiring very frequent maintenance and factory service. A newly developed instrument manufactured by TSI, Inc. has been designed specifically for ambient network deployment. While initial testing has shown promise, there is a need for additional long-term testing in challenging environments such as near a

busy freeway. U.S. EPA has approached AQMD and offered to provide funds for the purchase of one of these new instruments for testing at the I-710 monitoring location. TSI, Inc. has agreed to provide additional units for side-by-side testing over several months of deployment. This purchase has been specifically funded and approved by U.S. EPA. Therefore, staff is recommending that the Board authorize the Procurement Manager to issue a sole source purchase order with TSI, Inc. for an amount not to exceed $26,000 for the purchase of one (1) Model 3783 Water-based Environmental Particle Counter for ultrafine monitor testing as budgeted in the PM2.5 Monitoring award.

Issue RFQ for Six (6) Gas Calibration Systems Under the PAMS Award

Gas Calibration Systems are deployed in all air monitoring stations to dilute the standard gases to known levels in order to perform automated span and precision checks of air quality monitoring equipment. They are also utilized by staff in calibration, repair, quality assurance, and the laboratory. The current inventory of Gas Calibration Systems includes many aging systems that are no longer supported by the manufacturers, and these systems are in need of replacement. Furthermore, at least two more sophisticated Gas Calibration Systems are needed to meet the new U.S. EPA NCore monitoring requirements. This RFQ will solicit bids for systems with a variety of specifications to meet the various objectives of AQMD's monitoring programs. Therefore, staff is requesting the Board to release RFQ #Q2011-03 for six (6) Gas Calibration Systems at a cost not to exceed $106,000 as budgeted in the 19th year PAMS award.

Sole Source Justifications

A sole source award is authorized under Sections IV.B. of the Procurement Policy and Procedure when a purchase does not lend itself to substitution. Section VIII, B.2 of the Procurement Policy and Procedure identifies four major provisions under which a sole source award may be justified.

The requests for sole source purchases of the Primary Flow Standard Cell, the ICP-MS Auto Sampler, and the Beta Attenuation PM10 Monitors are made under Section VIII, B.2.d (6) of the Procurement Policy and Procedure. The equipment must be compatible with existing specialized equipment. The Primary Flow Standard Cell is an additional accessory to an existing Primary Flow Standard and is only manufactured by one source. Similarly, there is only one ICP-MS Auto Sampler with the specified capabilities that is compatible with the existing APEX® Desolvating sample introduction unit for the ICP-MS in the Laboratory. Finally, the Beta Attenuation PM10 Monitors must be paired with PM2.5 monitors from the same manufacturer in order to create the required federal equivalent method system for Coarse PM measurements under NCore.

The request for a sole source purchase of the Environmental Particle Counter is made under Section IV.B.4 and Section VIII, B.2.c (2) of the Procurement Policy and Procedure. The item is available from only one source as it involves the use of

proprietary technology. This particular ultrafine measurement instrument is targeted for testing and has been specified by the funding source, U.S. EPA, for purchase.

The requests for sole source purchases of the extended warranty services are made under Section VIII, B.2.c of the Procurement Policy and Procedure: The desired services are available from only the sole source based upon the unique experience and capabilities of the proposed contractor or contractor team; (2) The project involves the use of proprietary technology; and (3) The contractor has ownership of key assets required for project performance. Vaisala, Inc. and Atmospheric Systems Inc. are the only companies capable of providing repair parts and services for the equipment they manufacture.

Resource Impacts

U.S. EPA Section 105 Grant funding will support the 19th year operation of the PAMS Program and the Lead Monitoring Program, including equipment, temporary services, supplies and services necessary to meet the objectives of the programs.

Supplemental Section 103 monitoring program funding will fully support the purchase of equipment to meet the NCore Program's Coarse PM monitoring requirements and the needs of the ultrafine monitor testing project.

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

REQUEST FOR QUOTATION (RFQ) FOR CALIBRATION GAS DILUTION SYSTEMS

RFQ #Q2011-03

PURPOSE

The South Coast Air Quality Management District (AQMD) invites sealed quotes from qualified firms interested in providing up to 6 Calibration Gas Dilution Systems to dilute superblend concentrations of gas, generate precise amounts of ozone, and perform NOX gas phase titration's for use in ambient and NCORE air monitoring stations. In the preparation of this Request for Quotes (RFQ), the word "Proposer," "Contractor," "Vendor," and "Consultant" are used interchangeably.

INDEX - The following are contained in this RFQ.

SECTION I: BACKGROUND/INFORMATION/SCHEDULE OF EVENTS

The South Coast Air Quality Management District (AQMD) is a regional governmental agency responsible for meeting air quality health standards in Orange County and parts of Los Angeles, Riverside and San Bernardino counties.

The AQMD has the need to procure Calibration Gas Dilution Systems for the ambient/NCORE air monitoring network to precisely generate concentrations of O3, NO, NO2, CO, and SO2.

AQMD CONTACT PERSONS:

Questions regarding the content or intent of this RFQ or on procedural matters should be addressed to:

Administrative:	Technical:
Procurement Unit	David Sawyer, Principal Air Quality Instrument Specialist
South Coast Air Quality Management District	South Coast Air Quality Management District
21865 Copley Drive	21865 Copley Drive
Diamond Bar, CA 91765	Diamond Bar, CA 91765
909-396-3520	909-396-2112

SCHEDULE OF EVENTS

November 5, 2010	Release of RFQ
December 7, 2010	RFQ Closes, 2:00 P.M.
December 17, 2010	Quotation Evaluation
February 4, 2011	Governing Board Approval

SECTION II: PARTICIPATION IN THE PROCUREMENT PROCESS

A. It is the policy of the AQMD to ensure that all businesses including minority business enterprises, women business enterprises, disabled veteran business enterprises, and small businesses have a fair and equitable opportunity to compete for and participate in AQMD contracts.

B. Definitions:

The definition of minority or women business enterprise set forth below is included for purposes of determining compliance with the affirmative steps requirement described in Paragraph F below on procurements funded in whole or in part with U.S. EPA grant funds which involve the use of subcontractors. The definition provided for disabled veteran business enterprise, local business, and small business enterprise, low-emission vehicle business and off-peak hours delivery business are provided for purposes of determining eligibility for point or cost considerations in the evaluation process.

1. "Minority-or-women business enterprise" (MBE/WBE) as used in this policy means a business enterprise that meets all the following criteria:

   a. a business that is at least 51 percent owned by one or more minority persons or women, or in the case of any business whose stock is publicly held, at least 51 percent of the stock is owned by one or more minority persons or women.

   b. a business whose management and daily business operations are controlled by one or more minority persons or women.

   c. a business which is a sole proprietorship, corporation, or partnership with its primary headquarters office located in the United States, which is not a branch or subsidiary of a foreign corporation, foreign firm, or other foreign-based business.

2. "Minority person" for purposes of this policy, means a Black American, Hispanic American, Native American (including American Indian, Eskimo, Aleut, and Native Hawaiian), Asian-Indian American (including a person whose origins are from India, Pakistan, and Bangladesh), Asian-Pacific American (including a person whose origins are from Japan, China, the Philippines, Vietnam, Korea, Samoa, Guam, the United States Trust Territories of the Pacific, Northern Marianas, Laos, Cambodia, and Taiwan).

3. "Disabled veteran" as used in this policy is a United States military, naval, or air service veteran with at least 10 percent service-connected disability who is a resident of California.

4. "Disabled veteran business enterprise" (DVBE) as used in this policy means a business enterprise that meets all of the following criteria:

   a. is a sole proprietorship or partnership of which is at least 51 percent owned by one or more disabled veterans or, in the case of a publicly owned business, at least 51 percent of its stock is owned by one or more disabled veterans; a subsidiary which is wholly owned by a parent corporation but only if at least 51 percent of the voting stock of the parent corporation is owned by one or more disabled veterans; or a joint venture in which at least 51 percent of the joint venture's management and control and earnings are held by one or more disabled veterans.

   b. the management and control of the daily business operations are by one or more disabled veterans. The disabled veterans who exercise management and control are not required to be the same disabled veterans as the owners of the business.

   c. is a sole proprietorship, corporation, or partnership with its primary headquarters office located in the United States, which is not a branch or subsidiary of a foreign corporation, firm, or other foreign-based business.

5. "Local business" as used in the Procurement Policy and Procedure means a company that has an on-going business within the boundaries of the South Coast AQMD at the time of bid or proposal submittal and performs 90% of the work related to the contract within the boundaries of the AQMD and satisfies the requirements of Paragraph H below.

6. "Small business" as used in this policy means a business that meets the following criteria:

   a. 1) an independently owned and operated business; 2) not dominant in its field of operation; 3) together with affiliates is either:

   - A service, construction, or non-manufacturer with 100 or fewer employees, and average annual gross receipts of ten million dollars ($10,000,000) or less over the previous three years, or
   - A manufacturer with 100 or fewer employees.

   b. Manufacturer means a business that is both of the following:

      1) Primarily engaged in the chemical or mechanical transformation of raw materials or processed substances into new products.

      2) Classified between Codes 311000 and 339000, inclusive, of the North American Industrial Classification System (NAICS) Manual published by the United States Office of Management and Budget, 2007 edition.

7. "Joint ventures" as defined in this policy pertaining to certification means that one party to the joint venture is a DVBE or small business and owns at least 51

percent of the joint venture.

8. "Low-Emission Vehicle Business" as used in this policy means a company or contractor that uses low-emission vehicles in conducting deliveries to the AQMD. Low-emission vehicles include vehicles powered by electric, compressed natural gas (CNG), liquefied natural gas (LNG), liquefied petroleum (LPG), ethanol, methanol, hydrogen and diesel retrofitted with particulate matter (PM) traps.

9. "Off-Peak Hours Delivery Business" as used in this policy means a company or contractor that commits to conducting deliveries to the AQMD during off-peak traffic hours defined as between 10:00 a.m. and 3:00 p.m.

C. Under Request for Quotations (RFQ), DVBEs, DVBE joint ventures, small businesses, and small business joint ventures shall be granted a preference in an amount equal to 5% of the lowest cost responsive bid. Low-Emission Vehicle Businesses shall be granted a preference in an amount equal to 5% of the lowest cost responsive bid. Off-Peak Hours Delivery Businesses shall be granted a preference in the amount equal to 2% of the lowest cost responsive bid. Local businesses (if the procurement is not funded in whole or in part by U.S. EPA grant funds) shall be granted a preference in an amount equal to 2% of the lowest cost responsive bid.

D. Under Request for Proposals (RFP), DVBEs, DVBE joint ventures, small businesses, and small business joint ventures shall be awarded ten (10) points in the evaluation process. A non-DVBE or large business shall receive seven (7) points for subcontracting at least twenty-five (25%) of the total contract value to a DVBE or small business. Low-Emission Vehicle Businesses shall be awarded five (5) points in the evaluation process. On procurements which are not funded in whole or in part by U.S. EPA grant funds local businesses shall receive five (5) points. Off-Peak Hours Delivery Businesses shall be awarded two (2) points in the evaluation process.

E. AQMD will ensure that discrimination in the award and performance of contracts does not occur on the basis of race, color, sex, national origin, marital status, sexual preference, creed, ancestry, medical condition, or retaliation for having filed a discrimination complaint in the performance of AQMD contractual obligations.

F. When contracts are funded in whole or in part by U.S. EPA grant funds and if subcontracts are to be let, the Contractor must comply with the following, evidencing a good faith effort to solicit minority and women owned enterprises. Contractor shall submit a certification signed by an authorized official affirming compliance with the steps below at the time of proposal submission. The AQMD reserves the right to request documentation demonstrating compliance with these steps prior to contract execution.

1. Place qualified small and minority businesses and women's business enterprises on solicitation lists;

2. Ensure that small and minority businesses, and women's business enterprises are solicited whenever they are potential sources including advertising at least ten days in advance of the bid in a variety of media directed to minority-and women-owned business audiences;

3. Divide total requirements, when economically feasible, into smaller tasks or quantities to permit maximum participation by small and minority business, and women's business enterprises;

4. Establish delivery schedules, where requirements permit, which encourage participation by small and minority business, and women's business enterprises; and

5. Use the services and assistance of the Small Business Administration and the Minority Business Development Agency of the Department of Commerce.

G. To the extent that any conflict exists between this policy and any requirements imposed by federal and state law relating to participation in a contract by a certified MBE, WBE, and/or DVBE as a condition of receipt of federal or state funds, the federal or state requirements shall prevail.

H. When contracts are not funded in whole or in part by U.S. EPA grant funds, a local business preference will be awarded. For such contracts that involve the purchase of commercial off-the-shelf products, local business preference will be given to suppliers or distributors of commercial off-the-shelf products who maintain an on-going business within the geographical boundaries of the AQMD. However, if the subject matter of the RFP or RFQ calls for the fabrication or manufacture of custom products, only companies performing 90% of the manufacturing or fabrication effort within the geographical boundaries of the AQMD shall be entitled to the local business preference.

I. In compliance with federal fair share requirements set forth in 40 CFR 35.6580, the AQMD shall establish a fair share goal annually for expenditures covered by its procurement policy.

DISPOSITION: The AQMD reserves the right to reject any or all quotations. All materials and documents submitted with the quote will become the property of the AQMD.

SECTION III: RESPONSE SUBMITTAL REQUIREMENTS

QUOTES - All quotes must be submitted according to specifications set forth in this RFQ.

SIGNATURE- Quotes must be signed by an authorized representative of the vendor.

DUE DATE - **Four (4) complete copies of the quotes must be submitted.** Quotes must be typewritten and submitted in a sealed envelope, plainly marked in the upper, left-hand corner with the name and address of the vendor with the words, "Request for Quotation #Q2011-03". It should be addressed to:

Procurement Unit
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Quotes are due no later than 2:00 p.m. on December 7, 2010. Any corrections or resubmissions of the quote will not be sufficient reason to extend the deadline.

No late quotations will be accepted under any circumstances.

Grounds for rejection: A quote may be rejected if:

1. It is not prepared in the format described, or

2. It is signed by an individual not authorized to represent the firm.

FORMAT - the content and format of the quote will adhere to the specifications listed below. Failure to follow this format may result in quote disqualification.

1. The name and address of the vendor must be typed on the title page of the RFQ. An authorized signature is also required.

2. Include completed documents contained in Certifications and Representations attachment.

3. **Submit four (4) complete copies of the RFQ response.**

SECTION IV: EVALUATION AND SELECTION CRITERIA

Award will be made to the vendor submitting the lowest cost quotation which is most fully responsive to the specifications set forth in the RFQ. For purposes of determining lowest cost, cost shall be determined based upon the following factors which comprise the AQMD's Cost of Ownership:

1) Base price of system.
2) Annual cost of spare parts after warranty expires based on vendor-supplied failure rates for individual instruments and sub-systems comprising the total system. Vendor must supply documented data to support the failure rates quoted.

Staff will also award points based on the evaluation of analyzer reliability, performance, features, reputation, and ease of service.

Disabled Veteran Business Enterprises (DVBE's), Small Businesses, Low-Emission Vehicle Businesses, Off-Peak Hours Delivery Businesses, and Local Businesses meeting the definitions contained in Section II of this RFQ shall be granted a preference in an amount equal to the percentage listed below of the lowest cost responsive quote. Since the funds for is procurement is partially funded by U.S. EPA grant funds, Section II,C (pertaining to local business) is not applicable and no local business preference will be awarded.

Small Business or Small Business Joint Venture	5%
DVBE or DVBE Joint Venture	5%
Low-Emission Vehicle Business	5%
Local Business (Non-EPA Funded Projects only)	2%
Off-Peak Hours Delivery Business	2%

To receive additional points in the evaluation process for the categories of Small Business or Small Business Joint Venture, DVBE or DVBE Joint Venture or Local Business (for non-EPA funded projects), the bidder must submit a self-certification or certification from the State of California Office of Small Business Certification and Resources at the time of proposal submission certifying that the bidder meets the requirements set forth in Section III. To receive points for the use of DVBE and/or Small Business subcontractors, at least 25 percent of the total contract value must be subcontracted to DVBEs and/or Small Businesses. To receive points as a Low-Emission Vehicle Business, the bidder must demonstrate to the Executive Officer, or designee, that supplies and materials delivered to the AQMD are delivered in vehicles that operate on either clean-fuels or if powered by diesel fuel, that the vehicles have particulate traps installed. To receive points as an Off-Peak Hours Delivery Business, the proposer must submit,

at proposal submission, certification of its commitment to delivering supplies and materials to AQMD between the hours of 10:00 a.m. and 3:00 p.m. The cumulative points awarded for Small Business, DVBE, use of Small Business or DVBE Subcontractors, Local Business, Low-Emission Vehicle Business and Off-Peak Hour Delivery Business shall not exceed 15 points.

Note: The award of these additional points shall be contingent upon Proposer completing the Self-Certification section of Attachment B – Certifications and Representations and/or inclusion of a statement in the quotation self-certifying that Proposer qualifies for additional points as detailed above.

The Procurement Section will be responsible for monitoring compliance of suppliers awarded purchase orders based upon use of low-emission vehicles or off-peak traffic hour delivery commitments through the use of vendor logs which will identify the contractor awarded the incentive. The purchase order shall incorporate terms which obligate the supplier to deliver materials in low-emission vehicles or deliver during off-peak traffic hours. The Receiving department will monitor those qualified supplier deliveries to ensure compliance to the purchase order requirements. Suppliers in non-compliance will be subject to a two percent of total purchase order value penalty. The Procurement Manager will adjudicate any disputes regarding either low-emission vehicle or off-peak hour deliveries.

SECTION V: RFQ/TITLE PAGE

REQUEST FOR QUOTATION (RFQ) FOR CALIBRATION GAS DILUTION SYSTEMS

TO: South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Attention: Procurement Manager

The undersigned, having carefully examined AQMD's specifications attached hereto, hereby proposed and agrees to the conditions stated in this quotation. If this quote is accepted by the AQMD, the undersigned agrees to the conditions as stated.

REQUEST FOR QUOTATION (RFQ) FOR CALIBRATION GAS DILUTION SYSTEMS
RFQ #Q2011-03

November 5, 2010

GENERAL

These specifications cover the requirements of the South Coast Air Quality Management District for Calibration Gas Dilution Systems for the ambient air monitoring network to continuously monitor levels of nitric oxide and nitrogen dioxide in ambient air.

MANUFACTURER QUALIFICATIONS

The manufacturer of the instrument offered shall have been engaged for a period of three or more years in the fabrication of Calibration Gas Dilution Systems of the type being sought and shall supply evidence of his/her financial and technical capabilities. The vendor shall supply the names, addresses and phone numbers or point of contact of at least four users of the instrument being offered.

EQUIPMENT AND SERVICES TO BE FURNISHED BY THE VENDOR

The vendor shall provide with the dilution system the following:

1. All accessories and specialized tools required for operation and necessary servicing of each dilution system for a period of one year after completion of acceptance testing.
2. One operating manual for each dilution system, twelve (12) additional operating manuals, twelve (12) service manuals and twelve (12) sets of electronic schematics and flow diagrams. In addition, electronic versions of all these should be provided.
3. One (1) copy of the report of calibration by the manufacturer for each dilution system.
4. Four (4) copies of a complete list of spare parts, including current prices.
5. A list of vendor's standard rates for time and travel of his/her service personnel.
6. The vendor shall provide delivery and training schedules within 30 days of contract approval.

TRAINING

Vendor shall provide a one-day training to include operation, routine servicing, calibration, repair, and non-routing servicing, using dilution system schematics, flow diagrams and written trouble shooting guidelines. Training must be itemized in the quoted price.

WARRANTY

1. Specifications: The vendor shall provide a written warranty that, for a period of a least one year following its acceptance, each dilution system, including its components, will meet the requirements listed above and will comply with the physical and performance specifications listed hereinafter. If there is a failure of any component or part in any dilution system during the warranty period, the vendor shall agree to replace such component or part at no cost in time to arrive at the South Coast Air Quality Management District within 72 hours of notification of the vendor.

2. Field Service: In the event a dilution system develops a malfunction which cannot be solved by the application of routine servicing procedures described in the operating and

service manual or by replacement of a part supplied under the warranty, the vendor shall agree to place the dilution system into proper operating condition within seven days after the arrival of service personnel or to provide an operational, equivalent dilution system within the same seven-day period for use as a substitute until the original dilution system has been repaired. During the first year following acceptance by the AQMD, the vendor shall agree to make no charge for this service at any location within the jurisdiction of the AQMD and to provide this service in time to comply with the terms of the warranty concerning total operating hours per year.

3. Spare Parts: The vendor shall agree to supply, on request, spare parts for dilution system for at least ten years following the date of acceptance by the AQMD. The vendor shall agree to place parts vendor manufactured in the hands of the AQMD within 15 days of receipt of the order. In the case of spare parts which the vendor does not manufacture, the vendor shall agree to either of the following: (1) place the parts requested in the hands of the AQMD within 45 days of receipt of the first order and within 15 days of receipt of subsequent orders, or (2) find and identify to the AQMD, within 15 days a convenient, reliable source of supply which will place parts in the hands of the AQMD within 30 days of the receipt of the order.

   The vendor shall warrant all replacement parts to be of quality equal or superior to the components in the original dilution system. Repairs or replacements accomplished under the warranty during the last 90 days of the warranty year shall be further warranted for a minimum period of 90 days following completion of the work or delivery of replacement parts.

   The vendor shall agree not to make any unreasonable increases in the prices of spare parts and in no case more than those necessary to offset actual increases in costs of labor and materials. The vendor shall warrant that the price charged the AQMD for spare parts are no higher than the prices charged the vendor's most favored customer.

   As part of the response to this RFQ, vendor shall provide an annual estimated cost of spare parts after expiration on the warranty period. The annual estimated cost shall be based on an anticipated 10-year life and vendor supplied failure rates. Vendors must provide supporting documentation to substantiate the failure rates quoted.

ACCEPTANCE TESTING

The dilution system(s) will be required to pass acceptance testing. Within ten days after the equipment delivery, the acceptance test shall be initiated. The acceptance test shall consist of checking the dilution system for compliance with the requirements listed above and those listed under "PHYSICAL SPECIFICATIONS" and "PERFORMANCE SPECIFICATIONS". The duration of the acceptance test shall be 30 days minimum and 60 days maximum. Representatives of the vendor shall have the option, but not the requirement, of setting up the dilution system and making it ready for acceptance testing.

If the dilution system does not meet the specifications listed, the dilution system will be rejected and the vendor will have one opportunity to repair or replace the dilution system to cure all defects. The dilution system will be returned to the vendor freight collect. If the dilution system fails, except for external causes, within a 30-day period, the vendor shall be given the opportunity to make any necessary corrections or replacements, including the entire dilution system, if necessary, after which another 30-day test shall be initiated. If, by the end of 70 days after the beginning of the first 30-day test, the dilution system has not met all specifications, including a 30-day period of continuous operation (with allowance for shut-downs due to external causes)

followed by compliance with the performance specifications and the acceptance tests, the dilution system shall be rejected and the order canceled.

PAYMENT:

Payment will be made within thirty (30) days after the completion of the acceptance test.

SHIPMENT:

The dilution system ordered, assembled and complete with all accessories, specialized tools, manuals, calibration reports and parts lists, shall be shipped, transportation prepaid, to:

South Coast Air Quality Management District

SPECIFICATIONS

The dilution system will be expected to meet the specifications listed below. Minor deviations to the specifications may be acceptable if the AQMD determines that the performance of the dilution system meets the AQMD's requirements. Any deviations from these specifications must be listed in detail by the vendor in the space provided or on a separate page.

Specifications for a Continuous Calibration Dilution System	
FUNCTIONAL REQUIREMENTS:	**Exceptions or Alternatives [(a)]**
FLOW SYSTEM 1. Shall be a microprocessor based unit capable of delivering and mixing precise blends of gases. 2. Shall include a clean air dilution MFC capable of delivering 0 to 20 SLPM with an accuracy of 1% full scale. 3. Shall include a cylinder gas MFC capable of delivering 0 to 100 SCCM with an accuracy of 1% full scale. 4. (optional) Shall include a second cylinder gas MFC capable of delivering 0 to 10 SCCM with an accuracy of 1% full scale. This option may be listed and itemized in the final quote. 5. Shall be capable of calculating dilution and span gas flows based on command concentration or by manual mode. 6. Response time for flows shall be <= 60 seconds (98%) 7. Shall be equipped with digital control inputs/ outputs (opto-isolated). 8. Shall be equipped with digital status outputs (opto-isolated).	

[(a)] Where no exceptions are taken or alternatives proposed, and the space provided is left blank, it is assumed that bidder does not take any exceptions to the specification. Should an exception be later found, where none was taken by the bidder, this may constitute grounds for disqualification

Specifications for a Continuous Calibration dilution system	
FUNCTIONAL REQUIREMENTS (cont.)	**Exceptions or Alternatives [(a)]**
9. Shall meet or exceed all EPA requirements for air monitoring gas dilution systems. 10. Shall be equipped with multi-event programming functionality to perform unattended automatic operation of the instrument over a seven-day schedule. 11. Shall be entirely user calibratible for MFC operation and ozone generator. Ozone Generator 1. Shall include a reliable ozone generator for providing precise ozone calibrations and NO2 gas phase titrations. 2. Shall be equipped with optical feedback control. 3. (optional) Shall be equipped with O3 photometer for O3 generator control. This item may be listed and itemized in the final bid. 4. Generator performance must meet or exceed U.S. EPA criteria for ozone transfer standards. 5. Shall be equipped with pressure compensation. 6. Ozone generator control shall be user selectable for voltage control, lamp feedback control, or photometer control modes*. 7. Preferred ozone concentration range should be 0.1-2 PPM. 8. Response time should be <= 180 seconds (98%)	

*If equipped with a photometer.

[(a)] Where no exceptions are taken or alternatives proposed, and the space provided is left blank, it is assumed that bidder does not take any exceptions to the specification. Should an exception be later found, where none was taken by the bidder, this may constitute grounds for disqualification

Specifications for a Continuous Calibration dilution system	
FUNCTIONAL REQUIREMENTS (cont.)	**Exceptions or Alternatives [(a)]**
PHYSICAL SPECIFICATIONS: 1. The front panel of each dilution system shall include all the controls and displays necessary to operate and calibrate the dilution system. 2. Shall have at least four cylinder gas input ports and one clean air (diluent) input port. 3. (optional) Shall have two output ports. Instrument should be capable of switching between the two ports through the use of a three way valve controlled by the instrument's firmware. This item may be listed and itemized in the final bid. 4. Shall have a digital read-out on the front panel that has the capability to continuously display the current status of gas dilutions and all relevant operational and diagnostic parameters. 5. All tubing in each dilution system shall have connections, controls and fittings that are designed for rapid, easy and repeated disassembly and reassembly as may be required for cleaning, repair, and installations. All tubing, connections, fittings and controls shall be constructed of materials that will not react with atmospheric or higher concentrations of NO, NO2, ozone or hydrocarbons. All ports must be of type 316 stainless steel 1/4 inch Swagelock - NO EXCEPTIONS. The materials, design and construction of tube fittings shall be such that no leaks will develop as a result of repeated disassembly and reassembly. All gas handling dilution system and components will be free of leaks.	

[(a)] Where no exceptions are taken or alternatives proposed, and the space provided is left blank, it is assumed that bidder does not take any exceptions to the specification. Should an exception be later found, where none was taken by the bidder, this may constitute grounds for disqualification

Specifications for a Continuous Calibration dilution system	
FUNCTIONAL REQUIREMENTS (cont.)	**Exceptions or Alternatives [(a)]**
6. Each dilution system shall be equipped with an RS-232 data communications port and an Ethernet data communications port. 7. Communication software shall be provided allowing for remote communication and operation of dilution system. 8. All components in each dilution system shall be mounted so that they can be easily and quickly serviced, removed and installed. All units and subunits shall be interchangeable and shall be of modular construction. 9. Rack Mount: with slides and brackets that are necessary for mounting in 19" wide by 25" deep instrument rack. 10. Power Requirements: 105 - 125 VAC, 60 Hz, less than 400 watts. 11. Operating Temperature Range: 15 - 35 deg. The dilution system shall meet all performance specifications when operated in this temperature range. Safe Operating Temperature Range: 5 - 40 deg. C. The dilution system shall not suffer any damage or require extraordinary maintenance when operated within this range. 12. Dilution system shall be unaffected by normal vibration associated with air monitoring instrument operation and vibration of normal transport. 13. Shall meet all performance specifications when operated at any elevation between sea level and 8000 feet. .	

[(a)] Where no exceptions are taken or alternatives proposed, and the space provided is left blank, it is assumed that bidder does not take any exceptions to the specification. Should an exception be later found, where none was taken by the bidder, this may constitute grounds for disqualification

TERMS AND CONDITIONS

TERMS AND CONDITIONS

1. Cash Discount Cash discount period will be computed either from the date of delivery and acceptance of the goods ordered or the date of receipt of correct and proper invoices, prepared in accordance with the terms of the purchase order, whichever is later.

2. Sales or Use Taxes Unless otherwise definitely specified, the prices quoted herein do not include sales or use
taxes.

3. Transportation Charges No charges for transportation, unloading, containers, packing, etc., will be allowed unless specified in vendor's quotation.

4. Infringement Indemnity Vendor shall defend at its expense any suit against the District based on a claim that any item furnished under this agreement or the normal sale thereof infringes any United States Letters Patent or copyright and shall pay costs and damages finally awarded in any such suit provided Vendor is notified in writing of the suit and given authority, information, and assistance at Vendor's expense for defense of same if the use of said item is enjoined as a result of such suit. Vendor at no expense to District shall obtain for District the right to use and sell said item or shall substitute an equivalent item acceptable to District and extend this patent indemnity thereto.

5. Force Majeure Neither District nor Vendor shall be liable or deemed to be in default for any delay or failure in performance under this agreement or interruption of services resulting, directly or indirectly, from acts of God, civil or military authority, acts of public enemy, war, strikes, labor disputes, shortages of suitable parts, materials, labor or transportation, or any similar cause beyond the reasonable control of District or Vendor.

6. Non-Discrimination In the performance of this agreement , Vendor shall not discriminate in recruiting, hiring, promotion, demotion, or termination practices on the basis of race, religious creed, color, national origin, ancestry, sex, age, or physical or mental disability and shall comply with the provisions of the California Fair Employment & Housing Act (Government Code Section 12900 et. seq.), the Federal Civil Rights Act of 1964 (P.L. 88-352) and all amendments thereto, Executive Order no. 11246 (30 Federal Register 12319), and all administrative rules and regulations issued pursuant to said Acts and Order. Vendor shall likewise require each subcontractor to comply with this paragraph and shall include in each subcontract language similar to this paragraph.

7. Federal, State, and Local Laws Vendor warrants that in the performance of this agreement it shall comply with all applicable Federal, State and local laws and ordinances and all lawful orders, rules and regulations hereunder.

8. Assignments and Subcontractors Neither this agreement or any interest herein nor claim hereunder may be assigned by Vendor voluntarily or by operation of law, nor may all or substantially all of this agreement be further subcontracted by Vendor without the prior written consent of District . Consent by District shall not be deemed to relieve Vendor of its obligations to comply with the requirements hereof.

9. Indemnification Vendor agrees to hold harmless, indemnify, and defend District, its officers, employees, agents, representatives, and successors-in-interest against any and all loss, damage, cost, or expenses which District, its officers, employees, agents, representatives, and successors-in-interest may incur or be required to pay by reason of any injury or property damage caused or incurred by Vendor, its employees, contractors, or agents in the performance of this agreement.

10. Termination In the event Vendor fails to comply with any term or condition of this agreement, or fails to provide the supplies or services in the manner agreed upon by the parties, this failure shall constitute a breach of the agreement. District at its sole discretion shall either notify the Vendor that it must cure this breach within fifteen (15) days of notice of breach or provide written notification of its intention to terminate this agreement.

District reserves the right to terminate this agreement for its convenience and will reimburse Vendor for actual costs incurred in performance of this agreement through the effective date of termination. Upon receipt of notice of termination, Vendor shall immediately take action not to incur any further obligations, cost, or expenses except as may be reasonably necessary to termination activities. All finished or unfinished materials procured or produced by Vendor hereunder shall, at the option of District, become District property upon the date of such termination.

11. Changes By written notice, District may, from time to time, order work suspension or make changes in quantities, drawings, specifications, place of delivery or delivery schedules, methods of shipment and packaging and/or property and services to be furnished by District. If a change causes an increase or decrease in the price of this agreement or in the time required for its performance, Vendor shall promptly notify District and assert its claim for adjustment within thirty (30) days after the change is ordered and an equitable adjustment shall be made to the agreement. However, nothing in this clause shall excuse Vendor from proceedings immediately with the agreement as changed.

12. Title and Risk of Loss Unless otherwise provided in this agreement, Vendor shall have title to and bear the risk of any loss of or damage to items purchased hereunder until they are delivered in conformity with this agreement at the F.O. B. point specified herein. Upon such delivery, title shall pass from Vendor to District and Vendor's responsibility for loss or damage shall cease, except for loss or damage resulting from Vendor's negligence. Passing of title upon such delivery shall not constitute acceptance of the item by the District.

13. Inspection and Acceptance All items are subject to final inspection and acceptance by District at destination notwithstanding any payment or prior inspection at Vendor's facilities. Final inspection will be made within a reasonable time after receipt of items hereunder.

14. Payment Unless otherwise provided in this agreement, terms are net 30 days.

Business Information Request

Dear SCAQMD Contractor/Supplier:

The South Coast Air Quality Management District (SCAQMD) is committed to ensuring that our contractor/supplier records are current and accurate. If your firm is selected for award of a purchase order or contract, it is imperative that the information requested herein be supplied in a timely manner to facilitate payment of invoices. In order to process your payments, we need the enclosed information regarding your account. **Please review and complete the information identified on the following pages, complete the enclosed W-9 form, remember to sign both documents for our files, and return them as soon as possible to the address below:**

Attention: Accounts Payable, Accounting Department
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765-4178

If you do not return this information, we will not be able to establish you as a vendor. This will delay any payments and would still necessitate your submittal of the enclosed information to our Accounting department before payment could be initiated. Completion of this document and enclosed forms would ensure that your payments are processed timely and accurately.

If you have any questions or need assistance in completing this information, please contact Accounting at (909) 396-3777. We appreciate your cooperation in completing this necessary information.

Sincerely,

Michael B. O'Kelly
Chief Financial Officer

DISADVANTAGED BUSINESS CERTIFICATION

Federal guidance for utilization of disadvantaged business enterprises allows a vendor to be deemed a small business enterprise (SBE), minority business enterprise (MBE) or women business enterprise (WBE) if it meets the criteria below.

- is certified by the Small Business Administration or
- is certified by a state or federal agency or
- is an independent MBE(s) or WBE(s) business concern which is at least 51 percent owned and controlled by minority group member(s) who are citizens of the United States.

Statements of certification:

As a prime contractor to the SCAQMD,_____(name of business) will engage in good faith efforts to achieve the fair share in accordance with 40 CFR Section 31.36(e), and will follow the six affirmative steps listed below **for contracts or purchase orders funded in whole or in part by federal grants and contracts.**

1. Place qualified SBEs, MBEs, and WBEs on solicitation lists.
2. Assure that SBEs, MBEs, and WBEs are solicited whenever possible.
3. When economically feasible, divide total requirements into small tasks or quantities to permit greater participation by SBEs, MBEs, and WBEs.
4. Establish delivery schedules, if possible, to encourage participation by SBEs, MBEs, and WBEs.
5. Use services of Small Business Administration, Minority Business Development Agency of the Department of Commerce, and/or any agency authorized as a clearinghouse for SBEs, MBEs, and WBEs.
6. If subcontracts are to be let, take the above affirmative steps.

Self-Certification Verification: Also for use in awarding additional points, as applicable**, in accordance with SCAQMD Procurement Policy and Procedure:**

Definitions

Disabled Veteran-Owned Business Enterprise means a business that meets all of the following criteria:

- is a sole proprietorship or partnership of which is at least 51 percent owned by one or more disabled veterans, or in the case of any business whose stock is publicly held, at least 51 percent of the stock is owned by one or more disabled veterans; a subsidiary which is wholly owned by a parent corporation but only if at least 51 percent of the voting stock of the parent corporation is owned by one or more disabled veterans; or a joint venture in which at least 51 percent of the joint venture's management and control and earnings are held by one or more disabled veterans.
- the management and control of the daily business operations are by one or more disabled veterans. The disabled veterans who exercise management and control are not required to be the same disabled veterans as the owners of the business.
- is a sole proprietorship, corporation, partnership, or joint venture with its primary headquarters office located in the United States and which is not a branch or subsidiary of a foreign corporation, firm, or other foreign-based business.

Joint Venture means that one party to the joint venture is a DVBE and owns at least 51 percent of the joint venture. In the case of a joint venture formed for a single project this means that DVBE will receive at least 51 percent of the project dollars.

Local Business means a business that meets all of the following criteria:

- has an ongoing business within the boundary of the SCAQMD at the time of bid application.
- performs 90 percent of the work within SCAQMD's jurisdiction.

Minority-Owned Business Enterprise means a business that meets all of the following criteria:

- is at least 51 percent owned by one or more minority persons or in the case of any business whose stock is publicly held, at least 51 percent of the stock is owned by one or more minority persons.
- is a business whose management and daily business operations are controlled or owned by one or more minority person.
- is a business which is a sole proprietorship, corporation, partnership, joint venture, an association, or a cooperative with its primary headquarters office located in the United States, which is not a branch or subsidiary of a foreign corporation, foreign firm, or other foreign business.

"Minority" person means a Black American, Hispanic American, Native American (including American Indian, Eskimo, Aleut, and Native Hawaiian), Asian-Indian American (including a person whose origins are from India, Pakistan, or Bangladesh), Asian-Pacific American (including a person whose origins are from Japan, China, the Philippines, Vietnam, Korea, Samoa, Guam, the United States Trust Territories of the Pacific, Northern Marianas, Laos, Cambodia, or Taiwan).

Small Business Enterprise means a business that meets the following criteria:

a. 1) an independently owned and operated business; 2) not dominant in its field of operation; 3) together with affiliates is either:

   - A service, construction, or non-manufacturer with 100 or fewer employees, and average annual gross receipts of ten million dollars ($10,000,000) or less over the previous three years, or
   - A manufacturer with 100 or fewer employees.

b. Manufacturer means a business that is both of the following:

   1) Primarily engaged in the chemical or mechanical transformation of raw materials or processed substances into new products.

   2) Classified between Codes 311000 to 339000, inclusive, of the North American Industrial Classification System (NAICS) Manual published by the United States Office of Management and Budget, 2007 edition.

Small Business Joint Venture means that one party to the joint venture is a Small Business and owns at least 51 percent of the joint venture. In the case of a joint venture formed for a single project this means that the Small Business will receive at least 51 percent of the project dollars.

Women-Owned Business Enterprise means a business that meets all of the following criteria:

- is at least 51 percent owned by one or more women or in the case of any business whose stock is publicly held, at least 51 percent of the stock is owned by one or more women.
- is a business whose management and daily business operations are controlled or owned by one or more women.
- is a business which is a sole proprietorship, corporation, partnership, or a joint venture, with its primary headquarters office located in the United States, which is not a branch or subsidiary of a foreign corporation, foreign firm, or other foreign business.

Form **W-9**
(Rev. January 2005)
Department of the Treasury
Internal Revenue Service

Request for Taxpayer Identification Number and Certification

Give form to the requester. Do not send to the IRS.

Print or type
See Specific Instructions on page 2.

Name (as shown on your income tax return)

Business name, if different from above

Check appropriate box: ☐ Individual/ Sole proprietor ☐ Corporation ☐ Partnership ☐ Other ► _____ ☐ Exempt from backup withholding

Address (number, street, and apt. or suite no.) | Requester's name and address (optional)

City, state, and ZIP code

List account number(s) here (optional)

Part I Taxpayer Identification Number (TIN)

Enter your TIN in the appropriate box. The TIN provided must match the name given on Line 1 to avoid backup withholding. For individuals, this is your social security number (SSN). However, for a resident alien, sole proprietor, or disregarded entity, see the Part I instructions on page 3. For other entities, it is your employer identification number (EIN). If you do not have a number, see *How to get a TIN* on page 3.

Note. *If the account is in more than one name, see the chart on page 4 for guidelines on whose number to enter.*

Social security number
___ ___ ___ – ___ ___ – ___ ___ ___ ___

or

Employer identification number
___ ___ – ___ ___ ___ ___ ___ ___ ___

Part II Certification

Under penalties of perjury, I certify that:

1. The number shown on this form is my correct taxpayer identification number (or I am waiting for a number to be issued to me), and
2. I am not subject to backup withholding because: (a) I am exempt from backup withholding, or (b) I have not been notified by the Internal Revenue Service (IRS) that I am subject to backup withholding as a result of a failure to report all interest or dividends, or (c) the IRS has notified me that I am no longer subject to backup withholding, and
3. I am a U.S. person (including a U.S. resident alien).

Certification instructions. You must cross out item 2 above if you have been notified by the IRS that you are currently subject to backup withholding because you have failed to report all interest and dividends on your tax return. For real estate transactions, item 2 does not apply. For mortgage interest paid, acquisition or abandonment of secured property, cancellation of debt, contributions to an individual retirement arrangement (IRA), and generally, payments other than interest and dividends, you are not required to sign the Certification, but you must provide your correct TIN. (See the instructions on page 4.)

Sign Here Signature of U.S. person ► Date ►

Purpose of Form

A person who is required to file an information return with the IRS, must obtain your correct taxpayer identification number (TIN) to report, for example, income paid to you, real estate transactions, mortgage interest you paid, acquisition or abandonment of secured property, cancellation of debt, or contributions you made to an IRA.

U.S. person. Use Form W-9 only if you are a U.S. person (including a resident alien), to provide your correct TIN to the person requesting it (the requester) and, when applicable, to:

1. Certify that the TIN you are giving is correct (or you are waiting for a number to be issued),
2. Certify that you are not subject to backup withholding, or
3. Claim exemption from backup withholding if you are a U.S. exempt payee.

Note. *If a requester gives you a form other than Form W-9 to request your TIN, you must use the requester's form if it is substantially similar to this Form W-9.*

For federal tax purposes you are considered a person if you are:

- An individual who is a citizen or resident of the United States,
- A partnership, corporation, company, or association created or organized in the United States or under the laws of the United States, or
- Any estate (other than a foreign estate) or trust. See Regulations sections 301.7701-6(a) and 7(a) for additional information.

Foreign person. If you are a foreign person, do not use Form W-9. Instead, use the appropriate Form W-8 (see Publication 515, Withholding of Tax on Nonresident Aliens and Foreign Entities).

Nonresident alien who becomes a resident alien. Generally, only a nonresident alien individual may use the terms of a tax treaty to reduce or eliminate U.S. tax on certain types of income. However, most tax treaties contain a provision known as a "saving clause." Exceptions specified in the saving clause may permit an exemption from tax to continue for certain types of income even after the recipient has otherwise become a U.S. resident alien for tax purposes.

If you are a U.S. resident alien who is relying on an exception contained in the saving clause of a tax treaty to claim an exemption from U.S. tax on certain types of income, you must attach a statement to Form W-9 that specifies the following five items:

1. The treaty country. Generally, this must be the same treaty under which you claimed exemption from tax as a nonresident alien.
2. The treaty article addressing the income.
3. The article number (or location) in the tax treaty that contains the saving clause and its exceptions.

4. The type and amount of income that qualifies for the exemption from tax.

5. Sufficient facts to justify the exemption from tax under the terms of the treaty article.

Example. Article 20 of the U.S.-China income tax treaty allows an exemption from tax for scholarship income received by a Chinese student temporarily present in the United States. Under U.S. law, this student will become a resident alien for tax purposes if his or her stay in the United States exceeds 5 calendar years. However, paragraph 2 of the first Protocol to the U.S.-China treaty (dated April 30, 1984) allows the provisions of Article 20 to continue to apply even after the Chinese student becomes a resident alien of the United States. A Chinese student who qualifies for this exception (under paragraph 2 of the first protocol) and is relying on this exception to claim an exemption from tax on his or her scholarship or fellowship income would attach to Form W-9 a statement that includes the information described above to support that exemption.

If you are a nonresident alien or a foreign entity not subject to backup withholding, give the requester the appropriate completed Form W-8.

What is backup withholding? Persons making certain payments to you must under certain conditions withhold and pay to the IRS 28% of such payments (after December 31, 2002). This is called "backup withholding." Payments that may be subject to backup withholding include interest, dividends, broker and barter exchange transactions, rents, royalties, nonemployee pay, and certain payments from fishing boat operators. Real estate transactions are not subject to backup withholding.

You will not be subject to backup withholding on payments you receive if you give the requester your correct TIN, make the proper certifications, and report all your taxable interest and dividends on your tax return.

Payments you receive will be subject to backup withholding if:

1. You do not furnish your TIN to the requester, or

2. You do not certify your TIN when required (see the Part II instructions on page 4 for details), or

3. The IRS tells the requester that you furnished an incorrect TIN, or

4. The IRS tells you that you are subject to backup withholding because you did not report all your interest and dividends on your tax return (for reportable interest and dividends only), or

5. You do not certify to the requester that you are not subject to backup withholding under 4 above (for reportable interest and dividend accounts opened after 1983 only).

Certain payees and payments are exempt from backup withholding. See the instructions below and the separate Instructions for the Requester of Form W-9.

Penalties

Failure to furnish TIN. If you fail to furnish your correct TIN to a requester, you are subject to a penalty of $50 for each such failure unless your failure is due to reasonable cause and not to willful neglect.

Civil penalty for false information with respect to withholding. If you make a false statement with no reasonable basis that results in no backup withholding, you are subject to a $500 penalty.

Criminal penalty for falsifying information. Willfully falsifying certifications or affirmations may subject you to criminal penalties including fines and/or imprisonment.

Misuse of TINs. If the requester discloses or uses TINs in violation of federal law, the requester may be subject to civil and criminal penalties.

Specific Instructions

Name

If you are an individual, you must generally enter the name shown on your social security card. However, if you have changed your last name, for instance, due to marriage without informing the Social Security Administration of the name change, enter your first name, the last name shown on your social security card, and your new last name.

If the account is in joint names, list first, and then circle, the name of the person or entity whose number you entered in Part I of the form.

Sole proprietor. Enter your individual name as shown on your social security card on the "Name" line. You may enter your business, trade, or "doing business as (DBA)" name on the "Business name" line.

Limited liability company (LLC). If you are a single-member LLC (including a foreign LLC with a domestic owner) that is disregarded as an entity separate from its owner under Treasury regulations section 301.7701-3, enter the owner's name on the "Name" line. Enter the LLC's name on the "Business name" line. Check the appropriate box for your filing status (sole proprietor, corporation, etc.), then check the box for "Other" and enter "LLC" in the space provided.

Other entities. Enter your business name as shown on required Federal tax documents on the "Name" line. This name should match the name shown on the charter or other legal document creating the entity. You may enter any business, trade, or DBA name on the "Business name" line.

Note. You are requested to check the appropriate box for your status (individual/sole proprietor, corporation, etc.).

Exempt From Backup Withholding

If you are exempt, enter your name as described above and check the appropriate box for your status, then check the "Exempt from backup withholding" box in the line following the business name, sign and date the form.

Generally, individuals (including sole proprietors) are not exempt from backup withholding. Corporations are exempt from backup withholding for certain payments, such as interest and dividends.

Note. If you are exempt from backup withholding, you should still complete this form to avoid possible erroneous backup withholding.

Exempt payees. Backup withholding is not required on any payments made to the following payees:

1. An organization exempt from tax under section 501(a), any IRA, or a custodial account under section 403(b)(7) if the account satisfies the requirements of section 401(f)(2),

2. The United States or any of its agencies or instrumentalities,

3. A state, the District of Columbia, a possession of the United States, or any of their political subdivisions or instrumentalities,

4. A foreign government or any of its political subdivisions, agencies, or instrumentalities, or

5. An international organization or any of its agencies or instrumentalities.

Other payees that may be exempt from backup withholding include:

6. A corporation,

7. A foreign central bank of issue,

8. A dealer in securities or commodities required to register in the United States, the District of Columbia, or a possession of the United States,

9. A futures commission merchant registered with the Commodity Futures Trading Commission,

10. A real estate investment trust,

11. An entity registered at all times during the tax year under the Investment Company Act of 1940,

12. A common trust fund operated by a bank under section 584(a),

13. A financial institution,

14. A middleman known in the investment community as a nominee or custodian, or

15. A trust exempt from tax under section 664 or described in section 4947.

The chart below shows types of payments that may be exempt from backup withholding. The chart applies to the exempt recipients listed above, 1 through 15.

IF the payment is for . . .	THEN the payment is exempt for . . .
Interest and dividend payments	All exempt recipients except for 9
Broker transactions	Exempt recipients 1 through 13. Also, a person registered under the Investment Advisers Act of 1940 who regularly acts as a broker
Barter exchange transactions and patronage dividends	Exempt recipients 1 through 5
Payments over $600 required to be reported and direct sales over $5,000 [1]	Generally, exempt recipients 1 through 7 [2]

[1] See Form 1099-MISC, Miscellaneous Income, and its instructions.

[2] However, the following payments made to a corporation (including gross proceeds paid to an attorney under section 6045(f), even if the attorney is a corporation) and reportable on Form 1099-MISC are not exempt from backup withholding: medical and health care payments, attorneys' fees; and payments for services paid by a Federal executive agency.

Part I. Taxpayer Identification Number (TIN)

Enter your TIN in the appropriate box. If you are a resident alien and you do not have and are not eligible to get an SSN, your TIN is your IRS individual taxpayer identification number (ITIN). Enter it in the social security number box. If you do not have an ITIN, see *How to get a TIN* below.

If you are a sole proprietor and you have an EIN, you may enter either your SSN or EIN. However, the IRS prefers that you use your SSN.

If you are a single-owner LLC that is disregarded as an entity separate from its owner (see *Limited liability company (LLC)* on page 2), enter your SSN (or EIN, if you have one). If the LLC is a corporation, partnership, etc., enter the entity's EIN.

Note. See the chart on page 4 for further clarification of name and TIN combinations.

How to get a TIN. If you do not have a TIN, apply for one immediately. To apply for an SSN, get Form SS-5, Application for a Social Security Card, from your local Social Security Administration office or get this form online at *www.socialsecurity.gov/online/ss-5.pdf*. You may also get this form by calling 1-800-772-1213. Use Form W-7, Application for IRS Individual Taxpayer Identification Number, to apply for an ITIN, or Form SS-4, Application for Employer Identification Number, to apply for an EIN. You can apply for an EIN online by accessing the IRS website at *www.irs.gov/businesses/* and clicking on Employer ID Numbers under Related Topics. You can get Forms W-7 and SS-4 from the IRS by visiting *www.irs.gov* or by calling 1-800-TAX-FORM (1-800-829-3676).

If you are asked to complete Form W-9 but do not have a TIN, write "Applied For" in the space for the TIN, sign and date the form, and give it to the requester. For interest and dividend payments, and certain payments made with respect to readily tradable instruments, generally you will have 60 days to get a TIN and give it to the requester before you are subject to backup withholding on payments. The 60-day rule does not apply to other types of payments. You will be subject to backup withholding on all such payments until you provide your TIN to the requester.

Note. Writing "Applied For" means that you have already applied for a TIN or that you intend to apply for one soon.

Caution: *A disregarded domestic entity that has a foreign owner must use the appropriate Form W-8.*

Part II. Certification

To establish to the withholding agent that you are a U.S. person, or resident alien, sign Form W-9. You may be requested to sign by the withholding agent even if items 1, 4, and 5 below indicate otherwise.

For a joint account, only the person whose TIN is shown in Part I should sign (when required). Exempt recipients, see *Exempt From Backup Withholding* on page 2.

Signature requirements. Complete the certification as indicated in 1 through 5 below.

1. Interest, dividend, and barter exchange accounts opened before 1984 and broker accounts considered active during 1983. You must give your correct TIN, but you do not have to sign the certification.

2. Interest, dividend, broker, and barter exchange accounts opened after 1983 and broker accounts considered inactive during 1983. You must sign the certification or backup withholding will apply. If you are subject to backup withholding and you are merely providing your correct TIN to the requester, you must cross out item 2 in the certification before signing the form.

3. Real estate transactions. You must sign the certification. You may cross out item 2 of the certification.

4. Other payments. You must give your correct TIN, but you do not have to sign the certification unless you have been notified that you have previously given an incorrect TIN. "Other payments" include payments made in the course of the requester's trade or business for rents, royalties, goods (other than bills for merchandise), medical and health care services (including payments to corporations), payments to a nonemployee for services, payments to certain fishing boat crew members and fishermen, and gross proceeds paid to attorneys (including payments to corporations).

5. Mortgage interest paid by you, acquisition or abandonment of secured property, cancellation of debt, qualified tuition program payments (under section 529), IRA, Coverdell ESA, Archer MSA or HSA contributions or distributions, and pension distributions. You must give your correct TIN, but you do not have to sign the certification.

What Name and Number To Give the Requester

For this type of account:	Give name and SSN of:
1. Individual	The individual
2. Two or more individuals (joint account)	The actual owner of the account or, if combined funds, the first individual on the account [1]
3. Custodian account of a minor (Uniform Gift to Minors Act)	The minor [2]
4. a. The usual revocable savings trust (grantor is also trustee)	The grantor-trustee [1]
b. So-called trust account that is not a legal or valid trust under state law	The actual owner [1]
5. Sole proprietorship or single-owner LLC	The owner [3]
For this type of account:	**Give name and EIN of:**
6. Sole proprietorship or single-owner LLC	The owner [3]
7. A valid trust, estate, or pension trust	Legal entity [4]
8. Corporate or LLC electing corporate status on Form 8832	The corporation
9. Association, club, religious, charitable, educational, or other tax-exempt organization	The organization
10. Partnership or multi-member LLC	The partnership
11. A broker or registered nominee	The broker or nominee
12. Account with the Department of Agriculture in the name of a public entity (such as a state or local government, school district, or prison) that receives agricultural program payments	The public entity

[1] List first and circle the name of the person whose number you furnish. If only one person on a joint account has an SSN, that person's number must be furnished.

[2] Circle the minor's name and furnish the minor's SSN.

[3] You must show your individual name and you may also enter your business or "DBA" name on the second name line. You may use either your SSN or EIN (if you have one). If you are a sole proprietor, IRS encourages you to use your SSN.

[4] List first and circle the name of the legal trust, estate, or pension trust. (Do not furnish the TIN of the personal representative or trustee unless the legal entity itself is not designated in the account title.)

Note. If no name is circled when more than one name is listed, the number will be considered to be that of the first name listed.

Privacy Act Notice

Section 6109 of the Internal Revenue Code requires you to provide your correct TIN to persons who must file information returns with the IRS to report interest, dividends, and certain other income paid to you, mortgage interest you paid, the acquisition or abandonment of secured property, cancellation of debt, or contributions you made to an IRA, or Archer MSA or HSA. The IRS uses the numbers for identification purposes and to help verify the accuracy of your tax return. The IRS may also provide this information to the Department of Justice for civil and criminal litigation, and to cities, states, and the District of Columbia to carry out their tax laws. We may also disclose this information to other countries under a tax treaty, to federal and state agencies to enforce federal nontax criminal laws, or to federal law enforcement and intelligence agencies to combat terrorism.

You must provide your TIN whether or not you are required to file a tax return. Payers must generally withhold 28% of taxable interest, dividend, and certain other payments to a payee who does not give a TIN to a payer. Certain penalties may also apply.

United State Environmental Protection Agency
Washington, DC 20460

Certification Regarding
Debarment, Suspension, and Other Responsibility Matters

The prospective participant certifies to the best of its knowledge and belief that it and the principals:

(a) Are not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from covered transactions by any Federal department or agency;

(b) Have not within a three year period preceding this proposal been convicted of or had a civil judgement rendered against them or commission of fraud or a criminal offense in connection with obtaining, attempting to obtain, or performing a public (Federal, State, or local) transaction or contract under a public transaction: violation of Federal or State antitrust statute or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements, or receiving stolen property:

(c) Are not presently indicted for or otherwise criminally or civilly charged by a government entity (Federal, State, or local) with commission of any of the offenses enumerated in paragraph (1)(b) of this certification; and

(d) Have not within a three-year period preceding this application/proposal had one or more public transactions (Federal, State, or local) terminated for cause or default.

I understand that a false statement on this certification may be grounds for rejection of this proposal or termination of the award. In addition, under 18 USC Sec. 1001, a false statement may result in a fine of up to $10,000 or imprisonment for up to 5 years, or both.

CAMPAIGN CONTRIBUTIONS DISCLOSURE

California law prohibits a party, or an agent, from making campaign contributions to AQMD Governing Board Members or members/alternates of the Mobile Source Pollution Reduction Committee (MSRC) of $250 or more while their contract or permit is pending before the AQMD; and further prohibits a campaign contribution from being made for three (3) months following the date of the final decision by the Governing Board or the MSRC on a donor's contract or permit. Gov't Code §84308(d). For purposes of reaching the $250 limit, the campaign contributions of the bidder or contractor *plus* contributions by its parents, affiliates, and related companies of the contractor or bidder are added together. 2 C.C.R. §18438.5.

In addition, Board Members or members/alternates of the MSRC must abstain from voting on a contract or permit if they have received a campaign contribution from a party or participant to the proceeding, or agent, totaling $250 or more in the 12-month period prior to the consideration of the item by the Governing Board or the MSRC. Gov't Code §84308(c). When abstaining, the Board Member or members/alternates of the MSRC must announce the source of the campaign contribution on the record. *Id*. The requirement to abstain is triggered by campaign contributions of $250 or more in total contributions of the bidder or contractor, *plus* any of its parent, subsidiary, or affiliated companies. 2 C.C.R. §18438.5.

In accordance with California law, bidders and contracting parties are required to disclose, at the time the application is filed, information relating to any campaign contributions made to Board Members or members/alternates of the MSRC, including: the name of the party making the contribution (which includes any parent, subsidiary or otherwise related business entity, as defined below), the amount of the contribution, and the date the contribution was made. 2 C.C.R. §18438.8(b).

The list of current AQMD Governing Board Members can be found at the AQMD website (www.aqmd.gov). The list of current MSRC members/alternates can be found at the MSRC website (http://www.cleantransportationfunding.org).

DEFINITIONS

Parent, Subsidiary, or Otherwise Related Business Entity.

(1) Parent subsidiary. A parent subsidiary relationship exists when one corporation directly or indirectly owns shares possessing more than 50 percent of the voting power of another corporation.

(2) Otherwise related business entity. Business entities, including corporations, partnerships, joint ventures and any other organizations and enterprises operated for profit, which do not have a parent subsidiary relationship are otherwise related if any one of the following three tests is met:

(A) One business entity has a controlling ownership interest in the other business entity.

(B) There is shared management and control between the entities. In determining whether there is shared management and control, consideration should be given to the following factors:

- ***(i) The same person or substantially the same person owns and manages the two entities;***
- ***(ii) There are common or commingled funds or assets;***
- ***(iii) The business entities share the use of the same offices or employees, or otherwise share activities, resources or personnel on a regular basis;***
- ***(iv) There is otherwise a regular and close working relationship between the entities; or***

(C) A controlling owner (50% or greater interest as a shareholder or as a general partner) in one entity also is a controlling owner in the other entity.

2 Cal. Code of Regs., §18703.1(d).

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 8

PROPOSAL: Execute Contracts to Conduct Conceptual Feasibility Studies for Reduction of Near Roadway Pollutant Exposures

SYNOPSIS: Numerous air monitoring and health studies document elevated pollution levels and health risks in areas immediately adjacent to busy roadways and freeways. In addition to reducing on-road tailpipe emissions, other mitigation measures may be effective in reducing the pollution exposure of those living, working or playing in these affected areas. On March 5, 2010, an RFP was released for conceptual research studies to assess the feasibility and cost-effectiveness of roadside pollution mitigation measures, and six proposals were received. Based on the results of the technical evaluation process, this action is to execute three contracts in a total amount not to exceed $250,000 to study the reduction of pollutant exposures using near roadway mitigation measures.

COMMITTEE: Technology, October 15, 2010, Recommended for Approval

RECOMMENDED ACTION:
Authorize the Chairman to execute the following contracts to study near roadway pollutant exposure mitigation measures:

1. University of California, Riverside in an amount not to exceed $113,268;
2. Sierra Research, Inc. in an amount not to exceed $84,900; and
3. The Planning Center in an amount not to exceed $51,832

for a total not to exceed $250,000 from the Rule 1309.1 Priority Reserve Fund (Fund 36).

Barry R. Wallerstein, D.Env.
Executive Officer

CSL:PMF:cv

Background
Numerous air monitoring studies near freeways have demonstrated significantly elevated pollutants in immediately adjacent areas. Population exposure to diesel particulate matter and ultrafine particles can be 2-10 times higher near freeways and busy roadways. Recent health studies have shown that living or going to school next to these busy roads leads to an increased risk of adverse health effects.

The primary and most obvious approach to reducing these elevated exposures and health impacts is to reduce tailpipe emissions from on-road vehicles. However, other technologies and mitigation measures have the potential to also reduce exposure to roadway pollution. Sound walls and vegetation barriers have been shown to have some effect on lowering pollutant levels immediately downwind of freeways. Elevated or sunken roadways also have effects on downwind pollution levels. Enhanced filtration systems have been shown to reduce ultrafine and black carbon particle levels indoors. There may be other solutions which act to remove or deflect pollutants after they are emitted, but before they are inhaled by affected populations. However, much more work needs to be done to explore, assess, and develop solutions of this type.

Request for Proposals
On March 5, 2010, the Board authorized the release of RFP #P2010-18 soliciting bids to conduct conceptual research studies on the feasibility, design, cost, and benefits of one or more solutions to reduce near roadway exposure to pollutants. Both active and passive designs were to be assessed and compared. Passive designs include construction of sound walls, tree-lines, sunken roadways, or raised roadways that act to reduce near roadway exposure to emission from on-road vehicles. Active designs include roadside filtration, absorption, or scrubbing devices, installing enhanced filtration systems within roadside residences and schools, or air active flow diversion solutions. Pollutants of interest include ultrafine particles, PM2.5, PM10, Diesel PM, air toxics, and NOx.

Bidders were asked to describe in detail conceptual feasibility studies that include background research, proposed designs, calculated/modeled effectiveness, and cost/benefit analyses relative to more standard solutions (such as tailpipe controls). It was anticipated that several proposals would be selected, with the total amount awarded to all successful bids not exceeding $250,000 from the Rule 1309.1 Priority Reserve Fund (Fund 36).

Evaluation of Proposals
Six proposals were received by the RFP deadline of April 9, 2010. Proposals were evaluated for their technical merit by a panel consisting of two AQMD Air Quality Specialists, one from Science & Technology Advancement and one from Planning & Rules; a Division Chief from the California Air Resources Board, and a Senior

Transportation Engineer from the California Department of Transportation. The panel makeup relative to ethnicity and gender is as follows: two Asian, one Hispanic and one Caucasian; four males. The evaluation process was conducted according to the criteria described in the RFP. Scoring was based on the bidder's qualifications, technical approach, and management plan. A minimum of 56 technical points was required for a proposal to qualify for funding. The proposal evaluation results are given in Attachment A.

Of the six proposals received, two did not meet the minimum technical score according to the panel's evaluation. These two were not given scores for cost-effectiveness as they were disqualified from consideration based on their technical merits.

The study proposed by Sierra Research will identify multiple roadside barrier designs, model the effects with dispersion models, and then perform a multiday field monitoring study at a roadside location. The study proposed by Professor Princevac at UC Riverside will employ advanced fluid mechanics modeling to multiple roadside barrier configurations in conjunction with laboratory-scale models of the barriers. The study proposed by the Planning Center will use dispersion modeling to evaluate the impact of sound walls, vegetation lines, and other mitigation measures on the pollution levels of multiple pollutants indoors and outdoors downwind of freeways and perform a cost-benefit analysis compared to tail-pipe controls. The study proposed by Professor Venkatram at UC Riverside will develop a semi-empirical dispersion model to evaluate the effectiveness of roadside barriers and validate the model with wind tunnel experiments. Given the overlap between the two UC Riverside proposals and the fact that both investigators are in the same department at UC Riverside, the investigators were asked whether they could collaborate under one contract at a cost less than the sum of the two proposals. Both UC Riverside investigators have agreed to this approach.

The majority of the work in the proposed studies involves the evaluation of passive measures such as roadside barriers or roadway configurations. Staff will continue to evaluate the feasibility of active filtration approaches to reduce near roadway exposures, and may propose future RFPs for research and design of active pollution removal methods.

Recommendation

Staff recommends that AQMD fund all proposed projects that met the minimum technical score in a total amount not to exceed $250,000. With the combination of the two UC Riverside proposals, staff proposes awarding a total of three contracts: University of California, Riverside in an amount not to exceed $113,268; Sierra Research, Inc. in an amount not to exceed $84,900; and The Planning Center in an amount not to exceed $51,832.

Benefits to AQMD
These research contracts will advance the AQMD's mission of reducing the exposure of southern Californians to harmful air pollution. An evaluation of roadside mitigation measures will provide a basis for AQMD to inform and make recommendations to the public and transportation design agencies on the effectiveness and feasibility of such measures.

Resource Impacts
The total amount of AQMD funding for the program will not exceed $250,000. Sufficient funds are available in the Rule 1309.1 Priority Reserve Fund (Fund 36).

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 9

PROPOSAL: Execute Contract To Provide Technical Assistance for Alternative-Fueled Trucks Funded Under AQMD's Heavy-Duty Diesel Truck Replacement Program

SYNOPSIS: The AQMD has received grant awards from the Department of Energy and Environmental Protection Agency for LNG truck projects approved under AQMD's Heavy-Duty Diesel Truck Replacement Program, including administrative funds. AQMD's administration of the program consists of project outreach and solicitation, project evaluation, inspections, contracting, invoice processing, project monitoring and other activities to comply with all program requirements. AQMD is required to monitor the operation of each LNG truck on a quarterly basis for a period of two years. This action is to execute a contract with Clean Fuel Connection to provide technical assistance for quarterly reporting and other program administrative activities in an amount not to exceed $80,000.

COMMITTEE: Technology, October 15, 2010, Recommended for Approval

RECOMMENDED ACTIONS:
Authorize the Chairman to execute a contract with Clean Fuel Connection to provide technical assistance for quarterly reporting and other program administrative activities in an amount not to exceed $80,000 from the Proposition 1B–Goods Movement Program Fund (81), comprised of $40,000 each from the Department of Energy's (DOE) and the U.S. Environmental Protection Agency's (U.S. EPA) portion of the administrative funds.

Barry R. Wallerstein, D.Env.
Executive Officer

CSL:MMM:FM:VW

Background
The AQMD has received grant awards from the DOE and U.S. EPA, including administrative funds, to help fund the replacement of older heavy-duty diesel trucks used for goods movement with newer, low-emitting alternative fueled trucks. AQMD's program administration includes, but is not limited to, project outreach and solicitation, project evaluation, inspections, contracting, invoice processing, and project monitoring. Under both federal grants, AQMD is required to monitor the operation of each LNG truck on a quarterly basis for a period of two years. This involves the collection of operational information from the truck owners/operators, such as fuel usage and mileage data, after the end of each quarter for a period of two years. AQMD is also responsible for other administrative tasks, such as monitoring the overall performance of the program and keeping track of any changes in ownership of the alternative-fueled vehicles, to insure full compliance with the terms and conditions of the grant awards.

Proposal
AQMD requires technical assistance to help administer grant requirements affecting the alternative-fueled trucks funded under AQMD's Heavy-Duty Truck Replacement Program, including trucks funded by the Proposition 1B Program. AQMD was awarded grant funds from the DOE and U.S. EPA, including administrative funds, for this program. Both federal grants require AQMD to submit quarterly and annual reports documenting actual miles traveled by each alternative-fueled vehicle and other operational information. AQMD is also required to track ownership changes for each vehicle and monitor the overall performance of the program. This action is to execute a contract with Clean Fuel Connection to provide technical assistance for program administrative activities in an amount not to exceed $80,000 from the Proposition 1B-Goods Movement Program Fund (81), comprised of $40,000 each from the DOE's and the U.S. EPA's portion of the administrative funds.

Sole Source Justification
Section VIII.B.2 of the Procurement Policy and Procedures identifies four major provisions under which a sole source award may be justified. This request is for a sole source award pursuant to the provision B.2.d: Other circumstances exist which in the determination of the Executive Officer require such waiver in the best interest of the AQMD. Specifically, the circumstances that apply to this sole source award are: B.2.d. (4) Level-of-effort expert consultation services. Clean Fuel Connection has assisted AQMD with implementing a wide-array of incentive programs to deploy lower-emitting heavy-duty vehicles and advanced transportation technologies. Clean Fuel Connection's Principal, Ms. Enid Joffe, has over 15 years of experience with zero-emission and low-emission technologies and has extensive experience and professional knowledge about the feasibility and inner workings of AQMD's incentive programs. Specifically, Clean Fuel Connection assisted the AQMD in the evaluation, ranking, and contracting of the trucks under the Proposition 1B Program. Contractor's familiarity and solid foundation

of knowledge with respect to incentive programs is needed to help AQMD continue to develop and implement a wide array of incentive programs.

Benefits to AQMD

The successful implementation of this program will reduce NOx, PM and other pollutant emissions in a cost-effective and expeditious manner which will help achieve the goals of the 2007 AQMP. The new vehicles funded under this program are expected to operate for many years and provide long-term emission reduction benefits at the ports and in the region.

Resource Impacts

Total funding for this contract award to provide technical assistance for alternative-fueled trucks shall not exceed $80,000 from the Proposition 1B–Goods Movement Program Fund (81), comprised of $40,000 in administrative funds from the DOE grant and $40,000 in administrative funds from the U.S. EPA grant. Sufficient funds are available in the Proposition 1B–Goods Movement Program Fund (81).

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 10

PROPOSAL: Execute Sole Source Contract for Buy-Down Incentive Program for CNG Home Refueling Appliance

SYNOPSIS: Since May 6, 2005, the AQMD has implemented a buy-down incentive program for the *Phill* natural gas home refueling appliance (HRA) manufactured by FuelMaker Corporation to broaden the consumer base of light-duty natural gas vehicles. In April 2009, FuelMaker Corporation filed bankruptcy and was acquired by Fuel Systems Solutions, Inc. In July 2010, sale of the HRA in California resumed through an exclusive distributor, Gas Equipment Systems, Inc. (GESI). This action is to execute a sole source contract with GESI for an amount not to exceed $60,000 from the Clean Fuels Fund to provide a buy-down incentive of $1,000 per HRA.

COMMITTEE: Technology, October 15, 2010, Recommended for Approval

RECOMMENDED ACTION:
Authorize the Chairman to execute a sole source contract with Gas Equipment Systems, Inc. in an amount not to exceed $60,000 from the Clean Fuels Fund (Fund 31) for a buy-down incentive program for the purchase and installation of a home refueling appliance (HRA) at $1,000 incentive per HRA.

Barry R. Wallerstein, D.Env.
Executive Officer

CSL:HH:DKS:PMB

Background
In May 2005, the AQMD and MSRC started a buy-down incentive program for consumers to purchase or lease, and install within the jurisdictional boundaries of the AQMD, the CNG home refueling appliance manufactured by FuelMaker Corporation, and marketed under the name *Phill*. Overwhelming response to the buy-down incentive and the purchase of the *Phill,* resulted in the Board reapportioning and approving additional funds in February 2007 and July 2008. More than 260 consumers purchased

and installed the *Phill* with AQMD sponsored buy-down incentives as of April 2009. In April 2009, the buy-down incentive program was unexpectedly interrupted when FuelMaker Corporation filed bankruptcy. FuelMaker was acquired by another company and production was moved from Canada to Italy. Production of the *Phill* was resumed under the new owner, Fuel Systems Solutions, Inc., and reintroduced to the market in the latter part of July 2010. The contract between the AQMD and FuelMaker Corporation to implement the purchase buy-down incentive program was subsequently closed leaving a balance of $60,000 in contract funds for the incentive program. There have been general interest and inquiries from the public regarding the buy-down program after the reintroduction of the HRA into the California market.

Proposal

Staff is requesting the Board's approval to reinstate the buy-down incentive program for purchase of the compressed natural gas (CNG) home refueling appliance, marketed under the name *Phill*, and enter into a contract with Gas Equipment Systems, Inc., the exclusive dealer for the HRA in California for an amount not to exceed $60,000. Staff is proposing the buy-down incentive program provide $1,000 per HRA customer to purchase and install a *Phill* within the jurisdictional boundaries of the AQMD. The objective of the buy-down program is to facilitate the expansion and use of alternative fuel vehicles in the general consumer market.

Benefits to AQMD

Gasoline and diesel fueled mobile sources are a significant source of emissions in the AQMD and alternative fueled vehicles are a means of reducing these emissions. This project will continue the momentum for the expansion of natural gas home refueling appliances and passenger car alternative fuel vehicles.

Sole Source Justification

Section VIII.B.2 of the Procurement Policy and Procedure identifies four major provisions under which a sole source award may be justified. This request for a sole source award is made under provision c (3) "*the contractor has ownership of key assets required for project performance*". Gas Equipment Systems, Inc. is the sole distributor of the home refueling appliance in California.

Resource Impacts

In July 2008, the Board awarded $146,000 to the HRA purchase incentive program from the Clean Fuels Fund (31) through a contract modification with FuelMaker Corporation. FuelMaker Corporation subsequently changed ownership which resulted in closing out their contract with a balance of $60,000. Staff is requested this amount of $60,000 funded from the Clean Fuels Fund (31) be applied to a new contract with Gas Equipment System, Inc. to continue the incentive program.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 11

PROPOSAL: Execute Contracts to Support Electric Charging Infrastructure

SYNOPSIS: Southern California has an established but obsolete network of public charging for electric vehicles. State and federal funds are being invested in our region to support the deployment of plug-in electric vehicles including charging infrastructure. This action is to execute contracts with Clipper Creek, Coulomb Chargepoint and ETEC ECOtality to cofund the upgrade of existing chargers and install new chargers in high priority locations for a total cost not to exceed $210,000 from the Clean Fuels Fund.

COMMITTEE: Technology, October 15, 2010, Recommended for Approval

RECOMMENDED ACTIONS:

1. Authorize the Chairman to execute contracts from the Clean Fuels Fund (31) for electric charging infrastructure projects with:
   a. Clipper Creek, to upgrade existing chargers in an amount not to exceed $70,000;
   b. Coulomb Chargepoint, to install chargers at existing and new locations in an amount not to exceed $70,000; and
   c. ETEC ECOtality, to install chargers at existing and new locations in an amount not to exceed $70,000.
2. Authorize the Executive Officer to redistribute (add or reduce) funding among the participating contractors to address the demand and selection criteria for electric charging infrastructure for a total amount not to exceed $210,000 from the Clean Fuels Fund.

Barry R. Wallerstein, D.Env.
Executive Officer

CSL:MMM:DS:LHM

Background
There are currently about 1,800 chargers at approximately 500 sites in the South Coast Air Basin. Although some of these chargers remain to serve vehicles already in operation, many are good candidates for installation of new chargers compatible with new battery electric, plug-in hybrid, and extended range electric vehicles (PEV) that will be sold in our region starting this year.

The U.S. Department of Energy's (DOE) American Recovery and Reinvestment Act – Transportation Electrification funds were awarded to prepare communities for new PEVs. ETEC ECOtality was awarded $99.8 million for national efforts to increase electric charging infrastructure involving Nissan and General Motors, and this effort is expected to result in approximately $15 million for charging infrastructure in California. Coulomb Chargepoint was awarded $37 million for national efforts with General Motors, Ford, and Smart, and this amount of funding is expected to result in approximately $15 million for electric charging infrastructure in California.

In addition, the California Energy Commission (CEC) released solicitations for electric charging infrastructure, and through this effort the CEC awarded $8 million to ETEC ECOtality, $3.4 million to Coulomb Chargepoint, and $1.9 million to Clipper Creek to upgrade and install new chargers in California.

Proposal
This proposal would provide cofunding to the three charger manufacturers that have been awarded federal or state funding. Staff recommends providing up to $1,000 in cofunding for each charger. Cofunding above $1,000 per charger will be considered on a case-by-case basis. AQMD staff will provide a status update on electric vehicle charging including location, number of chargers and any signage replaced with this funding.

The AQMD will work with stakeholders including SoCalEV Ready participants, PEV drivers, auto manufacturers, charger manufacturers, charging equipment distributor, local electric utilities, public charging site providers, and other government agencies to prioritize public and workplace charger placement in the South Coast Air Basin.

Staff recommends upgrading existing chargers and installing new chargers using the following selection criteria: located within the South Coast Air Basin, publicly accessible, sites having SoCal EV Ready stakeholder interest, previous MSRC or Clean Fuels funded sites to ensure high utility, and sites with owner cooperation.

Electric Vehicle Support Equipment (EVSE) will be required to comply with SAE J1772 2010 recommended practice, be UL listed, and include adequate signage. AQMD funding will be used to install chargers additional to those funded with state

and federal funds; or will be used to reduce the actual cost to the site owner, as demonstrated on a case-by-case basis.

This action is to execute contracts with Clipper Creek, Coulomb Chargepoint and ETEC ECOtality in amounts not to exceed $70,000 each from the Clean Fuels Fund. This action further seeks authorization to allow the Executive Officer to reallocate money between the contracts in order to ensure funds are expended.

Benefits to AQMD
AQMD's Clean Fuels Program has been active in funding the development and demonstration of electric vehicles and electric charging infrastructure. The proposed electric charging infrastructure projects are included in the *Technology Advancement Office 2010 Plan Update* under "Electric/Hybrid Technologies."

Sole Source Justification
Section VII.C.2. of the Policy for Clean Air Incentive Contracts identifies provisions under which a sole source award may be justified. This request for three sole source awards is made under provision C.2.d.: Other circumstances exist which in the determination of the Executive Officer require such waiver in the best interest of the AQMD. Specifically, these circumstances are C.2.d.(1): Projects involving cost sharing by multiple sponsors and B.2.c.(3): Contractor has ownership of key assets required for project performance."

In addition to the AQMD's proposed funding, the DOE and the CEC will provide funding for the electric infrastructure projects with ECOtality, Coulomb Chargepoint and Clipper Creek.

ETEC ECOtality, Coulomb Chargepoint and Clipper Creek have extensive experience in the construction and deployment of electric charging stations and have received significant amounts of funding from the DOE and the CEC to expand the network of electric charging stations on a national basis and in California.

Resource Impacts
AQMD's proposed funding for ETEC ECOTality, Coulomb Chargepoint and Clipper Creek shall not exceed $210,000 from the Clean Fuels Fund. The funding partners and the proposed funding amounts are as follows:

Contractor	DOE ARRA	CEC AB 118	AQMD
ETEC ECOtality	$99.8 million in U.S. $15.0 million in California	$8.0 million in California $3.2 million in AQMD	$70,000
Coulomb Chargepoint	$37.0 million in U.S. $15.0 million in California	$3.4 million in California $1.4 million in AQMD	$70,000
Clipper Creek	N/A	$1.9 million in California $760,000 in AQMD	$70,000
Total	$136.8 million in U.S. $30.0 million in California	$13.3 million in California $5.4 million in AQMD	$210,000

Staff recommends providing up to $1,000 in cofunding for each charger. Cofunding above $1,000 per charger will be considered on a case-by-case basis.

Sufficient funds for the proposed projects are available from the Clean Fuels Fund, established as a special revenue fund resulting from the state-mandated Clean Fuels Program. The Clean Fuels Program, under Health and Safety Code Sections 40448.5 and 40512 and Vehicle Code Section 9250.11, establishes mechanisms to collect revenues from mobile sources to support projects to increase the utilization of clean fuels, including the development of the necessary advanced enabling technologies. Funds collected from motor vehicles are restricted, by statute, to be used for projects and program activities related to mobile sources that support the objectives of the Clean Fuels Program.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 12

PROPOSAL: Authorize Purchase of Desktop Computer Hardware Upgrades

SYNOPSIS: AQMD operational efficiency is dependent on staff's desktop computer systems, and many software applications (both off-the-shelf and in-house developed applications) are exceeding the capacity of the present desktop systems. This action is to authorize the purchase of new desktop computer systems, with adequate capacity to support current software applications, to replace older desktop systems. These replacements are in accord with AQMD's Information Management Strategic Plan. Funds ($150,000) for this purchase are included in the FY 2010-11 Budget.

COMMITTEE: Administrative, October 8, 2010, Recommended for Approval

RECOMMENDED ACTION:
Authorize the Procurement Manager to purchase 225 new desktop computer systems from JPK Micro Supply, Inc. at a cost not to exceed $150,000, and to execute all documents for this purchase.

Barry R. Wallerstein, D.Env.
Executive Officer

JCM:MAH:RG:agg

Background
The AQMD has become increasingly dependent on desktop computers for its operational efficiency. Each desktop computer uses a suite of standard desktop applications (word processing, spreadsheets, graphics, presentation, and desktop database management), and utilization of these components has steadily increased to the point that maximum capacity has been reached. Furthermore, many of the desktop systems are required to run the AQMD's Finance/Human Resource applications (PeopleSoft), Record Services imaging, and workflow automation applications. Computing capacity of older desktop computers hampers the performance of these applications.

Therefore, in accordance with Information Management's Strategic Plan and to efficiently support staff, all Pentium 4 single core processor systems (and below) will be replaced.

Bid Evaluation
In accordance with the AQMD Purchasing Policy and Procedure No. 35, bids for desktop computer hardware with the following configuration were solicited from the firms on the List of Prequalified Vendors to Provide Computer, Network, and Printer Hardware and Software, and Desktop Computer Hardware Upgrades; master agreements; cooperative agreements; and other interagency agreements with governmental entities, in order to achieve the best available price.

- Case: Antec New Solution VSK2450 Black Computer Case w/450W power supply
- Motherboard: Intel BOXDH57DD Micro ATX Intel Motherboard
- CPU: Intel Core i5-660 3.33GHz LGA 1156 73W Dual-Core Desktop Processor
- RAM: CORSAIR XMS 4GB (2 x 2GB) 240-Pin DDR3 SDRAM DDR3 1333 Ultra Stable Desktop Memory
- Hard Drives (Qty=2): Seagate Barracuda 7200.11 160GB 3.5" SATA 3.0Gb/s Internal Hard Drive
- DVD Writer: LG 22X DVD Burner - Bulk Black SATA Model GH22NS40
- Keyboard/Mouse: Microsoft Black PS/2 Wired Standard Business Hardware Pack
- 3 Year (On-Site Replacement) Warranty

The prequalified vendor list was approved by the Board on January 8, 2010, and is in effect for a period ending February 8, 2012. Of the fourteen vendors on the list, one was from a disabled veteran-owned business enterprise, three were from women-owned business enterprises, seven were from certified minority-owned businesses, and none were from non-certified minority-owned business enterprises.

Six complete bids and one "No Bid" for desktop computer hardware were received (see Attachment). JPK Micro Supply, Inc. submitted the lowest bid at $585 per unit. The total cost of 225 new desktop computer hardware systems, including tax of 9.75%, is $144,459. Staff recommends that the Board award the contract to JPK Micro Supply, Inc. for the purchase of 225 desktop computer hardware systems.

Resource Impacts
Sufficient funds are included in the FY 2010-11 Budget, under District General Office Expense Account.

Attachment
Evaluation of Bids from Prequalified Vendor List

Attachment

Evaluation of Bids from Prequalified Vendor List

Vendor Name	Complete Bid	Unit Cost	Extended Cost*
JPK Micro Supply, Inc.	Yes	$585.00	$144,458.44
Sigmanet, Inc.	Yes	$647.00	$159,768.56
En Pointe Technologies	Yes	$699.34	$172,693.27
Aprisa Technology	Yes	$748.00	$184,709.25
Intelli-Tech	Yes	$790.00	$195,080.63
New Day Computer	Yes	$993.17	$245,250.92

* Sales tax (9.75%) is included in the extended cost.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 13

PROPOSAL: Authorize Purchase of Ingres Relational Database Management System Software Support

SYNOPSIS: The Ingres Relational Database Management System is used for the implementation of the Central Information Repository database. This database is used by most enterprise-level software applications at the AQMD and currently supports a suite of client/server and web-based applications known collectively as the Clean Air Support System (CLASS). The CLASS applications are used to support all of the AQMD core activities. Maintenance support for this software expires November 29, 2010. This action is to obtain approval for the purchase of Ingres Database software maintenance support for another year. Funds in the amount of $115,831 for this expense are included in the FY 2010-11 Budget.

COMMITTEE: Administrative, October 8, 2010, Recommended for Approval

RECOMMENDED ACTION:
Authorize the Executive Officer to execute contracts to purchase Ingres Relational Database Management System software maintenance support for one year from Ingres Corporation in an amount not to exceed $115,831, which is allocated in the FY 2010-11 Budget.

Barry R. Wallerstein, D.Env.
Executive Officer

JCM: MH:agg

Background
In November 2006, the AQMD entered into an annual support and maintenance agreement for Ingres Relational Database Management System (RDBMS) software. The RDBMS software runs on three database servers for production, development, and

ad hoc reporting. The production server hosts the Central Information Repository database (DBCIR). This database supports a collection of more than 30 client/server and web-based applications known as the Clean Air Support System (CLASS). The CLASS application suite supports permits administration and processing of command-and-control and facility-based permits; emissions offsetting, monitoring and inventory management for New Source Review, RECLAIM and annual emission reporting operations; compliance-related complaint, inspection, assignment, notification, investigation and settlement operations; and financial accounts receivable operations. The development server supports software development for the CLASS and for other mini-computers and micro-computers accessing the Central Information Repository. The decision support server supports CLASS system ad-hoc query and reporting; and web-based inquiry applications. These applications are an integral component of the AQMD's day-to-day responsibilities. The Ingres software maintenance support expires on November 29, 2010.

Ingres maintenance includes the following services:

Software Maintenance	Licensed product updates, enhancements, and repairs; and
Software Support	Assistance in resolving online operating difficulties, system failures, Ingres application-related problems, potential system bugs, and installation and upgrade issues.

Sole-Source Justification
Section VIII.B.2 of the Procurement Policy and Procedure identifies circumstances under which a sole-source purchase award may be justified. These requests for a sole-source award are made under provision VIII.B.2.c.(2) the project involves the use of proprietary technology, and (3) the contractor has ownership of key assets required for project performance. Ingres Corporation is the sole manufacturer and provider of this software and therefore the only source for its maintenance and support licensing agreements.

Proposal
Staff recommends the purchase of one year of Ingres Relational Database Management System Software maintenance support to provide continued support for AQMD's CLASS applications in an amount not to exceed $115,831.

Resource Impacts
Sufficient funds are included in the FY 2010-11 Budget, under Information Management Professional and Special Services.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 14

PROPOSAL: Issue RFP for GHG Reduction Projects

SYNOPSIS: This action is to issue an RFP soliciting bids for proposed projects to generate certified GHG reductions. Projects proposed under this RFP must follow one of the GHG reduction protocols adopted under AQMD Reg. XXVII – Climate Change. Funding for these proposed projects will not exceed $300,000 from Chevron's CEQA mitigation fees.

COMMITTEE: Climate Change, October 13, 2010. Less than a quorum was present for the discussion of this item. The Committee Members present expressed their concurrence that this item be recommended for approval by the Board.

RECOMMENDED ACTION:
Approve issuance of RFP #P2011-10 to solicit proposals to develop GHG reduction projects within AQMD's jurisdiction.

Barry R. Wallerstein, D.Env.
Executive Officer

EC:JW:AK:af

Background

The AQMD has established the SoCal Climate Solutions Exchange to ensure the development of real, surplus, quantifiable, and verifiable GHG reductions through projects undertaken in Southern California. Focusing these projects within Southern California provides incentives for local investments, aids local businesses and communities, and also provides co-pollutant reductions. GHG projects developed under the SoCal Climate Solutions Exchange must follow an adopted GHG reduction protocol. Currently these protocols include projects for forestry, urban forestry, manure management, and boiler efficiency improvements. Under this RFP, only projects developed in accordance with the four protocols under AQMD Rule XXVII- Climate Change will be considered.

Funding for the GHG reduction projects will be from $300,000 that Chevron paid as additional mitigation funds for their Chevron Product Reliability (PRO) project at their existing El Segundo refinery. Previously, Chevron paid $1.5 million towards mitigation to the AQMD. These funds are currently being used to develop GHG reductions through the reforestation of areas within the Station Fire in the Angeles National Forest. The AQMD requested Chevron to pay an additional $300,000, to further mitigate GHG emissions, which was received in August 2010. AQMD has elected to use this $300,000 to seek other GHG projects.

Under the RFP, proposals will be received to develop certified GHG reductions within AQMD's jurisdiction following any of the approved protocols in Reg. XXVII – Climate Change.

Proposals
Staff requests the Board to authorize the issuance of an RFP to solicit bids from qualified contractors to develop and undertake GHG reduction projects following one or more of the protocols adopted under AQMD Reg. XXVII – Climate Change.

Outreach
In accordance with AQMD's Procurement Policy and Procedure, a public notice advertising the RFP/RFQ and inviting bids will be published in the Los Angeles Times, the Orange County Register, the San Bernardino Sun, and Riverside County Press Enterprise newspapers to leverage the most cost-effective method of outreach to the entire South Coast Basin.

Additionally, potential bidders may be notified utilizing AQMD's own electronic listing of certified minority vendors. Notice of the RFP/RFQ will be mailed to the Black and Latino Legislative Caucuses and various minority chambers of commerce and business associations, and placed on the Internet at AQMD's website (http://www.aqmd.gov where it can be viewed by making menu selections "Inside AQMD"/"Employment and Business Opportunities"/"Business Opportunities" or by going directly to http://www.aqmd.gov/rfp/index.html). Information is also available on AQMD's bidder's 24-hour telephone message line (909) 396-2724.

Bid Evaluation
Proposals will be reviewed and evaluated by a diverse, technically qualified panel in accordance with criteria contained in the attached RFP. Points will be awarded in the RFP evaluation process to proposals that meet the technical requirements and are cost effective. Points are also available for quantifiable co-pollutant reductions and projects that will occur within five miles of the Chevron El Segundo refinery.

Schedule of Events
The anticipated schedule of events for the RFP is as follows:

Date	Event
November 5, 2010	RFP Released
November 19, 2010	Bidder's Conference (optional)
December 10, 2010	Proposals Due – no later than 5:00 p.m.
January 2011	Proposal Evaluations
February 4, 2011	Board Award Consideration

Resource Impacts
The funds for these projects have already been obtained from Chevron and will not exceed $300,000 out of the CEQA Green House Gas Mitigation Fund (Rule 2702) (Fund 49). Existing staff resources will be adequate to administer and review the RFP.

Attachment
RFP #P2011-10 - Greenhouse Gas Reduction Projects

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

REQUEST FOR PROPOSALS

Greenhouse Gas Reduction Projects

#P2011-10

The South Coast Air Quality Management District (AQMD) requests proposals for the following purpose according to terms and conditions attached. In the preparation of this Request for Proposals (RFP) the words "Proposer," "Contractor," and "Consultant" are used interchangeably.

PURPOSE

The South Coast AQMD is soliciting proposals for projects to develop greenhouse gas reductions (also known as GHG offsets). Projects developed under this solicitation must be developed in accordance to GHG reduction protocols adopted under the AQMD SoCal Climate Solutions Exchange, Reg. XXVII – Climate Change; AQMD's program for generation and certification of GHG reductions (http://www.aqmd.gov/rules/reg/reg27_tofc.html) . Protocols under the SoCal Climate Solutions Exchange include urban tree planting, forestry, manure management, and boiler efficiency (http://www.aqmd.gov/prdas/climate-change/climate_change_gateway.html). All proposed GHG reductions developed under this solicitation must be considered additional under the criteria in Section V - Statement of Work.

Total funding for this RFP will be a maximum of $300,000 with anticipated contract terms ranging from one to five years depending upon the project. The intent of this RFP is to develop high quality verified GHG reductions that will be permanently retired.

INDEX - The following are contained in this RFP:

SECTION I: BACKGROUND/INFORMATION

The AQMD has established the SoCal Climate Solutions Exchange to ensure the development of real, surplus, verifiable GHG reductions through projects undertaken in Southern California. Focusing these projects within Southern California provides incentives for local investments, aids local businesses and communities, and also provides co-pollutant reductions. GHG projects developed under the SoCal Climate Solutions Exchange must follow an adopted GHG reduction protocol. Currently these protocols include projects for forestry, urban forestry, manure management, and boiler efficiency improvements. Future adoption of other protocols is anticipated. **Under this RFP only projects developed in accordance with the four protocols under AQMD Rule XXVII- Climate Change will be considered (http://www.aqmd.gov/prdas/climate-change/climate_change_gateway.html).** Under this announcement $300,000 for GHG reduction project(s) is available.

SECTION II: CONTACT PERSON:

Questions regarding the content or intent of this RFP or on procedural matters should be addressed to:

Aaron Katzenstein
SCAQMD – PRDAS
21865 Copley Drive
Diamond Bar, CA 91765-4178
(909) 396-2219 (akatzenstein@aqmd.gov)

SECTION III: SCHEDULE OF EVENTS

November 5, 2010	RFP Released
November 19, 2010	Bidder's Conference*
December 10, 2010	Proposals Due (no later than 5:00PM)
January 2011	Proposal Evaluations
February 4, 2011	Governing Board Approval
March 2011	Anticipated Contract Execution

*Participation in the Bidder's Conference is optional. The Bidder's Conference will be held in Room CC-6 at the AQMD Headquarters in Diamond Bar, California at 2:00 pm on Friday, November 19, 2010. Please contact Rachael Palos at (909) 396-2337 by close of business on Wednesday November 17, 2010 if you plan to attend.

SECTION IV: PARTICIPATION IN THE PROCUREMENT PROCESS

A. It is the policy of the South Coast Air Quality Management District to ensure that all businesses including minority business enterprises, women business enterprises, disabled veteran business enterprises and small businesses have a fair and equitable opportunity to compete for and participate in AQMD contracts.

Definitions:

The definition of minority or women business enterprise set forth below is included for purposes of determining compliance with the affirmative steps requirement described in Paragraph F below on procurements funded in whole or in part with EPA grant funds which involve the use of subcontractors. The definition provided for disabled veteran business enterprise, local business, small business enterprise, low-emission vehicle business and off-peak hours delivery business are provided for purposes of determining eligibility for point or cost considerations in the evaluation process.

1. "Minority-or-women business enterprise" as used in this policy means a business enterprise that meets all the following criteria:

    a. a business that is at least 51 percent owned by one or more minority persons or women, or in the case of any business whose stock is publicly held, at least 51 percent of the stock is owned by one or more minority persons or women.

    b. a business whose management and daily business operations are controlled by one or more minority persons or women.

    c. a business which is a sole proprietorship, corporation, or partnership with its primary headquarters office located in the United States, which is not a branch or subsidiary of a foreign corporation, foreign firm, or other foreign-based business.

2. "Minority person" for purposes of this policy, means a Black American, Hispanic American, Native American (including American Indian, Eskimo, Aleut, and Native Hawaiian), Asian-Indian American (including a person whose origins are from India, Pakistan, and Bangladesh), Asian-Pacific American (including a person whose origins are from Japan, China, the Philippines, Vietnam, Korea, Samoa, Guam, the United States Trust Territories of the Pacific, Northern Marianas, Laos, Cambodia, and Taiwan).

3. "Disabled veteran" as used in this policy is a United States military, naval, or air service veteran with at least 10 percent service-connected disability who is a resident of California.

4. "Disabled veteran business enterprise" as used in this policy means a business enterprise that meets all of the following criteria:

    a. is a sole proprietorship or partnership of which is at least 51 percent owned by one or more disabled veterans or, in the case of a publicly owned business, at least 51 percent of its stock is owned by one or more disabled veterans; a subsidiary which is wholly owned by a parent corporation but only if at least 51 percent of the voting stock of the parent corporation is owned by one or more disabled veterans; or a joint venture in which at least 51 percent of the joint venture's management and control and earnings are held by one or more disabled veterans.

    b. the management and control of the daily business operations are by one or more disabled veterans. The disabled veterans who exercise management and control are not required to be the same disabled veterans as the owners of the business.

c. is a sole proprietorship, corporation, or partnership with its primary headquarters office located in the United States, which is not a branch or subsidiary of a foreign corporation, firm, or other foreign-based business.

5. "Local business" as used in the Procurement Policy and Procedure means a company that has an ongoing business within the boundaries of the South Coast AQMD at the time of bid application and performs 90% of the work related to the contract within the boundaries of the AQMD and satisfies the requirements of Paragraph I below.

6. “Small business” as used in this policy means a business that meets the following criteria:

   a. 1) an independently owned and operated business; 2) not dominant in its field of operation; 3) together with affiliates is either:

      - A service, construction, or non-manufacturer with 100 or fewer employees, and average annual gross receipts of ten million dollars ($10,000,000) or less over the previous three years, or

      - A manufacturer with 100 or fewer employees.

   b. Manufacturer means a business that is both of the following:

      1) Primarily engaged in the chemical or mechanical transformation of raw materials or processed substances into new products.

      2) Classified between Codes 311000 and 339000, inclusive, of the North American Industrial Classification System (NAICS) Manual published by the United States Office of Management and Budget, 2007 edition.

7. "Joint ventures" as defined in this policy pertaining to certification means that one party to the joint venture is a DVBE or a small business and owns at least 51 percent of the joint venture.

8. "Low-Emission Vehicle Business" as used in this policy means a company or contractor that uses low-emission vehicles in conducting deliveries to the AQMD. Low-emission vehicles include vehicles powered by electric, compressed natural gas (CNG), liquefied natural gas (LNG), liquefied petroleum gas (LPG), ethanol, methanol, hydrogen and diesel retrofitted with particulate matter (PM) traps.

9. “Off-Peak Hours Delivery Business” as used in this policy means a company or contractor that commits to conducting deliveries to the AQMD during off-peak traffic hours defined as between 10:00 a.m. and 3:00 p.m.

B. Under Request for Quotations (RFQ), DVBEs, DVBE business joint ventures, small businesses, and small business joint ventures shall be granted a preference in an amount equal to 5% of the lowest cost responsive bid. Low-Emission Vehicle Businesses shall be granted a preference in an amount equal to 5 percent of the lowest cost responsive bid. Off-Peak Hours Delivery Businesses shall be granted a preference in an amount equal to 2 percent of the lowest cost responsive bid. Local businesses (if the procurement is not

funded in whole or in part by EPA grant funds) shall be granted a preference in an amount equal to 2% of the lowest cost responsive bid.

C. Under Request for Proposals, DVBEs, DVBE joint ventures, small businesses, and small business joint ventures shall be awarded ten (10) points in the evaluation process. A non-DVBE or large business shall receive seven (7) points for subcontracting at least twenty-five (25%) of the total contract value to a DVBE and/or small business. Low-Emission Vehicle Businesses shall be awarded five (5) points in the evaluation process. On procurements which are not funded in whole or in part by EPA grant funds local businesses shall receive five (5) points. Off-Peak Hours Delivery Businesses shall be awarded two (2) points in the evaluation process.

D. AQMD will ensure that discrimination in the award and performance of contracts does not occur on the basis of race, color, sex, national origin, marital status, sexual preference, creed, ancestry, medical condition, or retaliation for having filed a discrimination complaint in the performance of AQMD contractual obligations.

E. AQMD requires Contractor to be incompliance with all state and federal laws and regulations with respect to its employees throughout the term of any awarded contract, including state minimum wage laws and OSHA requirements.

F. When contracts are funded in whole or in part by EPA grant funds and if subcontracts are to be let, the Contractor must comply with the steps listed below, which demonstrate a good faith effort to solicit minority and women owned enterprises. Contractor shall submit a certification signed by an authorized official affirming compliance with the steps below at the time of proposal submission. The AQMD reserves the right to request documentation demonstrating compliance with these steps prior to contract execution.

    1. Place qualified small-and-minority businesses and women's business enterprises on solicitation lists;

    2. Ensure that small-and-minority businesses, and women's business enterprises are solicited whenever they are potential sources including advertising at least ten days in advance of the bid in a variety of media directed to minority-and women-owned business audiences;

    3. Divide total requirements, when economically feasible, into smaller tasks or quantities to permit maximum participation by small-and-minority business, and women's business enterprises;

    4. Establish delivery schedules, where requirements permit, which encourage participation by small-and-minority business, and women's business enterprises; and

    5. Use the services and assistance of the Small Business Administration and the Minority Business Development Agency of the Department of Commerce.

G. To the extent that any conflict exists between this policy and any requirements imposed by federal and state law relating to participation in a contract by a certified MBE/WBE/DVBE as a condition of receipt of federal or state funds, the federal or state requirements shall prevail.

H. When contracts are not funded in whole or in part by EPA grant funds, a local business preference will be awarded. For such contracts that involve the purchase of commercial off-the-shelf products, local business preference will be given to suppliers or distributors of commercial off-the-shelf products who maintain an ongoing business within the geographical boundaries of the AQMD. However, if the subject matter of the RFP or RFQ

calls for the fabrication or manufacture of custom products, only companies performing 90% of the manufacturing or fabrication effort within the geographical boundaries of the AQMD shall be entitled to the local business preference.

I. In compliance with federal fair share requirements set forth in 40 CFR 35.6580, the AQMD shall establish a fair share goal annually for expenditures covered by its procurement policy.

SECTION V: STATEMENT OF WORK/SCHEDULE OF DELIVERABLES

Contractor(s) awarded funds under this RFP will develop and undertake a GHG reduction project that will be verified. GHG reduction credits developed under this project will be verified and permanently retired. It is anticipated that contract terms will range from one to five years depending upon the type of project awarded funds. **Under this RFP only projects developed following the four currently adopted protocols under AQMD Reg. XXVII – Climate Change will be considered.** All projects must occur within the area under AQMD jurisdiction and will require project reports on a periodic basis.

Contractor(s) awarded funds under this solicitation are expected to expand and provide more details for each task included below:

Task 1: Project Plan

Under Task 1, proposers will be required to develop a GHG reduction project plan. The project plan will outline the technical details of the GHG reduction project and be developed to comply with the GHG protocol being followed. Included within the plan will be the location(s) the project will occur, specific actions taken to achieve GHG reductions, a detailed baseline GHG inventory, detailed calculations showing the anticipated GHG reductions, project timeline, and periods for verification. A project lifetime for the reductions to occur should be clearly stated. A discussion of any anticipated problems and/or risks to the GHG reductions that will be developed under this project should be addressed.

The project plan must also address work being conducted with relevant authorities (local, state, and/or federal) to acquire the necessary permits and/or permissions for the project. Depending upon the type of project, it may be necessary to have a signed MOU with a business or landowner on which the project may occur.

The project will proceed to the next task only upon successful completion of Task 1.

Task 2: Project Implementation

Under Task 2, the project outlined in Task 1 will be implemented. Any unanticipated project modifications will need prior AQMD approval.

Task 3: Monitoring

The implemented project will be monitored to ensure it is operational and GHG reductions will be realized within the project lifetime.

Task 4: Verification

Depending upon the type of project verification may occur as frequently as year. Verification will be conducted by either AQMD staff or a third party that has appropriate qualifications and/or accreditations. The frequency of verification and how verification is conducted will be determined by the AQMD. Verification will serve to determine the GHG reductions achieved by completion of the project. In addition, verification may also be used to help refine GHG reductions that will occur in future.

Task 5: Final Report
The final report will describe the project and show what the project accomplished, including the best estimate of GHG reductions achieved through the project.

SECTION VI: REQUIRED QUALIFICATIONS

Contractors proposing to bid on this RFP must be qualified in undertaking the type of project being proposed. The contractor must have familiarity of the GHG reduction protocol being followed and developing high quality GHG reductions. A summary of the contractor's qualifications along with any subcontractors is required and should be presented within the *Technical Proposal* under Qualifications.

SECTION VII: PROPOSAL SUBMITTAL REQUIREMENTS

Submitted proposals must follow the format outlined below and all requested information must be supplied. Failure to submit proposals in the required format will result in elimination from proposal evaluation. Several different proposals may be submitted from one applicant.

Each proposal must submit the following sections:

- Cover Letter
- Technical Proposal
- Cost Proposal
- Certifications and Representations - included in Attachment A to this RFP, should be executed by an authorized official of the Contractor.

Cover Letter

A separate cover letter including the name, address, and telephone number of the contractor, and signed by the person or persons authorized to represent the contractors business must accompany the proposal submission.

TECHNICAL PROPOSAL

DO NOT INCLUDE ANY COST INFORMATION IN THE TECHNICAL VOLUME

Project Description – Provide a detailed description of the proposed project, the sequence of activities, location(s) of the project, GHG reduction protocol being followed, and participation of each contractor(s), vendor or others. Also describe the permanence of the GHG reductions that will occur through the project and recommended periods for project verification to occur.

Points will be awarded for projects within five miles of the Chevron El Segundo Refinery (Section IX).

Anticipated GHG Reductions –Clearly present the anticipated GHG reductions from the project, in bold, at the top of this section and the time period required to achieve these reductions. The GHG reductions should be presented in metric tons of CO_2 equivalents.

Include a clear and concise presentation of the calculations, assumptions, baselines, and methods used to determine the estimated GHG reductions from undertaking the project. Clearly indicate any assumptions used in the calculations that may result in GHG reductions from the project being higher or lower. Using conservative assumptions and presenting a range of likely GHG reductions is acceptable, however, a best estimate is required to be presented at the top of this section in bold. Also reference the GHG protocol being followed when necessary.

When reviewing proposals, cost effectiveness of the proposal will be considered. The cost effectiveness will be based upon the proposal cost, the amount of GHG reductions achieved, and the time period for the GHG reductions to occur. If the GHG reductions developed in this section are not reasonable, further information may be required of the applicant and a lower cost effectiveness score may be given.

Points will be awarded for projects also having quantifiable criteria and/or toxic air pollutant reductions (Section IX).

Project Schedule - Provide project milestones or benchmarks for submitting reports within the total time allowed. Include a multiple period timeframe showing how GHG reductions accumulate over the projects crediting lifetime.

Additionality – Statement on how the proposed project would not occur under business-as-usual. Include an assurance of the permanent retirement of GHG reductions developed under this project and that no other environmental credits will be developed from the project (double counting) that could be sold or used for other purposes.

Qualifications – Describe the applicants' qualifications in developing and undertaking projects similar to that being proposed. References of other similar projects performed during the last five years demonstrating ability to successfully complete the project may be included. Include contact name, title, and telephone number for any references listed.

Subcontractors - This project may require expertise in multiple technical areas. List any subcontractors that may be used and the work to be performed by them.

Additional Information (Optional) - Provide other information that may assist in the evaluation of this proposal.

COST PROPOSAL

Cost Proposal – AQMD anticipates awarding a fixed price contract. Cost information must be provided as listed below:

1. Detail must be provided by the following categories:

    A. Labor - List the total number of hours and the hourly billing rate for each level of staff. A breakdown of the proposed billing rates must identify the direct labor rate, overhead

rate and amount, fringe benefit rate and amount, General and Administrative rate and amount, and proposed profit or fee. Provide a basis of estimate justifying the proposed labor hours and proposed labor mix.

B. Subcontractor Costs - List subcontractor costs and identify subcontractors by name. Itemize subcontractor charges per hour or per day.

C. Material and Supplies – Provide information for all material and supply costs to successfully complete the proposed project. These costs need to also include applicable shipping costs, administrative fees, taxes, etc.

D. Travel Costs - Indicate amount of travel cost and basis of estimate to include trip destination, purpose of trip, length of trip, airline fare or mileage expense, per diem costs, lodging and car rental.

E. Other Direct Costs -This category may include such items as postage and mailing expense, printing and reproduction costs, etc. Provide a basis of estimate for these costs.

CERTIFICATIONS AND REPRESENTATIONS (see Attachment A to this RFP)

SECTION VIII: PROPOSAL SUBMISSION

All proposals must be submitted according to specifications set forth in the section above. Failure to adhere to these specifications may be cause for rejection of proposal.

Signature - All proposals should be signed by an authorized representative of the Proposer within the cover letter.

Due Date - The Proposer shall submit eight (8) complete copies of the proposal in a sealed envelope, plainly marked in the upper left-hand corner with the name and address of the Proposer and the words "Request for Proposals #P2011-10." **All proposals are due no later than 5:00 p.m. on December 10, 2010**, and should be directed to:

Procurement Unit
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765-4178
(909) 396-3520

Late bids/proposals will not be accepted under any circumstances. Any correction or resubmission done by the Proposer will not extend the submittal due date.

Grounds for Rejection - A proposal may be immediately rejected if:
- It is not prepared in the format described, or
- It is signed by an individual not authorized to represent the firm.

Disposition of Proposals - AQMD reserves the right to reject any or all proposals. All responses become the property of AQMD. One copy of the proposal shall be retained for AQMD files. Additional copies and materials will be returned only if requested and at the proposer's expense.

Modification or Withdrawal - Once submitted, proposals cannot be altered without the prior written consent of AQMD. All proposals shall constitute firm offers and may not be withdrawn for a period of ninety (90) days following the last day to accept proposals.

SECTION IX: PROPOSAL EVALUATION/CONTRACTOR SELECTION CRITERIA

A. Proposals will be evaluated by a panel of three to five AQMD staff members familiar with the subject matter of the project. The panel shall be appointed by the Executive Officer or his designee. In addition, the evaluation panel may include such outside public sector or academic or community expertise as deemed desirable by the Executive Officer. The panel will make a recommendation to the Executive Officer and/or the Governing Board of the AQMD for final selection of a contractor and negotiation of a contract.

B. Each member of the evaluation panel shall be accorded equal weight in his or her rating of proposals. The evaluation panel members shall evaluate the proposals according to the specified criteria and numerical weightings set forth below.

Evaluation Criteria

Technical/Management Approach ---------- 35

Contractor Qualifications ---------- 20

Previous Experience on Similar Projects ---------- 5

Project occurs within 5 miles of the

Chevron El Segundo Refinery ---------- 5

Project has quantifiable reductions of

criteria and/or toxic air pollutants ---------- 5

Cost Effectiveness* ---------- 30

TOTAL ---------- 100

*- Cost Effectiveness will be based upon the GHG reductions anticipated from the project, time period for reductions to occur and normalized to the project cost.

Additional Points

Small Business or Small Business Joint Venture	10
DVBE or DVBE Joint Venture	10
Use of DVBE or Small Business Subcontractors	7
Low-Emission Vehicle Business	5
Local Business (Non-EPA Funded Projects Only)	5
Off-Peak Hours Delivery Business	2

The cumulative points awarded for small business, DVBE, use of small business or DVBE subcontractors, low-emission vehicle business, local business, and off-peak hours delivery business shall not exceed 15 points.

Note: The award of these additional points shall be contingent upon Proposer completing the Self-Certification section of Attachment A – Certifications and Representations and/or inclusion of a statement in the proposal self-certifying that Proposer qualifies for additional points as detailed above.

2. To receive additional points in the evaluation process for the categories of Small Business or Small Business Joint Venture, DVBE or DVBE Joint Venture or Local Business (for non-EPA funded projects), the proposer must submit a self-certification or certification from the State of California Office of Small Business Certification and Resources at the time of proposal submission certifying that the proposer meets the requirements set forth in Section III. To receive points for the use of DVBE and/or Small Business subcontractors, at least 25 percent of the total contract value must be subcontracted to DVBEs and/or Small Businesses. To receive points as a Low-Emission Vehicle Business, the proposer must demonstrate to the Executive Officer, or designee, that supplies and materials delivered to the AQMD are delivered in vehicles that operate on either clean-fuels or if powered by diesel fuel, that the vehicles have particulate traps installed. To receive points as an Off-Peak Hours Delivery Business, the proposer must submit, at proposal submission, certification of its commitment to delivering supplies and materials to AQMD between the hours of 10:00 a.m. and 3:00 p.m. The cumulative points awarded for small business, DVBE, use of Small Business or DVBE Subcontractors, Local Business, Low-Emission Vehicle Business and Off-Peak Hour Delivery Business shall not exceed 15 points.

   The Procurement Section will be responsible for monitoring compliance of suppliers awarded purchase orders based upon use of low-emission vehicles or off-peak traffic hour delivery commitments through the use of vendor logs which will identify the contractor awarded the incentive. The purchase order shall incorporate terms which obligate the supplier to deliver materials in low-emission vehicles or deliver during off-peak traffic hours. The Receiving department will monitor those qualified supplier deliveries to ensure compliance to the purchase order requirements. Suppliers in non-compliance will be subject to a two percent of total purchase order value penalty. The Procurement Manager will adjudicate any disputes regarding either low-emission vehicle or off-peak hour deliveries.

3. For procurement of Research and Development (R & D) projects or projects requiring technical or scientific expertise or special projects requiring unique

knowledge and abilities, technical factors including past experience shall be weighted at 70 points and cost shall be weighted at 30 points. A proposal must receive at least 56 out of 70 points on R & D projects and projects requiring technical or scientific expertise or special projects requiring unique knowledge and abilities, in order to be deemed qualified for award.

4. The lowest cost proposal will be awarded the maximum cost points available and all other cost proposals will receive points on a prorated basis. For example if the lowest cost proposal is $1,000 and the maximum points available are 30 points, this proposal would receive the full 30 points. If the next lowest cost proposal is $1,100 it would receive 27 points reflecting the fact that it is 10% higher than the lowest cost (90% of 30 points = 27 points).

C. During the selection process the evaluation panel may wish to interview some proposers for clarification purposes only. No new material will be permitted at this time.

D. The Executive Officer or Governing Board may award the contract to a proposer other than the proposer receiving the highest rating in the event the Governing Board determines that another proposer from among those technically qualified would provide the best value to AQMD considering cost and technical factors. The determination shall be based solely on the Evaluation Criteria contained in the Request for Proposal (RFP), on evidence provided in the proposal and on any other evidence provided during the bid review process. Evidence provided during the bid review process is limited to clarification by the Proposer of information presented in his/her proposal.

E. Selection will be made based on the above-described criteria and rating factors. The selection will be made by and is subject to Executive Officer or Governing Board approval. All proposers will be notified of the results by letter.

F. The Executive Officer or Governing Board may award contracts to more than one proposer if in (his or their) sole judgment the purposes of the (contract or award) would best be served by selecting multiple proposers.

G. If additional funds become available, the Executive Officer or Governing Board may increase the amount awarded. The Executive Officer or Governing Board may also select additional proposers for a grant or contract if additional funds become available.

H. Upon mutual agreement of the parties of any resultant contract from this RFP, the original contract term may be extended.

SECTION X: FUNDING

The maximum funding of $300,000 is available for completion of projects awarded funds under this RFP. The AQMD may choose to fund one project in this entire amount or several lesser amount projects. Section IX shows the evaluation criteria that will be used for proposals.

SECTION XI: DRAFT CONTRACT (Provided as a sample only)

South Coast
Air Quality Management District South Coast Air Quality Management District (referred to here as "AQMD") whose address is 21865 Copley Drive, Diamond Bar, California 91765-4178, and *** (referred to here as "CONTRACTOR") whose address is ***.

2. RECITALS
   A. AQMD is the local agency with primary responsibility for regulating stationary source air pollution in the South Coast Air Basin in the State of California. AQMD is authorized to enter into this Contract under California Health and Safety Code Section 40489. AQMD desires to contract with CONTRACTOR for services described in Attachment 1 - Statement of Work, attached here and made a part here by this reference. CONTRACTOR warrants that it is well-qualified and has the experience to provide such services on the terms set forth here.
   B. CONTRACTOR is authorized to do business in the State of California and attests that it is in good tax standing with the California Franchise Tax Board.
   C. All parties to this Contract have had the opportunity to have this Contract reviewed by their attorney.
   D. CONTRACTOR agrees to obtain the required licenses, permits, and all other appropriate legal authorizations from all applicable federal, state and local jurisdictions and pay all applicable fees.

3. PERFORMANCE REQUIREMENTS
   A. CONTRACTOR warrants that it holds all necessary and required licenses and permits to provide these services. CONTRACTOR further agrees to immediately notify AQMD in writing of any change in its licensing status.
   B. CONTRACTOR shall submit reports to AQMD as outlined in Attachment 1 - Statement of Work. All reports shall be submitted in an environmentally friendly format: recycled paper; stapled, not bound; black and white, double-sided print; and no three-ring, spiral, or plastic binders or cardstock covers. AQMD reserves the right to review, comment, and request changes to any report produced as a result of this Contract.
   C. CONTRACTOR shall perform all tasks set forth in Attachment 1 - Statement of Work, and shall not engage, during the term of this Contract, in any performance of work that is in direct or indirect conflict with duties and responsibilities set forth in Attachment 1 - Statement of Work.
   D. CONTRACTOR shall be responsible for exercising the degree of skill and care customarily required by accepted professional practices and procedures subject to AQMD's final approval which AQMD will not unreasonably withhold. Any costs incurred due to the failure to meet the foregoing standards, or otherwise defective services which require re-performance, as directed by AQMD, shall be the responsibility of CONTRACTOR. CONTRACTOR's failure to achieve the performance goals and objectives stated in Attachment 1- Statement of Work, is not a basis for requesting re-performance unless work conducted by CONTRACTOR is deemed by AQMD to have failed the foregoing standards of performance.
   E. CONTRACTOR shall post a performance bond in the amount of *** Dollars ($***) from a surety authorized to issue such bonds within the State. [USE IF REQUIRED]
   F. AQMD has the right to review the terms and conditions of the performance bond and to request modifications thereto which will ensure that AQMD will be compensated in the event CONTRACTOR fails to perform and also provides AQMD with the opportunity to review the qualifications of the entity designated by the issuer of the performance bond to perform in CONTRACTOR's absence and, if necessary, the right to reject such entity. [USE IF REQUIRED]

G. CONTRACTOR shall ensure, through its contracts with any subcontractor(s), that employees and agents performing under this Contract shall abide by the requirements set forth in this clause.

4. TERM - The term of this Contract is from the date of execution by both parties **(or insert date)** to ***, unless further extended by amendment of this Contract in writing. No work shall commence until this Contract is fully executed by all parties.

5. TERMINATION

A. In the event any party fails to comply with any term or condition of this Contract, or fails to provide services in the manner agreed upon by the parties, including, but not limited to, the requirements of Attachment 1 – Statement of Work, this failure shall constitute a breach of this Contract. The non-breaching party shall notify the breaching party that it must cure this breach or provide written notification of its intention to terminate this contract. Notification shall be provided in the manner set forth in Clause 11. The non-breaching party reserves all rights under law and equity to enforce this contract and recover damages.

B. AQMD reserves the right to terminate this Agreement, in whole or in part, without cause, upon thirty (30) days' written notice. Once such notice has been given, CONTRACTOR shall, except as and to the extent or directed otherwise by AQMD, discontinue any Work being performed under this Agreement and cancel any of CONTRACTOR's orders for materials, facilities, and supplies in connection with such Work, and shall use its best efforts to procure termination of existing subcontracts upon terms satisfactory to AQMD. Thereafter, CONTRACTOR shall perform only such services as may be necessary to preserve and protect any Work already in progress and to dispose of any property as requested by AQMD.

C. CONTRACTOR shall be paid in accordance with this Agreement for all work performed before the effective date of termination under Clause 5.B. Before expiration of the thirty (30) days' written notice, CONTRACTOR shall promptly deliver to AQMD all copies of documents and other information and data prepared or developed by CONTRACTOR under this Agreement with the exception of a record copy of such materials, which may be retained by CONTRACTOR.

6. INSURANCE

A. CONTRACTOR shall furnish evidence to AQMD of workers' compensation insurance for each of its employees, in accordance with either California or other states' applicable statutory requirements prior to commencement of any work on this Contract.

B. CONTRACTOR shall furnish evidence to AQMD of general liability insurance with a limit of at least $1,000,000 per occurrence, and $2,000,000 in a general aggregate prior to commencement of any work on this Contract. AQMD shall be named as an additional insured on any such liability policy, and thirty (30) days written notice prior to cancellation of any such insurance shall be given by CONTRACTOR to AQMD.

C. CONTRACTOR shall furnish evidence to AQMD of automobile liability insurance with limits of at least $100,000 per person and $300,000 per accident for bodily injuries, and $50,000 in property damage, or $1,000,000 combined single limit for bodily injury or property damage, prior to commencement of any work on this Contract. AQMD shall be named as an additional insured on any such liability policy, and thirty (30) days written notice prior to cancellation of any such insurance shall be given by CONTRACTOR to AQMD.

D. CONTRACTOR shall furnish evidence to AQMD of Professional Liability Insurance with an aggregate limit of not less than $5,000,000. [OPTIONAL FOR PROFESSIONAL SERVICES]

E. If CONTRACTOR fails to maintain the required insurance coverage set forth above, AQMD reserves the right either to purchase such additional insurance and to deduct the cost thereof from any payments owed to CONTRACTOR or terminate this Contract for breach.

F. All insurance certificates should be mailed to: AQMD Risk Management, 21865 Copley Drive, Diamond Bar, CA 91765-4178. **The AQMD Contract Number must be included on the face of the certificate.**
G. CONTRACTOR must provide updates on the insurance coverage throughout the term of the Contract to ensure that there is no break in coverage during the period of contract performance. Failure to provide evidence of current coverage shall be grounds for termination for breach of Contract.

7. INDEMNIFICATION - CONTRACTOR agrees to hold harmless and indemnify AQMD, its officers, employees, agents, representatives, and successors-in-interest against any and all loss, damage, cost, lawsuits, demands, judgments, legal fees or any other expenses which AQMD, its officers, employees, agents, representatives, and successors-in-interest may incur or be required to pay by reason of any injury or property damage arising from the negligent or intentional conduct or omission of CONTRACTOR, its employees, its subcontractors, or its agents in the performance of this Contract.

8. CO-FUNDING [USE IF REQUIRED]

A. CONTRACTOR shall obtain co-funding as follows: ***, *** Dollars ($***); ***, *** Dollars ($***); ***, *** Dollars ($***); ***, *** Dollars ($***); ***, *** Dollars ($***); and ***, *** Dollars ($***).
B. If CONTRACTOR fails to obtain co-funding in the amount(s) referenced above, then AQMD reserves the right to renegotiate or terminate this Contract.
C. CONTRACTOR shall provide co-funding in the amount of *** Dollars ($***) for this project. If CONTRACTOR fails to provide this co-funding, then AQMD reserves the right to renegotiate or terminate this Contract.

9. PAYMENT

[FIXED PRICE]-use this one or the T&M one below.

A. AQMD shall pay CONTRACTOR a fixed price of *** Dollars ($***) for work performed under this Contract in accordance with Attachment 2 - Payment Schedule, attached here and included here by reference. Payment shall be made by AQMD to CONTRACTOR within thirty (30) days after approval by AQMD of an invoice prepared and furnished by CONTRACTOR showing services performed and referencing tasks and deliverables as shown in Attachment 1 - Statement of Work, and the amount of charge claimed. Each invoice must be prepared in duplicate, on company letterhead, and list AQMD's Contract number, period covered by invoice, and CONTRACTOR's social security number or Employer Identification Number and submitted to: South Coast Air Quality Management District, Attn: ***.
B. An amount equal to ten percent (10%) shall be withheld from all charges paid until satisfactory completion and final acceptance of work by AQMD. *[OPTIONAL]*
C. AQMD reserves the right to disallow charges when the invoiced services are not performed satisfactorily in AQMD sole judgment.

[T & M]-use this one or the Fixed Price one above.

A. AQMD shall pay CONTRACTOR a total not to exceed amount of *** Dollars ($***), including any authorized travel-related expenses, for time and materials at rates in accordance with Attachment 2 – Cost Schedule, attached here and included here by this reference. Payment of charges shall be made by AQMD to CONTRACTOR within thirty (30) days after approval by AQMD of an itemized invoice prepared and furnished by CONTRACTOR referencing line item expenditures as listed in Attachment 2 and the amount of charge claimed. Each invoice must be prepared in duplicate, on company letterhead, and list AQMD's Contract number, period covered by invoice, and CONTRACTOR's social security number or Employer Identification Number and submitted to: South Coast Air Quality Management District, Attn: ***.
B. CONTRACTOR shall adhere to total tasks and/or cost elements (cost category) expenditures as listed in Attachment 2. Reallocation of costs between tasks and/or cost category expenditures is permitted up to

One Thousand Dollars ($1,000) upon prior written approval from AQMD. Reallocation of costs in excess of One Thousand Dollars ($1,000) between tasks and/or cost category expenditures requires an amendment to this Contract.

C. AQMD's payment of invoices shall be subject to the following limitations and requirements:

i) Charges for equipment, material, and supply costs, travel expenses, subcontractors, and other charges, as applicable, must be itemized by CONTRACTOR. Reimbursement for equipment, material, supplies, subcontractors, and other charges shall be made at actual cost. Supporting documentation must be provided for all individual charges (with the exception of direct labor charges provided by CONTRACTOR). AQMD's reimbursement of travel expenses and requirements for supporting documentation are listed below.

ii)CONTRACTOR's failure to provide receipts shall be grounds for AQMD's non-reimbursement of such charges. AQMD may reduce payments on invoices by those charges for which receipts were not provided.

iii)AQMD shall not pay interest, fees, handling charges, or cost of money on Contract.

D. AQMD shall reimburse CONTRACTOR for travel-related expenses only if such travel is expressly set forth in Attachment 2 – Cost Schedule of this Contract or pre-authorized by AQMD in writing.

i)AQMD's reimbursement of travel-related expenses shall cover lodging, meals, other incidental expenses, and costs of transportation subject to the following limitations:

Air Transportation - Coach class rate for all flights. If coach is not available, business class rate is permissible.

Car Rental - A compact car rental. A mid-size car rental is permissible if car rental is shared by three or more individuals.

Lodging - Up to One Hundred Fifty Dollars ($150) per night. A higher amount of reimbursement is permissible if pre-approved by AQMD.

Meals - Daily allowance is Fifty Dollars ($50.00).

ii)Supporting documentation shall be provided for travel-related expenses in accordance with the following requirements:

Lodging, Airfare, Car Rentals - Bill(s) for actual expenses incurred.

Meals - Meals billed in excess of $50.00 each day require receipts or other supporting documentation for the total amount of the bill and must be approved by AQMD.

Mileage - Beginning each January 1, the rate shall be adjusted effective February 1 by the Chief Financial Officer based on the Internal Revenue Service Standard Mileage Rate

Other travel-related expenses - Receipts are required for all individual items.

E. AQMD reserves the right to disallow charges when the invoiced services are not performed satisfactorily in AQMD sole judgment.

10. INTELLECTUAL PROPERTY RIGHTS - Title and full ownership rights to any software, documents, or reports developed under this Contract shall at all times remain with AQMD. Such material is agreed to be AQMD proprietary information.

A. Rights of Technical Data - AQMD shall have the unlimited right to use technical data, including material designated as a trade secret, resulting from the performance of services by CONTRACTOR under this Contract. CONTRACTOR shall have the right to use technical data for its own benefit.

B. Copyright - CONTRACTOR agrees to grant AQMD a royalty-free, nonexclusive, irrevocable license to produce, translate, publish, use, and dispose of all copyrightable material first produced or composed in the performance of this Contract.

11. NOTICES - Any notices from either party to the other shall be given in writing to the attention of the persons listed below, or to other such addresses or addressees as may hereafter be designated in writing for notices

by either party to the other. Notice shall be given by certified, express, or registered mail, return receipt requested, and shall be effective as of the date of receipt indicated on the return receipt card.

12. EMPLOYEES OF CONTRACTOR
    A. AQMD reserves the right to review the resumes of any of CONTRACTOR employees, and/or any subcontractors selected to perform the work specified here and to disapprove CONTRACTOR choices. CONTRACTOR warrants that it will employ no subcontractor without written approval from AQMD. CONTRACTOR shall be responsible for the cost of regular pay to its employees, as well as cost of vacation, vacation replacements, sick leave, severance pay and pay for legal holidays.
    B. CONTRACTOR, its officers, employees, agents, representatives or subcontractors shall in no sense be considered employees or agents of AQMD, nor shall CONTRACTOR, its officers, employees, agents, representatives or subcontractors be entitled to or eligible to participate in any benefits, privileges, or plans, given or extended by AQMD to its employees.
    C. AQMD requires Contractor to be incompliance with all state and federal laws and regulations with respect to its employees throughout the term of this Contract, including state minimum wage laws and OSHA requirements.

13. CONFIDENTIALITY - It is expressly understood and agreed that AQMD may designate in a conspicuous manner the information which CONTRACTOR obtains from AQMD as confidential. CONTRACTOR agrees to:
    A. Observe complete confidentiality with respect to such information, including without limitation, agreeing not to disclose or otherwise permit access to such information by any other person or entity in any manner whatsoever, except that such disclosure or access shall be permitted to employees or subcontractors of CONTRACTOR requiring access in fulfillment of the services provided under this Contract.
    B. Ensure that CONTRACTOR's officers, employees, agents, representatives, and independent contractors are informed of the confidential nature of such information and to assure by agreement or otherwise that they are prohibited from copying or revealing, for any purpose whatsoever, the contents of such information or any part thereof, or from taking any action otherwise prohibited under this clause.
    C. Not use such information or any part thereof in the performance of services to others or for the benefit of others in any form whatsoever whether gratuitously or for valuable consideration, except as permitted under this Contract.
    D. Notify AQMD promptly and in writing of the circumstances surrounding any possession, use, or knowledge of such information or any part thereof by any person or entity other than those authorized by this clause.
    E. Take at CONTRACTOR expense, but at AQMD's option and in any event under AQMD's control, any legal action necessary to prevent unauthorized use of such information by any third party or entity which has gained access to such information at least in part due to the fault of CONTRACTOR.

F. Take any and all other actions necessary or desirable to assure such continued confidentiality and protection of such information.
G. Prevent access to such information by any person or entity not authorized under this Contract.
H. Establish specific procedures in order to fulfill the obligations of this clause.
I. Notwithstanding the above, nothing herein is intended to abrogate or modify the provisions of Government Code Section 6250 et.seq. (Public Records Act).

14. PUBLICATION
A. AQMD shall have the right of prior written approval of any document which shall be disseminated to the public by CONTRACTOR in which CONTRACTOR utilized information obtained from AQMD in connection with performance under this Contract.
B. Information, data, documents, or reports developed by CONTRACTOR for AQMD, pursuant to this Contract, shall be part of AQMD public record unless otherwise indicated. CONTRACTOR may use or publish, at its own expense, such information provided to AQMD. The following acknowledgment of support and disclaimer must appear in each publication of materials, whether copyrighted or not, based upon or developed under this Contract.

> "This report was prepared as a result of work sponsored, paid for, in whole or in part, by the South Coast Air Quality Management District (AQMD). The opinions, findings, conclusions, and recommendations are those of the author and do not necessarily represent the views of AQMD. AQMD, its officers, employees, contractors, and subcontractors make no warranty, expressed or implied, and assume no legal liability for the information in this report. AQMD has not approved or disapproved this report, nor has AQMD passed upon the accuracy or adequacy of the information contained herein."

C. CONTRACTOR shall inform its officers, employees, and subcontractors involved in the performance of this Contract of the restrictions contained herein and require compliance with the above.

15. NON-DISCRIMINATION - In the performance of this Contract, CONTRACTOR shall not discriminate in recruiting, hiring, promotion, demotion, or termination practices on the basis of race, religious creed, color, national origin, ancestry, sex, age, or physical or mental disability and shall comply with the provisions of the California Fair Employment & Housing Act (Government Code Section 12900 et seq.), the Federal Civil Rights Act of 1964 (P.L. 88-352) and all amendments thereto, Executive Order No. 11246 (30 Federal Register 12319), and all administrative rules and regulations issued pursuant to said Acts and Order. CONTRACTOR shall likewise require each subcontractor to comply with this clause and shall include in each such subcontract language similar to this clause.

16. SOLICITATION OF EMPLOYEES - CONTRACTOR expressly agrees that CONTRACTOR shall not, during the term of this Contract, nor for a period of six months after termination, solicit for employment, whether as an employee or independent contractor, any person who is or has been employed by AQMD during the term of this Contract without the consent of AQMD.

17. PROPERTY AND SECURITY - Without limiting CONTRACTOR obligations with regard to security, CONTRACTOR shall comply with all the rules and regulations established by AQMD for access to and activity in and around AQMD premises.

18. ASSIGNMENT - The rights granted hereby may not be assigned, sold, licensed, or otherwise transferred by either party without the prior written consent of the other, and any attempt by either party to do so shall be void upon inception.

19. NON-EFFECT OF WAIVER - The failure of CONTRACTOR or AQMD to insist upon the performance of any or all of the terms, covenants, or conditions of this Contract, or failure to exercise any rights or remedies hereunder, shall not be construed as a waiver or relinquishment of the future performance of any such terms, covenants, or conditions, or of the future exercise of such rights or remedies, unless otherwise provided for herein.

20. ATTORNEYS' FEES - In the event any action is filed in connection with the enforcement or interpretation of this Contract, each party shall bear its own attorneys' fees and costs.

21. FORCE MAJEURE - Neither AQMD nor CONTRACTOR shall be liable or deemed to be in default for any delay or failure in performance under this Contract or interruption of services resulting, directly or indirectly, from acts of God, civil or military authority, acts of public enemy, war, strikes, labor disputes, shortages of suitable parts, materials, labor or transportation, or any similar cause beyond the reasonable control of AQMD or CONTRACTOR.

22. SEVERABILITY - In the event that any one or more of the provisions contained in this Contract shall for any reason be held to be unenforceable in any respect by a court of competent jurisdiction, such holding shall not affect any other provisions of this Contract, and the Contract shall then be construed as if such unenforceable provisions are not a part hereof.

23. HEADINGS - Headings on the clauses of this Contract are for convenience and reference only, and the words contained therein shall in no way be held to explain, modify, amplify, or aid in the interpretation, construction, or meaning of the provisions of this Contract.

24. DUPLICATE EXECUTION - This Contract is executed in duplicate. Each signed copy shall have the force and effect of an original.

25. GOVERNING LAW - This Contract shall be construed and interpreted and the legal relations created thereby shall be determined in accordance with the laws of the State of California. Venue for resolution of any disputes under this Contract shall be Los Angeles County, California.

26. CITIZENSHIP AND ALIEN STATUS
    A. CONTRACTOR warrants that it fully complies with all laws regarding the employment of aliens and others, and that its employees performing services hereunder meet the citizenship or alien status requirements contained in federal and state statutes and regulations including, but not limited to, the Immigration Reform and Control Act of 1986 (P.L. 99-603). CONTRACTOR shall obtain from all covered employees performing services hereunder all verification and other documentation of employees' eligibility status required by federal statutes and regulations as they currently exist and as they may be hereafter amended. CONTRACTOR shall have a continuing obligation to verify and document the continuing employment authorization and authorized alien status of employees performing services under this Contract to insure continued compliance with all federal statutes and regulations.
    B. Notwithstanding paragraph A above, CONTRACTOR, in the performance of this Contract, shall not discriminate against any person in violation of 8 USC Section 1324b.
    C. CONTRACTOR shall retain such documentation for all covered employees for the period described by law. CONTRACTOR shall indemnify, defend, and hold harmless AQMD, its officers and employees from employer sanctions and other liability which may be assessed against CONTRACTOR or AQMD, or both in connection with any alleged violation of federal statutes or regulations pertaining to the eligibility for employment of persons performing services under this Contract.

27. FEDERAL FAIR SHARE POLICY - As a recipient of Environmental Protection Agency (EPA) grant funds, AQMD is required to flow down to all of its contractors the provisions of 40 CFR Section 31.36(e) which addresses affirmative steps for contracting with small-and-minority firms, women's business enterprises, and labor surplus area firms. CONTRACTOR agrees to comply with these provisions.

28. REQUIREMENT FOR FILING STATEMENT OF ECONOMIC INTERESTS - In accordance with the Political Reform Act of 1974 (Government Code Sec. 81000 et seq.) and regulations issued by the Fair Political Practices Commission (FPPC), AQMD has determined that the nature of the work to be performed under this Contract requires CONTRACTOR to submit a Form 700, Statement of Economic Interests for Designated Officials and Employees, for each of its employees assigned to work on this Contract. These forms may be obtained from AQMD's District Counsel's office. [USE IF REQUIRED]

29. COMPLIANCE WITH SINGLE AUDIT ACT REQUIREMENTS *[OPTIONAL - TO BE INCLUDED IN CONTRACTS WITH FOR-PROFIT CONTRACTORS WHICH HAVE FEDERAL PASS-THROUGH FUNDING]* - During the term of the Contract, and for a period of three (3) years from the date of Contract expiration, and if requested in writing by the AQMD, CONTRACTOR shall allow the AQMD, its designated representatives and/or the cognizant Federal Audit Agency, access during normal business hours to all records and reports related to the work performed under this Contract. CONTRACTOR assumes sole responsibility for reimbursement to the Federal Agency funding the prime grant or contract, a sum of money equivalent to the amount of any expenditures disallowed should the AQMD, its designated representatives and/or the cognizant Federal Audit Agency rule through audit exception or some other appropriate means that expenditures from funds allocated to the CONTRACTOR were not made in compliance with the applicable cost principles, regulations of the funding agency, or the provisions of this Contract.

    [OPTIONAL - TO BE INCLUDED IN CONTRACTS WITH NON-PROFIT CONTRACTORS WHICH HAVE FEDERAL PASS-THROUGH FUNDING] - Beginning with CONTRACTOR's current fiscal year and continuing through the term of this Contract, CONTRACTOR shall have a single or program-specific audit conducted in accordance with the requirements of the Office of Management and Budget (OMB) Circular A-133 (Audits of States, Local Governments and Non-Profit Organizations), if CONTRACTOR expended Five Hundred Thousand Dollars ($500,000) or more in a year in Federal Awards. Such audit shall be conducted by a firm of independent accountants in accordance with Generally Accepted Government Audit Standards (GAGAS). Within thirty (30) days of Contract execution, CONTRACTOR shall forward to AQMD the most recent A-133 Audit Report issued by its independent auditors. Subsequent A-133 Audit Reports shall be submitted to the AQMD within thirty (30) days of issuance.

    CONTRACTOR shall allow the AQMD, its designated representatives and/or the cognizant Federal Audit Agency, access during normal business hours to all records and reports related to the work performed under this Contract. CONTRACTOR assumes sole responsibility for reimbursement to the Federal Agency funding the prime grant or contract, a sum of money equivalent to the amount of any expenditures disallowed should the AQMD, its designated representatives and/or the cognizant Federal Audit Agency rule through audit exception or some other appropriate means that expenditures from funds allocated to the CONTRACTOR were not made in compliance with the applicable cost principles, regulations of the funding agency, or the provisions of this Contract.

30. OPTION TO EXTEND THE TERM OF THE CONTRACT - AQMD reserves the right to extend the contract for a one-year period commencing *****(enter date) at the (option price or Not-to-Exceed Amount) set forth in Attachment 2. In the event that AQMD elects to extend the contract, a written notice of its intent to extend the contract shall be provided to CONTRACTOR no later than thirty (30) days prior to Contract expiration. [USE IF REQUIRED]

31. KEY PERSONNEL - *insert person's name* is deemed critical to the successful performance of this Contract. Any changes in key personnel by CONTRACTOR must be approved by AQMD. All substitute personnel must possess qualifications/experience equal to the original named key personnel and must be approved by AQMD. AQMD reserves the right to interview proposed substitute key personnel. [USE IF REQUIRED]

32. PREVAILING WAGES – [USE FOR INFRASTRUCTURE PROJECTS] CONTRACTOR is alerted to the prevailing wage requirements of California Labor Code section 1770 et seq. Copies of the prevailing rate of per diem wages are on file at the AQMD's headquarters, of which shall be made available to any interested party on request. Notwithstanding the preceding sentence, CONTRACTOR shall be responsible for determining the applicability of the provisions of California Labor Code and complying with the same, including, without limitation, obtaining from the Director of the Department of Industrial Relations the general prevailing rate of per diem wages and the general prevailing rate for holiday and overtime work, making the same available to any interested party upon request, paying any applicable prevailing rates, posting copies thereof at the job site and flowing all applicable prevailing wage rate requirements to its subcontractors. CONTRACTOR shall indemnify, defend and hold harmless the South Coast Air Quality Management District against any and all claims, demands, damages, defense costs or liabilities based on failure to adhere to the above referenced statutes.

33. APPROVAL OF SUBCONTRACT

    A. If CONTRACTOR intends to subcontract a portion of the work under this Contract, written approval of the terms of the proposed subcontract(s) shall be obtained from AQMD's Executive Officer or designee prior to execution of the subcontract. No subcontract charges will be reimbursed unless such approval has been obtained.
    B. Any material changes to the subcontract(s) that affect the scope of work, deliverable schedule, and/or cost schedule shall also require the written approval of the Executive Officer or designee prior to execution.
    C. The sole purpose of AQMD's review is to insure that AQMD's contract rights have not been diminished in the subcontractor agreement. AQMD shall not supervise, direct, or have control over, or be responsible for, subcontractor's means, methods, techniques, work sequences or procedures or for the safety precautions and programs incident thereto, or for any failure of subcontractor to comply with any local, state, or federal laws, or rules or regulations.

34. ENTIRE CONTRACT - This Contract represents the entire agreement between the parties hereto related to CONTRACTOR providing services to AQMD and there are no understandings, representations, or warranties of any kind except as expressly set forth herein. No waiver, alteration, or modification of any of the provisions herein shall be binding on any party unless in writing and signed by the party against whom enforcement of such waiver, alteration, or modification is sought.

IN WITNESS WHEREOF, the parties to this Contract have caused this Contract to be duly executed on their behalf by their authorized representatives.

Business Information Request

Dear SCAQMD Contractor/Supplier:

The South Coast Air Quality Management District (SCAQMD) is committed to ensuring that our contractor/supplier records are current and accurate. If your firm is selected for award of a purchase order or contract, it is imperative that the information requested herein be supplied in a timely manner to facilitate payment of invoices. In order to process your payments, we need the enclosed information regarding your account. **Please review and complete the information identified on the following pages, complete the enclosed W-9 form, remember to sign both documents for our files, and return them as soon as possible to the address below:**

Attention: Accounts Payable, Accounting Department
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765-4178

If you do not return this information, we will not be able to establish you as a vendor. This will delay any payments and would still necessitate your submittal of the enclosed information to our Accounting department before payment could be initiated. Completion of this document and enclosed forms would ensure that your payments are processed timely and accurately.

If you have any questions or need assistance in completing this information, please contact Accounting at (909) 396-3777. We appreciate your cooperation in completing this necessary information.

Sincerely,

Michael B. O'Kelly
Chief Financial Officer

DISADVANTAGED BUSINESS CERTIFICATION

Federal guidance for utilization of disadvantaged business enterprises allows a vendor to be deemed a small business enterprise (SBE), minority business enterprise (MBE) or women business enterprise (WBE) if it meets the criteria below.

- is certified by the Small Business Administration or
- is certified by a state or federal agency or
- is an independent MBE(s) or WBE(s) business concern which is at least 51 percent owned and controlled by minority group member(s) who are citizens of the United States.

Statements of certification:

As a prime contractor to the SCAQMD,_____(name of business) will engage in good faith efforts to achieve the fair share in accordance with 40 CFR Section 31.36(e), and will follow the six affirmative steps listed below **for contracts or purchase orders funded in whole or in part by federal grants and contracts.**

1. Place qualified SBEs, MBEs, and WBEs on solicitation lists.
2. Assure that SBEs, MBEs, and WBEs are solicited whenever possible.
3. When economically feasible, divide total requirements into small tasks or quantities to permit greater participation by SBEs, MBEs, and WBEs.
4. Establish delivery schedules, if possible, to encourage participation by SBEs, MBEs, and WBEs.
5. Use services of Small Business Administration, Minority Business Development Agency of the Department of Commerce, and/or any agency authorized as a clearinghouse for SBEs, MBEs, and WBEs.
6. If subcontracts are to be let, take the above affirmative steps.

Self-Certification Verification: Also for use in awarding additional points, as applicable**, in accordance with SCAQMD Procurement Policy and Procedure:**

Definitions

Disabled Veteran-Owned Business Enterprise means a business that meets all of the following criteria:

- is a sole proprietorship or partnership of which is at least 51 percent owned by one or more disabled veterans, or in the case of any business whose stock is publicly held, at least 51 percent of the stock is owned by one or more disabled veterans; a subsidiary which is wholly owned by a parent corporation but only if at least 51 percent of the voting stock of the parent corporation is owned by one or more disabled veterans; or a joint venture in which at least 51 percent of the joint venture's management and control and earnings are held by one or more disabled veterans.
- the management and control of the daily business operations are by one or more disabled veterans. The disabled veterans who exercise management and control are not required to be the same disabled veterans as the owners of the business.
- is a sole proprietorship, corporation, partnership, or joint venture with its primary headquarters office located in the United States and which is not a branch or subsidiary of a foreign corporation, firm, or other foreign-based business.

Joint Venture means that one party to the joint venture is a DVBE and owns at least 51 percent of the joint venture. In the case of a joint venture formed for a single project this means that DVBE will receive at least 51 percent of the project dollars.

Local Business means a business that meets all of the following criteria:

- has an ongoing business within the boundary of the SCAQMD at the time of bid application.
- performs 90 percent of the work within SCAQMD's jurisdiction.

Minority-Owned Business Enterprise means a business that meets all of the following criteria:

- is at least 51 percent owned by one or more minority persons or in the case of any business whose stock is publicly held, at least 51 percent of the stock is owned by one or more minority persons.
- is a business whose management and daily business operations are controlled or owned by one or more minority person.
- is a business which is a sole proprietorship, corporation, partnership, joint venture, an association, or a cooperative with its primary headquarters office located in the United States, which is not a branch or subsidiary of a foreign corporation, foreign firm, or other foreign business.

"Minority" person means a Black American, Hispanic American, Native American (including American Indian, Eskimo, Aleut, and Native Hawaiian), Asian-Indian American (including a person whose origins are from India, Pakistan, or Bangladesh), Asian-Pacific American (including a person whose origins are from Japan, China, the Philippines, Vietnam, Korea, Samoa, Guam, the United States Trust Territories of the Pacific, Northern Marianas, Laos, Cambodia, or Taiwan).

Small Business Enterprise means a business that meets the following criteria:

a. 1) an independently owned and operated business; 2) not dominant in its field of operation; 3) together with affiliates is either:

- **A service, construction, or non-manufacturer with 100 or fewer employees, and average annual gross receipts of ten million dollars ($10,000,000) or less over the previous three years, or**
- A manufacturer with 100 or fewer employees.

b. Manufacturer means a business that is both of the following:

1) Primarily engaged in the chemical or mechanical transformation of raw materials or processed substances into new products.

2) Classified between Codes 311000 to 339000, inclusive, of the North American Industrial Classification System (NAICS) Manual published by the United States Office of Management and Budget, 2007 edition.

Small Business Joint Venture means that one party to the joint venture is a Small Business and owns at least 51 percent of the joint venture. In the case of a joint venture formed for a single project this means that the Small Business will receive at least 51 percent of the project dollars.

Women-Owned Business Enterprise means a business that meets all of the following criteria:

- is at least 51 percent owned by one or more women or in the case of any business whose stock is publicly held, at least 51 percent of the stock is owned by one or more women.
- is a business whose management and daily business operations are controlled or owned by one or more women.
- is a business which is a sole proprietorship, corporation, partnership, or a joint venture, with its primary headquarters office located in the United States, which is not a branch or subsidiary of a foreign corporation, foreign firm, or other foreign business.

Form **W-9**
(Rev. January 2005)
Department of the Treasury
Internal Revenue Service

Request for Taxpayer Identification Number and Certification

Give form to the requester. Do not send to the IRS.

Print or type
See Specific Instructions on page 2.

Name (as shown on your income tax return)

Business name, if different from above

Check appropriate box: ☐ Individual/ Sole proprietor ☐ Corporation ☐ Partnership ☐ Other ► _____ ☐ Exempt from backup withholding

Address (number, street, and apt. or suite no.) | Requester's name and address (optional)

City, state, and ZIP code

List account number(s) here (optional)

Part I Taxpayer Identification Number (TIN)

Enter your TIN in the appropriate box. The TIN provided must match the name given on Line 1 to avoid backup withholding. For individuals, this is your social security number (SSN). However, for a resident alien, sole proprietor, or disregarded entity, see the Part I instructions on page 3. For other entities, it is your employer identification number (EIN). If you do not have a number, see *How to get a TIN* on page 3.

Note. *If the account is in more than one name, see the chart on page 4 for guidelines on whose number to enter.*

Social security number
___ ___ ___ – ___ ___ – ___ ___ ___ ___

or

Employer identification number
___ ___ – ___ ___ ___ ___ ___ ___ ___

Part II Certification

Under penalties of perjury, I certify that:

1. The number shown on this form is my correct taxpayer identification number (or I am waiting for a number to be issued to me), and
2. I am not subject to backup withholding because: (a) I am exempt from backup withholding, or (b) I have not been notified by the Internal Revenue Service (IRS) that I am subject to backup withholding as a result of a failure to report all interest or dividends, or (c) the IRS has notified me that I am no longer subject to backup withholding, and
3. I am a U.S. person (including a U.S. resident alien).

Certification instructions. You must cross out item 2 above if you have been notified by the IRS that you are currently subject to backup withholding because you have failed to report all interest and dividends on your tax return. For real estate transactions, item 2 does not apply. For mortgage interest paid, acquisition or abandonment of secured property, cancellation of debt, contributions to an individual retirement arrangement (IRA), and generally, payments other than interest and dividends, you are not required to sign the Certification, but you must provide your correct TIN. (See the instructions on page 4.)

Sign Here Signature of U.S. person ► Date ►

Purpose of Form

A person who is required to file an information return with the IRS, must obtain your correct taxpayer identification number (TIN) to report, for example, income paid to you, real estate transactions, mortgage interest you paid, acquisition or abandonment of secured property, cancellation of debt, or contributions you made to an IRA.

U.S. person. Use Form W-9 only if you are a U.S. person (including a resident alien), to provide your correct TIN to the person requesting it (the requester) and, when applicable, to:

1. Certify that the TIN you are giving is correct (or you are waiting for a number to be issued),
2. Certify that you are not subject to backup withholding, or
3. Claim exemption from backup withholding if you are a U.S. exempt payee.

Note. *If a requester gives you a form other than Form W-9 to request your TIN, you must use the requester's form if it is substantially similar to this Form W-9.*

For federal tax purposes you are considered a person if you are:

- An individual who is a citizen or resident of the United States,
- A partnership, corporation, company, or association created or organized in the United States or under the laws of the United States, or
- Any estate (other than a foreign estate) or trust. See Regulations sections 301.7701-6(a) and 7(a) for additional information.

Foreign person. If you are a foreign person, do not use Form W-9. Instead, use the appropriate Form W-8 (see Publication 515, Withholding of Tax on Nonresident Aliens and Foreign Entities).

Nonresident alien who becomes a resident alien. Generally, only a nonresident alien individual may use the terms of a tax treaty to reduce or eliminate U.S. tax on certain types of income. However, most tax treaties contain a provision known as a "saving clause." Exceptions specified in the saving clause may permit an exemption from tax to continue for certain types of income even after the recipient has otherwise become a U.S. resident alien for tax purposes.

If you are a U.S. resident alien who is relying on an exception contained in the saving clause of a tax treaty to claim an exemption from U.S. tax on certain types of income, you must attach a statement to Form W-9 that specifies the following five items:

1. The treaty country. Generally, this must be the same treaty under which you claimed exemption from tax as a nonresident alien.
2. The treaty article addressing the income.
3. The article number (or location) in the tax treaty that contains the saving clause and its exceptions.

4. The type and amount of income that qualifies for the exemption from tax.

5. Sufficient facts to justify the exemption from tax under the terms of the treaty article.

Example. Article 20 of the U.S.-China income tax treaty allows an exemption from tax for scholarship income received by a Chinese student temporarily present in the United States. Under U.S. law, this student will become a resident alien for tax purposes if his or her stay in the United States exceeds 5 calendar years. However, paragraph 2 of the first Protocol to the U.S.-China treaty (dated April 30, 1984) allows the provisions of Article 20 to continue to apply even after the Chinese student becomes a resident alien of the United States. A Chinese student who qualifies for this exception (under paragraph 2 of the first protocol) and is relying on this exception to claim an exemption from tax on his or her scholarship or fellowship income would attach to Form W-9 a statement that includes the information described above to support that exemption.

If you are a nonresident alien or a foreign entity not subject to backup withholding, give the requester the appropriate completed Form W-8.

What is backup withholding? Persons making certain payments to you must under certain conditions withhold and pay to the IRS 28% of such payments (after December 31, 2002). This is called "backup withholding." Payments that may be subject to backup withholding include interest, dividends, broker and barter exchange transactions, rents, royalties, nonemployee pay, and certain payments from fishing boat operators. Real estate transactions are not subject to backup withholding.

You will not be subject to backup withholding on payments you receive if you give the requester your correct TIN, make the proper certifications, and report all your taxable interest and dividends on your tax return.

Payments you receive will be subject to backup withholding if:

1. You do not furnish your TIN to the requester, or

2. You do not certify your TIN when required (see the Part II instructions on page 4 for details), or

3. The IRS tells the requester that you furnished an incorrect TIN, or

4. The IRS tells you that you are subject to backup withholding because you did not report all your interest and dividends on your tax return (for reportable interest and dividends only), or

5. You do not certify to the requester that you are not subject to backup withholding under 4 above (for reportable interest and dividend accounts opened after 1983 only).

Certain payees and payments are exempt from backup withholding. See the instructions below and the separate Instructions for the Requester of Form W-9.

Penalties

Failure to furnish TIN. If you fail to furnish your correct TIN to a requester, you are subject to a penalty of $50 for each such failure unless your failure is due to reasonable cause and not to willful neglect.

Civil penalty for false information with respect to withholding. If you make a false statement with no reasonable basis that results in no backup withholding, you are subject to a $500 penalty.

Criminal penalty for falsifying information. Willfully falsifying certifications or affirmations may subject you to criminal penalties including fines and/or imprisonment.

Misuse of TINs. If the requester discloses or uses TINs in violation of federal law, the requester may be subject to civil and criminal penalties.

Specific Instructions

Name

If you are an individual, you must generally enter the name shown on your social security card. However, if you have changed your last name, for instance, due to marriage without informing the Social Security Administration of the name change, enter your first name, the last name shown on your social security card, and your new last name.

If the account is in joint names, list first, and then circle, the name of the person or entity whose number you entered in Part I of the form.

Sole proprietor. Enter your individual name as shown on your social security card on the "Name" line. You may enter your business, trade, or "doing business as (DBA)" name on the "Business name" line.

Limited liability company (LLC). If you are a single-member LLC (including a foreign LLC with a domestic owner) that is disregarded as an entity separate from its owner under Treasury regulations section 301.7701-3, enter the owner's name on the "Name" line. Enter the LLC's name on the "Business name" line. Check the appropriate box for your filing status (sole proprietor, corporation, etc.), then check the box for "Other" and enter "LLC" in the space provided.

Other entities. Enter your business name as shown on required Federal tax documents on the "Name" line. This name should match the name shown on the charter or other legal document creating the entity. You may enter any business, trade, or DBA name on the "Business name" line.

Note. You are requested to check the appropriate box for your status (individual/sole proprietor, corporation, etc.).

Exempt From Backup Withholding

If you are exempt, enter your name as described above and check the appropriate box for your status, then check the "Exempt from backup withholding" box in the line following the business name, sign and date the form.

Generally, individuals (including sole proprietors) are not exempt from backup withholding. Corporations are exempt from backup withholding for certain payments, such as interest and dividends.

Note. If you are exempt from backup withholding, you should still complete this form to avoid possible erroneous backup withholding.

Exempt payees. Backup withholding is not required on any payments made to the following payees:

1. An organization exempt from tax under section 501(a), any IRA, or a custodial account under section 403(b)(7) if the account satisfies the requirements of section 401(f)(2),

2. The United States or any of its agencies or instrumentalities,

3. A state, the District of Columbia, a possession of the United States, or any of their political subdivisions or instrumentalities,

4. A foreign government or any of its political subdivisions, agencies, or instrumentalities, or

5. An international organization or any of its agencies or instrumentalities.

Other payees that may be exempt from backup withholding include:

6. A corporation,

7. A foreign central bank of issue,

8. A dealer in securities or commodities required to register in the United States, the District of Columbia, or a possession of the United States,

9. A futures commission merchant registered with the Commodity Futures Trading Commission,

10. A real estate investment trust,

11. An entity registered at all times during the tax year under the Investment Company Act of 1940,

12. A common trust fund operated by a bank under section 584(a),

13. A financial institution,

14. A middleman known in the investment community as a nominee or custodian, or

15. A trust exempt from tax under section 664 or described in section 4947.

The chart below shows types of payments that may be exempt from backup withholding. The chart applies to the exempt recipients listed above, 1 through 15.

IF the payment is for . . .	THEN the payment is exempt for . . .
Interest and dividend payments	All exempt recipients except for 9
Broker transactions	Exempt recipients 1 through 13. Also, a person registered under the Investment Advisers Act of 1940 who regularly acts as a broker
Barter exchange transactions and patronage dividends	Exempt recipients 1 through 5
Payments over $600 required to be reported and direct sales over $5,000 [1]	Generally, exempt recipients 1 through 7 [2]

[1] See Form 1099-MISC, Miscellaneous Income, and its instructions.

[2] However, the following payments made to a corporation (including gross proceeds paid to an attorney under section 6045(f), even if the attorney is a corporation) and reportable on Form 1099-MISC are not exempt from backup withholding: medical and health care payments, attorneys' fees; and payments for services paid by a Federal executive agency.

Part I. Taxpayer Identification Number (TIN)

Enter your TIN in the appropriate box. If you are a resident alien and you do not have and are not eligible to get an SSN, your TIN is your IRS individual taxpayer identification number (ITIN). Enter it in the social security number box. If you do not have an ITIN, see *How to get a TIN* below.

If you are a sole proprietor and you have an EIN, you may enter either your SSN or EIN. However, the IRS prefers that you use your SSN.

If you are a single-owner LLC that is disregarded as an entity separate from its owner (see *Limited liability company (LLC)* on page 2), enter your SSN (or EIN, if you have one). If the LLC is a corporation, partnership, etc., enter the entity's EIN.

Note. See the chart on page 4 for further clarification of name and TIN combinations.

How to get a TIN. If you do not have a TIN, apply for one immediately. To apply for an SSN, get Form SS-5, Application for a Social Security Card, from your local Social Security Administration office or get this form online at *www.socialsecurity.gov/online/ss-5.pdf*. You may also get this form by calling 1-800-772-1213. Use Form W-7, Application for IRS Individual Taxpayer Identification Number, to apply for an ITIN, or Form SS-4, Application for Employer Identification Number, to apply for an EIN. You can apply for an EIN online by accessing the IRS website at *www.irs.gov/businesses/* and clicking on Employer ID Numbers under Related Topics. You can get Forms W-7 and SS-4 from the IRS by visiting *www.irs.gov* or by calling 1-800-TAX-FORM (1-800-829-3676).

If you are asked to complete Form W-9 but do not have a TIN, write "Applied For" in the space for the TIN, sign and date the form, and give it to the requester. For interest and dividend payments, and certain payments made with respect to readily tradable instruments, generally you will have 60 days to get a TIN and give it to the requester before you are subject to backup withholding on payments. The 60-day rule does not apply to other types of payments. You will be subject to backup withholding on all such payments until you provide your TIN to the requester.

Note. Writing "Applied For" means that you have already applied for a TIN or that you intend to apply for one soon.

Caution: *A disregarded domestic entity that has a foreign owner must use the appropriate Form W-8.*

Part II. Certification

To establish to the withholding agent that you are a U.S. person, or resident alien, sign Form W-9. You may be requested to sign by the withholding agent even if items 1, 4, and 5 below indicate otherwise.

For a joint account, only the person whose TIN is shown in Part I should sign (when required). Exempt recipients, see *Exempt From Backup Withholding* on page 2.

Signature requirements. Complete the certification as indicated in 1 through 5 below.

1. Interest, dividend, and barter exchange accounts opened before 1984 and broker accounts considered active during 1983. You must give your correct TIN, but you do not have to sign the certification.

2. Interest, dividend, broker, and barter exchange accounts opened after 1983 and broker accounts considered inactive during 1983. You must sign the certification or backup withholding will apply. If you are subject to backup withholding and you are merely providing your correct TIN to the requester, you must cross out item 2 in the certification before signing the form.

3. Real estate transactions. You must sign the certification. You may cross out item 2 of the certification.

4. Other payments. You must give your correct TIN, but you do not have to sign the certification unless you have been notified that you have previously given an incorrect TIN. "Other payments" include payments made in the course of the requester's trade or business for rents, royalties, goods (other than bills for merchandise), medical and health care services (including payments to corporations), payments to a nonemployee for services, payments to certain fishing boat crew members and fishermen, and gross proceeds paid to attorneys (including payments to corporations).

5. Mortgage interest paid by you, acquisition or abandonment of secured property, cancellation of debt, qualified tuition program payments (under section 529), IRA, Coverdell ESA, Archer MSA or HSA contributions or distributions, and pension distributions. You must give your correct TIN, but you do not have to sign the certification.

What Name and Number To Give the Requester

For this type of account:	Give name and SSN of:
1. Individual	The individual
2. Two or more individuals (joint account)	The actual owner of the account or, if combined funds, the first individual on the account [1]
3. Custodian account of a minor (Uniform Gift to Minors Act)	The minor [2]
4. a. The usual revocable savings trust (grantor is also trustee)	The grantor-trustee [1]
b. So-called trust account that is not a legal or valid trust under state law	The actual owner [1]
5. Sole proprietorship or single-owner LLC	The owner [3]
For this type of account:	**Give name and EIN of:**
6. Sole proprietorship or single-owner LLC	The owner [3]
7. A valid trust, estate, or pension trust	Legal entity [4]
8. Corporate or LLC electing corporate status on Form 8832	The corporation
9. Association, club, religious, charitable, educational, or other tax-exempt organization	The organization
10. Partnership or multi-member LLC	The partnership
11. A broker or registered nominee	The broker or nominee
12. Account with the Department of Agriculture in the name of a public entity (such as a state or local government, school district, or prison) that receives agricultural program payments	The public entity

[1] List first and circle the name of the person whose number you furnish. If only one person on a joint account has an SSN, that person's number must be furnished.

[2] Circle the minor's name and furnish the minor's SSN.

[3] You must show your individual name and you may also enter your business or "DBA" name on the second name line. You may use either your SSN or EIN (if you have one). If you are a sole proprietor, IRS encourages you to use your SSN.

[4] List first and circle the name of the legal trust, estate, or pension trust. (Do not furnish the TIN of the personal representative or trustee unless the legal entity itself is not designated in the account title.)

Note. If no name is circled when more than one name is listed, the number will be considered to be that of the first name listed.

Privacy Act Notice

Section 6109 of the Internal Revenue Code requires you to provide your correct TIN to persons who must file information returns with the IRS to report interest, dividends, and certain other income paid to you, mortgage interest you paid, the acquisition or abandonment of secured property, cancellation of debt, or contributions you made to an IRA, or Archer MSA or HSA. The IRS uses the numbers for identification purposes and to help verify the accuracy of your tax return. The IRS may also provide this information to the Department of Justice for civil and criminal litigation, and to cities, states, and the District of Columbia to carry out their tax laws. We may also disclose this information to other countries under a tax treaty, to federal and state agencies to enforce federal nontax criminal laws, or to federal law enforcement and intelligence agencies to combat terrorism.

You must provide your TIN whether or not you are required to file a tax return. Payers must generally withhold 28% of taxable interest, dividend, and certain other payments to a payee who does not give a TIN to a payer. Certain penalties may also apply.

United State Environmental Protection Agency
Washington, DC 20460

Certification Regarding
Debarment, Suspension, and Other Responsibility Matters

The prospective participant certifies to the best of its knowledge and belief that it and the principals:

(a) Are not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from covered transactions by any Federal department or agency;

(b) Have not within a three year period preceding this proposal been convicted of or had a civil judgement rendered against them or commission of fraud or a criminal offense in connection with obtaining, attempting to obtain, or performing a public (Federal, State, or local) transaction or contract under a public transaction: violation of Federal or State antitrust statute or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements, or receiving stolen property:

(c) Are not presently indicted for or otherwise criminally or civilly charged by a government entity (Federal, State, or local) with commission of any of the offenses enumerated in paragraph (1)(b) of this certification; and

(d) Have not within a three-year period preceding this application/proposal had one or more public transactions (Federal, State, or local) terminated for cause or default.

I understand that a false statement on this certification may be grounds for rejection of this proposal or termination of the award. In addition, under 18 USC Sec. 1001, a false statement may result in a fine of up to $10,000 or imprisonment for up to 5 years, or both.

CAMPAIGN CONTRIBUTIONS DISCLOSURE

California law prohibits a party, or an agent, from making campaign contributions to AQMD Governing Board Members or members/alternates of the Mobile Source Pollution Reduction Committee (MSRC) of $250 or more while their contract or permit is pending before the AQMD; and further prohibits a campaign contribution from being made for three (3) months following the date of the final decision by the Governing Board or the MSRC on a donor's contract or permit. Gov't Code §84308(d). For purposes of reaching the $250 limit, the campaign contributions of the bidder or contractor *plus* contributions by its parents, affiliates, and related companies of the contractor or bidder are added together. 2 C.C.R. §18438.5.

In addition, Board Members or members/alternates of the MSRC must abstain from voting on a contract or permit if they have received a campaign contribution from a party or participant to the proceeding, or agent, totaling $250 or more in the 12-month period prior to the consideration of the item by the Governing Board or the MSRC. Gov't Code §84308(c). When abstaining, the Board Member or members/alternates of the MSRC must announce the source of the campaign contribution on the record. *Id*. The requirement to abstain is triggered by campaign contributions of $250 or more in total contributions of the bidder or contractor, *plus* any of its parent, subsidiary, or affiliated companies. 2 C.C.R. §18438.5.

In accordance with California law, bidders and contracting parties are required to disclose, at the time the application is filed, information relating to any campaign contributions made to Board Members or members/alternates of the MSRC, including: the name of the party making the contribution (which includes any parent, subsidiary or otherwise related business entity, as defined below), the amount of the contribution, and the date the contribution was made. 2 C.C.R. §18438.8(b).

The list of current AQMD Governing Board Members can be found at the AQMD website (www.aqmd.gov). The list of current MSRC members/alternates can be found at the MSRC website (http://www.cleantransportationfunding.org).

DEFINITIONS

Parent, Subsidiary, or Otherwise Related Business Entity.

(1) Parent subsidiary. A parent subsidiary relationship exists when one corporation directly or indirectly owns shares possessing more than 50 percent of the voting power of another corporation.

(2) Otherwise related business entity. Business entities, including corporations, partnerships, joint ventures and any other organizations and enterprises operated for profit, which do not have a parent subsidiary relationship are otherwise related if any one of the following three tests is met:

- *(A) One business entity has a controlling ownership interest in the other business entity.*
- *(B) There is shared management and control between the entities. In determining whether there is shared management and control, consideration should be given to the following factors:*
  - *(i) The same person or substantially the same person owns and manages the two entities;*
  - *(ii) There are common or commingled funds or assets;*
  - *(iii) The business entities share the use of the same offices or employees, or otherwise share activities, resources or personnel on a regular basis;*
  - *(iv) There is otherwise a regular and close working relationship between the entities; or*
- *(C) A controlling owner (50% or greater interest as a shareholder or as a general partner) in one entity also is a controlling owner in the other entity.*

2 Cal. Code of Regs., §18703.1(d).

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 15

PROPOSAL: Appropriate Funds from Designation for Litigation and Enforcement and Authorize Amending/Initiating Contracts with Outside Counsel

SYNOPSIS: AQMD District Counsel is currently being assisted in several environmental lawsuits by outside law firms and in other matters requiring specialized legal counsel. This action is to appropriate $425,000 from the Designation for Litigation and Enforcement to the Legal Budget, Professional and Special Services account, and to authorize the Chairman or the Executive Officer, as appropriate, to amend or initiate contracts to expend these funds with prequalified counsel approved by the Board as well as specialized legal counsel with monies to be appropriated as the need arises.

COMMITTEE: Administrative, October 8, 2010, Recommended for Approval

RECOMMENDED ACTIONS:

1. Appropriate $425,000 from the Designation for Litigation and Enforcement to Legal's FY 2010-11 Budget, Professional and Special Services account.

2. Authorize the Chairman or the Executive Officer, depending on whether the amount exceeds $75,000, to amend or initiate contracts with prequalified counsel approved by the Board as well as specialized legal counsel in a total amount not to exceed $685,000 in FY 2010-11, as the need arises.

Barry R. Wallerstein, D.Env.
Executive Officer

KRW:vmr

Background

The FY 2010-11 Budget for Legal included $260,000 for litigation expenses in environmental law cases and specialized legal counsel. Several firms, principally Woodruff Spradlin & Smart and Shute Mihaly & Weinberger, have been assisting District Counsel with environmental litigation and special litigation matters. The monies for these matters have been and will be expended on lawsuits, including those involving

the Architectural Coatings Rules, the recently adopted rule for consumer paint thinners – Rule 1143, the lawsuit seeking to overturn Rule 433 – Natural Gas Quality, the appeal of the federal lawsuit challenging the District's internal offset accounts, and Communities for a Better Environment's request for attorneys' fees in the challenge to a ConocoPhillips permit. Although District Counsel has put cost-containment measures in place, it is expected that expenses in these matters, and the other matters handled by specialized legal counsel, will require an additional amount up to $425,000. Accordingly, District Counsel is requesting the appropriation of additional funds in the amount of $425,000, for a total expected expenditure of $685,000 this fiscal year.

Proposal

In order to defend ongoing and threatened litigation, it is necessary to appropriate additional funds for expenditure by outside counsel. It is expected that ongoing lawsuits, and new litigation that is possible, as well as matters requiring specialized legal counsel will require an additional $425,000 to be appropriated to prequalified counsel approved by the Board, as well as specialized legal counsel, as the need arises.

Resource Impacts

Sufficient funds will be available in Legal's FY 2010-11 Budget following the transfer of funds from the Designation for Litigation and Enforcement.

Back to Agenda

Clean Transportation
Funding from the MSRC
Mobile Source Air Pollution Reduction Review Committee

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 16

PROPOSAL: Approve Contract Modifications and Award under FYs 2003-04, 2008-09 and 2010-11 AB 2766 Discretionary Fund Work Programs

SYNOPSIS: The MSRC approved a replacement contract for regional rideshare database enhancements as part of the FY 2003-04 AB 2766 Discretionary Fund Work Program, as well as a contract modification for BusWest providing additional funds for alternative fuel school buses as part of the FY 2008-09 Work Program. As the initial elements of their FY 2010-11 Work Program, the MSRC approved a $1,500 contract increase for upgrades to their existing website, a $100,000 set aside for development of a new website, and a $2,250,000 allocation for an off-road diesel exhaust after-treatment demonstration program. The MSRC seeks AQMD Board approval of the FY 2010-11 Work Program elements as well as the contract modifications and award under the FYs 2003-04, 2008-09 and 2010-11 AB 2766 Discretionary Fund Work Programs.

COMMITTEE: Mobile Source Air Pollution Reduction Review, October 21, 2010, Recommended for Approval

RECOMMENDED ACTIONS:

1. Approve new/replacement contract, as part of the FY 2003-04 Work Program, with Riverside County Transportation Commission in the amount of $225,000 to perform enhancements to the regional rideshare database, as described in this letter;
2. Approve a funding augmentation in an amount not to exceed $240,000, as part of the FY 2008-09 Work Program, to existing contract #MS09047 with BusWest under the Alternative Fuel School Bus Incentives Program, using funds previously allocated to this Program but not yet awarded, as described in this letter;
3. Approve Partial FY 2010-11 AB 2766 Discretionary Fund Work Program with the following elements:
   a. New MSRC Website Development, including hardware and subsequent two years' hosting, maintenance and upgrades, totaling $100,000;
   b. Off-Road Diesel Exhaust After-treatment Demonstration Program totaling $2,250,000;
   c. Website Upgrades totaling $1,500.

4. Approve a $1,500 funding augmentation to existing contract #MS05070 with Haaland Internet Productions, for MSRC website development and maintenance, under the FY 2010-11 Work Program, as described in this letter;
5. Authorize MSRC the authority to adjust contract awards up to five percent, as necessary and previously granted in prior work programs; and
6. Authorize the Chairman of the Board to execute new and modified contracts under FYs 2003-04, 2008-09, and 2010-11 AB 2766 Discretionary Fund Work Programs, as described above and within this letter.

Greg Winterbottom
Chair, MSRC

CSL:HH:CR

Background

In September 1990 Assembly Bill 2766 was signed into law (Health & Safety Code Sections 44220-44247) authorizing the imposition of an annual $4 motor vehicle registration fee to fund the implementation of programs exclusively to reduce air pollution from motor vehicles. AB 2766 provides that 30 percent of the annual $4 vehicle registration fee subvened to the AQMD be placed into an account to be allocated pursuant to a work program developed and adopted by the MSRC and approved by the Board.

FY 2003-04 Work Program

As an element of the FY 2003-04 Work Program, the Riverside County Transportation Commission (RCTC) was awarded a $225,000 contract to enhance the region's rideshare database systems through the creation of a direct communications link between RCTC's RidePro and the Los Angeles County Metropolitan Transportation Authority's (Metro's) TripMaster. Among other features, the communications link will facilitate the access of transit itineraries through the CommuteSmart.info website. In August 2010, RCTC requested a one-year contract term extension. Due to the contract's incipient termination, a two-month extension was prepared to allow time for the MSRC to consider the remainder of RCTC's request, but the modification to extend the term was not executed by all appropriate parties prior to the contract's August 31, 2010 expiration date. At its October 21, 2010 meeting, the MSRC considered a new/replacement contract for RCTC as part of the FY 2003-04 Work Program. Further details are provided below in the Proposals section.

FY 2008-09 Work Program

As part of the FY 2008-09 Work Program, the MSRC has allocated a total of $3,000,000 for the Alternative Fuel School Bus Incentives Program to provide buydown incentives for school districts. $2,520,000 of this funding was previously awarded to A-Z Bus Sales

and $240,000 to BusWest, leaving an available balance of $240,000. At its October 21, 2010 meeting, the MSRC considered a request from BusWest for an additional $240,000 for an order from the Rowland Unified School District; further details are provided below in the Proposals section.

FY 2010-11 Work Program

The MSRC maintains a website www.CleanTransportationFunding.org for outreach and assistance to contractors, proposers and others interested in clean transportation. Development of the website was done several years ago by Haaland Internet Productions (HiP Design), and HiP Design continues to provide maintenance and hosting services to the MSRC. The MSRC previously authorized the development of a website feature which would allow proposals and applications to be submitted online. This feature has been built, but has not yet been activated. Additional desired parameters have been identified which would help maintain consistency with AQMD's current procurement processes. At its October 21, 2010 meeting, the MSRC considered recommendations from its MSRC-TAC for two areas of improvement for the website's online submittal feature, and the funding required to implement these concepts. Further details are provided in the Proposals section.

Proposals

At its October 21, 2010 meeting, considered recommendations from its MSRC-TAC and unanimously approved the following:

FY 2003-04 Work Program

As mentioned in the Background section, RCTC was awarded a contract to create a direct communications link between Metro's TripMaster and RCTC's RidePro. The contract expired before all work could be completed. The MSRC unanimously approved a new/replacement twelve-month contract with RCTC in the amount of $225,000.

FY 2008-09 Work Program

As mentioned in the Background section, the MSRC previously awarded a total of $2,760,000 of the $3 million allocated for this Program to BusWest and another qualified vendor to continue the implementation of the Alternative Fuels School Bus Incentives Program, based on their pending orders. This $2,760,000 has already been expended or has purchase orders issued against it. BusWest has received an order from Rowland Unified School District for four CNG buses, for which the total incentive would be $240,000. BusWest requests an additional $240,000 to cover the buydown incentives for these buses. The MSRC has a balance of $240,000 remaining in this FY 2008-09 Alternative Fuel School Bus Incentives Program. The MSRC considered recommendations from its MSRC-TAC and awarded the remaining $240,000 of this allocation to BusWest to provide the full incentives for the buses for Rowland Unified School District.

FY 2010-11 Work Program

The MSRC established the initial elements of its FY 2010-11 AB 2766 Discretionary Fund Work Program, as follows:

a. New MSRC Website Development, to include hardware and two years' subsequent hosting, maintenance and upgrades, totaling $100,000;
b. Off-Road Diesel Exhaust After-treatment Demonstration Program totaling $2,250,000;
c. Website Upgrades totaling $1,500.

The MSRC approved a contract modification for one of these elements, which is delineated below for the AQMD Board's consideration. The MSRC is anticipated to approve and bring forward additional FY 2010-11 AB 2766 Discretionary Fund Work Program elements in the coming months.

As discussed in the Background section, the MSRC maintains a website www.CleanTransportationFunding.org which was designed and is still maintained and hosted by HiP Design on behalf of the MSRC. An online application submission feature has been built, but not yet activated. Two areas for improvement of the feature have been identified: 1) build in additional level of password protection to proposal submission area in back-end; and 2) add e-mail notification and attachment mechanism. HiP Design provided an estimate to perform these improvements under its existing contract, with an upper cost limit of $1,500. The MSRC-TAC recommended approval of the proposed upgrades. The MSRC considered the recommendations from its MSRC-TAC and approved an additional $1,500 for this work as part of its FY 2010-11 Work Program.

At this time the MSRC requests the AQMD Board to approve the FY 2010-11 Work Program elements, contract modifications and award under the FYs 2003-04, 2008-09 and 2010-11 Work Programs as outlined above. The MSRC also requests the Board to authorize the AQMD Chairman of the Board the authority to execute all agreements described in this letter. The MSRC further requests authority to adjust the funds allocated to each project specified in this Board letter by up to five percent of the project's recommended funding. The Board has granted this authority to the MSRC for all past Work Programs.

Resource Impacts

The AQMD acts as fiscal administrator for the AB 2766 Discretionary Fund Program (Health & Safety Code Section 44243). Money received for this program is recorded in a special revenue fund (Fund 23) and the contracts will be drawn from this fund. These contracts will have no fiscal impact on the AQMD's operational budget.

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 17

REPORT: Establish Board Meeting Schedule for Calendar Year 2011

SYNOPSIS: The proposed Board Meeting Schedule for Calendar Year 2011 (includes January 2012) is submitted for Board consideration. The Administrative Committee meeting schedule (second Friday of the month) is included for information only.

COMMITTEE: Administrative, October 8, 2010, Recommended for Approval

RECOMMENDED ACTION:
Adopt the 2011 Board Meeting Schedule.

Dr. William A. Burke, Chair
Administrative Committee

tc

Resolution

RESOLUTION NO. 10-

A Resolution of the South Coast Air Quality Management Governing Board setting the time and place of regular meetings.

WHEREAS, the regular meetings of the South Coast Air Quality Management Governing Board have been established by Resolution in the past, and

WHEREAS, the Governing Board is establishing the regularly scheduled meetings for Calendar Year 2011.

NOW, THEREFORE, BE IT RESOLVED that, effective January 2011, the regular meetings of the Governing Board shall be held at 9:00 a.m. on the first Friday of each month, except for July and September to accommodate holidays and August where there is no meeting scheduled, in the Auditorium at AQMD Headquarters, 21865 Copley Dr., Diamond Bar, California.

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 18

PROPOSAL: Legislative and Public Affairs Report

SYNOPSIS: This report highlights September 2010 outreach activities of Legislative and Public Affairs, which include: Environmental Justice Update, Community Events/Public Meetings, Business Assistance, and Outreach to Business and Federal, State, and Local Government.

COMMITTEE: Not Applicable

RECOMMENDED ACTION:
Receive and file.

Barry R. Wallerstein, D.Env.
Executive Officer

OA:AG:MC:DA:jns

Background
This report summarizes the activities of Legislative and Public Affairs for September 2010. The report includes four major areas: Environmental Justice Update; Community Events/Public Meetings (including the Speakers Bureau/Visitor Services, Communications Center, and Public Information Center); Business Assistance; and Outreach to Business and Federal, State, and Local Governments.

Environmental Justice Update
The following are key environmental justice-related activities in which staff participated during September 2010. These events involved communities which suffer disproportionately from adverse air quality impacts.

- On September 2, staff met with the President of the Black Business Association (BBA) to discuss a presentation to BBA members from the health community on air quality and public health impacts of poor air quality.

- On September 7, staff met with representatives from the Los Angeles Metro Churches Council. The purpose of the meeting was to schedule a presentation to African-American pastors on the health impacts of poor air quality and how the AQMD can better educate and engage the community on air quality issues.

- On September 11, staff participated in the 25th Senate District School Readiness & Health Fair in South Los Angeles. Approximately 500 people mostly from environmental justice communities attended. Staff provided information on the health impacts of poor air quality and promoted Clean Air Connections.

- On September 11, staff met with the President of the National Council of Negro Women, Southern California to introduce the organization to the AQMD and to discuss potential partnership opportunities.

- On September 15, AQMD, in partnership with Mission Ebenezer Family Church, hosted an Air Quality Institute briefing. The briefing was given in English and Spanish and educated parishioners on general air quality and the health impacts of poor air quality.

- On September 17, staff attended the Hispanic Chamber of Orange County meeting and made a general air quality presentation and discussed legislation that affects their membership.

- On September 17-19, staff participated in the Taste of Holy Spirit event in Fountain Valley. There was significant representation from the Vietnamese and Latino communities. Staff provided general air quality information and promoted Clean Air Connections.

- On September 23, staff attended the Black Chamber of Orange County Gala. Staff had a booth at the event and distributed air quality information and promoted Clean Air Connections.

- On September 25, staff hosted a booth at the Community Health Expo in Anaheim to provide health and air quality information to low-income minority residents.

COMMUNITY EVENTS/PUBLIC MEETINGS

Each year, thousands of residents engage in valuable information exchanges through events and meetings that AQMD sponsors alone, or in partnership with others. Attendees typically receive the following information: tips on reducing their exposure to smog and its health effects; invitations or notices of conferences, seminars, workshops and other public events, ways to participate in AQMD rule and policy development; and

assistance in resolving air quality-related problems. The events that AQMD staff attended and provided information and updates include:

September 1-2	Women in Green Forum, Pasadena
September 8	Los Angeles Unified School District School Nurses Annual Meeting and Educational Symposium
September 11	25th Senate District School Readiness and Health Fair
September 11	Santa Clarita Environmental Expo and River Rally
September 15	La Quinta/Indio Chambers of Commerce Legislative Summit
September 15	City National Bank Health Fair, Los Angeles
September 15	Irwindale Chamber of Commerce Environmental Awards Luncheon
September 16-19	21st Annual Route 66 Rendezvous, San Bernardino
September 18	Huntington Beach Goes Green
September 22	Anaheim Transportation Fair
September 24	Charles Drew University Environmental Conference, Los Angeles
September 25	Monrovia Sustainability Fair
September 27	CleanTech OC Conference, Irvine

Speakers Bureau/Visitor Services
AQMD receives requests for staff to speak on a variety of air quality-related issues. The requests come from organizations such as trade associations, chambers of commerce, community-based groups, schools, hospitals and health-based organizations. AQMD also hosts visitors from around the world who meet with staff on a wide range of air quality issues.

On September 10, staff provided a briefing and tour of AQMD's facility and laboratory to the Bureau of Environmental Protection, Keelung City, Taiwan.

On September 16, staff provided a presentation on Rule 1147 and permit processing to the California Auto Body Association, Pasadena Foothill Chapter at Brookside Country Club, Pasadena.

Communication Center Statistics
The Communication Center handles calls on the AQMD main line, 1-800-CUT-SMOG® line and Spanish line. Calls received in the month of September 2010 are summarized below:

Main Line Calls	3,109
1-800-CUT-SMOG® Line	2,013
After Hours Calls*	565
Spanish Line Calls	29
Clean Air Connections	24
Total Phone Calls	5,740

*Saturday, Sunday, holidays and after 9:00 p.m., Monday through Friday.

Public Information Center Statistics
The Public Information Center (PIC) handles phone calls and walk-in requests for general information. Information for the month of September 2010 is summarized below:

Visitor Transactions	209
Packages Mailed Out	2
Calls Received by PIC Staff	57
Calls to Automated System	1,983
Total Phone Calls	2,040

BUSINESS ASSISTANCE

AQMD assists businesses by notifying them of proposed regulations so they can participate in the development of these rules. AQMD also works with other agencies and states to identify efficient, cost-effective ways to reduce air pollution and shares that information broadly. Additionally, staff provides personalized assistance to small businesses both over the telephone and by on-site consultation. The information is summarized below.

- Conducted six free on-site consultation
- Provided assistance in filing one request for variance
- Provided permit application assistance to 227 companies
- Issued 19 clearance letters

Types of business assisted:

- ✓ Food products manufacturing
- ✓ Auto body shops
- ✓ Gasoline stations
- ✓ Building/property management
- ✓ Concrete pumping
- ✓ Restaurants

- ✓ Medical center
- ✓ Metal products manufacturing and coating
- ✓ Dry cleaners
- ✓ Chemical products manufacturing

OUTREACH TO BUSINESS AND FEDERAL, STATE, AND LOCAL GOVERNMENT

Field visits and communications were conducted with staff from the following cities:

Alhambra, Aliso Viejo, Anaheim, Arcadia, Azusa, Baldwin Park, Bradbury, Buena Park, Burbank, Cerritos, Claremont, Coachella, Compton, Costa Mesa, Covina, Dana Point, Diamond Bar, Downey, Duarte, El Monte, Fountain Valley, Glendora, Hermosa Beach, Huntington Beach, Irvine, Irwindale, La Canada Flintridge, Lake Forest, La Palma, La Puente, La Quinta, Laguna Hills, Laguna Niguel, Laguna Woods, Long Beach, Los Angeles, Manhattan Beach, Mission Viejo, Monrovia, Monterey Park, Norwalk, Orange, Palm Desert, Pasadena, Pomona, Rancho Santa Margarita, Redondo Beach, Riverside, Rosemead, San Bernardino, San Dimas, San Gabriel, San Juan Capistrano, Santa Ana, Santa Clarita, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Villa Park, Walnut, West Covina, West Hollywood, Westminster and Whittier.

Visits and/or communications were conducted with elected officials or staff from the following offices:

- U.S. Senator Dianne Feinstein
- U.S. Representative Joe Baca
- U.S. Representative Xavier Becerra
- U.S. Representative Howard Berman
- U.S. Representative John Campbell
- U.S. Representative Judy Chu
- U.S. Representative David Dreier
- U.S. Representative Grace Napolitano
- U.S. Representative Laura Richardson
- U.S. Representative Ed Royce
- U.S. Representative Linda Sanchez
- U.S. Representative Brad Sherman
- Senator Bob Huff
- Senator Gilbert Cedillo
- Senator Lou Correa
- Senator Tom Harman
- Senator Alan Lowenthal
- Senator Alex Padilla
- Senator Anthony Portantino
- Senator Mimi Walters

- Senator Roderick Wright
- Assembly Speaker John A. Perez
- Assembly Member Anthony Adams
- Assembly Member Bob Blumenfield
- Assembly Member Hector De La Torre
- Assembly Member Mike Eng
- Assembly Member Mike Feuer
- Assembly Member Warren Furutani
- Assembly Member Curt Hagman
- Assembly Member Diane Harkey
- Assembly Member Ed Hernandez
- Assembly Member Tony Mendoza
- Assembly Member Jeff Miller
- Assembly Member Brian Nestande
- Assembly Member Anthony Portantino
- Assembly Member Cameron Smythe

Staff represented AQMD and/or provided a presentation to the following groups:

American Lung Association Air Quality Committee
Anaheim Chamber of Commerce
Annenberg School of Nursing
Archdiocese of Los Angeles' Creation Sustainability Committee
Asthma Coalition of Los Angeles County
Asthma and Allergy Foundation of America
Beach Cities Health District
Beverly Hills Chamber of Commerce
Black Business Association
Black Chamber of Commerce of Orange County
Brotherhood Crusade
California Black Women's Health Project
California School Nurses Organization
Carson Black Chamber of Commerce

Report of September 2010 Hearing Board Cases

Case Name and Case No.	Rules	Reason for Petition	District Position/ Hearing Board Action	Type and Length of Variance or Order	Excess Emissions
1. Eastern Municipal Water District Case No. 4937-43 K. Manwaring	203(b)	Biocube odor control failed. Petitioner must continue to operate equipment serving municipal water district pending delivery of replacement.	Not Opposed/Granted	Ex Parte EV granted commencing 9/23/10 and continuing for 30 days or until the SV hearing currently scheduled for 10/14/10, whichever comes first.	H2S: TBD by 10/8/10
2. EnerTech Environmental California, LLC Case No. 5778-1 K. Manwaring	202(a)	Startup problems have prevented petitioner from conducting compliance tests at full load as required.	Not Opposed/Granted	RV granted commencing 9/16/10 and continuing through 2/28/12, the FCD.	None
3. Prestone Products Corporation Case No. 5788-1 N. Sanchez	203(b)	Petitioner cannot comply with the VOC temperature limits for its container filling system.	Not Opposed/Granted	SV granted commencing 9/2/10 and continuing through 11/2/10.	None
4. San Diego Gas & Electric Company Case No. 3607-12 K. Manwaring	203(b) 1110.2(d)(1)(B)(ii) 2004(f)(1) 3002(c)(1)	Petitioner cannot comply with VOC limit for its ICEs and has not demonstrated that its equipment cannot meet the limit.	Not Opposed/Granted	RV granted commencing 9/8/10 and continuing through 11/2/10, the FCD.	ROG: TBD by 9/23/10
5. SCAQMD vs. Colton Avenue Auto Body, Inc. Case No. 5787-1 T. Barrera	203(a)	Respondent has been operating a paint spray booth for 21 months without a valid permit to operate.	Not stipulated/Issued	O/A issued commencing 9/30/10 and continuing until Status Report currently scheduled for 10/14/10. The Board shall retain jurisdiction over this matter until 9/30/12.	N/A
6. SCAQMD vs. Matrix Oil Corporation Case No. 5776-1 N. Sanchez	201 203(a) 203(b)	Respondent has exceeded hours and days limitation on operation of flare serving oil production operations.	Stipulated/No Action	Mod. O/A Status Report. No Action Taken by the Board.	N/A

Case Name and Case No.	Rules	Reason for Petition	District Position/ Hearing Board Action	Type and Length of Variance or Order	Excess Emissions
7. SCAQMD vs. Warren E & P, Inc. Case No. 5649-4 K. Manwaring	203(a) 203(b)	Respondent is operating six micro turbines in conjunction with a flare. Micro turbines are exceeding the heat input rate limits and are awaiting issuance of new permits.	Stipulated/Issued	O/A issued commencing 9/21/10 and continuing through 10/1/11. The Board shall retain jurisdiction over this matter until 10/1/11.	N/A
8. SFPP,LP Case No. 4215-11 K. Manwaring	202(a) 203(b) 462(e)(1)(E)(i)(II) 3002(c)(1)	CARB certification test of VRS was not done during the prescribed period.	Not Opposed/Granted	RV granted commencing 9/16/10 and continuing through 8/20/11, the FCD.	None
9. Southern California Gas Company Case No. 137-68 K. Manwaring	203(b) 1110.2(d)(1)(B)(ii) 2004(f)(1) 3002(c)(1)	Petitioner cannot comply with VOC limit for its ICEs and has not demonstrated that its equipment cannot meet the limit.	Not Opposed/Granted	RV granted commencing 9/8/10 and continuing through 11/2/10, the FCD.	ROG: TBD by 9/23/10
10. Universal City Studios LLC Case No. 4935-8 N. Feldman	401(b)(1)(B) H&S Code §41701	Petitioner will exceed opacity limits by use of fog generating machine for Halloween production at amusement park.	Not Opposed/Granted	SV granted commencing 9/20/10 and continuing through 11/2/10.	Opacity: TBD by 10/1/10
11. U.S. Government, Air Force Department, March AFB Case No. 2051-27 N. Sanchez	2004(f)(1)	Failure of uninterruptable power supply system forced petitioner to operate emergency backup generators beyond annual hour limit.	Not Opposed/ Granted	IV granted for 90 days or until the RV hearing currently scheduled for 10/21/10, whichever comes first.	NOx: 871.25 Total Variance period for each engine.

Acronyms

CARB: California Air Resources Board
CO: Carbon Monoxide
EV: Emergency Variance
FCCU: Fluid Catalytic Cracking Unit
FCD: Final Compliance Date
H2S: Hydrogen Sulfide
H&S: Health & Safety Code
ICE: Internal Combustion Engine
I/P: Increments of Progress
IV: Interim Variance
MFCD/EXT: Modification of a Final Compliance Date and Extension of a Variance
Mod. O/A: Modification of an Order for Abatement
NH3: Ammonia
NOV: Notice of Violation
NOx: Oxides of Nitrogen
N/A: Not Applicable
O/A: Order for Abatement
RECLAIM: Regional Clean Air Incentives Market
ROG: Reactive Organic Gas
RV: Regular Variance
SCR: Selective Catalytic Reduction
SOx: Oxides of Sulfur
SV: Short Variance
TBD: To be determined
VOC: Volatile Organic Compound
VRS: Vapor Recovery System

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 20

REPORT: Civil Filings and Civil Penalties Report

SYNOPSIS: This reports the monthly penalties from July 1 through August 31, 2010, and legal actions filed by the District Prosecutor during September 1 through September 30, 2010. An Index of District Rules is attached with the penalty report.

COMMITTEE: Stationary Source, September 24, 2010, Reviewed

RECOMMENDED ACTION:
Receive and file this report.

Kurt R. Wiese
General Counsel

KRW:lc

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 21

REPORT: Rule and Control Measure Forecast

SYNOPSIS: This report highlights AQMD rulemaking activity and public workshops potentially scheduled for the year 2010 and portions of 2011.

COMMITTEE: Not Applicable

RECOMMENDED ACTION:
Receive and file.

Barry R. Wallerstein, D.Env.
Executive Officer

EC:LT:cg

The Rule and Control Measure Forecast Report provides the Board with a monthly update of AQMD's rulemaking and control measure implementation schedule. Scheduling changes that occurred since last month's forecast are summarized.

1113	Architectural Coatings (MCS-07)
Rule 1113 is moved to March of 2011 from the 2nd Quarter of 2011, since staff will be able to complete the necessary technology review earlier than expected.	
1311	PM2.5 New Source Review Program
Rule 1311 is moved to the 1st Quarter of 2011 to allow more time to develop the proposal and work with stakeholders.	

Rules to be rescheduled/ removed and added (continued)

1315	Federal New Source Review Tracking System
Proposed Rule 1315 is moved to January 2011 from December, due to the extension of the CEQA public comment period.	
1903	Emission Budgets and Mitigation Program for General Conformity Projects (EGM-02)
Rule 1903 is moved to the 1st Quarter of 2011 from December to allow staff additional time to continue work with U.S. EPA on policy issues.	
2005	New Source Review for RECLAIM
Rule 2005 is added to the schedule for hearing in the 1st Quarter of 2011 to address recurring RTC holding requirements for emission increases, from new or modified sources at existing RECLAIM facilities.	
2202	On-Road Motor Vehicle Mitigation Options
Rule 2202 is moved to March of 2011 from December to allow staff time to resolve additional issues raised by stakeholders.	

2010 MASTER CALENDAR
Advance Target for Board Hearings

Below is a list of all rulemaking activity scheduled for the year 2010. The last four columns refer to the type of rule adoption or amendment. A more detailed description of the proposed rule adoption or amendment is located in the Attachments (A through D) under the type of rule adoption or amendment (i.e. AQMP, Toxics, Other and Climate Change).

**An asterisk indicates that the rulemaking is a potentially significant hearing.*
+This proposed rule will reduce criteria air contaminants and assist toward attainment of ambient air quality standards.
[1]Subject to Board approval
California Environmental Quality Act shall be referred to as "CEQA."
Socioeconomic Analysis shall be referred to as "Socio."

2010

December		AQMP	Toxics	Other	Climate Change
223	Emission Reductions Permits for Large Confined Animal Facilities	√			
1127+	Emission Reductions from Livestock Waste (MCS-05)	√			
1127.1+	Control of Emissions from Hog and Poultry Operations (MCS-05)	√			
1143	Consumer Paint Thinners and Multi-Purpose Solvents			√	
1147	NOx Reductions from Miscellaneous Sources			√	
1415	Reduction of Refrigerant Emissions from Stationary Refrigerant and Air Conditioning Systems				√
1415.1	Reduction of Refrigerant Emissions from Stationary Refrigeration Systems				√

2010 TO-BE DETERMINED

TBD		AQMP	Toxics	Other	Climate Change
102	Definition of Terms			√	
402	Nuisance			√	

2010 MASTER CALENDAR (continued)

2010 TO-BE DETERMINED

TBD	(continued)	AQMP	Toxics	Other	Climate Change
404+	Particulate Matter – Concentration (MCS-01)	√			
1114*+	Control of Emissions from Refinery Coking Operations (MCS-01)	√			
461	Gasoline Transfer and Dispensing			√	
1106	Marine Coating Operations (MCS-07)	√			
1106.1	Pleasure Craft Coating Operations (MCS-07)	√			
1123	Pilot Program for Refinery Start-up, Shutdown and Turnaround Procedures (MCS-06)	√			
1139+	Reduction of VOC Emissions from Cleaning Operations at Large Institutional and Commercial Facilities			√

2010 MASTER CALENDAR (continued)

2010 TO-BE DETERMINED

TBD	(continued)	AQMP	Toxics	Other	Climate Change
1426	Emissions from Metal Finishing Operations		√		
1480	Major Diesel Indirect Sources		√		
1610	Old-Vehicle Scrapping			√	
1625	Generation of ERCs for Particulate Matter			√	
Reg. XXVII	Climate Change				√
Reg. XXX	Title V Permits				√
Reg. IV, IX, X, XI, XIV, and XX Rules	Various rule amendments may be needed to meet the requirements of state and federal laws, address variance issues/technology-forcing limits, or to seek additional reductions to meet the SIP short-term measure commitment. The Clean Communities Plan (CCP) which was formerly the Air Toxics Control Plan (ATCP) is being updated to include new measures to address toxic emissions in the basin. The CCP will include a variety of measures that will reduce exposure to air toxics from stationary, mobile, and area sources. Rule amendments may include updates to provide consistency with CARB Statewide Air Toxic Control Measures.	√	√	√	√

Note: AQMD may add control measures necessary to satisfy federal requirements, to abate a substantial endangerment to public health or welfare, state regulatory requirements or SIP commitment.

2010 MASTER CALENDAR (continued)

ATTACHMENT A

AQMP Rule Activity Schedule

This attachment lists those control measures that are being developed into rules or rule amendments for the Board consideration that are designed to implement the amendments to the 2007 Air Quality Management Plan.

2010

December	
223 1127+ 1127.1+	**Emission Reduction Permits for Large Confined Animal Facilities** **Emission Reductions from Livestock Waste (MCS-05)** **Control of Emissions from Hog and Poultry Operations (MCS-05)** *[Projected Emission Reduction unknown and TBD]* Proposed amendments to Rule 223 may be necessary to harmonize rule requirements with those in Rules 1127 and 1127.1. Proposed amendments to Rule 1127 will add mitigation measures, consistent with the latest scientific research, for dairy manure management practices. Rule 1127.1 will reduce PM10, VOC and ammonia (NH_3) emissions from livestock operations, excluding dairy operations, in the South Coast Basin. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*

TO-BE DETERMINED 2010

To-Be Determined	
404+ 1114*+	**Particulate Matter – Concentration (MCS-01)** **Control of Emissions from Refinery Coking Operations (MCS-01)** *[Projected Emission Reduction for both rules: TBD]* Proposed Rule 1114 will establish emission limits and other requirements for the operation of coking units at petroleum refineries. Amendments to Rule 404 will ensure consistency with Rule 1114. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
1106	**Marine Coating Operations (MCS-07)** *[Projected Emission Reduction: N/A]* Proposed amendments will further reduce VOC emissions from the application of marine coatings. Amendments may also improve clarity and enforceability. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT A

AQMP Rule Activity Schedule (continued)

TO-BE DETERMINED 2010

To-Be Determined	(continued)
1106.1	**Pleasure Craft Coating Operations (MCS-07)** *[Projected Emission Reduction: unknown]* Amendments to Rule 1106.1 will reduce VOC emissions from the application of coatings to pleasure craft and improve the enforceability and clarity of the rule. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
1123	**Pilot Program for Refinery Start-up, Shutdown and Turnaround Procedures (MCS-06)** *[Projected Emission Reduction: N/A]* Rule 1123 would implement 2007 AQMP, Control Measure MCS-06 by identifying improved operating procedures and best management practices to reduce emissions from start-up, shutdown and turnaround operations. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Leu (3059)*
1180	**Petroleum Refinery Pilot Program (FLX-02)** *[Projected Emission Reduction: N/A]* The proposed rule serves as a placeholder should a pilot program be deemed feasible. The pilot program would allow refineries to fulfill their SIP obligations through implementation of on- or off-site mitigation projects, provided certain criteria are met. *Jill Whynot 909.396.3104 CEQA: Smith (3054) Socio: Lieu (3059)*
Reg. IV, IX, X, XI, XIV, and XX Rules	Various rule amendments may be needed to meet the requirements of state and federal laws, address variance issues/technology-forcing limits, or to seek additional reductions to meet the SIP short-term measure commitment. The Clean Communities Plan (CCP) which was formerly the Air Toxics Control Plan (ATCP) is being updated to include new measures to address toxic emissions in the basin. The CCP will include a variety of measures that will reduce exposure to air toxics from stationary, mobile, and area sources. Rule amendments may include updates to provide consistency with CARB Statewide Air Toxic Control Measures.

ATTACHMENT A

AQMP Rule Activity Schedule (continued)

2011

January	
317*+	**Clean Air Act Emissions Fees for Major Stationary Sources of VOC and NOx** *[Projected Emission Reduction: N/A]* Rule 317 is continued to January 2011 by direction of the Governing Board in July. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
March	
1113*+1	**Architectural Coatings (MCS-07)** *[Projected Emission Reduction: TBD]* The proposed amendments would further clarify language to improve rule enforceability and seek additional VOC reductions from colorants and specialty coating categories. Any proposed amendments will be coordinated with architectural coatings fee Rule 314. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
1st Quarter	
1133.3+	**Emission Reductions from Green Waste Composting (MCS-05)** *[Projected Emission Reduction: TBD]* Proposed Rule 1133 would reduce volatile organic compounds (VOC) and ammonia (NH_3) emissions from green waste. *Jill Whynot 909.396.3104 CEQA: Smith (3054) Socio: Lieu (3059)*
1138*+	**Control of Emissions from Restaurant Operations (BCM-05)** *[Projected Emission Reduction: TBD]* The proposed amended rule will add requirements for under-fired charbroilers and implement 2007 AQMP Control Measure BCM-05. *Jill Whynot 909.396.3104 CEQA: Smith (3054) Socio: Lieu (3059)*
1162	**Polymer Resin Operations (MCS-07)** *[Projected Emission Reduction: N/A]* Proposed amendments to Rule 1162 would require further VOC reductions from new or emerging technologies such as the use of low-monomer resins and other adjustments based on the availability of technology. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
1903*+1	**Emission Budgets and Mitigation Program for General Conformity Projects (EGM-02)** *[Projected Emission Reduction: N/A]* Rule 1903 would implement Control Measure EGM-02 of the 2007 AQMP. The rule would specify procedures for how federal projects subject to general conformity could access an emission budget and/or pay mitigation fees for emissions from the project. *Joe Cassmassi 909.396.3155 909.396.3155 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT A

AQMP Rule Activity Schedule (continued)

2011

1st Quarter	(continued)
2301*+	**Control of Emissions from New or Redevelopment Projects (EGM-01)** *[Projected Emission Reduction: Committed to reduce 0.5 tons per day of VOC, 0.8 tons per day of NOx, and 0.5 tons per day of PM2.5 in 2023.]* Rule 2301 would implement Control Measure EGM-01 of the 2007 AQMP to manage emissions growth from new and redevelopment projects. *Carol Gomez 909.396. 3264 CEQA: Smith (3054) Socio: Lieu (3059)*
2nd Quarter	
1107	**Coating of Metal Parts and Products (MCS-07)** *[Projected Emission Reduction: N/A]* Amendments to Rule 1107 would further reduce VOC emissions and improve rule clarity and enforceability. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT B

Toxics Rule Activity Schedule

This attachment lists those rules or rule amendments for the Governing Board consideration that are designed to implement the Air Toxics Control Plan.

To-Be Determined 2010

To-Be Determined	
1401 1402	**New Source Review of Toxic Air Contaminants** **Control of Toxic Air Contaminants from Existing Sources** *[Projected Emission Reduction: TBD]* The Office of Environmental Health Hazard Assessment (OEHHA) periodically reviews the list of toxic compounds and revises or establishes risk values. Rules 1401 and 1402 will be amended to revise the list of TACs. OEHHA is currently revising their risk assessment guidelines and, when adopted, District guidelines will be amended requiring Board approval. In addition, other administrative changes may be proposed. *Susan Nakamura 909.396.3105 CEQA: Smith (3054) Socio: Lieu (3059)*
1420	**Emissions Standard for Lead** *[Projected Emission Reduction: TBD]* Rule 1420 would be amended to incorporate the 2008 National Ambient Air Quality Standard for Lead and may include measures to reduce lead emissions to ensure compliance with the new standard. *Susan Nakamura 909.396.3105 CEQA: Smith (3054) Socio: Lieu (3059)*
1426	**Emissions from Metal Finishing Operations** *[Projected Emission Reduction: TBD]* During the adoption of Rule 1426 in May 2003, the Board directed staff to prepare a technical assessment within three years of date of adoption to evaluate the risk reduction strategies for facilities exceeding the action risk level specified in Rule 1402. Based on the technical assessment, Rule 1426 may be amended. *Susan Nakamura 909.396.3105 CEQA: Smith (3054) Socio: Lieu (3059)*
1480	**Major Diesel Indirect Sources** *[Projected Emission Reduction: TBD]* A new rule may be recommended to implement a proposed measure in the draft Clean Communities Plan (CCP) for reducing exposure to toxic air contaminant emissions from indirect sources. *Susan Nakamura 909.396.3105 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT B

Toxics Rule Activity Schedule (continued)

To-Be Determined 2010

To-Be Determined	(continued)
Reg. IV, IX, X, XI, XIV, and XX Rules	Various rule amendments may be needed to meet the requirements of state and federal laws, address variance issues/technology-forcing limits, or to seek additional reductions to meet the SIP short-term measure commitment. The Clean Communities Plan (CCP) which was formerly the Air Toxics Control Plan (ATCP) is being updated to include new measures to address toxic emissions in the basin. The CCP will include a variety of measures that will reduce exposure to air toxics from stationary, mobile, and area sources. Rule amendments may include updates to provide consistency with CARB Statewide Air Toxic Control Measures.

2011

April	
1470	**Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines**
1471	**Requirements for Diesel-Fueled Internal Combustion and Other Compression Ignition Engines Used in Agricultural Operations** *[Projected Emission Reduction: TBD]* CARB has amended the ATCM for stationary diesel-fueled internal combustion engines to reduce particulate emissions from stationary diesel powered agricultural engines that are used for growing crops, raising fowl or other animals at farms, ranches, universities, or other places. Proposed Rule 1471 will consolidate requirements for existing and new diesel-powered agricultural engines. *Susan Nakamura 909.396.3105 CEQA: Smith (3054) Socio: Lieu (3059)*
4010*+	**General Provisions and Requirements for Ports of Los Angeles and Long Beach (MOB-03)**
4020*+	**Backstop Requirements for Ports of Los Angeles and Long Beach (MOB-03)** *[Projected Emission Reduction: TBD]* The proposed rules will address toxic and criteria pollutant emissions from new and existing port-related sources. *Susan Nakamura 909.396.3105 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT C

Other Rule Activity Schedule

This attachment lists those rules or rule amendments for the Governing Board consideration that are designed to improve rule enforceability, SIP corrections, or implementing state or federal regulations.

2010

December	
1143	**Consumer Paint Thinners and Multi-Purpose Solvents** *[Projected Emission Reduction: N/A]* Proposed amendments to Rule 1143 will propose an exemption for artist solvents and thinners and make minor clarifications and editorial correction to the rule. *Naveen Berry 909.396.2363 CEQA: Smith (3054) Socio: Lieu (3059)*
1147	**NOx Reductions From Miscellaneous Sources** [Projected Emission Reduction: TBD] Proposed amendments will make necessary administrative modifications. Joe Cassmassi 909.396.3155 CEQA: Smith (3054) Socio: Lieu (3059)

To-Be Determined 2010

To-Be Determined	
102	**Definition of Terms** *[Projected Emission Reduction: N/A]* Proposed amendments to Rule 102 will include compounds exempted by the U.S. EPA with consideration for health risks as defined by the Office of Environmental Health Hazard Assessment (OEHHA). *Naveen Berry 909.396.2363 CEQA: Smith (3054) Socio: Lieu (3059)*
402	**Nuisance** *[Projected Emission Reduction: TBD]* The AQMD staff will assess the feasibility of expanding the current nuisance rule as part of a proposed measure in the draft Clean Communities Plan (CCP). The assessment may result in a recommendation to amend Rule 402 to make it more effective and more responsive to public complaints. *Susan Nakamura 909.396.3105 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT C

Other Rule Activity Schedule (continued)

To-Be Determined 2010

To-Be Determined	(continued)
461	**Gasoline Transfer and Dispensing** *[Projected Emission Reduction: TBD]* Proposed amendments to Rule 461 are to reduce VOC and toxic emissions from gasoline dispensing facilities by improving implementation of the Enhanced Vapor Recovery Regulation. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
1139+	**Reduction of VOC Emissions from Cleaning Operations at Large Institutional and Commercial Facilities** *[Projected Emission Reduction: N/A]* Proposed Rule 1139 will reduce VOC and other emissions from the use of cleaning products at institutional and commercial facilities. *Naveen Berry 909.396.2363 CEQA: Smith (3054) Socio: Lieu (3059)*
1151*+	**Motor Vehicle and Mobile Equipment Non-Assembly Line Coating Operations** *[Projected Emission Reduction: unknown]* Amendments to the rule may be necessary to reflect further findings relative to tertiary butyl acetate (TBAc) toxicity. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
1171	**Solvent Cleaning Operations** *[Projected Emission Reduction: N/A]* The proposed amendment will reflect the results of the recently completed technology assessments for the future VOC limits established for the cleanup of lithographic and screen printing ink application equipment. *Naveen Berry 909.396.2363 CEQA: Smith (3054) Socio: Lieu (3059)*
1190 Series	**Fleet Vehicle Requirements** *[Projected Emission Reduction: TBD]* Amendments to Rule 1190 series fleet rules may be necessary to address remaining outstanding implementation issues and in the event the court's future action requires amendments. In addition, the current fleet rules may be expanded to achieve additional air quality and air toxic benefits. *Dean Saito 909.396.2647 CEQA: Smith (3054) Socio: Lieu (3059)*
Reg. XIII	**New Source Review** *[Projected Emission Reduction: TBD]* Proposed amendment will address U.S. EPA comments on SIP approvability issues and/or requirements that may result from U.S. EPA amendments, legislation or CARB requirements. Amendments may also be proposed for clarity and improved enforceability. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT C

Other Rule Activity Schedule (continued)

To-Be Determined 2010

To-Be Determined	(continued)
1610	**Old-Vehicle Scrapping** *[Projected Emission Reduction: TBD]* Proposed amendment may be necessary to harmonize the rule with voluntary state vehicle scrapping program. *Naveen Berry 909.396.2363 CEQA: Smith (3054) Socio: Lieu (3059)*
1625	**Generation of ERCs for Particulate Matter** [Projected Emission Reduction: TBD] A new rule will establish requirements for the generation of Emission Reduction Credits (ERCs) from particulate matter sources, such as paving unpaved roads. *Jill Whynot 909.396.3104 CEQA: Smith (3054) Socio: Lieu (3059)*
Reg. IV, IX, X, XI, XIV, and XX Rules	Various rule amendments may be needed to meet the requirements of state and federal laws, address variance issues/technology-forcing limits, or to seek additional reductions to meet the SIP short-term measure commitment. The Clean Communities Plan (CCP) which was formerly the Air Toxics Control Plan (ATCP) is being updated to include new measures to address toxic emissions in the basin. The CCP will include a variety of measures that will reduce exposure to air toxics from stationary, mobile, and area sources. Rule amendments may include updates to provide consistency with CARB Statewide Air Toxic Control Measures.

2011

January	
1315[*1]	**Federal New Source Review Tracking System** *[Projected Emission Reduction: N/A]* Proposed of Rule 1315 will codify the emission reduction tracking procedure used to demonstrate equivalence of the AQMD New Source Review Program with the Federal New Source Review Program. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
March	
2202[1]	**On-Road Motor Vehicle Mitigation Options** *[Projected Emission Reduction: unknown]* Proposed Rule 2202 amendments will include language to clarify program options, facilitate meeting rule emission reduction targets, and clarify definitions. Rule 2202 supporting guidelines will also be updated to reflect rule requirements, policies, and practices. *Carol Gomez 909.396.3264 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT C

Other Rule Activity Schedule (continued)

2011

1st Quarter	
701	**Air Pollution Emergency Contingency Actions** *[Projected Emission Reduction: N/A]* Proposed amendments to Rule 701 will update the episode criteria to reflect newly established standards and clarify air quality reporting and dissemination protocol. *Joe Cassmassi 909.396.3155 909.396.3155 CEQA: Smith (3054) Socio: Lieu (3059)*
1311*+1	**PM2.5 New Source Review Program** *[Projected Emission Reduction: N/A]* Proposed Rule 1311 will implement U.S. EPA's New Source Review program requirements relative to PM2.5. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
2005[1]	**New Source Review for RECLAIM** [Projected Emission Reduction: TBD] The proposed amendment is to address recurring RTC holding requirements for emission increases at existing RECLAIM facilities. Joe Cassmassi 909.396.3155 CEQA: Smith (3054) Socio: Lieu (3059)
2nd Quarter	
314	**Fees for Architectural Coatings** *[Projected Emission Reduction: TBD]* Rule 314 is a fee rule specifically for architectural coatings, and any proposed amendments will be coordinated with Rule 1113. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
1118	**Control of Emissions from Refinery Flares** *[Projected Emission Reduction: TBD]* Amendments may be necessary to address results of the additional analysis required by the adopting resolution for the last amendment and to consider the advances in monitoring technology. Amendments may also be necessary to implement an AB 32 measure. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
2511	**Credit Generation Program for Locomotive Head End Power Unit Engines** *[Projected Emission Reduction: TBD]* Develop a rule to allow generation of PM mobile source emission reduction credits from Locomotive Head End Power Unit Engines. Credits will be generated by retrofitting engines with PM controls or replacing the engines with new lower-emitting engines. *Randal Pasek 909.396.2251 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT C

Other Rule Activity Schedule (continued)

2011

2nd Quarter	(continued)
2512	**Credit Generation Program for Ocean-Going Vessels at Berth** *[Projected Emission Reduction: TBD]* Develop a rule to allow generation of PM, NOx and SOx emission reduction credits from ocean-going vessels while at berth. Credits will be generated by controlling the emissions from auxiliary engines and boilers of ships while docked. *Randal Pasek 909.396.2251 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT D

Climate Change

This attachments lists rules or rule amendments for the Governing Board consideration that are designed to implement South Coast Air Quality Managements District's Climate Change Policy or for consistency with state or federal rules.

2010

December	
1415	**Reduction of Refrigerant Emissions from Stationary Refrigeration and Air Conditioning Systems**
1415.1	**Reduction of Refrigerant Emissions from Stationary Refrigeration Systems** *[Projected Emission Reduction: TBD]* Proposed Rule 1415.1 is being developed to be in concert with provisions of CARB's statewide Refrigeration Management Program established to reduce emissions of high global warming potential (GWP) refrigerants from stationary refrigeration systems. Emission control requirements for air conditioning systems remain in Rule 415 and will include GWP refrigerants. *Naveen Berry 909.396.2363 CEQA: Smith (3054) Socio: Lieu (3059)*

To-Be Determined 2010

To-Be Determined	
1173	**Control of Volatile Organic Compound Leaks and Releases from Components at Petroleum Facilities and Chemical Plants** *[Projected Emission Reduction: TBD]* Amendment to Rule 1173 may be necessary to address greenhouse gas emissions from petroleum facilities and chemical plants. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*
Reg. XXVII	**Climate Change** *[Projected Emission Reduction: TBD]* Additional protocols may be added to Rules 2701 and 2702. *Jill Whynot 909.396.3104 CEQA: Smith (3054) Socio: Lieu (3059)*
Reg. XXX	**Title V Permits** *[Projected Emission Reduction: TBD]* This proposed rule amendment would address pending federal legislation if it requires changes to Title V permitting requirements for facilities that emit greenhouse gases. *Jill Whynot 909.396.3104 CEQA: Smith (3054) Socio: Lieu (3059)*

ATTACHMENT D

Climate Change (continued)

To-Be Determined 2010

To-Be Determined	(continued)
Reg. IV, IX, X, XI, XIV, and XX Rules	Various rule amendments may be needed to meet the requirements of state and federal laws, address variance issues/technology-forcing limits, or to seek additional reductions to meet the SIP short-term measure commitment. The Clean Communities Plan (CCP), which was formerly the Air Toxics Control Plan (ATCP), is being updated to include new measures to address toxic emissions in the basin. The CCP will include a variety of measures that will reduce exposure to air toxics from stationary, mobile, and area sources. Rule amendments may include updates to provide consistency with CARB Statewide Air Toxic Control Measures.

2011

2nd Quarter	
1118	**Control of Emissions from Refinery Flares** *[Projected Emission Reduction: TBD]* Amendments may be necessary to address results of the additional analysis required by the adopting resolution for the last amendment and to consider the advances in monitoring technology. Amendments may also be necessary to implement an AB32 measure. *Laki Tisopulos 909.396.3123 CEQA: Smith (3054) Socio: Lieu (3059)*

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 22

REPORT: Lead Agency Projects and Environmental Documents Received by the AQMD

SYNOPSIS: This report provides, for the Board's consideration, a listing of CEQA documents received by the AQMD between September 1, 2010, and September 30, 2010, and those projects for which the AQMD is acting as lead agency pursuant to CEQA.

COMMITTEE: Mobile Source, October 15, 2010

RECOMMENDED ACTION:
Receive and file.

Barry R. Wallerstein, D.Env.
Executive Officer

EC:LT:SN:SS:AK

Background

CEQA Document Receipt and Review Logs (Attachments A and B) – Each month, the AQMD receives numerous CEQA documents from other public agencies on projects that could adversely affect air quality. A listing of all documents received during the reporting period of September 1, 2010 through September 30, 2010, is contained in Attachment A. A list of active projects from previous reporting periods for which AQMD staff is continuing to evaluate or prepare comments is included as Attachment B.

The Intergovernmental Review function, which consists of reviewing and commenting on the adequacy of the air quality analysis in CEQA documents prepared by other lead agencies, is consistent with the Board's 1997 Environmental Justice Guiding Principles and Initiative #4. Consistent with the Environmental Justice Program Enhancements for FY 2002-03 approved by the Board in September 2002, each of the attachments notes those proposed projects where the AQMD has been contacted regarding potential air quality-related environmental justice concerns. The AQMD has established an internal central contact to receive information on projects with potential air quality-related

environmental justice concerns. The public may contact the AQMD about projects of concern by the following means: in writing via fax, e-mail, or standard letters; through telephone communication; as part of oral comments at AQMD meetings or other meetings where AQMD staff is present; or submitting newspaper articles. The attachments also identify for each project the dates of the public comment period and the public hearing date, if known at the time the CEQA document is received by the AQMD.

At the January 6, 2006 Board meeting, the Board approved the Workplan for the Chairman's Clean Port Initiatives. One action item of the Chairman's Initiatives was to prepare a monthly report describing CEQA documents for projects related to goods movement and to make full use of the process to ensure the air quality impacts of such projects are thoroughly mitigated. In response to describing goods movement CEQA documents, Attachments A and B were reorganized to group projects of interest into the following categories: goods movement projects; schools; landfills and wastewater projects; airports; and general land use projects; etc. In response to the mitigation component, guidance information on mitigation measures were compiled into a series of tables relative to the following equipment: off-road engines, on-road engines, harbor craft, ocean-going vessels, locomotives, and fugitive dust. These mitigation measure tables are on the CEQA webpages portion of the AQMD's website. Staff will continue compiling tables of mitigation measures for other emission sources including airport ground support equipment, etc.

As resources permit, staff focuses on reviewing and preparing comments for projects: where the AQMD is a responsible agency; that may have significant adverse regional air quality impacts (e.g., special event centers, landfills, goods movement, etc.); that may have localized or toxic air quality impacts (e.g., warehouse and distribution centers); where environmental justice concerns have been raised; and those projects for which a lead or responsible agency has specifically requested AQMD review.

During the period September 1, 2010, through September 30, 2010, the AQMD received 60 CEQA documents. Of the total of 78 documents listed in Attachments A and B:

- 17 comment letters were sent;
- 19 documents were reviewed, but no comments were made;
- 28 documents are currently under review;
- 12 documents did not require comments (e.g., public notices, plot plans, Final Environmental Impact Reports); and
- 1 documents were not reviewed.

Copies of all comment letters sent to lead agencies can be found on the AQMD's CEQA webpage at the following internet address: www.aqmd.gov/ceqa/letters.html.

AQMD Lead Agency Projects (Attachment C) – Pursuant to CEQA, the AQMD periodically acts as lead agency for stationary source permit projects. Under CEQA, the lead agency is responsible for determining whether an Environmental Impact Report (EIR) or a Negative Declaration (ND) is appropriate for any proposal considered to be a "project" as defined by CEQA. An EIR is prepared when the AQMD, as lead agency, finds substantial evidence that the proposed project may have significant adverse effects on the environment. A ND or Mitigated Negative Declaration (MND) may be prepared if the AQMD determines that the proposed project will not generate significant adverse environmental impacts, or the impacts can be mitigated to less than significance. The ND and MND are written statements describing the reasons why proposed projects will not have a significant adverse effect on the environment and, therefore, do not require the preparation of an EIR.

Attachment C to this report summarizes the active projects for which the AQMD is lead agency and is currently preparing or has prepared environmental documentation. Through the end of September, the AQMD received no new requests to be the lead agency for a stationary source permit application project. No CEQA documents for permit application projects were certified in September. As noted in Attachment C, through the end of September 2010, the AQMD continued working on the CEQA documents for four active projects.

To date in 2010, AQMD staff has been responsible for preparing or having prepared CEQA documents for six stationary source permit projects, four continuing from 2009. Through the end of September 2010, two CEQA documents have been certified for permit application projects.

INCOMING CEQA DOCUMENTS LOG
SEPTEMBER 1, 2010 TO SEPTEMBER 30, 2010

SCAQMD LOG-IN NUMBER PROJECT TITLE	PROJECT DESCRIPTION	TYPE OF DOC.	LEAD AGENCY	COMMENT STATUS
General Land Use (residential, etc.) LAC100901-02 Hillside Development Permit, Conditional Use Permit, Tentative Tract Map, Design Review, and Environmental Assessment	The proposed project consists of constructing nine town homes, ranging from 1,230 square feet to 1,940 square feet. The total proposed floor area is 14,671 square feet on a 29,267 square-foot lot. Comment Period: N/A Public Hearing: 9/27/2010	ND	City of Pasadena	Document reviewed - No comments
General Land Use (residential, etc.) LAC100901-03 Hillside Development Permit, Design Review, and Environmental Assessment	The proposed project consists of constructing a 1,067 square-foot addition to an existing 1,602 square-foot house on a down slope lot. The proposal consists of a 217 square-foot addition to the first floor and an 857 square-foot addition to the lower level that will fill in the space beneath the existing house. Comment Period: N/A Public Hearing: 8/25/2010	ND	City of South Pasadena	Document reviewed - No comments
General Land Use (residential, etc.) LAC100901-04 Variance, Hillside Development Permit, Design Review, and Environmental Assessment	The proposed project consists of constructing a 370 square-foot addition to an existing 1,503 square-foot two-story house on a 5,738 square-foot lot. Comment Period: N/A Public Hearing: 8/25/2010	ND	City of South Pasadena	Document reviewed - No comments
General Land Use (residential, etc.) LAC100901-05 Rim of the Valley Corridor Special Resource Study	This document consists of a notice of the National Park Service conducting a special resource study of the Rim of the Valley Corridor. The purpose of this special resource study is to determine whether any portion of the Rim of the Valley Corridor study area is eligible to be designated as a unit of the national park system or added to an existing national park. The study will also explore other ways that private or government entities can protect resources and provide more outdoor recreation opportunities. Comment Period: N/A Public Hearing: N/A	Other	National Park Service	Document does not require comments

SCAQMD LOG-IN NUMBER PROJECT TITLE	PROJECT DESCRIPTION	TYPE OF DOC.	LEAD AGENCY	COMMENT STATUS
General Land Use (residential, etc.) LAC100924-03 Architectural and Site Plan Review #09-A36, 101 S. Mills Ave	The proposed project consists of reuse and new construction of an existing facility at 101 S. Mills Avenue. Comment Period: 9/22/2010 - 10/13/2010 Public Hearing: 10/13/2010	Mitigated ND	City of Claremont	Document reviewed - No comments
General Land Use (residential, etc.) LAC100924-05 100 E. Ocean Boulevard Acquisition Project	The proposed project consists of acquiring a privately owned property owned by the Long Beach Redevelopment Agency for the purpose of land assembly for future development. Acquisition of the subject property would allow the Redevelopment Agency to improve the physical appearance of the subject property in short term while encouraging long term redevelopment of the site, as well as improve access to Victory Park. Comment Period: 9/23/2010 - 10/22/2010 Public Hearing: N/A	ND	City of Long Beach	Document reviewed - No comments
General Land Use (residential, etc.) ODP100930-02 Santa Susana Field Laboratory	This document consists of a Final Agreement in Principle between the U.S. Department of Energy and the State of California. The proposed project consists of having the Department of Energy and NASA clean up radioactive and chemical contamination in their respective areas at the Santa Susana Field Laboratory. Comment Period: 10/30/2010 - 10/1/2010 Public Hearing: 9/16/2010	Other	Department of Toxic Substance	Document reviewed - No comments
General Land Use (residential, etc.) ORC100910-01 Orange County Vector Control District Integrated Vector Management Practices: Orange County, California	The proposed project consists of all ongoing activities of the Orange County Vector Control District (OCVCD). The OCVCD uses Intergrated Vector Management techniques to guide its comprehensive control programs. This includes surveillance for vector and diseases, source reduction, public education, and chemical and biological control. Future objectives of the current programs involve the increased use of vector species- or genus-specific chemicals and species- and genus-specific biological control, use of less persistent chemicals, and improved methods of delivery, including replacement of gasoline-fueled vehicles with those using alternative fuels. Public information efforts may be expanded or modified as new disease threats arise. Comment Period: 9/10/2010 - 9/30/2010 Public Hearing: N/A	NOP/IS	Orange County Vector Control District	AQMD commented 9/17/2010
General Land Use (residential, etc.) ORC100921-03 Newport Beach Country Club (PA 2005-140)	The proposed project consists of demolition of the existing tennis and golf clubhouses and the construction of a new tennis clubhouse and golf clubhouses and ancillary facilities. The project also includes the construction of 27 short-term visitor-serving units and a bungalow spa/fitness area and concierge and guest meeting facilities; and five single-family residential dwelling units on the subject property. Comment Period: 9/20/2010 - 10/19/2010 Public Hearing: N/A	ND	City of Newport Beach	Document reviewed - No comments

INCOMING CEQA DOCUMENTS LOG
SEPTEMBER 1, 2010 TO SEPTEMBER 30, 2010

SCAQMD LOG-IN NUMBER PROJECT TITLE	PROJECT DESCRIPTION	TYPE OF DOC.	LEAD AGENCY	COMMENT STATUS
Waste and Water-related LAC100908-04 Colorado Lagoon Estuary Restoration Project	The proposed project consists of sediment removal of approximately 32,500 cubic yards from the Lagoon. Disposal of the dredge material would occur at a disposal site within Slip 1 at the Port of Long Beach. The dredged material would be stabilized prior to transport with a lead treatment process. Comment Period: 9/8/2010 - 9/17/2010 Public Hearing: N/A	Draft EA	Los Angeles County	Document reviewed - No comments
Waste and Water-related LAC100916-06 Al Larson Boat Shop Improvement Project	The proposed project consists of redeveloping an existing boat shop to modernize the facilities, comply with regulatory requirements, and to improve its ability to build and repair ships and vessels. Improvements would include maintenance dredging to ensure adequate vessel access to the site, beneficially reusing dredged material by constructing two confined disposal facility which would result in approximately 0.9 acre of new land for increased vessel maintenance and repair, constructing new wharves, and installing a new travel-lift boat hoist. In addition, the proposed project would improve site hydrology to comply with stormwater regulations and remove historical sediment and soil contamination. Comment Period: 9/16/2010 - 10/18/2010 Public Hearing: N/A	NOP/IS	The Port of Los Angeles	AQMD commented 9/24/2010
Waste and Water-related ORC100903-03 North Basin Groundwater Protection Project	This document consists of a letter that a Draft Subsequent EIR for modifications to its North Basin Groundwater Projection Project is being prepared. The project is intended to protect groundwater supplies by containing groundwater contaminated with industrial degreasing solvents. The plan also includes wells to extract contaminated groundwater, a treatment plant to remove the contaminants from the extracted groundwater, injection wells to recharge the treatment groundwater Comment Period: 9/3/2010 - 9/30/2010 Public Hearing: N/A	Other	Orange County Water District	Currently under review
Waste and Water-related RVC100902-03 Brookside South Recharge	The proposed project consists of utilizing approximately 5,580 linear feet of the graded South Noble Creek stream channel south of Brookside Avenue to impound and recharge imported water during the non-storm season. Comment Period: 9/2/2010 - 10/1/2010 Public Hearing: N/A	Mitigated ND	San Gorgonio Pass Water Agency	Document reviewed - No comments
Waste and Water-related RVC100903-01 Salton Sea Species Conservation Habitat Project	This document consists of a request for project information for a cumulative impact analysis for the Salton Sea Species Conservation Habitat Project. The project would consist of compensating for some of the fish and wildlife habitat that is being lost as the Salton Sea becomes more saline. The project would also restore about 2,400 acres of habitat configured in a series of interconnected shallow ponds. Comment Period: 7/13/2010 - 8/12/2010 Public Hearing: N/A	Other	US Army Corps of Engineers	Document does not require comments

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 23

PROPOSAL: Status Report on Major Projects for Information Management Scheduled to Start During First Six Months of FY 2010-11

SYNOPSIS: Information Management is responsible for data systems management services in support of all AQMD operations. This action is to provide the monthly status report on major automation contracts and projects to be initiated by Information Management during the first six months of FY 2010-11.

COMMITTEE: Not Applicable

RECOMMENDED ACTION:
Receive and file.

Barry R. Wallerstein, D.Env.
Executive Officer

JCM:MAH:OSM:nv

Background

Information Management (IM) provides a wide range of information systems and services in support of all AQMD operations. IM's primary goal is to provide automated tools and systems to implement Board-approved rules and regulations, and to improve internal efficiencies. The annual Budget specifies projects planned during the fiscal year to develop, acquire, enhance, or maintain mission-critical information systems. As provided in July for the first six months of the fiscal year, Information Management is providing this report to detail major projects/contracts or purchases that are expected during these six months.

Summary of Report

The attached report identifies each of the major projects/contracts or purchases that are expected to come before the Board between July 1 and December 31, 2010. Information provided for each project includes a brief project description, FY 2010-11 Budget, and the schedule associated with known major milestones (issue RFP/RFQ, execute contract, etc.).

Attachments(s)

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 25

REPORT: Administrative Committee

SYNOPSIS: The Administrative Committee met on Friday, October 8, 2010. The Committee discussed various issues detailed in the Committee report. The next Administrative Committee meeting is scheduled for Friday, November 12, at 10:00 a.m. in Conference Room CC-8.

RECOMMENDED ACTION:
Receive and file.

Dennis Yates, Vice Chair
Administrative Committee

tc

Attendance: Attending the October 8, 2010 meeting were Committee Members Mayor Dennis Yates, Jane Carney, and Supervisor Josie Gonzales. Chair William A. Burke and Mayor Ron Loveridge were absent due to conflicts in schedules.

ACTION/DISCUSSION ITEMS:

1. **Board Members' Concerns:** None.

2. **Chairman's Report of Approved Travel:** Dr. Wallerstein stated that Dr. Joe Lyou participated on a panel at WSPA's 2010 Issues conference held in Rancho Bernardo, and Supervisor Josie Gonzales will be attending the California Fuel Cell Partnership Steering Team meeting on October 19-20, 2010.

3. **Approval of Compensation for Board Member Assistant(s)/Consultant(s):** None.

4. **Report of Approved Out-of-Country Travel:** None.

NOVEMBER AGENDA ITEMS:

5. **Establish Board Meeting Schedule for Calendar Year 2011**

   Moved by Carney; seconded by Gonzales; unanimously approved.

6. **Appropriate Funds from Designation for Litigation and Enforcement and Authorize Amending/Initiating Contracts with Outside Counsel:** Barbara Baird, District Counsel, stated that staff is requesting authorization from the Board for an additional $425,000 to pursue pending litigation in the environmental arena, including architectural coating rules, Rule 1143 related to consumer coatings products, and challenging AQMD's Rule 433 – Natural Gas Quality. She continued that since some of these are high-profile cases, outside counsel has been used. Mrs. Carney suggested that staff evaluate and report on the possibility of hiring one to two litigation attorneys to reduce the cost and provide the same quality of representation. Ms. Baird responded that two new attorneys have recently been hired, one of which has heavy experience in CEQA litigation and is assisting in these issues. Nonetheless, the requested evaluation will be undertaken.

   Moved by Gonzales; seconded by Carney; unanimously approved.

7. **Appropriate Funds for PAMS and Lead Monitoring Programs from U.S. EPA Section 105, Recognize and Appropriate Funds for Section 103 Monitoring Programs, and Authorize Purchases and Release of RFQ Under These Programs**

   Moved by Carney; seconded by Gonzales; unanimously approved.

8. **Execute Contract for Biennial Audit of Motor Vehicle Registration Revenues for FYs 2007-08 and 2008-09:** Michael O'Kelly, Chief Financial Officer, explained that this is the eighth biennial audit, which is paid by local governments, the MSRC and AQMD. An RFP was approved by the Board and the firm of Thompson, Cobb, Bazilio and Associates, PC was selected. Committee member Gonzales asked how staff arrived at the recommendation, and Mr. O'Kelly responded that the cost, technical scores, and additional points determined the winner, and Dr. Wallerstein added that the recommended firm was also the lowest bidder.

   Moved by Carney; seconded by Gonzales; unanimously approved.

There was a discussion on the status of Dr. Burke's e-mail database, where Chris Marlia, Asst. DEO/Information Management, explained that efforts are being continued to procure lists and AQMD released an RFP to bring in a firm with expertise in assisting in managing the mailing list to be efficient in sending out e-mail blasts. He stated that AQMD currently has mailing lists with 40,000 to 50,000 contacts, but it still is not the magnitude requested by the Chairman. Dr. Wallerstein added that Public Affairs and Information Management have been working on this project together, but have not been able to locate the lists for a low cost; and that this item will be brought to this Committee later this year for consideration. Staff may have a lead on a supplier of the desired list.

9. **Authorize Purchase of Desktop Computer Hardware Upgrades**

   Moved by Carney; seconded by Gonzales; unanimously approved.

10. **Authorize Purchase of Ingres Relational Database Management System Software Support**

    Moved by Carney; seconded by Gonzales; unanimously approved.

11. **Execute Contract for Security Guard Services at Diamond Bar Headquarters:** Bill Johnson, Asst. DEO/Administrative & Human Resources, stated that staff is recommending going with the current contractor who has been with AQMD since 2001. Their services have been very good, but most importantly their retention of guards on the premises have been for a long period. Current retention at AQMD is 6% turnover, whereas the general industry is 10-15%. Mr. Johnson continued that staff would recommend option 2 as it provides for a pay increase of $.25 per hour each six months over the contract term. There is an option to provide health insurance benefits but this would increase the cost by $230,000 for the life of the contract, which staff feels is not appropriate at this time. Mrs. Carney asked if the Committee has the latitude to approve a two-year contract in order to determine how the federal government's health reform legislation would impact the contract, and Mr. Johnson agreed.

    Two-year contract moved by Carney; seconded by Gonzales with the amendment; unanimously approved.

12. **Advertising and Public Outreach Initiative to Chinese-American Communities to Increase Awareness of the Impacts of Air Pollution:** Sam Atwood, Media Office Manager, presented this item stating that this outreach is targeted toward the Mandarin and Cantonese population in the Southland to raise awareness of AQMD, the health efforts of air pollution, inform the communities

of what AQMD is doing to improve the air they breathe, and try to encourage and solicit their increased involvement. Mr. Atwood continued that this is a 26-week program which has been budgeted for up to $400,000 to include newspapers, radio, TV, and on-line advertising. Another aspect of this program is to become involved in sponsorships for festivals with media outlets for the Chinese New Year (February 3, 2011) or home and garden shows. Also, 30-second TV commercials will be prepared in both languages at prime time markets with interviews with Board Members or AQMD staff, where Mrs. Carney asked why real individuals could not be interviewed, and Mr. Atwood agreed. Staff is seeking discounts for TV advertising where the story boards, scripts, and graphics are prepared by staff and the studio is provided by the TV station, along with Mandarin-speaking actors.

Mr. Atwood explained that the development and testing of messages would occur in November, with a soft launch in December, and the full launch in January 2011. Vice Chair Yates asked whether the full launch should occur on the actual date of the Chinese New Year.

Dr. Wallerstein stated that Dr. Burke has requested Supervisor Antonovich to take a lead on this project, who is supporting this current proposal, with funding coming from a settlement from Wal-Mart to be used for public outreach and education. He added that the Supervisor recently hosted a luncheon with the Chinese media, which was well received and supportive feedback was received. This project is a joint effort with Media, Public Affairs and Media's current contractor, Valencia, who has a subcontractor that specializes in outreach and media relations with the Asian community.

Committee member Gonzales suggested that this project should create a long-term return in outreach towards the Chinese and Mandarin elementary, middle and high school students due to their strong culture and gravitational pull in relationships in building businesses. She believes it is essential to include youth as this will allow them to become leaders in clean air transformation so they begin to own it over the years, have familiarity with the issues, and interest in AQMD's mission. She continued that their faith-based organizations, culture, and lifestyle should be incorporated into our approach with their holidays and other celebrations.

Dr. Wallerstein stated that Public Affairs currently has a faith-based outreach that can now be tied into this project. He stated that Dr. Burke has requested a package (previously produced by Think Earth) to be updated, produced and provided to schools, churches and temples to provide air quality information to

children. It was then discussed that some type of contest and award be provided to the child who participates and motivates others.

Debra Mendelsohn, Board Consultant to Supervisor Antonovich, stated that the Supervisor supports this project and that their office is ready to assist staff in any way possible. She also mentioned that Chinese New Year falls on February 3, 2011 and is the year of the rabbit.

Moved by Gonzales; seconded by Carney; unanimously approved.

13. **Recommendation to Approve Nomination for Local Government & Small Business Advisory Group**: Vice Chair Yates stated that Sergio Carrillo is being nominated by Councilmember Mitchell as a member of Local Government & Small Business Assistance Advisory Group.

    Moved by Carney; seconded by Gonzales; unanimously approved.

14. **Local Government & Small Business Advisory Group Minutes for the July 16, 2010 Meeting:** Attached for information only are the Local Government & Small Business Advisory Group Minutes of the July 16, 2010 meeting.

15. **Review November 5, 2010 Governing Board Agenda:** Dr. Wallerstein stated that there are several items on the agenda, such as the continued item Adopt Proposed Rule 1420.1 (Emissions Standard for Lead From Large Lead-acid Battery Recycling Facilities); Approve the Revised Draft Clean Communities Plan; Amend Regulations XVII (Prevention of Significant Deterioration) and XXX (Title V Permits); Amend Regulation XX (RECLAIM Program); and Amend Rule 1175 (Control of Emissions from the Manufacture of Polymeric Cellular (Foam) Products).

16. **Other Business:** None.

17. **Public Comment:** None.

Meeting adjourned at 10:44 a.m.

Attachment

- Minutes from the July 16, 2010 Local Government & Small Business Assistance Advisory Group Meeting

LOCAL GOVERNMENT & SMALL BUSINESS ASSISTANCE ADVISORY GROUP
FRIDAY, JULY 16, 2010
MEETING MINUTES

MEMBERS PRESENT:
Dennis Yates, AQMD Governing Board Member, LGSBA Chairman
Greg Adams, L.A. County Sanitation District
Paul Avila, P.B.A. & Associates
Geoffrey Blake, Metal Finishers of Southern California/All Metals
Daniel Cunningham, Metal Finishing Association
Jacob Haik, Office of School Board Member Richard Vladovic
Maria Elena Kennedy, Kennedy Communications
Steve Mugg, South Orange County Representative, City of Mission Viejo

MEMBERS ABSENT:
Ronald Loveridge, AQMD Governing Board Member, LGSBA Vice Chairman
Felipe Aguirre, Vice Mayor, City of Maywood
Todd Campbell, Clean Energy
Angelo Logan, East Yard Communities for Environmental Justice
Kelly Moulton, Paralegal

OTHERS PRESENT:
Earl Elrod, Board Member Assistant *(Yates)*
Nicole Nishimura, Board Member Assistant *(Lyou)*
Frank Caponi, Los Angeles County Sanitation District
Kris Flaig, Los Angeles County Sanitation District
Paul Ryan, California Refuse and Recycling Council

AQMD STAFF:
Philip Crabbe, Community Relations Manager
Nancy Feldman, Principal Deputy District Counsel
Anupom Ganguli, Asst. Deputy Executive Officer/Public Advisor
Patricia Kwon, Air Quality Specialist
Lori Langrell, Secretary
Chung Liu, Deputy Executive Officer
Dairo Moody, Air Quality Specialist
John Olvera, Principal Deputy District Counsel
David Ono, Program Supervisor
Gary Quinn, Program Supervisor
Kevin Orellana, Air Quality Specialist
Laki Tisopulos, Asst. Deputy Executive Officer
Greg Ushijima, Air Quality Engineer II
Jill Whynot, Director of Strategic Initiatives

Agenda Item #1 - Call to Order/Opening Remarks
Chair Dennis Yates called the meeting to order at 11:14 a.m.

Agenda Item #2 – Approval of June 11, 2010 Meeting Minutes/Review of Follow-Up/Action Items
Chair Yates called for approval of the meeting minutes.

The June 11, 2010 meeting minutes were approved. The action items from that meeting were completed.

Agenda Item #3 –Amend Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills
Ms. Jill Whynot gave a presentation on Rule 1150.1 – control of gaseous emissions from municipal solid waste landfills.

Agenda Item #4 –On-Road Heavy Duty Vehicle Voucher Incentive Program (VIP and HVIP)
Mr. Fred Minassian provided an update on the On-Road Heavy Duty Vehicle Voucher Incentive Program (VIP and HVIP).

Mr. Geoff Blake asked what percent of the purchase price of a truck represents the incentive. Mr. Minassian replied that the incentive is approximately 40%.

Mr. Greg Adams asked if there is a still a three vehicle per fleet limitation. Mr. Minassian replied in the negative.

Agenda Item #5 – Rule 1146 – Emissions of Oxides of Nitrogen from Industrial, Institutional and Commercial Boilers, Steam Generators, and Process Heaters and Rule 1146.1 – Emissions of Oxides of Nitrogen from Small Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters, Implementation Assessment Report
Mr. Gary Quinn provided a status update on the Implementation Assessment Report for Rules 1146 and 1146.1.

Mr. Adams asked if this discussion pertained to natural gas burners. Mr. Quinn confirmed this.

Mr. Blake asked if this addresses Rule 1146.2, and whether there are changes coming in that category. Mr. Quinn and Mr. Laki Tisopulos replied that this does not address Rule 1146.2 and they do not believe any changes are coming.

Agenda Item #6 – Installation of Air Filtration Systems in the South Coast Air Basin
Ms. Patricia Kwon provided a presentation on the administration of air filtration systems in schools near the Ports of Los Angeles and Long Beach, and other communities.

Mr. Adams asked why the VOC aspect is being abandoned. Ms. Kwon replied that the VOC removal, technically, is tricky since the amount of carbon needed is very large and it would only be good for a single event. She added that it is more cost effective to focus on PM removal, and conduct further testing on VOC removal technologies before using in a larger scale program.

Mr. Adams asked what additional modifications needed to be made to classrooms. Ms. Kwon stated that for the most part no modifications need to be done. She added that most involved a simple panel filter change out or some duct modifications to widen the opening. She also added that they were careful not to cut into walls as there may be asbestos issues, with the goal to keep the modifications at a minimum.

Mr. Adams commented that he felt vindicated because he had previously suggested using funds to install filters in schools next to standby generators, but his proposal was rejected five years ago.

Mr. Blake asked how effective the filters are. Ms. Kwon responded that in terms of PM and black carbon they are very effective, and regarding VOC's the results are inconclusive. Ms. Kwon offered to provide a pilot study report to the members.

Action Item: *Provide to LGSBA members the Pilot Study Report on the Air Filtration Systems.*

Mr. Jacob Haik stated that he is involved with two schools currently being built within LAUSD. He asked Ms. Kwon if the school district will be required to install something at this time. Ms. Kwon indicated that the most commonly used filters have a cost of $3.00-$5.00 per filter and last approximately three months. There are new high performance filters that are approximately $100.00 per filter with a lifetime of approximately one year. They are noticing also that there are more manufacturers producing these filters and as a result the price is going down.

Mr. Adams mentioned about incentives for a business picking up the cost of filter installations, and due to PM 2.5 reductions, the business could receive an offset credit, for example in the high impact areas or along the 710 freeway.

Agenda Item #7 – Monthly Report on Small Business Assistance Activities
No comments.

Agenda Item #8 – Update on Climate Change Activities (Written Report)
Ms. Jill Whynot provided a written report on climate change activities.

Agenda Item #9 - Other Business
Dr. Ganguli announced that at the Administrative Committee meeting earlier this morning, there were some reappointments and appointments of members to the LGSBA Advisory Group. This brings the total number of members on the Group to 14. The re-appointments were as follows:

Greg Adams
Geoffrey Blake
Daniel Cunningham
Jacob Haik
Kelly Moulton

The following individuals were appointed as new members to the Advisory Group:

Rita Loof, Radtech
Mary Ann Lutz, City of Monrovia
Sam Garrison, Los Angeles Area Chamber of Commerce
Lucy Dunn, Orange County Business Council
Luis Ayala, City of Alhambra

Mr. Adams asked if there was a way to obtain the new member's bios. Dr. Ganguli indicated that they are available online with the Administrative Committee package.

Ms. Maria Elena Kennedy announced that she has recently been appointed to the U.S. EPA's National Drinking Water Advisory Council by Lisa Jackson.

Agenda Item #10 - Public Comment
No comments.

Agenda Item #10 - Adjournment
The meeting adjourned at 11:59 p.m.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 26

PROPOSAL: Climate Change Committee

SYNOPSIS: The Climate Change Committee met on Wednesday, October 13, 2010. Following is a summary of that meeting.

RECOMMENDED ACTION:
Receive and file.

Miguel Pulido, Acting Chair
Climate Change Committee

Attendance
The Climate Change Committee meeting was held on October 13, 2010. Committee members who participated were Supervisor Josie Gonzales and Mayor Miguel Pulido. Dr. William Burke, Councilmember Judith Mitchell and Mayor Ron Loveridge were absent.

The meeting convened at 8:50 a.m.

Discussion / Action Items

Dr. Barry Wallerstein, Executive Officer, welcomed the committee members and then self introductions were made.

RFP for Additional GHG Reduction Projects
Jill Whynot, Director of Strategic Initiatives, described an RFP that staff will bring to the Governing Board for consideration at their November 5, 2010 meeting. Three hundred thousand dollars has been received from Chevron as additional mitigation funds related to a CEQA project on a previous refinery modification. Chevron previously paid $1.5 million, which was used for a large reforestation project in the Angeles National Forest.

The RFP would seek one or more projects for greenhouse gas (GHG) reductions in the AQMD jurisdiction. Projects would follow pre-approved protocols in Regulation XXVII – Climate Change.

Review criteria would include up to five points each for projects implemented within five miles of the refinery or for quantifiable co-benefits. If the RFP is approved, a voluntary bidder's conference would be held in mid-November of 2010 and the recommendation for contract awards would go to the Governing Board in February 2011.

This was an action item, however less than a quorum was present for the discussion of this item. The members present indicated their support that this item be recommended for approval by the Board.

Chairman's Initiative for Urban Tree Planting

Aaron Katzenstein, Program Supervisor, updated the Committee on the Urban Tree Planting program, which was one of the Chairman's Initiatives for 2009. This program will result in approximately 11,000 California native, low-biogenic VOC trees being planted throughout the AQMD jurisdiction. Thirty three cities and two counties are participating. To date, approximately 600 trees have been planted. The program also includes a student employment component.

Mayor Pulido inquired if there would be funds for additional city projects. Dr. Katzenstein mentioned that some cities will not be able to plant the total number of trees originally planned, so there may be some remaining funds. Supervisor Gonzales stated that it would be good to put such funds back to work. She asked about the size of trees required, as trees that are too large have lower survival rates. Under these contracts, the acceptable size range is 15 gallon to 24 inch box.

Reforestation Project

Dr. Katzenstein provided a briefing on the reforestation project within the Station Fire area in the Angeles National Forest. This project was funded by AQMD using $1.5 million that Chevron paid as a mitigation fund for a refinery project at their El Segundo facility. The U.S. Forest service, through the National Forest Foundation, will replant 2,500 to 4,000 acres under this project. 470,000 seedlings are being grown to support this effort. Planting will occur in Spring 2011 and GHG reductions will be monitored and verified to ensure accurate quantification.

Supervisor Gonzales suggested that this project be included in information that goes to the community to promote AQMD's programs. She and Mayor Pulido both were very pleased with this effort.

Update on Green Team Activities

Ms. Whynot summarized activities of the AQMD Green Team, which was formed ten months ago. A group of employees, representing each division and the two labor unions meets quarterly to work on green initiatives from the AQMD Green Policy and review employee suggestions. Many accomplishments have been realized or are in progress.

Several graphs and charts were shown to illustrate the AQMD's GHG emissions and related metrics.

Mayor Pulido asked to see more frequent updates on these efforts. Supervisor Gonzales asked if the data presented for AQMD included tenants that share our building. Staff responded that in some areas, such as electricity usage, that is true. Supervisor Gonzales recommended that we work with our tenants to make sure they are cognizant of our green initiatives. Dr. Wallerstein will ask staff to meet with tenants to discuss this and to actively seek their participation.

Update on Discussions with CARB Regarding Implementation for Local Air Districts

Ms. Whynot reported on recent developments regarding air district participation in the state's proposed cap-and-trade program and verification of mandatory GHG emission reports. The initial draft cap-and-trade rules included many restrictions on how entities could or could not participate in various roles related to program implementation. Local air districts were treated in the same manner as private, for-profit, businesses. Staff has drafted suggested language and is working, with contractor assistance, to get language included in the next draft rule language. CARB staff has been receptive to some of these concepts, so staff is cautiously optimistic that AQMD may be able to have an expanded role.

The other area of positive progress relates to GHG verification for mandatory emission reports that large facilities have to submit to CARB. Last winter, approximately a dozen AQMD staff took a one-week CARB training class and got certified as GHG emission verifiers. However, they cannot perform this function until the AQMD is given verification body status. CARB staff will approve AQMD and one to two other local air districts as verification bodies.

In addition, CARB staff will propose clarifying language for the mandatory reporting rule in December 2010. Dr. Wallerstein will brief Mayor Loveridge on these two items before the December 2010 CARB Board meeting.

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 27

REPORT: Legislative Committee

SYNOPSIS: The Legislative Committee held a meeting on Friday, October 8, 2010. The next Legislative Committee meeting is scheduled for Friday, November 12, 2010 at 9:00 a.m. in Conference Room CC8. The Committee deliberated on agenda items for Board consideration and recommended the following position:

Bill/Title	**Recommended Position**
H.R. 6291 (Richardson) Freight FOCUS Act of 2010	Support with Amendments

RECOMMENDED ACTION:
Receive and file this report, and approve position on the bill as specified in this letter. Also, approve staff to participate in future discussions regarding SB 375 implementation with legislative representatives and other governmental agencies.

Jane Carney, Chair
Legislative Committee

OA:AG:PC:ar

Attendance [Attachment 1]
The Legislative Committee met on October 8, 2010. Committee Chair Jane Carney was present. Committee Members Jan Perry and Michael D. Antonovich were present via videoconference.

Update on Federal Legislative Issues
With regard to the Federal Clean Air Act Section 185 issue, Mr. Mark Kadesh, AQMD federal legislative consultant, reported that there continues to be good progress.

Additionally, AQMD staff has been very responsive to requests for information from Congressional staff on this issue.

Regarding our appropriations requests, Mr. Chris Kierig, AQMD federal legislative consultant, explained that current funding levels are expected to be maintained through a continuing resolution in late December or early next year.

Mr. Andrew Wheeler, AQMD federal legislative consultant, reported that they continue to work with Congressman Waxman regarding the Section 185 issue. He added that they are also working to communicate to members of Congress the favorable U.S. EPA decision that dismissed NRDC's petition regarding the use of New Source Review offsets. Mr. Wheeler also reported that they continue to work with AQMD staff to identify bills that will be important to AQMD for next year's legislative strategy.

Recommend Position on the following Federal Bills [Attachment 2]
Henry Hogo, Assistant DEO, briefed the Committee on the following federal legislation:

H.R. 6291 (Richardson) Freight FOCUS Act of 2010
Mr. Hogo, explained that this bill, which addresses similar policy areas as S. 3629 (Lautenberg), will establish a national process for freight planning and prioritization of funding. This bill establishes a transportation Trust Fund, which will be used for funding eligible projects focused on improving goods movement, based on specified merits. The Trust Fund would be funded in part by a twelve cent increase in the diesel tax paid by trucks. Staff's proposed amendments include suggestions to include air quality and health related impacts and costs, allow local air pollution control agencies to provide input, and prioritize projects involving "zero or near-zero emissions technology".

Staff recommends a position of SUPPORT WITH AMENDMENTS.

The Legislative Committee approved staff's recommendation to Support H.R. 6291 with Amendments.

Anupom Ganguli, Assistant DEO/Public Advisor, briefed the Committee on the following federal legislation:

S. 3072/H.R. 4753 (Rockerfeller/Rahall) Stationary Source Regulations Delay Act
Dr. Ganguli reported that these two identical companion bills would suspend, for a two-year period, any U.S. EPA action for greenhouse gas (GHG) regulations under the Clean Air Act with respect to carbon dioxide or methane, except for motor vehicle emissions and reports or enforcement of reporting requirements. Since this is contrary to AQMD's past policies and Board actions, staff recommended an Oppose position.

Dr. Wallerstein added that the U.S. EPA was very responsive to comments made by AQMD and other agencies regarding the phasing in of GHG requirements for stationary sources, and that there were co-benefits for air pollution reduction from such actions.

Chair Jane Carney stated that she would like to hear public testimony on AQMD's proposed rule regarding this subject in the future, and suggested a delay in taking this item up. The Legislative Committee directed staff to bring this issue back at its November meeting.

Update on Sacramento Legislative Issues
Mr. Paul Gonsalves, AQMD state legislative consultant, reported that a budget for the state of California had just been adopted. Additional information will be available in the near future. Mr. Gonsalves added that pension reform was also passed which impacts new state employees hired on or after November 10, 2010.

Ms. Carolyn V. Hunter, AQMD state legislative consultant, reported that they have been monitoring bills that were moved to the Governor's desk. Ms. Hunter added that there has been some movement regarding the process relating to AB 1318 and the needs analysis, including several internal meetings between California Air Resources Board (CARB) and California Energy Commission. Discussions are underway about possibly holding a public workshop at AQMD within the next month or so.

Discussion on SB 375 implementation
Dr. Barry Wallerstein, AQMD Executive Officer, reported on SB 375 implementation. Dr. Wallerstein reminded the committee that the intent of the bill was to reduce GHG emissions. At their last meeting, CARB established regional GHG emission reduction targets, on a per capita basis. However, the SCAG Regional Council had asked CARB to establish lower targets than were proposed. For 2020, SCAG asked for a 6% decrease and for 2035, an 8% decrease, as a target. However, CARB adopted an 8% decrease for 2020 and a 13% decrease for 2035, as a target. An agreement was reached to have an update in February 2011 to revisit the 13% target to see if it needs to be modified based on additional analyses. SCAG is required to submit a sustainable communities plan directed at achieving these targets. Dr. Wallerstein added that part of the rationale from SCAG in asking to establish lower targets are decreases in funding.

Dr. Wallerstein requested that the committee allow AQMD staff to participate in future discussions on implementation, including funding with legislative representatives and other governmental agencies in order to protect AQMD's policy priorities.

The Legislative Committee approved AQMD staff to participate in future discussions regarding SB 375 implementation with legislative representatives and other governmental agencies.

Governor's Final Actions on Bills Passed by the Legislature. [Attachment 3]
Dr. Ganguli briefly discussed the bills referenced within the written report.

ATTACHMENT 2

H.R. 6291 (Richardson)
Freight FOCUS Act of 2010

S. 3072/H.R. 4753 (Rockefeller/Rahall)
Stationary Source Regulations Delay Act

H.R. 6291 (Richardson)

The Freight FOCUS Act of 2010

Summary: This legislation proposes to establish a national process for freight planning and prioritization of funding. The bill will create a Goods Movement Trust Fund, which will be used for funding eligible projects focused on improving goods movement based on specified merits.

The objectives of this bill are to "provide for merit-based investment in the freight transportation system of the U.S. to ensure economic growth, increase vitality and competitiveness in national and global markets, address good mobility and accessibility issues, reduce air pollution and other environmental impacts of freight transportation, better public health conditions, enhance energy security, and improve the condition and connectivity of the freight transportation system."

Background: Freight or goods movement activity has been rapidly growing in the transportation industry. As the nation grows, urban transportation issues also grow. As ports and goods movement activity expands throughout the United States, major challenges are created. For example, the Ports of Los Angeles and Long Beach have been considered Southern California's "economic engine." Studies report that imports coming through these corridors have generated jobs, income, and tax revenue in almost every state in the nation, revealing the economic importance of international trade. However, the movement of freight has also been identified by the U.S. Environmental Protection Agency as a "health concern at the national, regional, and community level." The ports of Los Angeles and Long Beach are the single largest source of pollution in Southern California and have greatly contributed to Southern California's diesel particulate pollution and resulting health impacts.

Improvements to the nation's transportation system could be achieved through advancements in areas that are impacted by the system, such as the economy, technology, safety, health and the environment. This legislation is aimed towards creating enhancements in the country's goods movement system and mitigating associated impacts or challenges that this freight transportation system creates.

Status: N/A

Specific Provisions: The Freight FOCUS Act of 2010 would specifically:

1) Create an Office of Freight Planning and Development at the Department of Transportation, a National Freight Advisory Committee consisting of 15 individuals representing public and private stakeholders with respect to freight, and would require development of a national freight plan with public and private participation;
2) Designate freight corridors of national significance to help prioritize projects;
3) Form freight corridor coalitions that allow participation from local and regional

entities;
4) Select projects along the corridors and across the county;
5) Raise revenue by increasing diesel tax paid by trucks by 12 cents, provide for a $3 billion/year transfer from the General Fund into the Goods Movement Trust Fund, and would allow for other revenue raising options;
6) Create the Goods Movement Trust Fund (GMT);
7) Issue merit-based grants from GMT administered by the Assistant Secretary for Freight planning; and
8) Ensure financial integrity of projects and ensure that labor standards are maintained and protected.

Impacts on AQMD's mission, operations or initiatives: The goods movement industry is a vital component of California's economy. The important issues regarding improving the freight transportation system and reducing its environmental impacts in California need to be further addressed. Additionally, developing policies and programs would be essential in reducing congestion, emissions, and other environmental and economic impacts resulting from goods movement in California.

The Freight FOCUS Act of 2010 will have the potential to accelerate the implementation of existing emission reduction programs and plans for goods movement. This legislation may also facilitate the creation of new emission reduction projects related to freight transportation.

Recommended Position: SUPPORT WITH AMENDMENTS
Proposed amendments:

1) Pages 3-4 – Within the National Freight Plan, specifically include "air quality and health related impacts" as a type of challenge related to freight movement that needs to be assessed and to have recommendations made to address that challenge. – Section 2(d)(5);
2) Page 4 - Specifically include air pollution control agencies within the types of stakeholders to be included in the Freight Advisory Committee. – Section 3(b) *;*
3) Page 8 - Add "health costs" to list of criteria to be considered when designating freight corridors of national significance. -- Section 4(b)(4)(B)(v);
4) Pages 9-10 - Specifically include air pollution control agencies within the types of stakeholders to be included in freight corridor coalitions. -- Section 4(c)(2);
5) Page 15 – Specifically include "zero or near-zero emissions technology" as a type of innovative technology that is to be included as a factor in project prioritization. – Section 4(c)(5)(B)(vii);

6) Page 16-18 – Specifically include "A project that benefits the environment and air quality through the utilization of zero or near-zero emissions technology" as a type of project eligible for a grant. – Section 4(d)(2);
7) Page 19 – Specifically include local governments, including air quality agencies, as entities eligible to submit an application for a grant. – Section 4(d)(3)(A); and
8) Page 20 – Specifically include "A project that benefits the environment and air quality through the utilization of zero or near-zero emissions technology" as a type of project eligible for not less than 7% of the amounts made available for grants. – Section 4(d)(6);

LEGISLATIVE COMMITTEE RECOMMENDED: October 8, 2010 Support with Amendments

CONGRESSWOMAN LAURA RICHARDSON OF CALIFORNIA

THE FREIGHT FOCUS ACT OF 2010

"FREIGHT IS THE FUTURE OF COMMERCE IN THE UNITED STATES"

Congresswoman Richardson is preparing to introduce a comprehensive bill on goods movement. Below is an outline of the bill. We hope your organization supports her effort to improve the movement of goods throughout the country.

Bill Highlights

The bill would establish a process for freight planning and prioritization of funding. The bill provides for public and private sector involvement in the process, and prioritizes major goods movement corridors and funds projects to alleviate choke points.

The bill also creates a Goods Movement Trust Fund, which would be dedicated to funding such projects, and contains safeguards to ensure that if funding came in from a specific mode, those funds will be dedicated to projects for that mode.

While the current draft only includes funding from an increase in the diesel tax, the structure is flexible to incorporate other revenue streams or transfers of funds from any other source.

It is anticipated that this bill will be introduced on Wednesday, September 29th and we hope to have your support by that time.

Major Provisions:

1. Create an office of freight planning at DOT
    a. The office would conduct freight planning and publish reports
    b. The office would designate corridors of national significance

   c. The office would be ultimately responsible for administering a competitive, merit based grant program
2. Create a National Freight Advisory Committee
   a. This would allow a formal mechanism for the private sector to have input into funding priorities and planning
3. Creates a national freight plan with input from public and private entities, including the National Freight Advisory Committee
4. Designate Freight corridors of national significance
   a. This would help prioritize projects along our most important trade corridors
5. Form freight corridor coalitions
   a. Allowing local and regional entities to have direct input into what projects are selected and prioritized if they choose to form a coalition.
6. Select projects along the corridors and across the country
   a. A public metric would be developed to prioritize projects along the corridors and across the country
7. Raise revenue
   a. The primary source is currently a 12 cent increase in the diesel tax paid by trucks
   b. There would also be a $3 billion a year transfer from the General Fund into the Goods Movement Trust Fund.
   c. The bill is drafted in an open format so other revenue raisers can be added
   d. Any funds raised from only a single mode would be dedicated for projects that benefit that mode
8. Create Goods Movement Trust Fund (GMT)
9. Issue grants from GMT
   a. The Assistant Secretary for Freight planning would administer a competitive, merit based grant program to projects around the country from funds in the GMT. Funding would be available for projects across many different modes.
10. Ensure the financial integrity of projects
11. Ensure that labor standards are maintained and protected
12. Provide for administrative costs for all levels of the program
13. Create a national freight plan, including a “Freight Snapshot” to keep track of current trends in freight that would be publicly available.

.....

111TH CONGRESS
2D SESSION

H. R. _____

To provide for merit-based investment in the freight transportation system of the United States to ensure economic growth, increase vitality and competitiveness in national and global markets, address goods mobility and accessibility issues, reduce air pollution and other environmental impacts of freight transportation, better public health conditions, enhance energy security, and improve the condition and connectivity of the freight transportation system, and for other purposes.

IN THE HOUSE OF REPRESENTATIVES

Ms. RICHARDSON introduced the following bill; which was referred to the Committee on _____

A BILL

To provide for merit-based investment in the freight transportation system of the United States to ensure economic growth, increase vitality and competitiveness in national and global markets, address goods mobility and accessibility issues, reduce air pollution and other environmental impacts of freight transportation, better public health conditions, enhance energy security, and improve the condition and connectivity of the freight transportation system, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE; TABLE OF CONTENTS.

(a) SHORT TITLE.—This Act may be cited as the ''Freight is the Future Of Commerce in the United States Act of 2010'' or the ''Freight FOCUS Act of 2010''.

(b) TABLE OF CONTENTS.—

SEC. 2. OFFICE OF FREIGHT PLANNING AND DEVELOPMENT.

(a) ESTABLISHMENT.—Not later than 180 days after the date of enactment of this Act, the Secretary shall establish in the Office of the Secretary an Office of Freight Planning and Development (in this section referred to as the ''Office'').

(b) ASSISTANT SECRETARY.—The Office shall be headed by an Assistant Secretary for Freight Planning and Development who shall be appointed by the Secretary.

(c) DUTIES.—The Assistant Secretary shall—

(1) advise the Secretary on freight issues;

(2) carry out the freight corridors of national significance program under section 4;

(3) facilitate communication among public and private stakeholders with respect to freight issues;

(4) provide recommendations to the Secretary on funding sources for projects with respect to freight; and

(5) develop the national freight plan under subsection (d).

(d) NATIONAL FREIGHT PLAN.—Not later than 2 years after the date of enactment of this Act, and every 3 years thereafter, the Assistant Secretary shall submit to Congress and publish on the Web site of the Department of Transportation a national freight plan, which shall include—

(1) projections relating to freight for the 20-year period beginning on the date on which the plan is submitted to Congress and recommendations for supporting freight movement during that period;

(2) a list of the freight corridors designated as freight corridors of national significance under section 4(b);

(3) the most recent freight corridor snapshot report published under section 4(e);

(4) an analysis of emerging and long-term trends in—

(A) economic and trade policies related to freight movement; and

(B) public health and environmental conditions related to freight movement; and

(5) an assessment of challenges related to freight movement and recommendations for addressing those challenges.

SEC. 3. FREIGHT ADVISORY COMMITTEE.

(a) ESTABLISHMENT.—Not later than 180 days after the date of enactment of this Act, the Secretary shall establish a Freight Advisory Committee (in this section referred to as the ''Committee'').

(b) MEMBERSHIP.—The Committee shall be composed of 15 individuals who represent public and private stakeholders with respect to freight, including representatives of—

(1) each mode of freight transportation;

(2) ports;

(3) shippers of freight;

(4) metropolitan planning organizations (as that term is defined in section 134(b) of title 23, United States Code) serving areas in which a freight corridor is located;

(5) State transportation agencies;

(6) environmental protection organizations;

(7) public health advocates;

(8) labor; and

(9) others determined appropriate by the Secretary.

(c) CHAIRPERSON.—The Assistant Secretary for Freight Planning and Development (appointed under section 2(b)) shall be the chairperson of the Committee.

(d) MEETINGS.—The Committee shall meet at the call of the chairperson at least twice each year.

(e) DUTIES.—The Committee shall—

(1) advise the Assistant Secretary on issues, projects, and funding needs with respect to freight, including the determination of freight priorities;

(2) develop measures to predict growth in freight movement;

(3) facilitate the sharing of information relating to freight between public and private entities;

(4) assist the Assistant Secretary with the development of the national freight plan under section 2(d); and

(5) assist the Assistant Secretary with the development of freight corridor snapshot reports under section 4(e).

SEC. 4. FREIGHT CORRIDORS OF NATIONAL SIGNIFICANCE PROGRAM.

(a) ESTABLISHMENT.—Not later than one year after the date of enactment of this Act, the Assistant Secretary for Freight Planning and Development (appointed under section 2(b)) shall establish a freight corridors of national significance program (in this section referred to as the ''Program'') in accordance with this section.

(b) DESIGNATION OF FREIGHT CORRIDORS OF NATIONAL SIGNIFICANCE.—

(1) IN GENERAL.—Not later than one year after the date of enactment of this Act, and every 3 years thereafter, the Assistant Secretary shall designate the multimodal freight corridors in the United States that the Assistant Secretary has determined, in accordance with this subsection, are freight corridors of national significance based on the importance of the corridors to freight movement.

(2) PUBLICATION.—The Assistant Secretary shall publish on the Web site of the Department of Transportation a document that specifies the corridors designated under paragraph (1) and contains—

(A) a map of the corridors;

(B) a detailed description of the standards used to designate the corridors;

(C) statistics supporting the designation of each corridor; and

(D) a description of the role of each corridor in supporting the economy and freight transportation system of the United States.

(3) PUBLIC PARTICIPATION.—The Secretary shall make designations under paragraph (1) after providing notice and an opportunity for public comment.

(4) RULEMAKING TO DETERMINE DESIGNATION STANDARDS.—

(A) IN GENERAL.—The Assistant Secretary, in consultation with the Freight Advisory Committee (established under section 3(a)), shall conduct a rulemaking proceeding to establish publically available, objective, and quantifiable standards for designating freight corridors as freight corridors of national significance under paragraph (1).

(B) CRITERIA.—The standards established under subparagraph (A) shall ensure that, in designating a freight corridor as a freight corridor of national significance, the following criteria are accurately measured and considered

(with the criteria listed in descending order of importance):

(i) The volume of freight moved along the corridor.

(ii) The value of freight moved along the corridor.

(iii) The benefits that may be generated by transportation improvements carried out along the corridor, including the creation or sustaining of jobs, expansion of business opportunities, or increasing of the gross domestic product.

(iv) The potential for growth in freight movement along the corridor.

(v) The economic, environmental, and other costs associated with traffic congestion and travel delay along the corridor.

(5) DATA COLLECTION.—

(A) IN GENERAL.—The Assistant Secretary, in consultation with the Freight Advisory Committee, shall collect and review all data relating to freight necessary to designate freight corridors of national significance under paragraph (1) and shall consider, in consultation with the heads of relevant Federal agen-

cies, methods for improving the sources of the data to reduce deficiencies in the data and assist projections of transportation demand.

(B) PROJECTIONS.—The Assistant Secretary, in consultation with the Freight Advisory Committee and the Administrator of the Environmental Protection Agency, shall analyze short- and long-term trends in the movement of freight domestically and internationally to assist the designation of freight corridors of national significance under paragraph (1), including by analyzing economic and trade policies and public health and environmental conditions related to freight movement.

(c) FREIGHT CORRIDOR COALITIONS.—

(1) IN GENERAL.—With respect to each freight corridor of national significance designated under subsection (b), the Assistant Secretary may designate one entity to serve as a freight corridor coalition that represents the freight corridor for purposes of this section.

(2) COALITION COMPOSITION.—To be eligible for designation as a freight corridor coalition under paragraph (1), an entity shall be composed of individuals representing each of the following:

(A) The State transportation agency of each State in which a portion of the corridor is located.

(B) The metropolitan planning organization (as that term is defined under section 134(b) of title 23, United States Code) for each area in which a portion of the corridor is located.

(C) Each mode of freight transportation that operates along the corridor.

(D) Each port along the corridor.

(E) Environmental protection organizations.

(F) Public health advocates.

(G) Labor.

(H) Private stakeholders, including shippers, carriers, and freight-related associations.

(3) APPLICATION PROCESS.—

(A) IN GENERAL.—The Assistant Secretary shall establish a process for entities to apply for designation as a freight corridor coalition under paragraph (1).

(B) APPLICATION.—The application of an entity for designation as a freight corridor coa-

lition under paragraph (1) shall include at least the following:

(i) A description of the composition of the entity and how that composition meets requirements under paragraph (2).

(ii) A description of the proposed functions and authorities of the entity, including with respect to the performance of analysis, consensus building, and planning.

(iii) Information demonstrating that the entity has, or will develop, the legal, financial, technical, and political capacity and support from relevant organizations necessary to carry out the functions of a freight corridor coalition under this subsection.

(iv) A description of the proposed budget for the entity, including—

(I) a staffing plan;

(II) a spending plan; and

(III) a plan for acquiring funding from sources other than grants under paragraph (4).

(4) GRANTS FOR ADMINISTRATIVE EXPENSES.—The Assistant Secretary is authorized to

make grants to a freight corridor coalition designated under paragraph (1) to assist the coalition with administrative expenses.

(5) FREIGHT CORRIDOR PLAN.—

(A) IN GENERAL.—Not later than one year after the date on which an entity is designated as a freight corridor coalition under paragraph (1), and annually thereafter, the freight corridor coalition shall submit to the Assistant Secretary a freight corridor plan that includes—

(i) a prioritized list of projects that are eligible for grant assistance under subsection (d) and that the coalition has determined will improve the freight movement performance of the freight corridor of national significance represented by the coalition;

(ii) an estimate of the cost of each project specified in the list under clause (i) and the aggregate cost of all listed projects;

(iii) a specification of a State sponsor willing to carry out each project specified in the list under clause (i) and the support

that each member of the coalition shall provide the State sponsor with respect to the project;

(iv) a funding plan, including a specification of funding sources, for each project specified in the list under clause (i);

(v) a description of how projects specified in the list under clause (i) support connectivity at State borders;

(vi) a detailed description of the corridor, including a description of—

(I) the modes of transportation that operate along the corridor;

(II) the transportation facilities along the corridor;

(III) the interaction of passenger and freight movement along the corridor;

(IV) the performance of the corridor and projections of future corridor performance, including with respect to the speed and reliability of travel along the corridor;

(V) any environmental or public health issues related to freight movement along the corridor; and

(VI) any economic costs related to congestion and travel delay along the corridor; and

(vii) any additional information the Assistant Secretary determines appropriate.

(B) PROJECT PRIORITIZATION.—In determining the priority of a project specified in a freight corridor plan under subparagraph (A), a freight corridor coalition shall consider the following:

(i) The schedule for completing the project and the appropriate sequencing of projects.

(ii) Whether the project will improve a component of a freight corridor determined to be performing poorly in a freight corridor snapshot report under subsection (e).

(iii) The improvement in freight movement that will result from the project and the impact of failing to carry out the project.

(iv) Whether the project will address a bridge in need of repair.

(v) The amount of non-Federal funding available for the project, including funding from public-private partnerships.

(vi) The benefits of the project unrelated to freight movement and whether there is funding available from nonfreight sources commensurate with those benefits.

(vii) Whether innovative technologies are incorporated into the project.

(viii) The extent to which the project will reduce air, water, or noise pollution, including through improved energy conservation or efficiency.

(ix) The congestion reduction benefits of the project.

(x) The improvement in the condition of freight movement infrastructure that will result from the project.

(xi) The public health and safety benefits of the project, including with respect to accident and injury reduction with a goal of reducing by 10 percent the number

of fatalities related to freight transportation by the year 2015.

(xii) Whether the project involves the replacement or repair of an existing surface transportation facility—

(I) the replacement or repair of which will result in economic and mobility benefits for the United States; and

(II) that, if not replaced or repaired, will likely deteriorate substantially and negatively impact the economy and transportation system of the United States.

(xiii) Whether the project will not be completed without Federal support.

(xiv) The regional and national economic development benefits of the project, including with respect to trade facilitation.

(xv) Whether the project will be carried out on a publicly owned site.

(d) GRANTS.—

(1) IN GENERAL.—In carrying out the Program, the Assistant Secretary is authorized to make a grant to any State to assist any project—

(A) specified in paragraph (2); and

(B) for the improvement of freight movement.

(2) ELIGIBLE PROJECTS.—The projects eligible for grant assistance under paragraph (1) are the following:

(A) A project for the development or improvement of a port.

(B) A project for the development or improvement of a multimodal terminal facility.

(C) A project for the development or improvement of a land port of entry.

(D) A project to improve freight rail performance, including through capacity expansion.

(E) A project for the development or improvement of a road or bridge, including a road or bridge that—

(i) is essential to supporting local, interregional, interstate, or international freight movement;

(ii) improves access to freight facilities, including ports, terminals, and distribution centers;

(iii) improves freight transportation to or from an international gateway, includ-

ing ports, airports, and border crossings; or

(iv) improves access for, and the emergency capabilities of, military personnel and equipment.

(F) A project for the development or improvement of an intelligent transportation system for freight that reduces congestion and improves safety.

(G) A project for the development or improvement of a facility that provides long-term truck parking.

(H) A project for the development of freight movement capacity where that capacity is needed.

(I) A project for the development of a roadway-rail grade separation.

(J) A dredging project or a project to develop or improve a lock or dam.

(K) A project to benefit the environment, including through the reduction of emissions determined by the Assistant Secretary, in consultation with the Administrator of the Environmental Protection Agency, to be harmful to the environment.

(L) A project to improve safety or security with respect to freight movement.

(M) A project that will improve public health.

(N) Any other project the Assistant Secretary determines appropriate.

(O) Planning, preparation, or design activities with respect to any project described in this paragraph.

(3) APPLICATION PROCESS.—

(A) IN GENERAL.—The Assistant Secretary shall establish a process for States to submit an application for a grant under paragraph (1).

(B) RESPONSES.—Without regard to whether a grant is made under paragraph (1) with respect to an application, the Assistant Secretary shall provide a written response to each application submitted under subparagraph (A) and the response shall include a written determination by the Assistant Secretary that the project for which the application was submitted is—

(i) highly recommended to be carried out;

(ii) recommended to be carried out; or

(iii) not recommended to be carried out.

(4) PRIORITIES AND CONSIDERATION.—In making grants under paragraph (1), the Assistant Secretary shall—

(A) give priority to projects listed in a freight corridor plan submitted under subsection (c)(5)(A) and according to the prioritization of projects in that plan; and

(B) give consideration to the criteria specified in subsection (c)(5)(B).

(5) FEDERAL SHARE.—The Federal share of the cost of a project assisted with a grant under paragraph (1) shall not exceed 80 percent.

(6) PROJECTS THAT BENEFIT THE ENVIRONMENT.—The Assistant Secretary shall use not less than 7 percent of the amounts made available for grants under paragraph (1) each fiscal year for grants to assist projects that benefit the environment, including through reducing emissions determined by the Assistant Secretary, in consultation with the Administrator of the Environmental Protection Agency, to be harmful to the environment.

(7) PROJECTS THAT BENEFIT FREIGHT SECURITY.—The Assistant Secretary shall use not less than 1 percent of the amounts made available for grants under paragraph (1) each fiscal year for grants to assist projects that improve freight security, including cargo inspection projects and education and training projects related to security.

(8) PROJECT COSTS.—In carrying out this subsection, the Assistant Secretary shall develop standards for estimating project costs and shall evaluate the cost estimation, contracting, and cost reduction practices of States that receive grants under paragraph (1).

(9) PROJECT MANAGEMENT AND FINANCIAL PLANS.—

(A) MAJOR PROJECTS.—A recipient of a grant under paragraph (1) for a project with an estimated total cost of at least $500,000,000, or for any other project the Assistant Secretary determines appropriate, shall submit to the Assistant Secretary, with respect to the project—

(i) a project management plan; and

(ii) an annual financial plan.

(B) OTHER PROJECTS.—A recipient of a grant under paragraph (1) for a project with an

estimated total cost of at least $100,000,000, but less than $500,000,000, shall prepare an annual financial plan with respect to the project and shall make that plan available for review at the request of the Assistant Secretary.

(C) PROJECT MANAGEMENT PLAN.—For purposes of this paragraph, a project management plan shall document, with respect to a project—

(i) the procedures in effect to provide timely information to project decisionmakers to allow the decisionmakers to effectively manage the scope, costs, schedules, quality, and Federal requirements with respect to the project; and

(ii) the role of non-Federal interests in the delivery of the project.

(D) FINANCIAL PLAN.—For purposes of this paragraph, a financial plan shall, with respect to a project, provide detailed estimates of the costs of completing the project, including potential increases to those costs.

(10) MAINTENANCE OF EFFORT.—

(A) IN GENERAL.—As a condition of receiving a grant under paragraph (1), the Gov-

ernor of the State receiving the grant shall submit to the Assistant Secretary a certification that the State will maintain its effort with respect to the funding of freight projects.

(B) STATEMENT OF INTENDED FUNDING.—As part of the certification under subparagraph (A), the Governor shall submit a statement to the Assistant Secretary identifying the amount that the State plans to expend from non-Federal sources for freight projects during the 6-year period beginning on the date of the submission of the certification.

(C) FAILURE TO MEET INTENDED FUNDING.—If the Assistant Secretary determines that a State failed to expend the amount for freight projects identified in the statement under subparagraph (B), the Assistant Secretary may prohibit the State from receiving a grant under paragraph (1) during a period—

(i) not to exceed 3 years; and

(ii) beginning on the date on which that determination is made.

(11) PREVAILING RATE OF WAGE.—

(A) IN GENERAL.—The Secretary shall take such action as may be necessary to insure

that all laborers and mechanics employed by contractors or subcontractors on construction work performed on projects assisted with a grant under paragraph (1) shall be paid wages at rates not less than those prevailing on the same type of work on similar construction in the immediate locality as determined by the Secretary of Labor in accordance with sections 3141, 3146, and 3147 of title 40, United States Code.

(B) CONSULTATION.—In carrying out the duties of subparagraph (A), the Secretary of Labor shall consult with the relevant agency of the State in which a project assisted with a grant under paragraph (1) is to be performed. After giving due regard to the information thus obtained, the Secretary of Labor shall make a predetermination of the minimum wages to be paid laborers and mechanics in accordance with the provisions of subparagraph (A) which shall be set out in each project advertisement for bids and in each bid proposal form and shall be made a part of the contract covering the project.

(C) EXCEPTIONS.—The provisions of this paragraph shall not be applicable to employment pursuant to apprenticeship and skill training programs which have been certified by the Secretary as promoting equal employment opportunity in connection with a construction program.

(12) FUNDING BY MODE.—

(A) DETERMINATION.—In making grants under paragraph (1) each fiscal year, the Assistant Secretary shall determine if any portion of the amounts made available for the grants was generated for deposit in the Goods Movement Trust Fund (established under section 5(a)) by a single mode of transportation.

(B) PORTIONS GENERATED BY A SINGLE MODE OF TRANSPORTATION.—If the Assistant Secretary determines under subparagraph (A) that any portion of the amounts made available for a fiscal year for grants under paragraph (1) was generated by a single mode of transportation, the Assistant Secretary shall ensure that at least 92.5 percent of that portion is used for grants to assist projects that benefit that mode.

(C) PORTION NOT GENERATED BY A SINGLE MODE OF TRANSPORTATION.—If the Assistant Secretary determines under subparagraph (A) that any portion of the amounts made available for a fiscal year for grants under paragraph (1) was generated by a single mode of transportation, the Assistant Secretary shall ensure that 50 percent of the portion of those amounts that was not generated by a single mode of transportation is used solely for grants to assist projects that benefit the modes of transportation to which subparagraph (B) applied that fiscal year according to the amounts generated by each of those modes.

(e) FREIGHT CORRIDOR SNAPSHOT REPORT.—Not later than 3 years after the date of enactment of this Act, and annually thereafter, the Assistant Secretary shall publish on the Web site of the Department of Transportation a detailed analysis of the performance of each freight corridor designated as a freight corridor of national significance under subsection (b) and any other freight corridor determined appropriate for inclusion by the Assistant Secretary, including an analysis of congestion, safety, environmental, public health, infrastructure condition, and accessibility issues with respect to the freight corridor.

SEC. 5. FUNDING.

(a) GOODS MOVEMENT TRUST FUND.—

(1) ESTABLISHMENT.—

(A) IN GENERAL.—Subchapter A of chapter 98 of the Internal Revenue Code of 1986 is amended by adding at the end the following:

"SEC. 9512. GOODS MOVEMENT TRUST FUND.

"(a) CREATION OF TRUST FUND.—There is established in the Treasury of the United States a trust fund to be known as the 'Goods Movement Trust Fund', consisting of such amounts as may be appropriated or credited to such Trust Fund as provided in this section or section 9602(b).

"(b) TRANSFERS TO TRUST FUND.—There are hereby appropriated to the Goods Movement Trust Fund amounts equivalent to so much of the taxes received in the Treasury under section 4081 as are determined at the rate specified in section 4081(a)(5).

"(c) APPROPRIATION OF ADDITIONAL SUMS.—In addition to amounts appropriated under subsection (b), there is hereby authorized to be appropriated to the Goods Movement Trust Fund to make the expenditures referred to in subsection (d) $3,000,000,000 for each of fiscal years 2011 through 2016.

"(d) EXPENDITURES.—

''(1) IN GENERAL.—Amounts in the Goods Movement Trust Fund shall be available, as provided in appropriations Acts, only for purposes of making expenditures to carry out the Freight FOCUS Act of 2010.

''(2) TRANSFERS FROM TRUST FUND FOR CERTAIN REPAYMENTS AND CREDITS.—The Secretary shall pay from time to time from the Goods Movement Trust Fund into the general fund of the Treasury amounts equivalent to amounts paid under section 6433 or credits allowed under section 34(a)(4).''.

(B) CONFORMING AMENDMENT.—Paragraph (1) of section 9503(b) of such Code is amended by adding at the end the following: ''There shall not be taken into account under subparagraph (D) so much of the taxes imposed by section 4081 as are determined at the rate specified in section 4081(a)(5).''.

(C) CLERICAL AMENDMENT.—The table of sections for subchapter A of chapter 98 of such Code is amended by adding at the end the following:

''Sec. 9512. Goods Movement Trust Fund.''.

(2) INCREASE IN DIESEL TAX FOR TRANSPORTATION OF GOODS BY HIGHWAY.—

(A) IN GENERAL.—Subsection (a) of section 4081 of the Internal Revenue Code of 1986 is amended by adding at the end the following:

''(5) DIESEL FUEL USED FOR TRANSPORTATION OF GOODS BY HIGHWAY.—

''(A) IN GENERAL.—In the case of diesel fuel, the rate in effect under paragraph (2)(A)(iii) shall be increased by 12 cents.

''(B) INFLATION ADJUSTMENT.—

''(i) IN GENERAL.—In the case of any diesel fuel removed, entered, or sold during any calendar year beginning after 2011, the 12 cent amount under subparagraph (A) shall be increased by an amount equal to—

''(I) such amount, multiplied by

''(II) the costs of living adjustment determined under section 1(f)(3) for the calendar year, determined by substituting 'calendar year 2010' for 'calendar year 1992' in subparagraph (B) thereof.

''(ii) ROUNDING.—Any increase under clause (i) shall be rounded to the nearest multiple of one-tenth of 1 cent.''.

(B) EFFECTIVE DATE.—The amendment made by this paragraph shall apply to fuel removed, entered, or sold after September 30, 2011.

(3) DIESEL FUEL NOT USED FOR MOVEMENT OF GOODS BY HIGHWAY.—

(A) IN GENERAL.—Subchapter B of chapter 65 of the Internal Revenue Code of 1986 is amended by adding at the end the following:

"SEC. 6433. DIESEL FUEL NOT USED FOR MOVEMENT OF GOODS BY HIGHWAY.

''(a) IN GENERAL.—In the case of diesel fuel on the sale of which tax was imposed by section 4081 and which is used for any purpose other than in the trade or business of moving goods by highway, the Secretary shall pay (without interest) to the ultimate purchaser of such fuel an amount equal to the product of the number of gallons of such fuel so used multiplied by the rate specified in section 4081(a)(5).

''(b) FILING OF CLAIMS.—Claims filed under subsection (a) shall be filed at such time and in such form and manner as the Secretary of the Treasury shall by regulation prescribe.

''(c) APPLICABLE LAWS.—

''(1) IN GENERAL.—All provisions of law, including penalties, applicable in respect of the taxes imposed by section 4081 shall, insofar as applicable and not inconsistent with this section, apply in respect of the payments provided for in this section to the same extent as if such payments constituted refunds of overpayments of the tax so imposed.

''(2) EXAMINATION OF BOOKS AND WITNESSES.—For the purpose of ascertaining the correctness of any claim made under this section, or the correctness of any payment made in respect of any such claim, the Secretary shall have the authority granted by paragraphs (1), (2), and (3) of section 7602(a) (relating to examination of books and witnesses) as if the claimant were the person liable for tax.

''(d) INCOME TAX CREDIT IN LIEU OF PAYMENT.—

''(1) PERSONS NOT SUBJECT TO INCOME TAX.—Payment shall be made under this section only to—

''(A) the United States or an agency or instrumentality thereof, a State, a political subdivision of a State, or any agency or instrumentality of one or more States or political subdivisions, or

''(B) an organization exempt from tax under section 501(a) (other than an organization required to make a return of the tax imposed under subtitle A for its taxable year).

''(2) ALLOWANCE OF CREDIT AGAINST INCOME TAX.—For allowance of credit against the income tax imposed by subtitle A for diesel fuel used for any purpose other than in the trade or business of moving goods by highway, see section 34.''.

(B) ALLOWANCE OF CREDIT AGAINST INCOME TAX.—

(i) IN GENERAL.—Subsection (a) of section 34 of the Internal Revenue Code of 1986 is amended by striking ''and'' at the end of paragraph (2), by striking the period at the end of paragraph (3) and inserting '', and'', and by adding at the end the following:

''(4) under section 6433 (determined without regard to section 6433(d)).''.

(ii) CONFORMING AMENDMENT.—Subsection (b) of section 34 of such Code is amended—

(I) by striking ''6421 or 6427'' and inserting ''6421, 6427, or 6433'', and

(II) by striking ''6421(i) or 6427(k)'' and inserting ''6421(i), 6427, or 6433''.

(C) CLERICAL AMENDMENT.—The table of sections for subchapter B of chapter 65 of such Code is amended by adding at the end the following:

''Sec. 6433. Diesel fuel not used for movement of goods by highway.''.

(D) EFFECTIVE DATE.—The amendments made by this paragraph shall apply to fuel sold after September 30, 2011.

(b) AUTHORIZATIONS OF APPROPRIATIONS.—

(1) IN GENERAL.—There is authorized to be appropriated from the Goods Movement Trust Fund (established under subsection (a)) to carry out this Act for a fiscal year the level of receipts plus interest (as that term is defined in subsection (d)) with respect to the Goods Movement Trust Fund for that fiscal year.

(2) ALLOCATION OF AMOUNTS.—Of the amounts made available to carry out this Act for a fiscal year—

(A) $5,000,000 shall be available to carry out section 2 for that fiscal year;

(B) $3,000,000 shall be available to carry out section 3 for the first full fiscal year beginning after the date of enactment of this Act and $1,000,000 for each fiscal year thereafter;

(C) $5,000,000 shall be available to carry out section 4, except for the making of grants under subsections (c)(4) and (d) of that section, for that fiscal year;

(D) $1,000,000 shall be available to make grants under section 4(c)(4) for that fiscal year; and

(E) the remainder shall be available to make grants under section 4(d) for that fiscal year.

(c) CONTRACT AUTHORITY.—

(1) DATE AVAILABLE FOR OBLIGATION.—Authorizations from the Goods Movement Trust Fund to carry out this Act shall be available for obligation on October 1 of the fiscal year for which they are authorized.

(2) GRANTS AS CONTRACTUAL OBLIGATIONS.—A grant made under subsection (c)(4) or (d) of section 4 that is approved by the Assistant Secretary

is a contractual obligation of the Government to pay the Federal share of the cost of the project.

(d) GOODS MOVEMENT TRUST FUND GUARANTEE.—

(1) IN GENERAL.—The total budget resources made available from the Goods Movement Trust Fund each fiscal year to carry out this Act shall be equal to the level of receipts plus interest with respect to the Goods Movement Trust Fund for that fiscal year. Such amounts may be used only to carry out this Act.

(2) GUARANTEE.—No funds may be appropriated to carry out this Act unless the amount described in paragraph (1) has been provided.

(3) ENFORCEMENT OF GUARANTEES.—It shall not be in order in the House of Representatives or the Senate to consider any bill, joint resolution, amendment, motion, or conference report that would cause total budget resources in a fiscal year to carry out this Act for such fiscal year to be less than the amount required by paragraph (1) for such fiscal year.

(4) DEFINITIONS.—In this subsection, the following definitions apply:

(A) TOTAL BUDGET RESOURCES.—The term ''total budget resources'' means the total

amount made available by appropriations Acts from the Goods Movement Trust Fund for a fiscal year to carry out this Act.

(B) LEVEL OF RECEIPTS PLUS INTEREST.—The term ''level of receipts plus interest'' means the level of funding appropriated or credited to the Goods Movement Trust Fund under section 9512 of the Internal Revenue Code of 1986 for a fiscal year as estimated in the budget of the United States Government for that fiscal year submitted by the President pursuant to section 1105 of title 31, United States Code. The President shall ensure that an estimate of such funding is included in each such budget.

SEC. 6. DEFINITIONS.

In this Act, the following definitions apply:

(1) FREIGHT.—The term ''freight'' means goods transported for a fee by a water, land, or air transportation mode.

(2) FREIGHT CORRIDOR.—The term ''freight corridor'' means a designated route along which freight is moved, including water, land, and air routes.

(3) SECRETARY.—The term ''Secretary'' means the Secretary of Transportation.

S. 3072 (Rockefeller) / H.R. 4753 (Rahall) Stationary Source Regulations Delay Act

Summary:
This bill would suspend, during the 2-year period beginning on the date of enactment of this Act, any Environmental Protection Agency (EPA) action under the Clean Air Act with respect to carbon dioxide or methane, except for motor vehicle emissions and reports or enforcement of reporting requirements.

Background:
U.S. EPA climate change regulations, including standards relating to light-duty motor vehicles, Title V permits, and actions related to Prevention of Significant Deterioration (PSD), have already been adopted and are scheduled to be implemented beginning January 2, 2011. The stationary source regulations that would be delayed if this Act passed include Title V permits and actions related to PSD. Future New Source Performance Standards (NSPS) to reduce carbon dioxide or methane would also be delayed.

Status:
Mar 4, 2010 Read twice and referred to the Senate Committee on Environment and Public Works. / Mar 4, 2010 Referred to the House Committee on Energy and Commerce.

Specific Provisions:

- During the 2-year period beginning on the date of enactment of this Act, the EPA may not take any action under the Clean Air Act (42 U.S.C. 7401 et seq.) with respect to any stationary source permitting requirement (Title V or PSD) or any requirement under section 111 (NSPS) of that Act (42 U.S.C. 7411) relating to carbon dioxide or methane.
- The Act would not apply to:
    - any action under part A of Title II of the Clean Air Act (42 U.S.C. 7521 et seq.) relating to the vehicle emissions standards contained in Docket No. EPA-HQ-OAR-2009-0171 or Docket No. EPA-HQ-OAR-2009-0472;
    - any action relating to the preparation of a report or the enforcement of a reporting requirement; or
    - any action relating to the provision of technical support at the request of a State.
- The act provides that no action taken by EPA prior to the end of the 2-year period shall make CO2 or methane a pollutant "subject to regulation" under the Clean Air Act.

Impacts on AQMD's mission, operations or initiatives:
This bill is contrary to AQMD's legislative principles relating to climate change. Also the delay resulting from this bill would reduce opportunities for possible simultaneous co-benefit emission reductions of greenhouse gases and criteria pollutants. The bill would apparently prevent EPA from imposing sanctions or a federal implementation plan (FIP) on an area that fails to implement the GHG Tailoring Rule for PSD and Title V, and would

have the effect of making PSD & Title V inapplicable to GHGs at least prior to the 2-year period.

Recommended Position:

Oppose.

LEGISLATIVE COMMITTEE RECOMMENDED: October 8, 2010 Legislative Committee directed staff to bring this issue back at its November meeting.

111th CONGRESS

2d Session

S. 3072

To suspend, during the 2-year period beginning on the date of enactment of this Act, any Environmental Protection Agency action under the Clean Air Act with respect to carbon dioxide or methane pursuant to certain proceedings, other than with respect to motor vehicle emissions, and for other purposes.

IN THE SENATE OF THE UNITED STATES

March 4, 2010

Mr. ROCKEFELLER introduced the following bill; which was read twice and referred to the Committee on Environment and Public Works

---

A BILL

To suspend, during the 2-year period beginning on the date of enactment of this Act, any Environmental Protection Agency action under the Clean Air Act with respect to carbon dioxide or methane pursuant to certain proceedings, other than with respect to motor vehicle emissions, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the `Stationary Source Regulations Delay Act'.

SEC. 2. SUSPENSION OF CERTAIN EPA ACTION.

(a) In General- Except as provided in subsection (b), notwithstanding any provision of the Clean Air Act (42 U.S.C. 7401 et seq.), during the 2-year period beginning on the date of enactment of this Act, the Administrator of the Environmental Protection Agency may not take any action under the Clean Air Act (42 U.S.C. 7401 et seq.) with respect to any stationary source permitting requirement or any requirement under section 111 of that Act (42 U.S.C. 7411) relating to carbon dioxide or methane.

(b) Exceptions- Subsection (a) shall not apply to--

(1) any action under part A of title II of the Clean Air Act (42 U.S.C. 7521 et seq.) relating to the vehicle emissions standards contained in Docket No. EPA-HQ-OAR-2009-0171 or Docket No. EPA-HQ-OAR-2009-0472;

(2) any action relating to the preparation of a report or the enforcement of a reporting requirement; or

(3) any action relating to the provision of technical support at the request of a State.

(c) Treatment- Notwithstanding any other provision of law, no action taken by the Administrator of the Environmental Protection Agency before the end of the 2-year period described in subsection (a) shall be considered to make carbon dioxide or methane a pollutant subject to regulation under the Clean Air Act (42 U.S.C. 7401 et seq.) for any source other than a new motor vehicle or new motor vehicle engine, as described in section 202(a) of that Act (42 U.S.C. 7521(a)).

END

I

111TH CONGRESS
2D SESSION

H. R. 4753

To suspend, during the 2-year period beginning on the date of enactment of this Act, any Environmental Protection Agency action under the Clean Air Act with respect to carbon dioxide or methane pursuant to certain proceedings, other than with respect to motor vehicle emissions, and for other purposes.

IN THE HOUSE OF REPRESENTATIVES

MARCH 4, 2010

Mr. RAHALL (for himself, Mr. MOLLOHAN, and Mr. BOUCHER) introduced the following bill; which was referred to the Committee on Energy and Commerce

---

A BILL

To suspend, during the 2-year period beginning on the date of enactment of this Act, any Environmental Protection Agency action under the Clean Air Act with respect to carbon dioxide or methane pursuant to certain proceedings, other than with respect to motor vehicle emissions, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the ''Stationary Source Regulations Delay Act''.

SEC. 2. SUSPENSION OF CERTAIN EPA ACTION.

(a) IN GENERAL.—Except as provided in subsection (b), notwithstanding any provision of the Clean Air Act (42 U.S.C. 7401 et seq.), during the 2-year period beginning on the date of enactment of this Act, the Administrator of the Environmental Protection Agency may not take any action under the Clean Air Act (42 U.S.C. 7401 et seq.) with respect to any stationary source permitting requirement or any requirement under section 111 of that Act (42 U.S.C. 7411) relating to carbon dioxide or methane.

(b) EXCEPTIONS.—Subsection (a) shall not apply to—

(1) any action under part A of title II of the Clean Air Act (42 U.S.C. 7521 et seq.) relating to the vehicle emissions standards contained in Docket No. EPA–HQ–OAR–2009–0171 or Docket No. EPA–HQ–OAR–2009–0472;

(2) any action relating to the preparation of a report or the enforcement of a reporting requirement; or

(3) any action relating to the provision of technical support at the request of a State.

(c) TREATMENT.—Notwithstanding any other provision of law, no action taken by the Administrator of the Environmental Protection Agency before the end of the

2-year period described in subsection (a) shall be considered to make carbon dioxide or methane a pollutant subject to regulation under the Clean Air Act (42 U.S.C. 7401 et seq.) for any source other than a new motor vehicle or new motor vehicle engine, as described in section 202(a) of that Act (42 U.S.C. 7521(a)).

○

ATTACHMENT 3

All Bills of Interest to AQMD Acted on by the Governor

Bills Supported by the District and signed by the Governor into law between January 1st through September 30, 2010.

- AB 1500 (Lieu) High-occupancy lanes: single occupancy vehicles: sunset date**.**
  Would extend the date, to January 1, 2015, that specified low-emission vehicles can use high-occupancy lanes, the department can issue low-emission decals or other identifiers, and illegal use of a department-issued decal on a low-emission vehicle is considered a misdemeanor, creating a state-mandated local program. This bill contains other related provisions and other existing laws.

- AB 1863 (Gaines) Diesel generators: health facilities.
  Would extend this repeal date to January 1, 2016. This bill contains other related provisions and other existing laws.

- AB 2037 (V.M. Perez) Electricity: air pollution
  This bill would prohibit a load-serving entity or local publicly owned electric utility from entering into, and would prohibit the PUC from approving for an electrical corporation, a long-term financial commitment with or for a new electrical generation facility constructed in California, or in a shared pollution area, as defined, that does not meet specified air pollution criteria.

- AB 2289 (Eng) Smog check program: testing: penalties
  Would require State Bureau of Automotive Repair to implement testing using onboard diagnostic systems only on model year 2000 and newer vehicles, beginning no earlier than January 1, 2013.

- AB 2514 (Skinner) Energy Storage Systems

  Would require the CPUC, by March 1, 2012, to open a proceeding to determine appropriate targets, if any, for each load-serving entity to procure viable and cost-effective energy storage systems and, by October 1, 2013, to adopt an energy storage system procurement target, if determined to be appropriate, to be achieved by each load-serving entity by December 31, 2015, and a 2nd target to be achieved by December 31, 2020. The bill would require the governing board of a local publicly owned electric utility, by March 1, 2012, to open a proceeding to determine appropriate targets, if any, for the utility to procure viable and cost-effective energy storage systems and, by October 1, 2014, to adopt an energy storage system procurement target, if determined to be appropriate, to be achieved by the utility by December 31, 2016, and a 2nd target to be achieved by December 31, 2021.

- ACR 109 (Nestande) Roy Wilson Memorial Highway
  Would designate a specified portion of State Highway Route 74 in the City of Palm Desert and Riverside County as the Roy Wilson Memorial Highway. The measure would also request the Department of Transportation to determine the cost for appropriate signs showing this special designation and, upon receiving donations from nonstate sources covering that cost, to erect those signs.

- SB 435 (Pavley) Vehicles: pollution control devices
  Would make it a crime for a person to park, use, or operate a motorcycle, registered in the state, that is manufactured on and after January 1, 2013, or a motorcycle, registered in the state, with aftermarket exhaust system equipment that is manufactured on or after January 1, 2013, that does not have the above label, and would make a violation of this provision punishable by a specified fine, thereby imposing a state-mandated local program by creating a new crime.

- SB 1224 (Wright) Air discharges
  Until January 1, 2014, would authorize a local air pollution control district or air quality management district to adopt a rule or regulation, consistent with protecting the public's comfort, repose, health, and safety, and not causing injury, detriment, nuisance, or annoyance, that ensures district staff and resources are not used to investigate complaints determined to be repeated and unsubstantiated, alleging a nuisance odor violation of that discharge prohibition. If a district adopts such a rule or regulation, the bill would require the district to submit the rule or regulation to the Senate Committee on Environmental Quality and the Assembly Committee on Natural Resources within 30 days of adopting the rule or regulation.

- SB 1479 (Committee on Public Employment and Retirement) Public employment: retirement benefits: administration.
  Among other provisions, this bill authorizes the AQMD to prepay is annual SBCERA obligation at a cost savings in excess of $1 million per year.

Bills supported by the District, but vetoed by the Governor.

- SB 1433 (Leno) Air pollution penalties: inflation adjustments.
  Would require the state board, on March 1, 2011, and annually thereafter, to adjust maximum civil and criminal penalties for inflation, and to publish the inflation-adjusted maximum penalties on its Internet Web site.
  Vetoed: 9/28/10
  AQMD Position: Support

Other Bills of Interest Sorted by Category **(Chaptered or Vetoed by 9/30)**

Alternative Fuels and Vehicle Technology

- AB 1106 (Fuentes) Alternative and Renewable fuel and vehicle technology
  Would extend this authorization to contract with the Treasurer indefinitely, and would also authorize the commission to contract with small business financial development corporations established by the Business, Transportation and Housing Agency to expend funds through the Small Business Loan Guarantee Program, if the expenditure is consistent with all of the requirements of the program.
  Chaptered: 9/27/10

- SB 1340 (Kehoe) Energy
  Would additionally, specify projects eligible for funding under the program to include a cost-effective program to provide funding for homeowners who purchase an electric vehicle to offset costs associated with modifying electrical sources to include a residential plug-in electric vehicle charging station. This bill contains other related provisions and other existing laws.
  Chaptered: 9/30/10

- SB 1455 (Kehoe) Plug-in hybrid and electric vehicles: Internet Web site.
  Would require the Energy Commission, by July 1, 2011, in consultation with the PUC, to develop and maintain an Internet Web site containing specific links to electrical corporation or local publicly owned electric utility Internet Web sites that contain information specific to plug-in hybrid or fully electric vehicles, or other Internet Web sites that include specified information. This bill contains other existing laws.
  Chaptered: 9/27/10

CEQA

- AB 231 (Huber) Environment: CEQA: overriding consideration
  Would authorize a lead agency, until January 1, 2016, to incorporate by reference a finding of overriding consideration made in a prior EIR for a later project if specified conditions are met, including that the lead agency determines that the later project's significant impacts on the environment are not greater than or different from those identified in the prior EIR.
  Chaptered: 9/29/10

- AB 499 (Hill) Environment: CEQA: determination: dispute
  Would instead require that a petitioner or plaintiff name, as a real party in interest, a recipient of approval, as identified by the public agency in its notice of determination or notice of exemption, that is the subject of an action or proceeding challenging the determination, finding, or decision of a public agency pursuant to CEQA. The bill would authorize the court to dismiss a petition or complaint if a petitioner or plaintiff fails to serve the recipient of approval identified by the public agency within the above service period. The bill would require the court to issue an order providing additional time for, and specifying the manner of, service if the petitioner or plaintiff demonstrates to the court's satisfaction that he or she has made a good faith effort to service the identified recipient of approval within the above service period.

Vetoed: 9/29/10

- SB 1456 (Simitian) Environmental quality: cumulative effects and mediation
  Until January 1, 2016, would provide that if a lead agency determines that a cumulative effect has been adequately addressed in a prior environmental impact report, in accordance with a specified procedure, that cumulative effect is not required to be examined in a later environmental impact report, mitigated negative declaration, or negative declaration. This bill contains other related provisions and other existing laws.
  Chaptered: 9/29/10

Government Reorganization and or Efficiency

- AB 1659 (Huber) State government: agency repeals
  Would create the Joint Sunset Review Committee to identify and eliminate waste, duplication, and inefficiency in government agencies and to conduct a comprehensive analysis of every "eligible agency," as defined, to determine if the agency is still necessary and cost effective. The bill would define an "eligible agency" as an entity of state government, however denominated, for which a date for repeal has been established by statute on or after January 1, 2011. The bill would require each eligible agency scheduled for repeal to submit a report to the committee containing specified information. The bill would require the committee to take public testimony and evaluate the eligible agency prior to the date the agency is scheduled to be repealed, and would require that an eligible agency be eliminated unless the Legislature enacts a law to extend, consolidate, or reorganize the agency. The bill would specify the composition of the committee, which would be appointed by the Senate Committee on Rules and the Speaker of the Assembly, and certain aspects of its operating procedure.
  Chaptered: 9/30/10

- SB 959 (Ducheny) Development: expedited permit review
  Would require the office to provide information to developers explaining the permit approval process at the state and local levels, or assisting them in meeting statutory environmental quality requirements, as specified, and would prohibit the office or the state from incurring any liability as a result of the provision of this assistance. The bill would require the office to assist state and local agencies in streamlining the permit approval process, and an applicant in identifying any permit required by a state agency for the proposed project. The bill would authorize the office to call a conference of parties at the state level to resolve questions or mediate disputes arising from a permit application for a development project. The bill would require that the office be located exclusively in Sacramento, and to consist of no more than 4 personnel through 2013
  Vetoed: 9/29/10

Greenhouse Gas / Climate Change

- AB 1405 (DeLeon) CA Global Warming Solutions Act of 2006: CA Climate Change Community Benefits Fund
  Would establish the California Climate Change Community Benefits Fund, and would require a minimum of 10% of revenues generated for the state each year from the state sale of compliance instruments for market-based compliance mechanisms pursuant to the act, other than revenues collected for administrative purposes, to be deposited into that fund. The moneys in the fund would be used, upon appropriation by the Legislature, in the most impacted and disadvantaged communities , as defined, to fund programs or projects that reduce greenhouse gas emissions or mitigate direct health, or environmental, impacts of climate change through competitive grants, loans, or other funding mechanisms. The Secretary for Environmental Protection would be required to administer moneys appropriated from the fund and would be required to establish criteria and procedures
  Vetoed: 9/30/10

- AB 1507 (Lieu) Motor Vehicle greenhouse gas emission reduction projects
  Would require the State Air Resources Board, by July 1, 2011, to revise project guidelines, for a project that reduces greenhouse gas emissions, to allow funds from specified programs and funding sources to be used for a project also funded under the Carl Moyer Memorial Air Quality Standards Attainment Program without those additional public funds being factored into the criteria emission reduction cost-effectiveness calculations under that program.
  Chaptered: 9/30/10

- ACR 133 (Perez) Earth Hour.
  Would endorse efforts to raise awareness of global climate change and energy efficiency and would declare the hour of 8:30 to 9:30 p.m. on the last Saturday of March to be "Earth Hour" throughout the state. The measure would encourage city, county, and state employees, and businesses to turn off nonessential lights in government buildings, public schools, public landmarks, and other buildings for that hour on March 27, 2010.
  Chaptered: 4/1/10

- SB 1006 (Pavley) Natural Resources: climate change: Strategic Growth Council
  Would require the council to manage and award revolving loans or grants to a city, county, special district, nonprofit organization, or entity formed under a joint powers agreement. The bill would require that these revolving loans or grants be awarded for urban greening plans and projects. This bill contains other existing laws.
  Chaptered: 9/30/10

- SB 1328 (Lowenthal) Greenhouse gas emissions: motor vehicle cabin temperature
  Would require the state board to consider specified matters if adopting or amending regulations to reduce motor vehicle cabin temperature in order to reduce greenhouse gas emissions.
  Chaptered: 9/30/10

- SJR 17 (Leno) Climate change: ocean acidification: Arctic.
  Would reaffirm the Legislature's commitment to reducing greenhouse gases in California to 1990 levels by 2020. It would urge the United States Environmental Protection Agency to regulate greenhouse gases and the federal government to persevere in its commitment to leading the world in efforts to address global climate change and ocean acidification, and reduce the concentration of carbon dioxide in the atmosphere to 350 parts per million.
  Chaptered: 8/27/10

HOV Lanes

- AB 1224 (Eng) High-occupancy toll lanes
  Would extend the authorization for the demonstration program until January 15, 2015, and would require the associated report to be submitted to the Legislature by December 31, 2014.
  Chaptered: 9/29/10

- SB 535 (Yee) Vehicles: high-occupancy vehicle lanes.
  Would revise that provision to provide that it shall remain in effect only until January 1, 2015, or until the Secretary of State receives that specified notice, with respect to a vehicle that meets California's super ultra-low exhaust emission standard and the federal inherently low-emission evaporative emission (ILEV) standard and a vehicle produced during the 2004 model-year or earlier that meets the California ultra-low emission vehicle standard and the ILEV standard. With respect to all other vehicles described above, this provision shall be operative only until July 1, 2011, or only until the Secretary of State receives that specified notice, whichever occurs first. This bill contains other related provisions and other existing laws.
  Chaptered: 8/30/10

Power Generation and Transmission

- AB 1947 (Fong) Solar Energy
  Would authorize a local publicly owned electric utility to adopt, implement, and finance a solar initiative program exempt from those offset and same-premises program requirements, where residential and business consumers offset part or all of their electricity demand with electricity generated by a solar energy system not located on the premises of the consumer, if the program meets certain requirements.
  Chaptered: 9/29/10

- AB 1954 (Skinner) Electrical transmission: renewable energy resources.
  Would provide that an application by an electrical corporation for a certificate of public convenience and necessity for new transmission facilities is necessary to the provision of electric service if the CPUC finds that the new transmission facility is necessary to facilitate achievement of the renewables portfolio standard. The bill would authorize the CPUC to approve the recovery in retail rates by an electrical corporation of certain costs for transmission facilities that are incurred in certain circumstances if not approved for recovery in transmission rates by the Federal Energy Regulatory Commission.
  Chaptered: 9/29/10

- AB 2514 (Skinner) Energy Storage Systems
  Would require the CPUC, by March 1, 2012, to open a proceeding to determine appropriate targets, if any, for each load-serving entity to procure viable and cost-effective energy storage systems and, by October 1, 2013, to adopt an energy storage system procurement target, if determined to be appropriate, to be achieved by each load-serving entity by December 31, 2015, and a 2nd target to be achieved by December 31, 2020. The bill would require the governing board of a local publicly owned electric utility, by March 1, 2012, to open a proceeding to determine appropriate targets, if any, for the utility to procure viable and cost-effective energy storage systems and, by October 1, 2014, to adopt an energy storage system procurement target, if determined to be appropriate, to be achieved by the utility by December 31, 2016, and a 2nd target to be achieved by December 31, 2021.
  Chaptered: 9/29/10

- SB 77 (Pavley) Energy: California Alternative Energy and Advanced Transportation Financing Authority: Property Assessed Clean Energy (PACE).
  Would require the authority to establish a Property Assessed Clean Energy (PACE) Reserve program to assist local jurisdictions in financing the installation of distributed generation renewable energy sources or energy or water efficiency improvements meeting specified requirements that are permanently affixed on real property through the use of a voluntary contractual assessment. The bill would, until January 1, 2015, appropriate up to $50,000,000 from the Renewable Resource Trust Fund to the authority for the purposes of the PACE Reserve program. The bill would require the authority, on March 31, 2011, and annually thereafter until January 1, 2015, to submit to the Legislature a report containing specified information regarding the implementation of the above provisions. This bill contains other related provisions and other existing laws.
  Chaptered: 4/21/10

- SB 730 (Wiggins) Energy Efficiency
  Would require the commission, in evaluating energy efficiency investments, to ensure that local and regional interests, multifamily dwellings, and energy service industry capabilities are incorporated into an electrical corporation's energy efficiency program portfolio design, and to encourage participation from local governments, community-based organizations, and energy efficiency service providers in program design, revision, and implementation, where appropriate. The bill would require an electrical corporation, when developing or revising its energy efficiency program portfolio design, to collaborate with, and seek comments from, county climate protection authorities or other public agencies that are directly authorized to implement regional or countywide climate protection and energy efficiency programs.
  Vetoed: 9/29/10

Retirement

- AB 1856 (Fong) Public employees' retirement
  The bill would require that installment payments automatically resume at the end of the suspension period, or earlier if requested by the member. The bill would prohibit an additional suspension of those installment payments for the same service for 3 years following the resumption of installment payments. The bill would require that the balance due at the end of a

suspension period be recalculated to include interest accrued during the suspension. This bill contains other related provisions
Chaptered: 8/27/10

- AB 194 (Torricco) Retirement: local employees
  Would specify that, notwithstanding any other law, for the purposes of determining a retirement benefit paid to a person who first becomes a member of a public retirement system on or after January 1, 2011, the maximum salary or pay rate upon which retirement benefits shall be based shall not exceed 125% of the salary recommended by the California Citizens Compensation Commission to be paid to the Governor of the State of California, effective December 7, 2009. The bill would require that this amount be adjusted annually based on changes in the All Urban California Consumer Price Index.
  Vetoed: 9/30/10

- AB 609 (Conway) County Employees Retirement: administrative costs
  Would prohibit expenses for the costs of administration of the retirement system incurred in any year from exceeding the greater of 21/100 of 1% of the accrued actuarial liability of the retirement system or $2,000,000, as adjusted annually by a specified annual cost-of-living adjustment. This bill would eliminate the exclusion of expenditures for legal services and costs of litigation from the costs of administration of the retirement system and would, instead, exclude from those costs of administration expenditures for computer software and hardware and computer technology consulting services in support of these products.
  Chaptered: 9/30/10

- AB 1821 (Ma) Public Employees Retirement System: preretirement death benefits
  Would require assets and liabilities of contracting agencies subject to those provisions to be pooled, as specified, after June 30, 2011. The bill would also provide that on and after July 1, 2011, certain members employed by a contracting agency entitled to receive benefits under the 1959 survivor allowance provisions instead receive increased benefits, as specified. This bill contains other related provisions and other existing laws.
  Vetoed: 9/30/10

- AB 1987 (Ma) Public retirement: final compensation: computation: retirees.
  Would generally provide, effective July 1, 2011, that any change in salary, compensation, or remuneration principally for the purpose of enhancing a member's benefits would not be included in the calculation of a member's final compensation for purposes of determining that member's defined benefit. The bill would require the board of each state and local public retirement system to establish, by regulation, accountability provisions that would include an ongoing audit process to ensure that a change in a member's salary, compensation, or remuneration is not made principally for the purpose of enhancing a member's retirement benefits. This bill would limit the calculation of a member's final compensation to an amount not to exceed the average increase in compensation received within the final compensation period and the 2 preceding years by employees in the same or a related group as that member. This bill would also provide that a person who retires on or after January 1, 2012, may not perform services for any employer covered by a state or local retirement system until that person has been separated from service for a period of at least 180 days. This bill would

provide for the implementation of the changes under the applicable retirement laws that apply to counties and cities.
Vetoed: 9/30/10

- SB 1139 (Correa) State retirement: benefit programs.
The Public Employees' Retirement Law (PERL) provides a comprehensive set of rights and benefits for various employees of the state and local agencies. That law also establishes the Public Employees' Retirement System (PERS) and sets forth the provisions for the delivery of benefits, including retirement benefits, health benefits, and an optional tax-deferred compensation program, to its members. Under that law, the retirement benefits of a retirement system member are based, in part, on the completed service credit and compensation received by that member. This bill would make technical and clarifying changes to those provisions of law, including amendments that rename the current "deferred compensation program" as the "tax-preferred retirement savings program." This bill contains other related provisions and other existing laws.
Chaptered: 9/30/10

Vehicular Pollution Control

- AB 787 (Hill) Smog Check: Vehicle Repair Assistance and retirement program
Would require the department to pay a person who retires his or her vehicle $1,500 for a low-income motor vehicle owner, as defined, and $1,000 for all other motor vehicle owners, and would authorize additional payments above these amounts based on consideration of specified criteria . The bill would require the department to permit vehicle retirement for any motor vehicle that has been continuously registered in the state for at least 2 years prior to vehicle retirement, and that fails any type of smog check inspection lawfully performed in the state.
Chaptered: 9/24/10

- SB 435 (Pavley) Vehicles: Pollution Control Devices
Would make it a crime for a person to park, use, or operate a motorcycle, registered in the state, that is manufactured on and after January 1, 2013, or a motorcycle, registered in the state, with aftermarket exhaust system equipment that is manufactured on or after January 1, 2013, that does not have the above label, and would make a violation of this provision punishable by a specified fine, thereby imposing a state-mandated local program by creating a new crime. The bill would require the person to whom a notice to appear is issued, or against whom a complaint is filed, for the above violation, to provide proof of correction. The bill would authorize a court to dismiss the penalty imposed for a first violation if the person produces proof of correction to the satisfaction of the court. This bill contains other related provisions and other existing laws.
Chaptered: 9/28/10

- AB 2461 (Emmerson) Vehicles: vehicle registration amnesty program
Would require the department to establish the above amnesty program from July 1, 2011, to June 30, 2012, and would make related changes. For the purposes of that program, the bill would require a specially constructed vehicle to be considered "correctly registered" if it has been issued a certificate of compliance on the basis that the specially constructed vehicle has

met the inspection and maintenance tailpipe emissions requirements, as determined by the Bureau of Automotive Repair, for the model year assigned in the amnesty application. Because the bill would expand the scope of the crime of perjury, this bill would impose a state-mandated local program. This bill contains other related provisions and other existing laws.
Chaptered: 9/27/10

Workforce Development

- AB 2696 (Bass) California Workforce Investment Board: Green Collar Jobs Council.
  Would revise the duties of the GCJC, as specified. The bill would authorize the board to accept any revenues, moneys, grants, goods, or services from federal and state entities, philanthropic organizations, and other sources, to be used for purposes relating to the administration and implementation of the strategic initiative. The bill would authorize the Employment Development Department, upon appropriation by the Legislature, to expend those moneys and revenues for purposes related to the strategic initiative and the award of grants, as provided. The bill would require the GCJC to consult with appropriate state and local agencies to identify opportunities to coordinate the award of grant and green workforce training funds received by the state under the federal American Recovery and Reinvestment Act of 2009 or any other funding sources. The bill would require the board, on or before April 1, 2011, and annually each April 1 thereafter, to report to the Legislature on the status of GCJC activities, grants awarded, and the development and implementation of a green workforce.
  Chaptered: 9/27/10

- SB 675 (Steinberg) Partnership academies: Clean Technology and Renewable Energy Job Training, Career Technical Education, and Dropout Prevention Program.
  Would require the Controller annually to allocate $8,000,000 from the Energy Resources Program Account, upon appropriation by the Legislature, to the Superintendent of Public Instruction for expenditure in the form of local grants to be allocated pursuant to the existing provisions for creating and maintaining partnership academies. The bill would require a grantee to implement or maintain a partnership academy that focuses on employment in clean technology businesses and renewable energy businesses and provides skilled workforces for the products and services for energy or water conservation, or both, renewable energy, pollution reduction, or other technologies. This bill contains other related provisions and other existing laws.
  Vetoed: 9/30/10

Miscellaneous

- SB 1172 (Negrete-McLeod) Regulatory boards: diversion programs
  Would specify that those records and documents shall be kept for 3 years and kept confidential and are not subject to discovery or subpoena unless otherwise expressly provided by law. This bill contains other related provisions and other existing laws. \
  Chaptered: 9/29/10

- SB 1402 (Dutton) State Air Resources Board: administrative and civil penalties

Would require a written communication from the state board alleging that an administrative or civil penalty will be, or could be, imposed either by the state board or another party, including the Attorney General, for a violation of air pollution law, to contain specified information. The bill would require this information and final mutual settlement agreements reached between the state board and a person alleged to have violated air pollution laws to be made available to the public.
Chaptered: 9/28/10

- AJR 41 (Lieu) Santa Monica Airport
  Would memorialize the Federal Aviation Administration, the federal Environmental Protection Agency, the federal Department of Transportation, and the members of the California congressional delegation to work collaboratively to review noise levels and the safety of flight
  Chaptered: 8/30/10

- SB 70 (Committee on Budget and Fiscal Review) Sales and use taxes: fuel taxes.
  Would exempt the sale of, and the storage, use, or other consumption of, specified diesel fuel from that tax that would be imposed by AB 6 of the 2009-10 8th Extraordinary Session. This bill contains other related provisions and other existing laws.
  Chaptered: 3/24/10

- SJR 33 (Lowenthal) National freight policy.
  Would request that Congress adopt a national freight policy as a component of the next federal transportation bill and subsequently direct the United States Department of Transportation to implement its provisions.
  Chaptered: 8/20/10

ATTACHMENT 4

Home Rule Advisory Group
September 15, 2010

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT
LEGISLATIVE REPORT

FROM HOME RULE ADVISORY GROUP
MEETING OF SEPTEMBER 15, 2010

HRAG members present:
Dr. Dr. Elaine Chang (SCAQMD)
Greg Adams, L.A. County Sanitation Districts
Enrique Chiock, Breathe L.A. (participated by phone)
Curtis Coleman, Southern California Air Quality Alliance
Chris Gallenstein on behalf of Richard Corey, CARB (participated by phone)
Jayne Joy, Eastern Municipal Water District
Rongsheng Luo on behalf of Jonathan Nadler, SCAG (participated by phone)
Bill LaMarr, California Small Business Alliance
Art Montez, AMA International
Larry Rubio, Riverside Transit
Steve Schuyler on behalf of Mike Wang, WSPA
Lee Wallace, So Cal Gas and SDG&E

LEGISLATIVE UPDATE

Philip Crabbe provided a preview of what is scheduled to be discussed at the Legislative Committee meeting on September 17, 2010. The legislative consultants are scheduled to provide an update on federal legislation. The following federal bills will be presented to the Committee for consideration:

Bill #(s)	Author(s)	Bill Title
S. 3495	Dorgan	Promoting Electric Vehicles Act of 2010
S. 3608 H.R. 5174	Schumer/ Tonko	Fuel Cell Industrial Vehicle Jobs Act of 2010 (related bills)
S. 3629 H.R. 5976	Lautenberg/ Sires	Focusing Resources, Economic Investment, and Guidance to Help Transportation Act of 2010 (companion bills)

S. 3495

S. 3495 would establish within the Department of Energy (DOE) a national plug-in electric drive vehicle deployment program. During a five-year period, approximately 700,000 vehicles would be deployed. The bill also would task DOE with monitoring the progress and providing technical assistance to states. The bill would identify and create five to 15 targeted plug-in deployment communities that would be eligible for federal funding of up to $500,000,000.

S. 3629 (Lautenberg)/H.R. 5976 (Sires)
These bills would define the federal government's role in freight transportation policy and planning. The bills would instruct the U.S. DOT to develop a strategic plan for investing in the country's goods movement infrastructure. It would call for the creation of a new national freight infrastructure investments grant program that would fund projects prioritized through merit-based criteria.

S. 3608 (Schumer)/H.R. 5174 (Tonko)
These bills would amend the internal revenue code to maintain a level of an $8,000 tax credit for qualified fuel cell motor vehicles placed in service after 2009. The bills would also allow credit for certain off-highway vehicles. The Tonko bill would provide for possible increases in the credit for certain off-highway vehicles that achieve higher electricity generation efficiency.

At the Legislative Committee meeting, staff will provide an update on the state budget and a summary of the air quality related bills that will be going to the Governor or were acted on this year.

Discussion
A participant asked if staff will be giving an update on Section 185 of the Clean Air Act at the Legislative Committee meeting on September 17. Mr. Crabbe responded that this issue will likely be discussed at the Legislative Committee meeting.

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 28

REPORT: Mobile Source Committee

SYNOPSIS: The Mobile Source Committee met Friday, October 15, 2010. Following is a summary of that meeting.

RECOMMENDED ACTION:
Receive and file.

Jane Carney, Acting Chair
Mobile Source Committee

EC:fmt

Attendance

Acting Chair Jane Carney called the meeting to order at 9:00 a.m. Present at the AQMD was Committee Member Josie Gonzales. Attending via videoconference was Committee Member John J. Benoit. Chair Ronald Loveridge, Committee Members Bill Campbell and Jan Perry were absent. The following items were presented:

INFORMATIONAL ITEMS:

1) Status Report on 2010 Update to Ports' Clean Air Action Plan

Peter Greenwald, Senior Policy Advisor, provided a status report on the 2010 Update to the Clean Air Action Plan (CAAP) for the Ports of Los Angeles and Long Beach. The CAAP was adopted in 2006 and included control measures to reduce emissions at the ports from ships, cargo handling equipment, trucks, harbor craft, and locomotives. The 2010 CAAP Update incorporates comments and changes to the plan and was developed with significant input from AQMD, CARB, and EPA. AQMD staff has some concerns with the draft document and proposed strengthening amendments for locomotives and railyards, electrification, oceangoing vessels, risk reduction standard, 2014 NOx San Pedro Bay standard, and San Pedro Bay Standards implementation. The 2010 CAAP Update was considered for adoption at a joint hearing of the Harbor Commissions on October 6, 2010. Testimony was heard from industry and environmental groups who requested more time to review the document. Consideration of the Update was

continued to November with port staff to provide further explanations to stakeholders and the Harbor Commissions. AQMD staff will continue to participate.

2) Report on Senate Bill 375 Implementation

Mark Butala, Manager of Comprehensive Planning for the Southern California Association of Governments (SCAG), was invited by staff to provide a report on the strategy development and technical analysis for Senate Bill 375 (SB 375) implementation. Dr. Elaine Chang, Deputy Executive Officer, explained that SCAG staff will be providing periodic updates to the Mobile Source Committee on the status of the Sustainable Communities Strategy (SCS) development and the development of the 2012 Regional Transportation Plan (RTP) as this data will be incorporated into the next Air Quality Management Plan.

Mr. Butala's presentation focused on statutory components and greenhouse gas (GHG) reduction strategies for the SCS. The strategies to reduce GHG emissions have been divided into two categories, land use and transportation. Land use strategies include infill development, transit oriented development (TOD), and mixed use developments. Transportation strategies include infrastructure investments, transportation demand management and transportation system management policies. In addition, SCAG will be looking at current programs in which GHG reductions can be claimed. For example, 80 Compass Blueprint Projects have been completed or are in development. In addition to the Compass Blueprint Projects there are also pedestrian and bicycle initiatives, green building programs, and projects that will be completed under Measure R.

Mr. Butala discussed a number of challenges for implementation of an SCS. There is no additional funding for the planning and implementation of SCS projects. This is to be completed under the current funding structures. Time, particularly as it relates to the Regional Housing Needs Assessment (RHNA) process, will be an issue. SCAG is also still waiting for the California Air Resources Board to complete their evaluation of SCAG's proposed methodologies; and two sub-regions, Orange County Council of Governments (OCCOG) and Gateway Cities Council of Governments (Gateway COG), are going to develop their own SCS's which will need to be incorporated into the regional SCS.

SCAG local sustainability planning tool will soon be available for local government use, and the first round of SCS development workshops will be held in December 2010/January 2011. Other workshops and development activities will follow, with the draft 2012 RTP/SCS scheduled for release in November

2011. It is planned that public hearings will be held November 2011 to January 2012, with the final 2012 RTP/SCS released in April 2012.

Supervisor Josie Gonzales was interested in seeing SCAG's plan for outreach to the local governments. She is concerned because planning decisions are made through different processes among local governments and she wants to ensure that the correct planning structures have been identified.

Ms. Jane Carney suggested that SCAG try to identify funds for a study to look at the completed Compass Blueprint projects to determine what has and has not worked to reduced vehicle miles traveled.

3) 2010 Ozone Season and Ongoing Air Quality Trends

Joe Cassmassi, Planning and Rules Manager, provided an update of the ozone air quality season through mid-October. The trend of Basin days exceeding the federal 75 ppb standard has continued to show progress with 2010 having the lowest total to date. Peak concentrations are also lower than previous years. The trend was evaluated to discuss the potential influence of seasonal weather conditions on ozone formation and the impact of the economic downturn on the pattern. In general, the mid-summer months did not show any significant weather bias toward ozone formation. The sensitivity analysis addressing the economic slowdown suggested that lower overall concentrations in the Basin would likely result but the mix of VOC and NOx could force more frequent impacts to areas closer to the emissions source region. Observations of ozone concentrations and patterns supported this postulation.

Ms. Carney asked staff to clarify the definition of the monsoon in southern California, and Mr. Cassmassi responded that the typical flow in the late summer is from the south and it draws moisture from the Gulf of Mexico and Gulf of Baja to increase desert precipitation probability. Mr. Cassmassi, pointed out that the monsoonal flow was very weak this year and more stable conditions due to the lack of monsoon may have lead to a nominal increase in ozone for the Coachella Valley. In closing, Mr. Cassmassi pointed out that the 2010 smog season still has a few weeks left and that staff will continue to monitor the air quality and augment the analysis at the end of the year.

4) Rule 2202 Activity Report

Written report submitted. No comments.

5) Monthly Report on Environmental Justice Initiatives – CEQA Document Commenting Update

Written report submitted. No comments.

6) Other Business
None

7) Public Comment
None

The meeting adjourned at 10:20 a.m.

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 29

REPORT: Refinery Committee

SYNOPSIS: The Refinery Committee met Friday, August 18, 2010. Following is a summary of that meeting.

RECOMMENDED ACTION:
Receive and file.

Dennis Yates, Acting Chair
Refinery Committee

EC:LT:JC:GQ

Attendance
Mayor Dennis Yates, Acting Committee Chair, called the meeting to order at approximately 10:00 AM. Also present at the AQMD were Judith Mitchell and Dr. Joseph Lyou, with Dr. William Burke joining via videoconference and Jane Carney joining via teleconference.

Overview of Proposed Amendments to SOx RECLAIM Program
Dr. Laki Tisopulos, Assistant Deputy Executive Officer with Planning, Rule Development and Area Sources, gave a presentation on the legal mandates to reduce SOx emissions, staff's proposed SOx shave and the methodology applied, RTC reductions, and future water demands [Attachment]. Mayor Yates inquired about the main source of SOx pollution. Dr. Tisopulos responded that ocean-going ships are the main contributors to SOx emissions. RECLAIM sources contribute approximately 25 percent to the overall SOx emissions.

Mayor Yates asked if the 2007 AQMP identified the committed reductions in SOx as three tons per day and whether the industries were pointing to that figure. Dr. Barry Wallerstein, Executive Officer, responded that the AQMP is a snapshot in time and detailed analyses are prepared during rulemaking to identify available emission

reductions and such estimates can be higher or lower than the preliminary estimate in the AQMP.

Dr. Lyou added that in an Appendix in the AQMP, it states "*It should be noted that during rule development all SOx sources in RECLAIM will be subject to a thorough BARCT evaluation to achieve the maximum feasible SOx reductions*".

Board Member Mitchell inquired on the 3 ton per day AQMP estimate and staff's proposed reduction of over 6 tons per day. Dr. Tisopulos responded that staff's proposal of a 55% shave reflects an RTC (RECLAIM Trading Credit) reduction of 6.1 tons per day by 2019. Dr. Lyou indicated that between the original staff proposal and the current staff proposal there's a 1.4 ton per day difference. Dr. Wallerstein responded that after the last Refinery Committee Meeting, meetings were held with various refiners to review detailed data for their specific refineries. After holding internal discussions with the consultants and a review of the numbers, staff amended its proposal. Dr. Elaine Chang, Deputy Executive Officer, explained that there were three reasons that contributed to the change: (1) staff excluded some very costly controls at a single facility (2) staff extended the compliance date from 2017 to 2019 and incorporated appropriate growth assumptions in the methodology presented and (3) staff recently completed audited emissions rather than reported emissions.

Joe Sparano, WSPA Executive Advisor, Rod Spackman from Chevron, and Stan Holmes representing Exxon-Mobil presented an alternative to staff's proposal. At the conclusion of the presentation and discussion on their alternative proposal, Joe Sparano reiterated that they are committed to meeting the three tons per day requirement under the 2007 AQMP. They also expressed concern with staff's proposal on shave methodology. However, WSPA is prepared to work with staff on addressing their concerns. The WSPA representatives pointed to their $2.7 billion cost estimate as more accurately representing the cost to reduce the SOx emissions and that staff had underestimated these costs.

Board Member Mitchell asked why, according to staff, there was no need to remove electrostatic precipitators (ESPs). Dr. Tisopulos responded that ESPs are installed to control predominantly directly emitted particulates in order to meet the Rule 1105.1 standards. The wet gas scrubbers are mainly used to control SOx emissions. Based on feedback received from the consultants, staff does not believe that any of the ESPs will need to be removed.

Dr. Lyou inquired on whether consideration was given to the physical layout of the refineries and whether this makes sense to each individual refinery. Dr. Tisopulos stated that both sets of consultants had a walkthrough of the refineries to identify a location and also heard concerns expressed by each refinery. Several refiners did not agree with the locations recommended by the first set of consultants. Alternative

locations were recommended by Norton Engineering in response to comments received, which has contributed to increasing the original costs by approximately 20 percent.

Dr. Tisopulos reviewed the projected potable water demand, availability of recycled water and well water for the scrubber technology. Board Member Mitchell inquired on the geographic range of distribution for the Harbor Water Project and Dr. Lyou asked the water purveyors if they could meet the water demand increase. Water purveyors attending the meeting included Uzi Daniel (West Basin Municipal Water District), Joe Walters (West Basin Municipal Water District, and Jesus Gonzalez (LADWP – Water Recycling Group). They responded to the Committee Members' questions that the pipeline is built to serve the harbor corridor area and that they would be able to meet the demands to supply recycled water at the required levels.

Dr. Burke commented that he was pleased to see WSPA and staff members partnering on resolving the issues at hand. He stressed the importance on meeting our legal obligation under the law to meet SIP commitments, implement all BARCT for existing sources, and demonstrate equivalency to Command and Control regulations.

Dr. Lyou requested staff to prepare an analysis of the difference between the cost estimates of $2.7 billion (WSPA) and $750 million (staff's consultants). In addition, he requested site visits to the refineries to observe the proposed physical location of equipment.

Board Member Carney requested a copy of both consultant reports and the draft CEQA document.

Public Comments
Adrian Martinez, NRDC, requested both presentations by staff and WSPA be made available on the district website. He also requested that the environmental community have an opportunity to present at the next Refinery Committee meeting.

Meeting adjourned at 12:25 pm.

SCAQMD Presentation

Attachment

SOx RECLAIM

Refinery Committee Meeting
August 18, 2010

BACKGROUND

Why Reduce SOx Emissions?

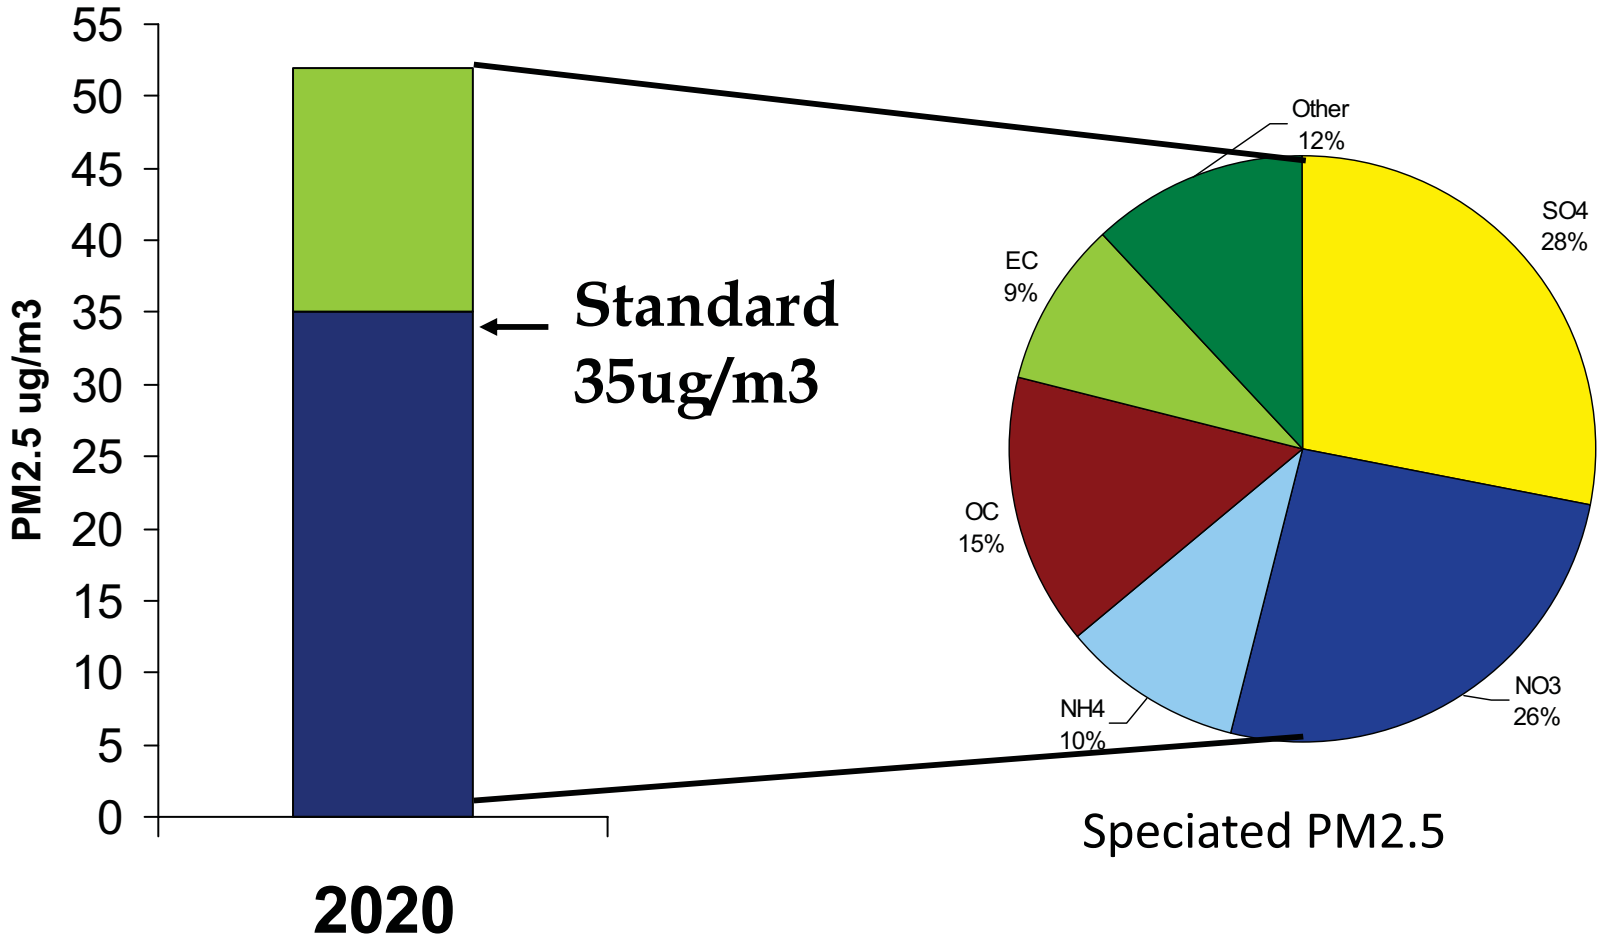
Legal Mandates

- Periodic BARCT update (H&S §40440)
- Command & control equivalency (H&S §39616 (c)(1))
- SIP commitment (2007 AQMP/SIP CMB-02)

Need for Reductions Beyond 2007 AQMP

- 24-hour PM2.5 standard by 2020
- Proposed annual and 24-hr PM2.5 standards
  - 24-hr standard: 30-35 ug/m3
  - Annual standard: 11-13 ug/m3

Predicted Maximum 24-hour PM 2.5 Concentration (2020)

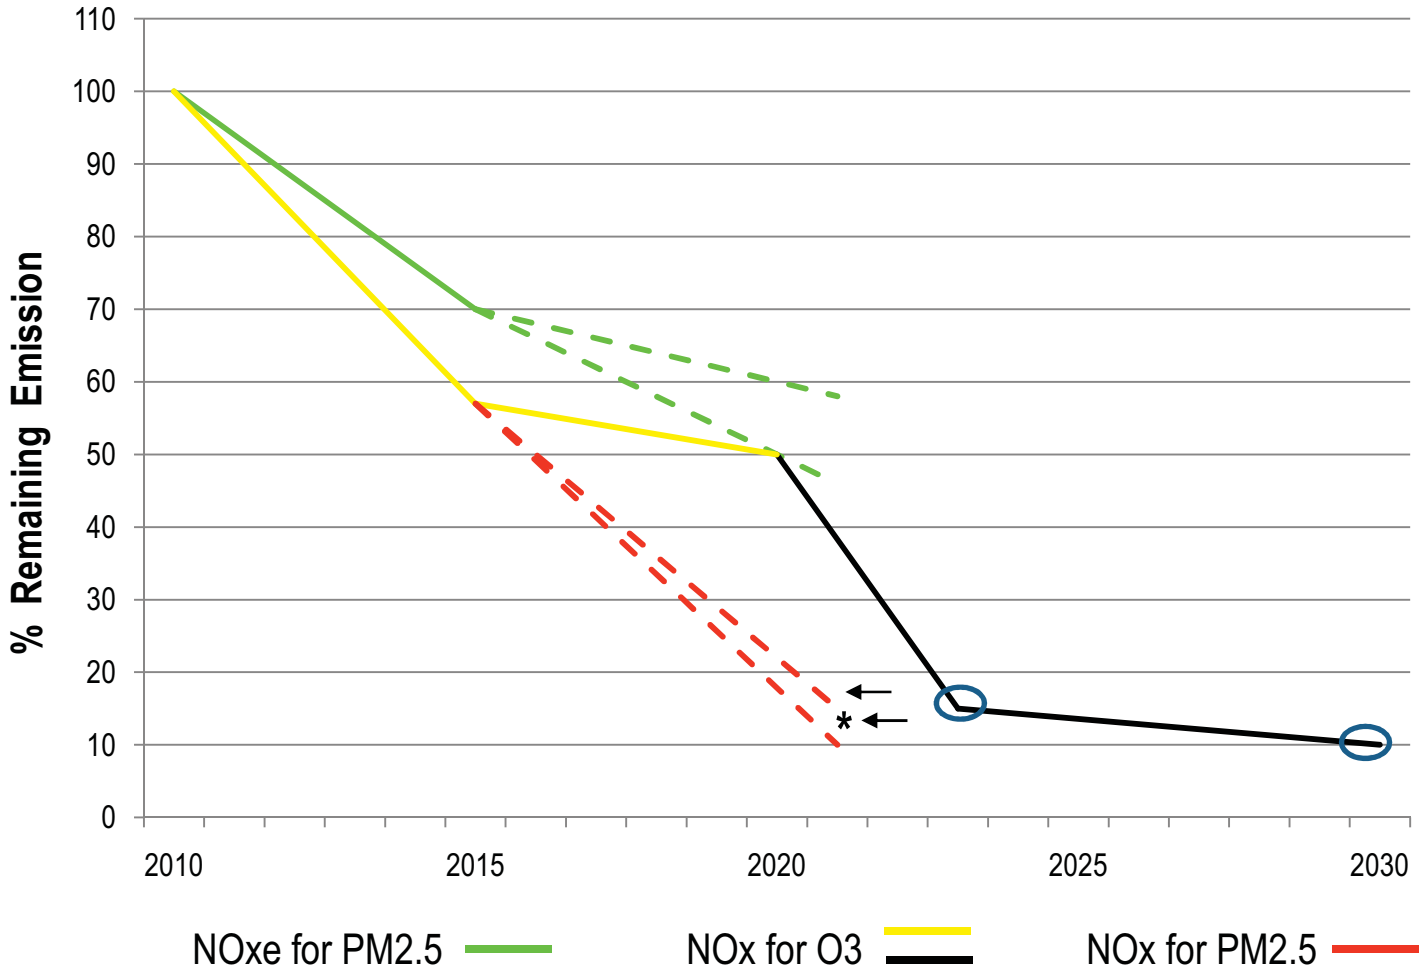


Source, 2007 AQMP

PM2.5 Preliminary Analysis

- Reduction effectiveness among PM2.5 and its precursors:
  - NOx:SOx:PM2.5:VOC = 1:15:10:0.4
- Basin wide average PM2.5 air quality improvement
  - 150 tons/day NOxe reductions for every 1 ug/m3
- Annual standard under consideration 11-13 ug/m3
  - 300 to 600 tons/day NOxe reductions

Preliminary Analysis of Emission Levels for Pending O3 & PM2.5 Standards



*Additional SOx and PM2.5 reductions still needed

Staff Proposal

- BARCT for 6 source categories (5ppm – 10ppm)
  - FCCUs
  - Sulfur Recovery/Tail Gas Units (SRU/TGU)
  - Sulfuric Acid Plants
  - Coke Calciner
  - Glass Melting Furnaces
  - Cement Kilns
- Investment (present value, 25 years)= $630 – $750 million
- Weighted Average Cost Effectiveness= $15k-19k/ton SOx
- CEQA Alternatives: 3 tpd – 6.14 tpd RTC Reductions (25% – 55% shave)

Staff Proposal (continued)

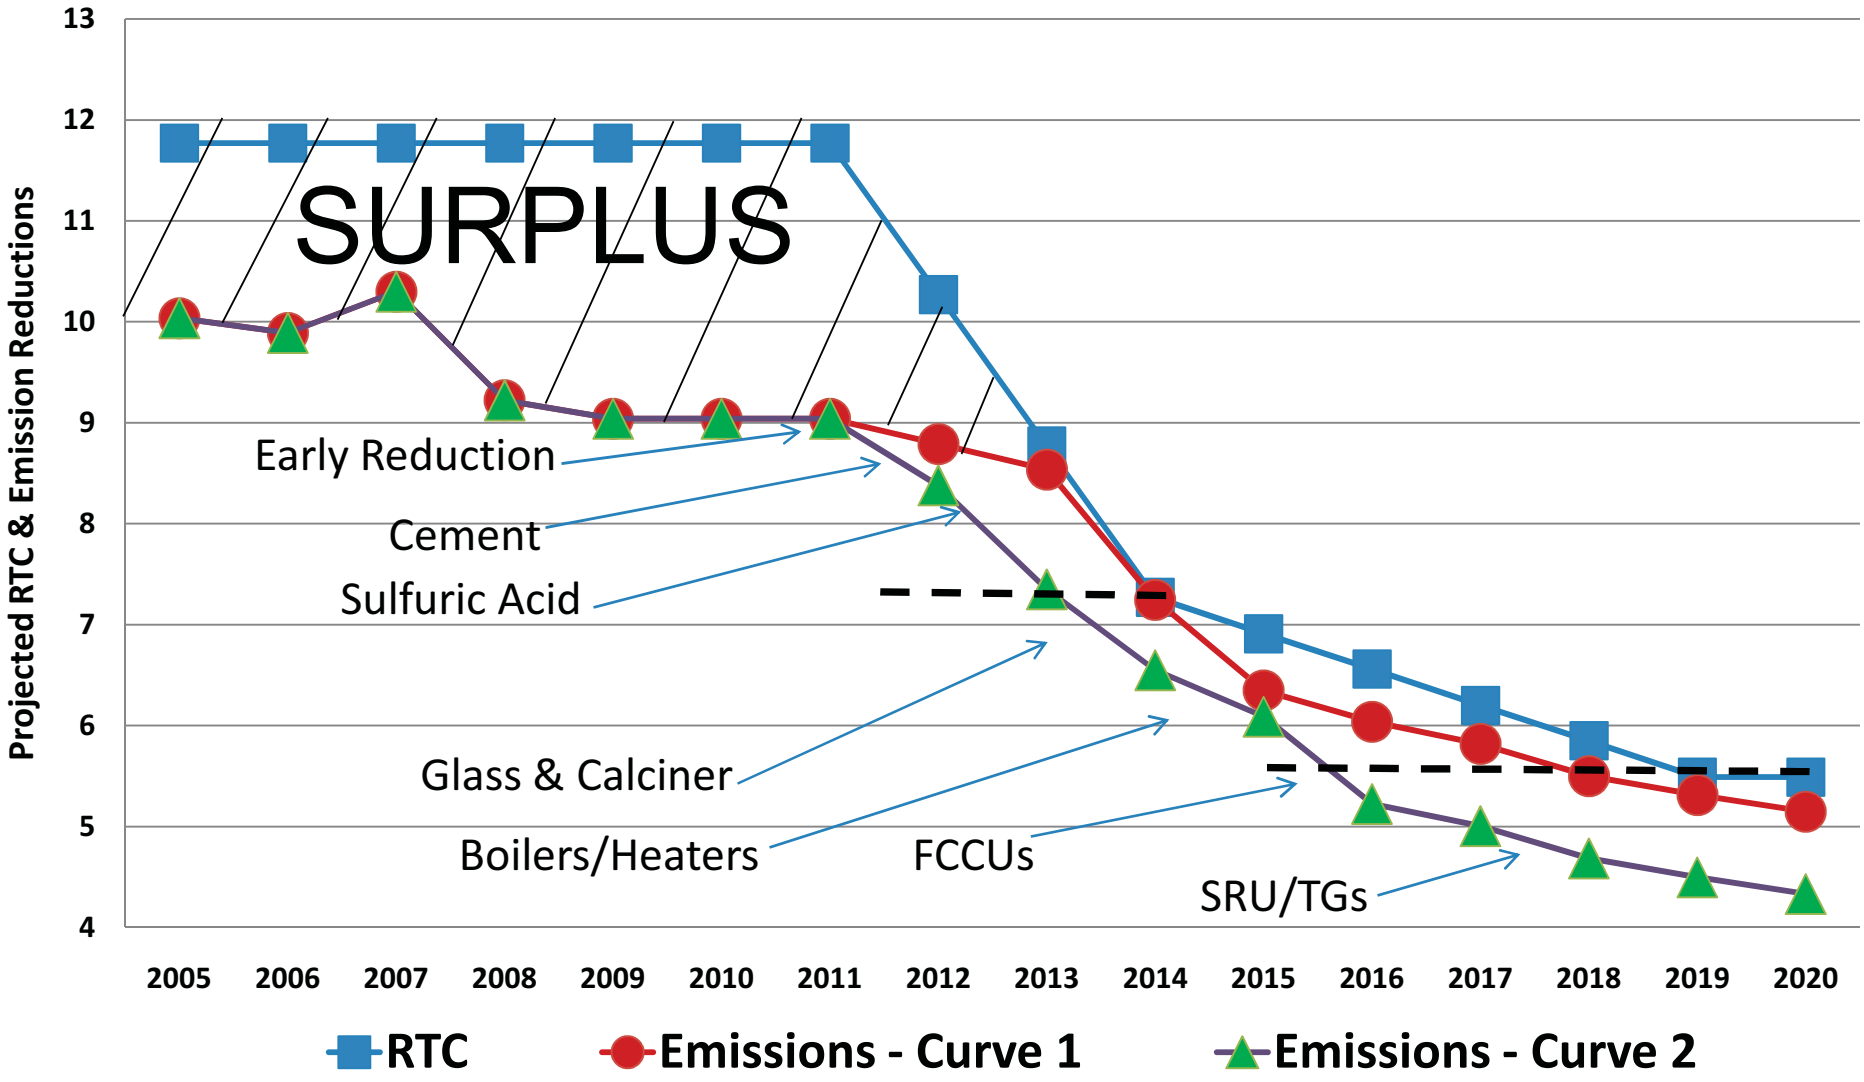
- 55% shave (RTC Reductions 6.14 tpd) by 2019 in two phases
  - Original staff proposal: 67.5% shave by 2017
  - 6.14 tpd RTC Reductions = 5.35 tpd actual emission reductions
- Two-phase reduction w/ annual reduction targets
  - 41% by 2014 (4.5 tpd)
  - 55% by 2019 (6.14 tpd)
- Limited exemption from shave for certain small emitters
- Provisions for market viability
  - Set-aside RTC amounts similar to NOx RECLAIM
  - Board review if SOx RTC price greater than $50k per ton SOx

Staff Proposal (continued)
% Shave* & RTC Reductions

	2014		2017		2019	
	Shave	Reductions	Shave	Reductions	Shave	Reductions
Original Proposal	41%**	4.5 tpd	67.5%	7.5	------	------
Current Proposal	41%	4.5 tpd			55%	6.1

* % shave is calculated by dividing RTC Reductions by RTC Holdings of major emitters and investors (11.09 tpd)
** Current margin (unused RTCs) between RTC Holdings and Actual Emissions: ~2.55 tpd (22% of RTC holdings)

Staff Proposal



Emissions - Curve 1: BARCT for staff proposal. Curve 2: Additional opportunity for reductions with slower rate of growth than Curve 1

Is SOx RECLAIM Shave Overdue?

- Significant overallocation since program inception
- First BARCT review since 1994
- 1994 BARCT review included only two source categories by 2000
- More reduction options than needed

Command and Control Equivalency
&
SOx Shave Methodology

Staff's Approach

- Not to penalize or create windfalls due to trades since the inception of the program
- Afford the same growth opportunities as C&C
- Consistent with NOx RECLAIM

AQMP Methodology

- Use 1997 audited emissions at the start of the program
- Apply 2007 AQMP growth assumptions by industry between 1997- 2019
- Full implementation of Tier 1 controls by 2000
- Full implementation of proposed BARCT by 2019
- 10% compliance margin

Who Does the Shave Apply to?

- SOx RECLAIM Universe = 32 Facilities
- Staff Proposes to Apply Shave to:
  - 11 largest emitters (93% of emissions)
  - Private investors/brokers
  - Exclude 21 facilities
    - small emitters
    - no applicable BARCT
    - holdings less than initial allocation minus recently acquired credits (3 facilities)
    - 4 facilities with no holdings

Work Plan

Work Plan Elements	Completed	Partially Completed	Conclusions
Stranded Investments (ESPs)	✓		•Equipment costs w/in estimated range •Installation costs varied significantly •Bottlenecks: Preference toward, same vendor/contractor and compressed construction schedule due to litigation •No need to remove ESPs
Consultant Analyses	✓		•Hired 2nd consultant •Higher cost estimates than 1st set of consultants but w/in uncertainty range of analysis •Cost-effectiveness ~20% higher

Work Plan (continued)

Work Plan Elements	Completed	Partially Completed	Conclusions
Water Demand & Wastewater Discharge	✓		•Water demand can be met •Water demand significant •Mitigation: Use recycled water if available •Wastewater treatment capacity adequate
Market Viability		✓	•Staff analysis completed and being discussed with WSPA
CEQA	✓		•Program EA •Water and GHG emission significant •Mitigation: Use recycled water, if available
Permitting		✓	•Wil initiate meetings between WSPA and E & C

Water & Wastewater

Water Demand

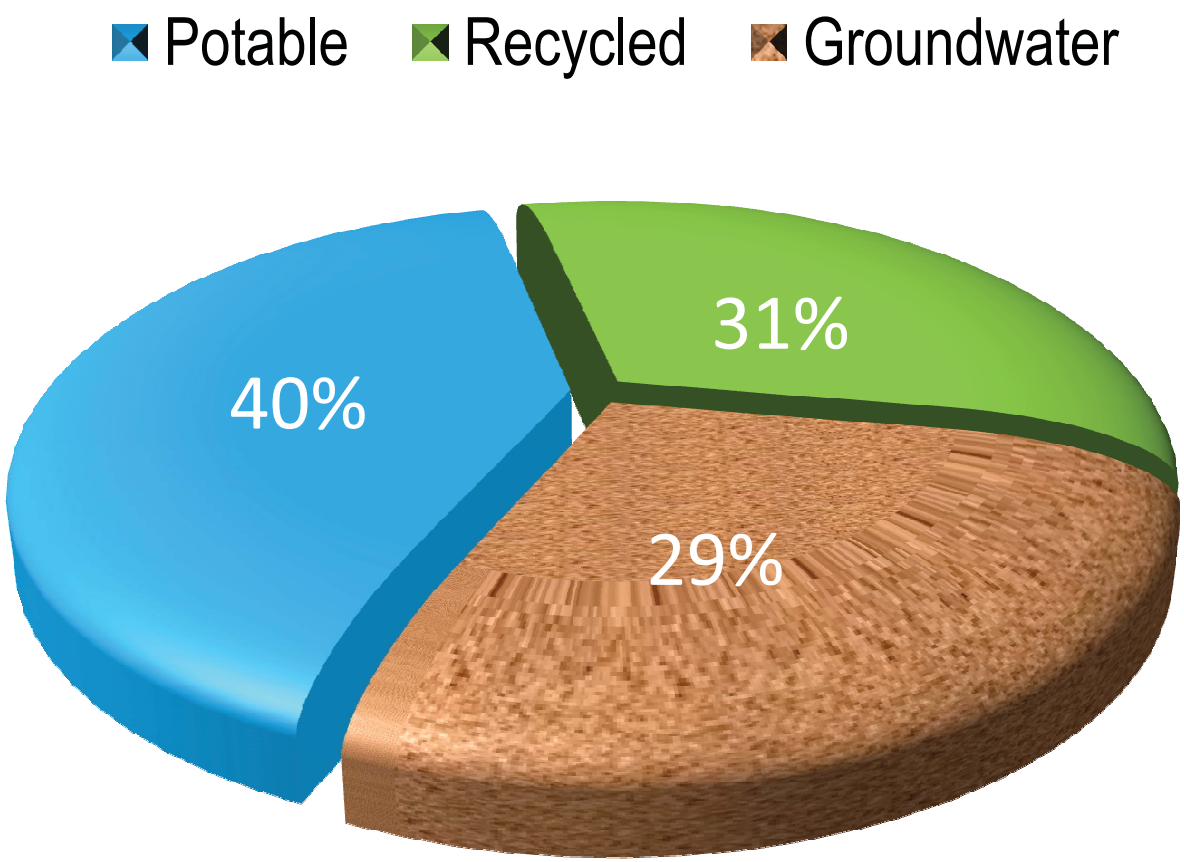
Facility	Baseline (Million Gals/Day)	Increase (Million Gals/Day)	% Increase
Refinery 1	2	0.04	2%
Refinery 2	9	0.2	2%
Refinery 3	10	0.2	2%
Refinery 4	6	0.06	1%
Refinery 5*	9	0.02	<1%
Refinery 6	12	0.2	2%
Sulf. Acid	0.7	0.02	3%
Coke	1	0.04	4%
Glass	0.1	0.06	48%
Cement	3	0.1	3%
Total	53 Million Gals/Day 163 Acre-Ft/Day 59 Thousand Acre-Ft/Yr	1 Million Gals/Day 3 Acre-Ft/Day 1 Thousand Acre-Ft/Yr	2%

Water Demand

- South Coast Regional Water Demand = 6.37 Million Acre-Ft Per Year
  - Project Increase = 1,000 Acre-Ft Per Year = 0.02% of South Coast Water Demand
  - 80% Below CEQA Threshold of 5 Million Gals Per Day
- Water Suppliers Can Meet Demand for Next 20 Years (2005 Urban Water Management Plans)
- Potable Water Increase = 0.3 Acre-Ft per Day
  - Negligible Effect on Governor's Goal of 20% Potable Reduction by 2020
- Recycled Water & Well Water Available

Water Demand

Current Water Demand

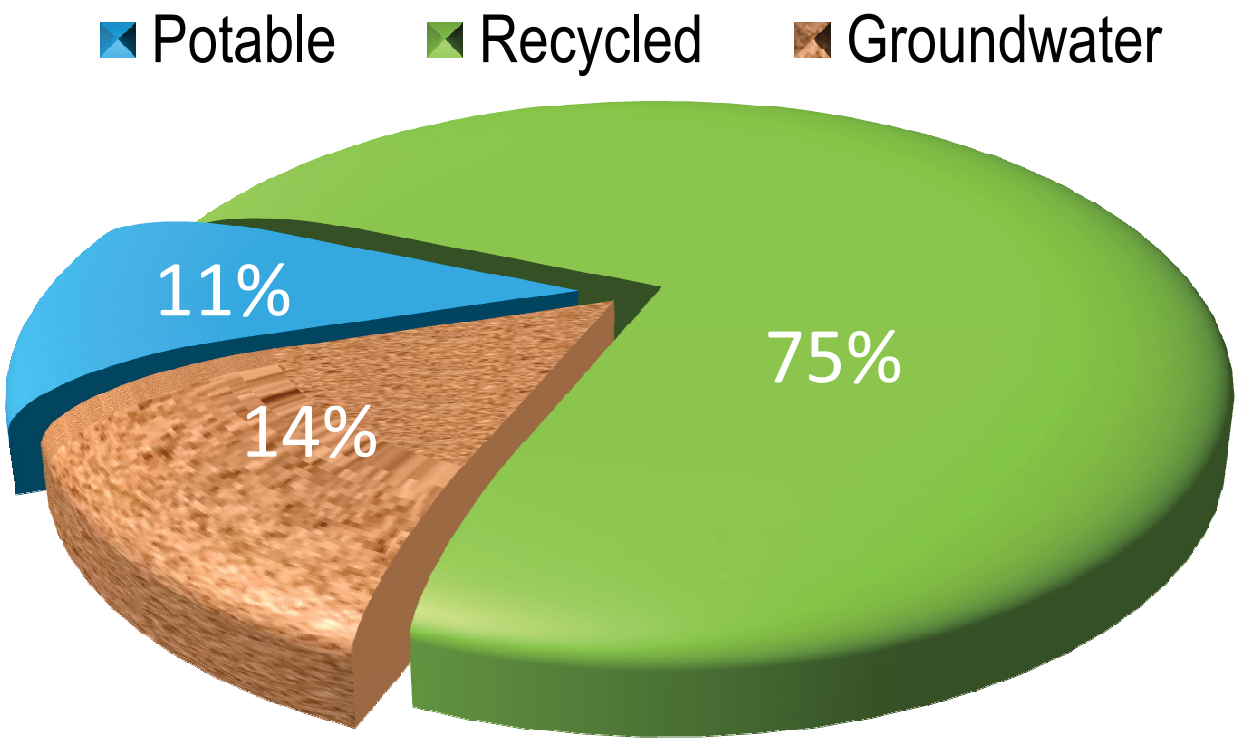


Total Baseline Water Use in CEQA = 58 million gallons per day*

* Reflects potential demand. Actual usage is 53 million gallons per day.

Water Demand

Future Water Demand With Wet Gas Scrubbers (Option 1)
If Future Supplies of Recycled Water ARE Available

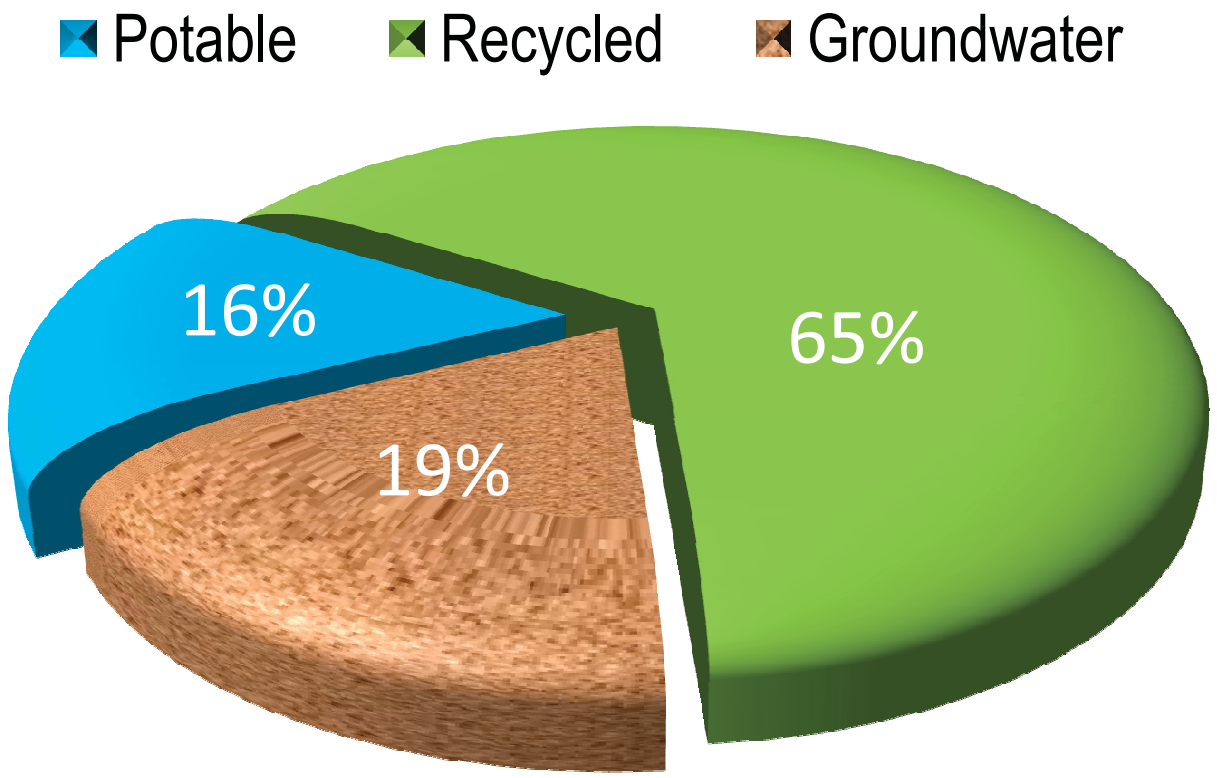


Increase in Water Use = 883,368 gallons per day

Potable water projected increase is below CEQA Significance Threshold

Water Demand

Future Water Demand With SOx Reducing Catalysts (Option 2)
If Future Supplies of Recycled Water ARE Available



Increase in Water Use = 642,272 gallons per day

Potable water projected increase is below CEQA Significance Threshold

Water Demand

- CEQA Significance Threshold = 5 million gallons per day
- Exercise Abundance of Caution – Consider New CEQA Significance Threshold
  - Potable water usage by a 500 dwelling unit project
    - 0.134 million – 0.223 million gallons per day
- The projected increase in potable water usage in Option 1 triggers significance if future recycled water supplies are not available
- Mitigation to reduce potable water demand:
  - Use recycled water, if available (Harbor Refineries Recycled Water Pipeline Project)

Wastewater

- Small increase in wastewater discharge. No need to revise discharge permits.

Facility	Discharge Limit (GPM)	Current Discharge (GPM)	Increase (GPM)	% Increase
Refinery 1	764 - 1,000	903	15	2%
Refinery 2	7,500 - 12,200	3,000	40	<1%
Refinery 3	6,000 – 16,000	5,000	36	<1%
Refinery 4	10,000	2,200	22	<1%
Refinery 5*	5,000	1,400 – 2,000	14	<1%
Refinery 6	5,200 – 8,000	4,000	51	1%
Sulf. Acid	425	175 - 387	8	2%
Coke	125	65	11	9%
Glass	Not Reported	250	9	----
Cement	No Limit	Evaporation Pond	Small	Small
Total	35,000 – 53,000	17,000 – 18,000	206	<1%

Next Steps

- Continue to Meet with Stakeholders
- Draft CEQA Released Today
- Revised Draft Staff Report & Socioeconomic Analysis - In Progress
- Public Hearing – November 2010

REVISED

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 29A

REPORT: Refinery Committee

SYNOPSIS: The Refinery Committee met Wednesday, September 22, 2010. Following is a summary of that meeting.

RECOMMENDED ACTION:
Receive and file.

Jane Carney, Chair
Refinery Committee

EC:LT:JC:GQ:KO

Attendance
Jane Carney, Committee Chair, called the meeting to order at approximately 12:00 PM. Present were Chair Carney and Committee Members Dennis Yates, Judith Mitchell, and Dr. Joseph Lyou, with Jan Perry joining via teleconference and Dr. William Burke joining via videoconference.

Overview of Proposed Amendments to SOx RECLAIM Program
Dr. Laki Tisopulos, Assistant Deputy Executive Officer with Planning, Rule Development and Area Sources, gave a presentation to compare the proposals from the District and WSPA for RTC (RECLAIM Trading Credit) reductions [Attachment 1].

Dr. Tisopulos stated in the presentation that there are three outlier units in the refineries that are driving up the costs, according to WSPA's estimates. Board Member Carney asked if the costs being used by AQMD included the contingency amounts set forth in the report from Norton Engineering Consultants. Dr. Tisopulos responded that the overall costs do include contingencies. Board Member Mitchell asked what the basis is for WSPA's estimates. Mayor Yates asked if the costs take into account any logistical problems that will be encountered with regard to plot space and location for wet gas scrubber installations. Dr. Tisopulos responded that both sets of consultants took this

into consideration as part of the cost estimates, although some of the proposed locations of the scrubbers differed between the consultants which accounted for some of the cost differences. However, this does not explain the large gap between the District and WSPA's estimates, particularly for the three outlier units.

Jan Perry joined via teleconference at 12:35 pm

Dr. Burke expressed his apprehension regarding some governmental assessment of costs. He advised District staff to ensure reasonableness in its cost estimates. Mayor Yates expressed his frustration at the fact that the District and WSPA were still going back and forth with regard to the costs. He stated that this exercise should be completed before the next Refinery Committee Meeting. Cathy Reheis-Boyd, WSPA President, said that WSPA will meet with District staff the following day (September 23, 2010) to address these concerns in detail. Dr. Burke asked about market viability, inquiring about the "wiggle room" in the market after the shave.

Dr. Burke left the meeting at 1:20 pm.

Mayor Yates left the meeting at 1:35 pm.

The Committee provided the opportunity for members of the environmental community to comment on the proposed rule amendment. Their members expressed contentment with the progress of rule development and stated that the transparency of the cost figures from both sides is of utmost importance. Representatives also stated that it is very important for the refineries take into account the prevention of premature deaths with the successful adoption of this rule amendment and that the refineries could pass the project's cost to the consumer. Industry representatives responded that this proposed regulation would severely impact the job market in California.

Mrs. Reheis-Boyd presented to the Committee a slide presentation addressing WSPA's concerns regarding costs of meeting the proposed RTC shave [Attachment 2]. Board Member Carney inquired about the infrastructure to deliver recycled water to the refineries. She wanted to know what those costs are and if those should be included in the staff proposal. Board Member Mitchell added that this discussion really needs to be clarified for the Board Members.

Dr. Lyou stated that the District has to ensure that it does what the law requires, especially if it is cost effective. In addition, he had questions on the ERCs to RTCs portion of the shave. Mrs. Reheis-Boyd responded that WSPA and the District will discuss this further at the following day's meeting. Dr. Lyou said that he will want a write-up of that explanation and that he also will want error bars included in the costs provided by WSPA.

Public Comments
The Committee then opened the floor to comments from the public. These comments focused on concerns regarding the potential job impacts and the selection of a proper RTC cost threshold in order to ensure optimum flexibility in the SOx RECLAIM trading program.

Dr. Tisopulos concluded by stating that a very brief presentation will be delivered at the Stationary Source Committee on Friday, September 24, 2010. The presentation will include the progress of the discussions between WSPA and the District at the Thursday, September 23 meeting.

Meeting adjourned at 2:35 pm.

Attachment 1

SOx RECLAIM
Refinery Committee Meeting

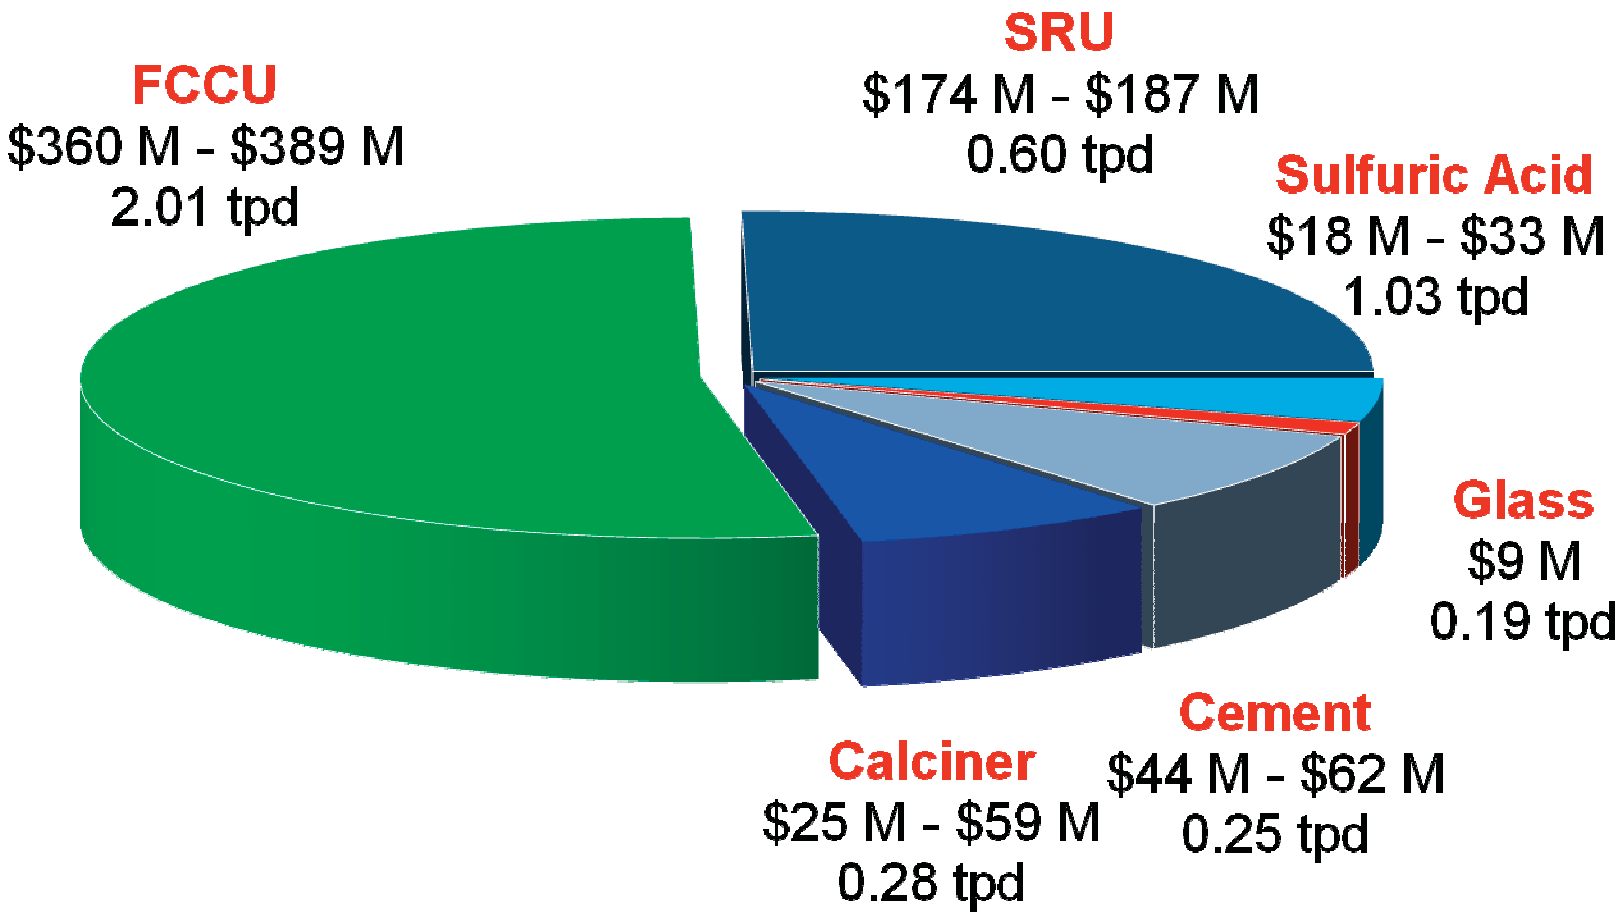
September 22, 2010

Explaining the Gap on Cost Estimates

- WSPA's estimate = $2.85 billion (60% shave)
- Limited information on WSPA/ENVIRON presentation
- Difficult format for meaningful analysis
- Overlapping costs (e.g. hydrotreating, DeSOx, wet gas scrubbing)
- Does not reflect the revised 55% shave scenario

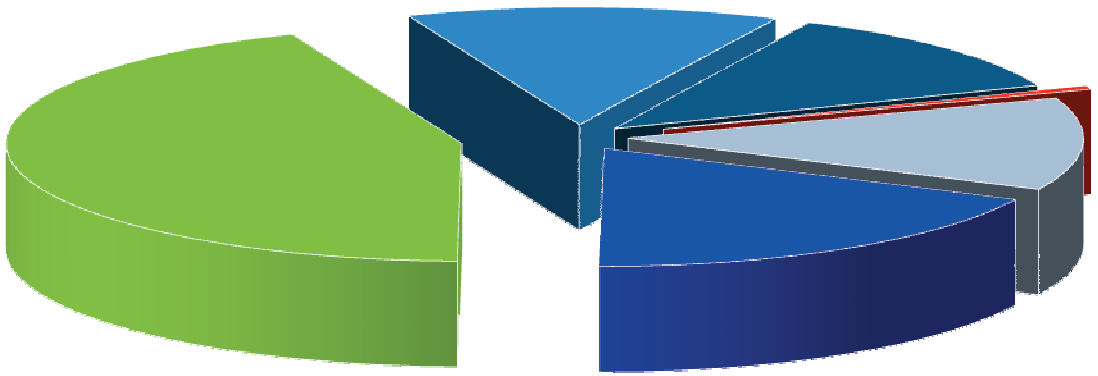
Estimate	Reasons
$2,850 M	
- $720 M	Remove costs for boilers/heaters control options
- $101 M	Remove costs for early controls already in place
- $467 M	Remove costs for cost-ineffective units
$1,562 M	
- $700 M	Remove overestimated costs for FCCU's WGSs
+ $196 M	**Add consultant's estimates for FCCU's WGSs (2 outliers)**
- $459 M	Remove overestimated costs for SRU/TG's WGS
+ $73 M	**Add consultant's estimate for SRU/TG's WGS (1 outlier)**
$672 M	

Costs & Emission Reductions by Equipment Category (based on Consultants' Input)



SOx RECLAIM project = $630 - $738 million, 5.4 tpd emission reductions, cost effectiveness $15 - $19 K per ton
Refinery sector = $561 - $638 million (86% total costs), 3.9 tpd emission reductions (73% total reductions)
FCCU controls = 53% of total costs and 53% of total emission reductions

Costs & Emission Reductions by Refinery (based on Consultants' Input)



Refinery 4
$78 M - $84 M
0.2 tpd

Refinery 2
$60 M - $76 M
0.17 tpd

Refinery 6
$232 M - $279 M
1.51 tpd

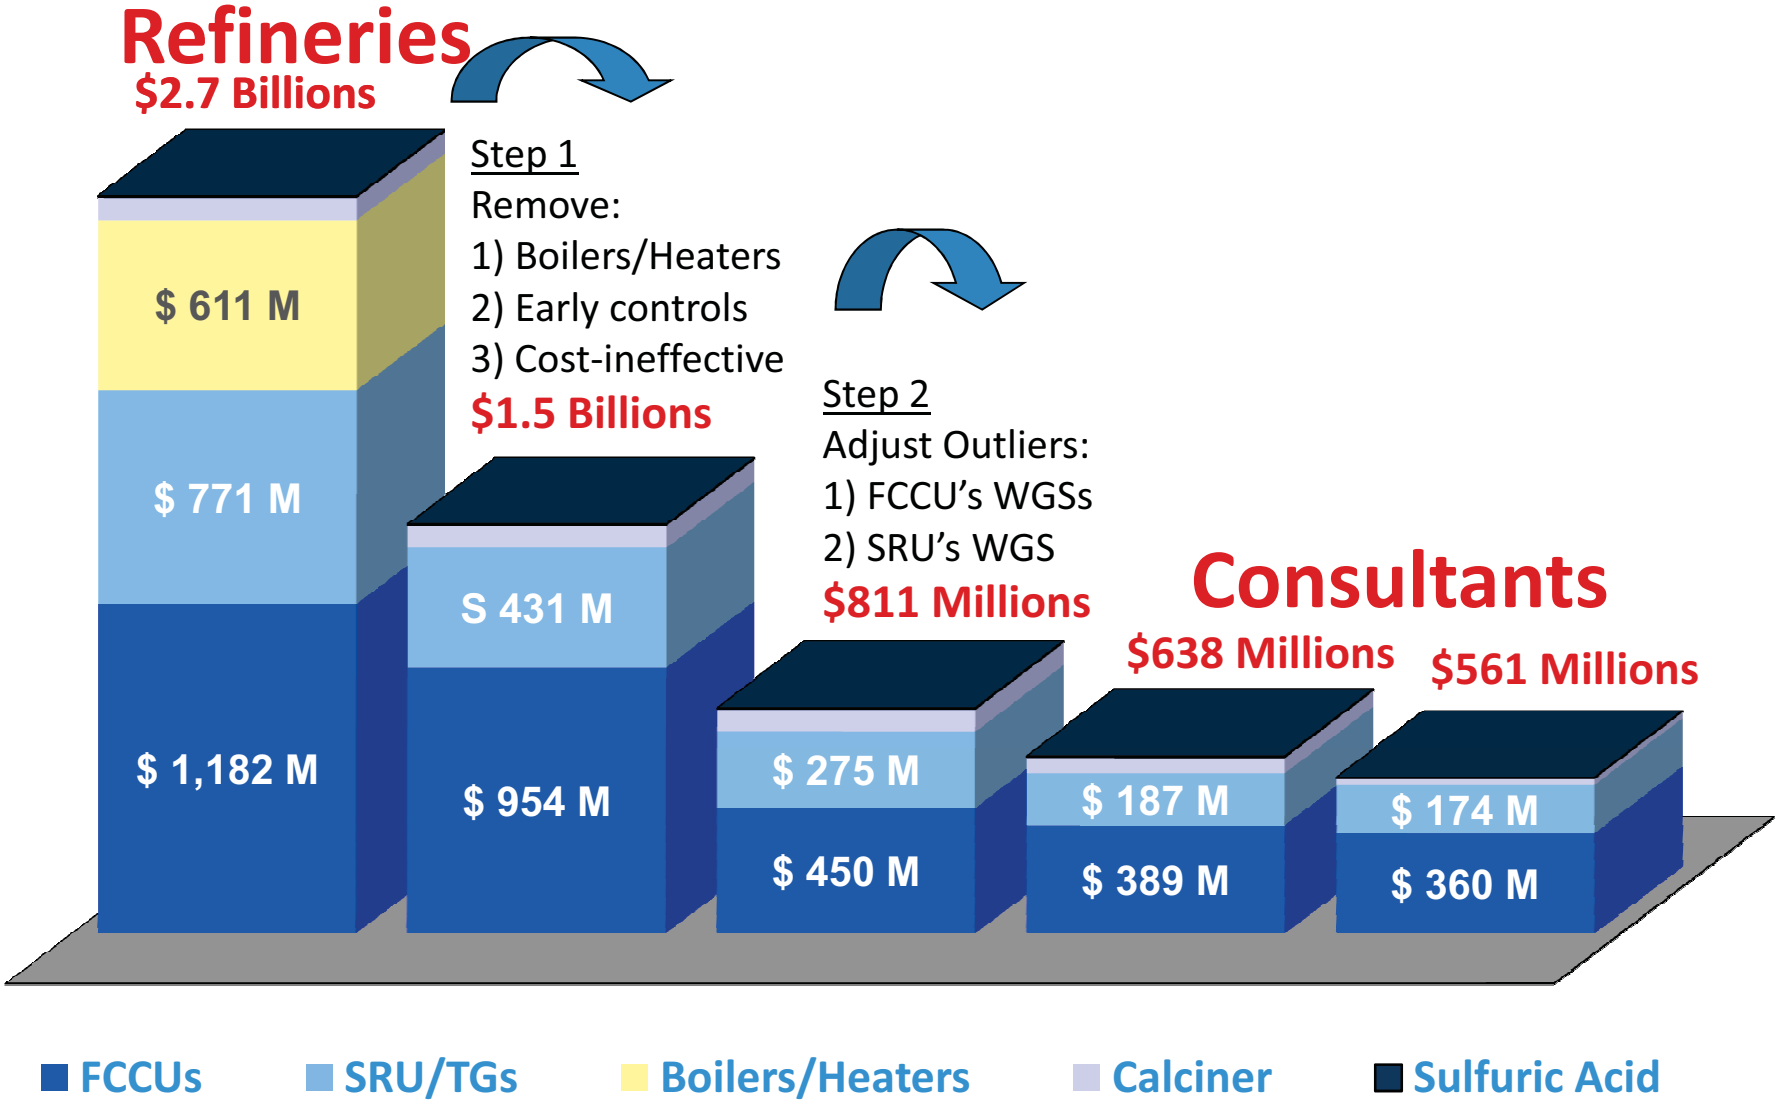
Refinery 5
$2 M - $3 M
0.03 tpd

Refinery 1
$76 M - $81 M
0.58 tpd

Refinery 3
$112 M - $115 M
0.43 tpd

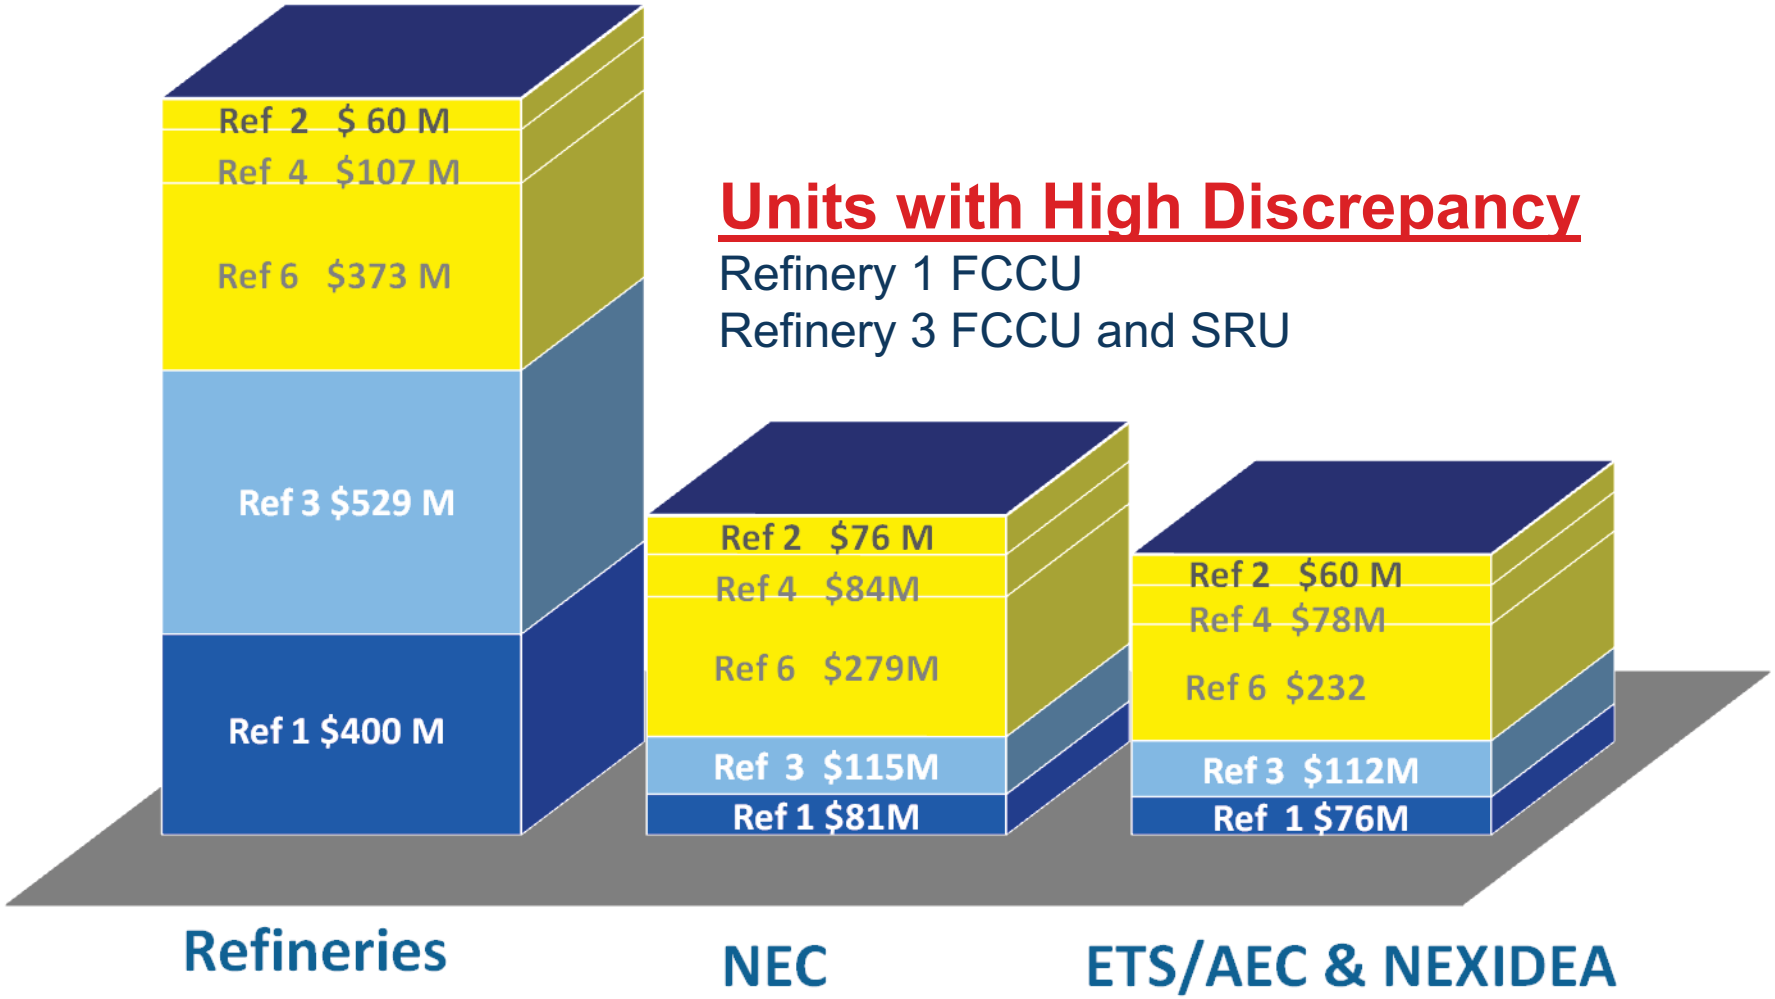
SOx RECLAIM project = $630 - $738 million, 5.4 tpd emission reductions, cost effectiveness $15 - $19 K per ton
Refinery sector = $561 - $638 million (86% total costs), 3.9 tpd emission reductions (73% total reductions)

Explaining the Gap in Two Steps



Step 1: 2.7 billions –(611millions for boilers/heaters +101 millions for early controls + 467 million for cost-ineffective)= 1,471 millions
Step 2: 1.47 billion – (700 millions for FCCUs + 229 millions for SRU as refinery's estimate) + (196 millions for FCCUs + 73 millions for SRU as consultants' estimate) = 811 millions

Explaining the Gap in Two Steps

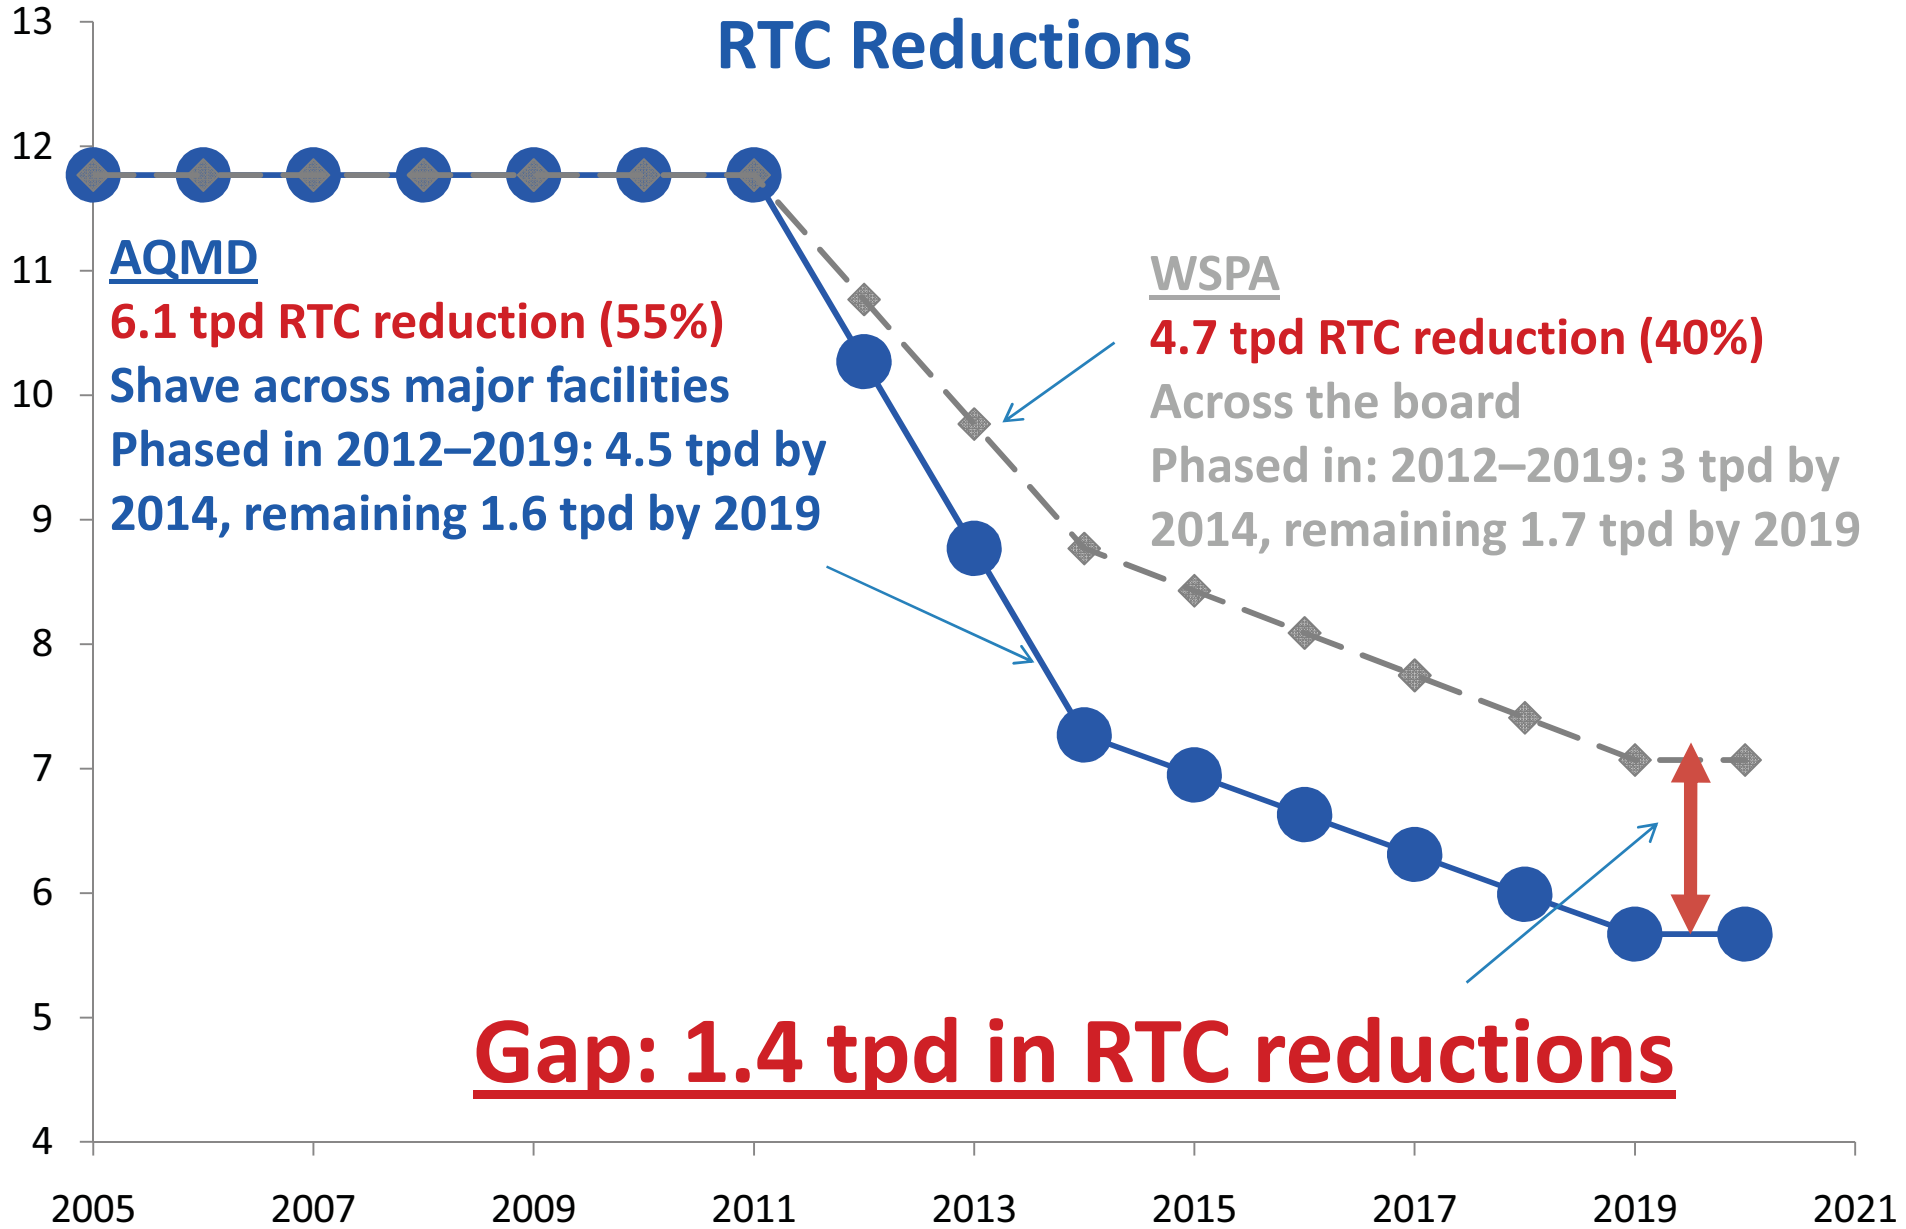


Units with High Discrepancy

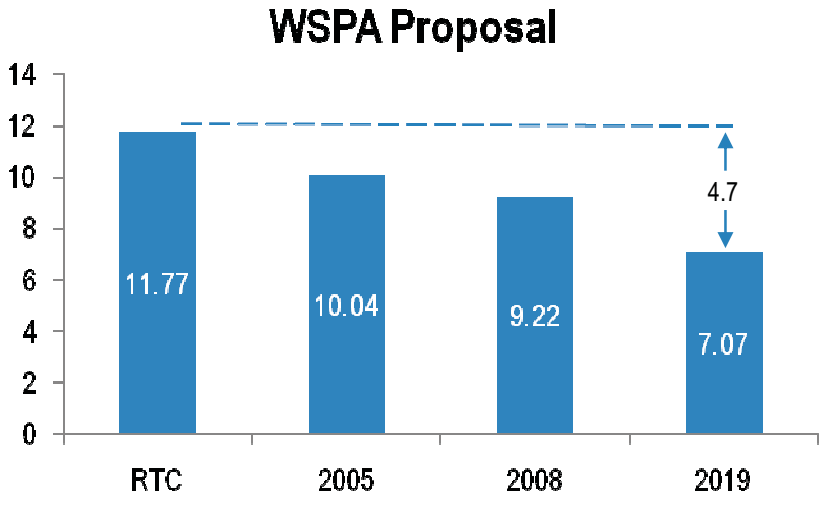
Refinery 1 FCCU

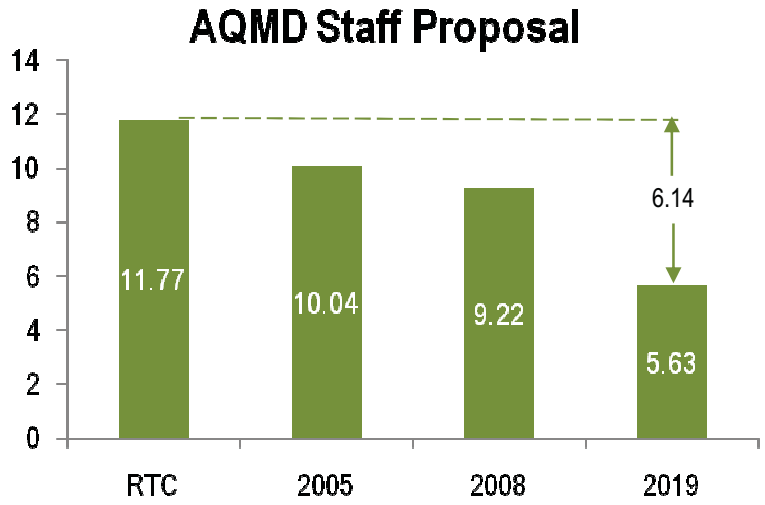
Refinery 3 FCCU and SRU

Staff's versus WSPA's Proposal
RTC Reductions



BARCT Reductions 2005 = 5.35 TPD





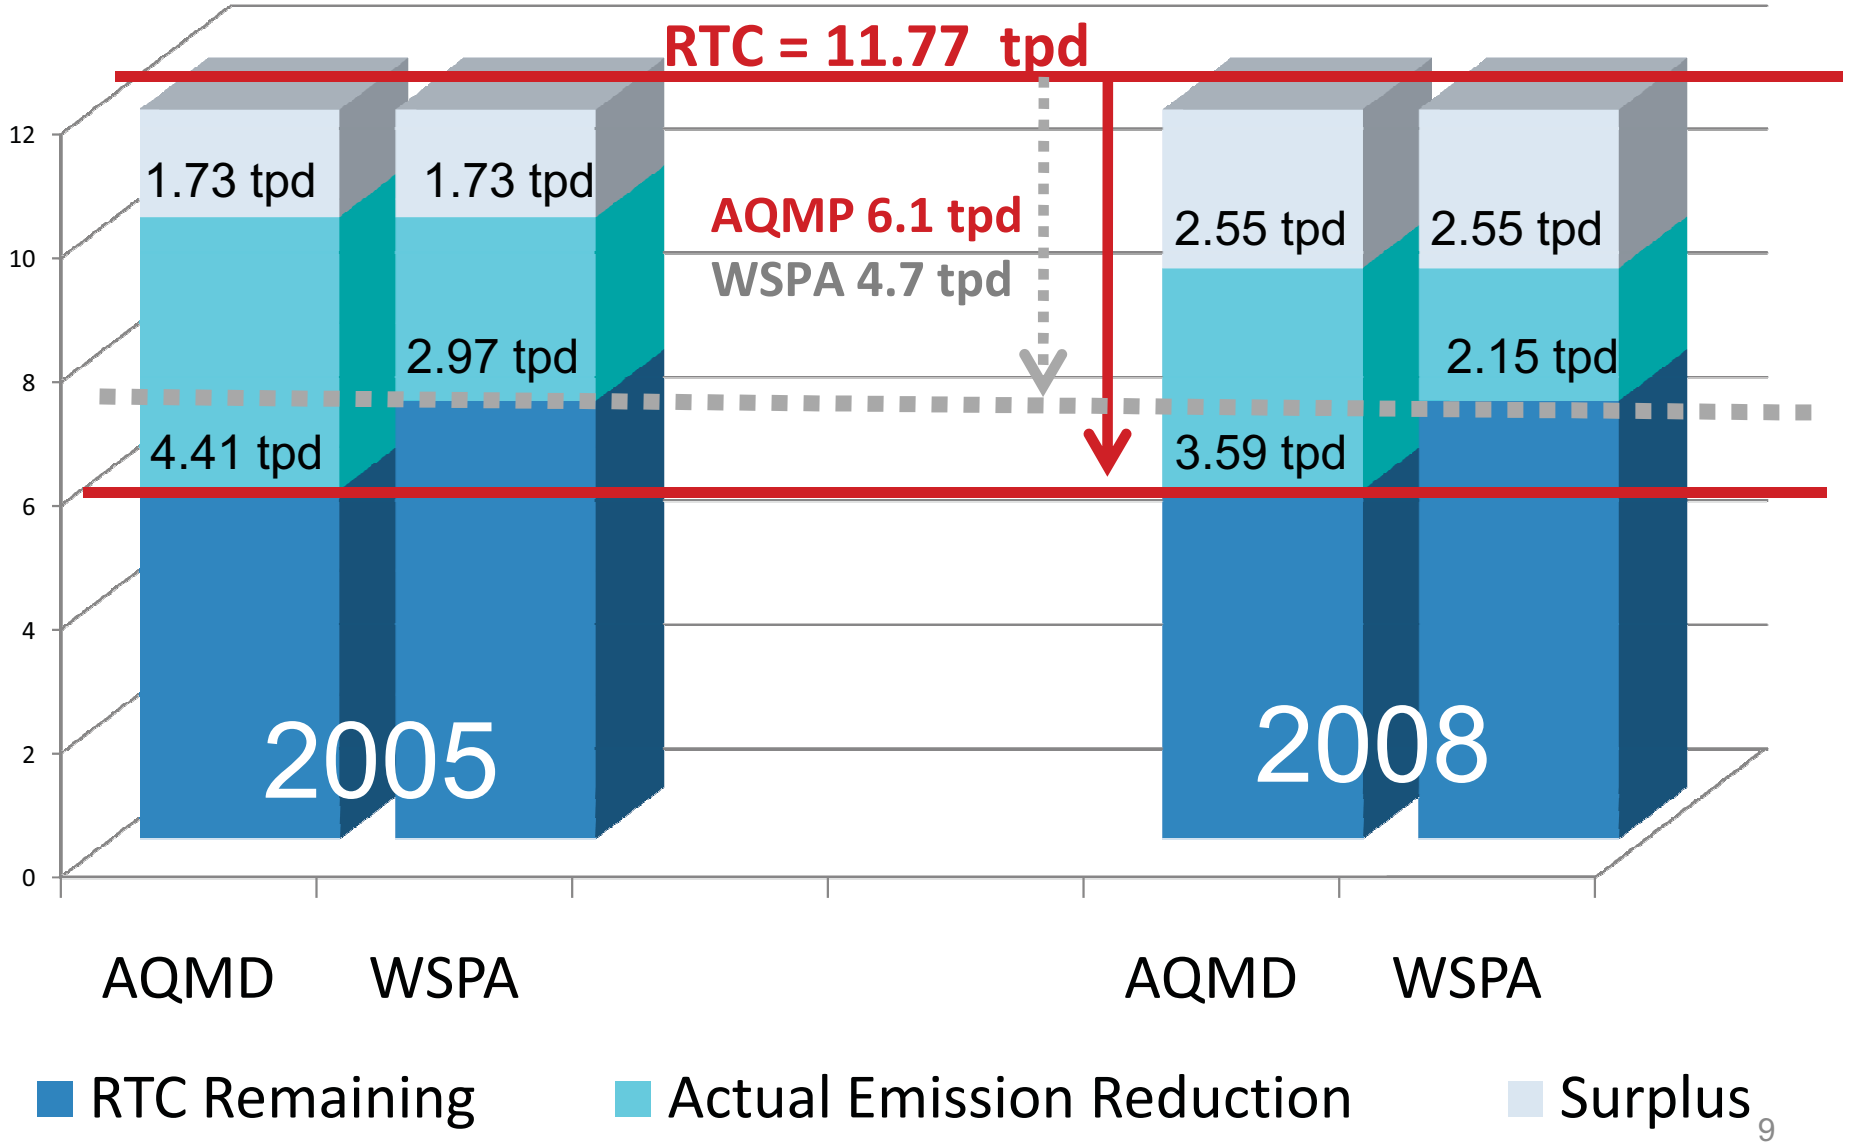
RTC = Reduction

RTC = Remaining Emissions

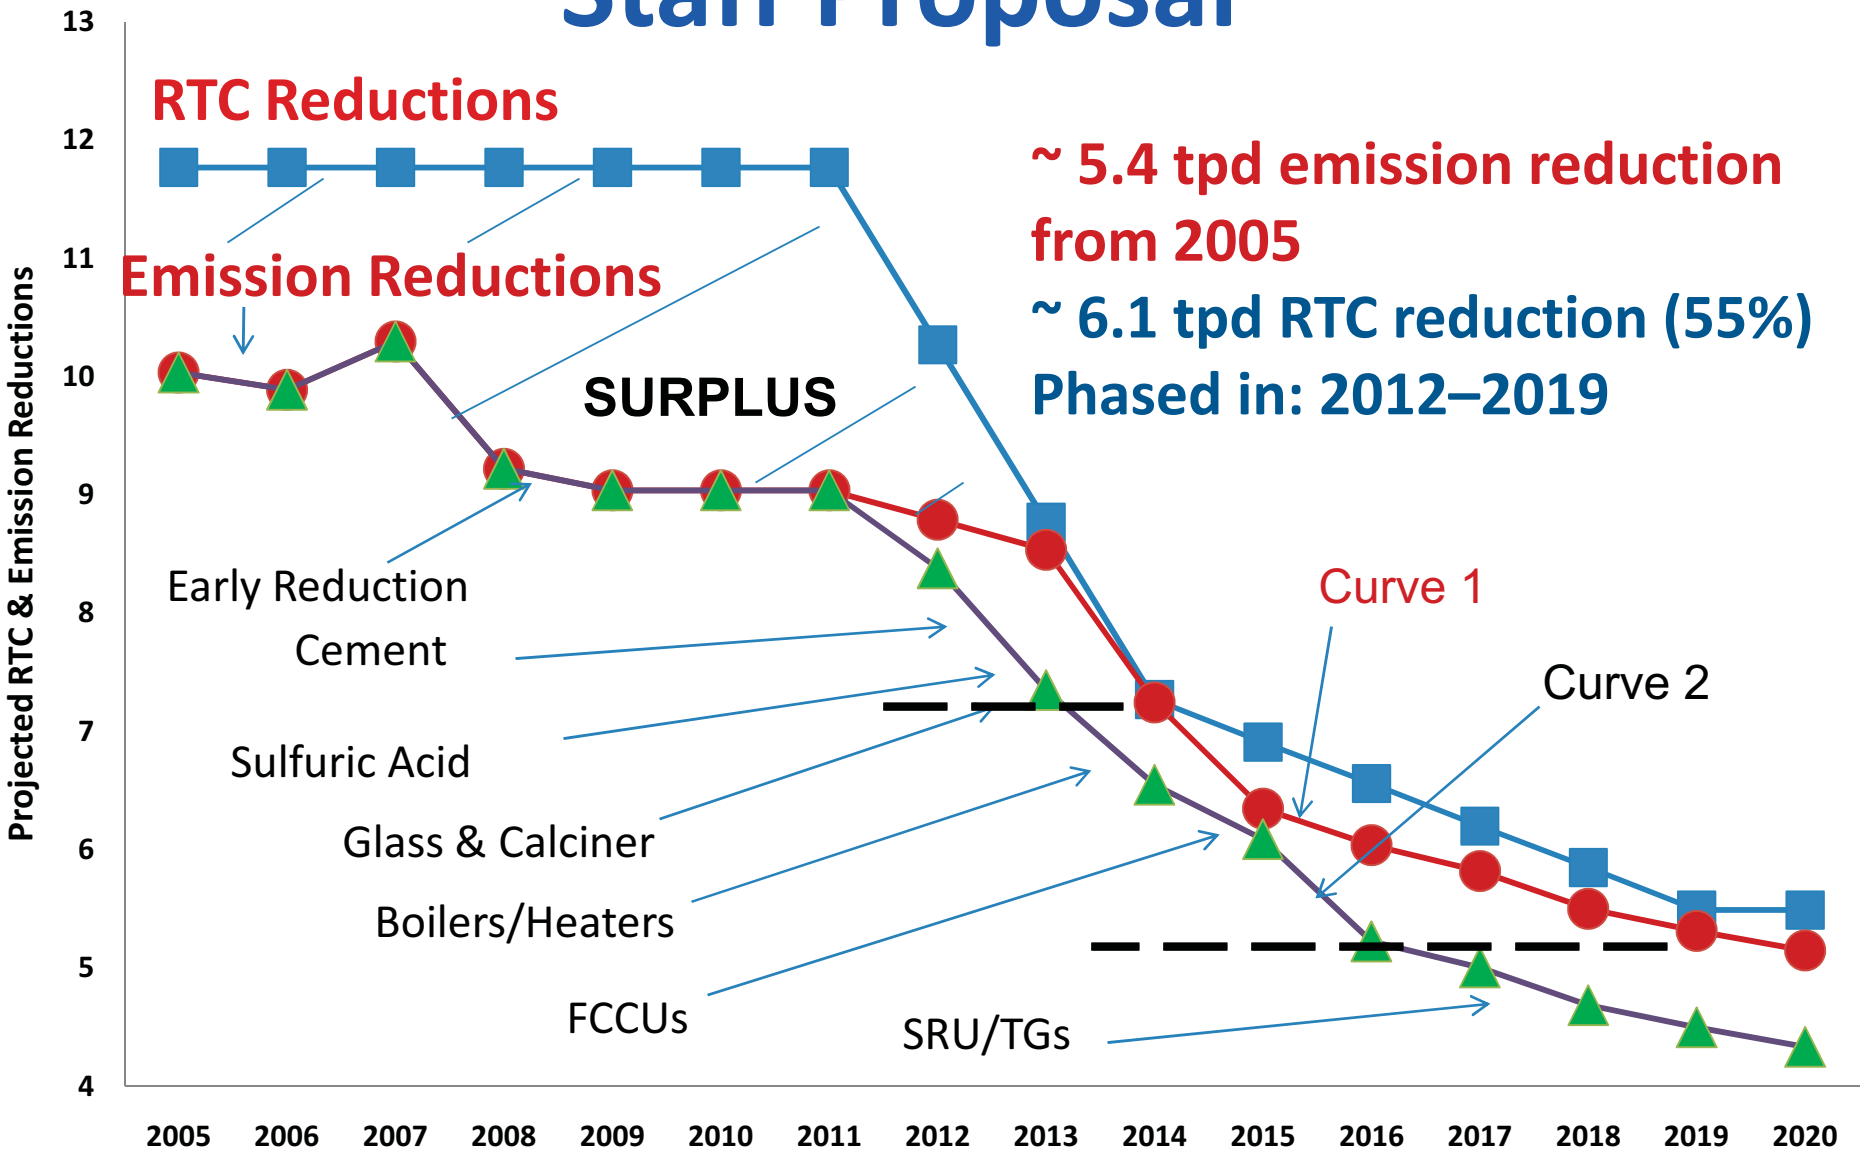
Summary Table (TPD)

	WSPA	AQMD
RTC Reductions	4.7	6.14
Act. Reductions 2005	2.97	4.41
Act Reductions 2008	2.15	3.59

Staff's versus WSPA's Proposal
RTC Reductions



Staff Proposal



Emissions - Curve 1: BARCT for staff proposal. Curve 2: Additional opportunity for reductions from boilers/heaters

Potential Strategy Options - Target 55% Shave

		Consultants' Estimates of PWV ($ Million)	Cumulative Costs ($ Million)	Emission Reductions (Tons per Day)	Cumulative Emission Reductions (Tons per Day)

AQMD Minimum reductions needed to reach 55% shave

Next Steps

- Continue to meet with stakeholders
- Draft Program Environmental Assessment – released on August 18, 2010. Comments due by October 1, 2010 (45-day review)
- Socioeconomic analysis on going; to be released 30 days prior to public hearing
- Set Hearing – October 2010
- Public Hearing – November 2010

Western States Petroleum Association

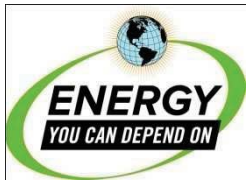
WSPA Presentation – RECLAIM SOx Shave

SCAQMD Refinery Committee

Presented by
Cathy Reheis-Boyd
President, WSPA

September 22, 2010



Where are we today?

- WSPA met with District staff more than 30 times since 2008 rule development began
  - Provided cost numbers to the District from WSPA's 3rd party Consultant, Environ
  - Individual companies have met with the District's consultants and District Staff to understand compliance costs
  - Offered Refinery tours to Board members
- July 30, 2010 WSPA proposed an alternate shave methodology to District Staff
- August 18, 2010 Refinery Committee meeting:
  - WSPA presented a new position from 25%/3 TPD shave by end of 2014 as required by the AQMP to 33% (3.9 TPD) by end of 2019 and District staff came back with 41% by end of 2014 and 55% (6.1 TPD) by 2019
  - Compliance costs and treatment of RTC's are two core unresolved issues that remain between WSPA and the District
  - Refinery Committee suggested WSPA and District come together on a shave
- September 16, 2010 WSPA President presented a revised proposal to Dr. Wallerstein; discussed by phone on September 17
  - WSPA proposed 40% (4.7 TPD) shave, with 3 TPD achieved by the end of 2014 AQMP target date and the remaining 1.7 TPD shaved by end of 2019
  - Dr. Wallerstein uncomfortable with WSPA's proposal; did not move from 55% but agreed to additional dialogue
- September 21, WSPA President and team and Barry Wallerstein and Staff met
  - Thoughtful dialogue; continue to discuss and resolve differences on treatment of RTC's and cost. Intent is to inform Socioeconomic Report and Board decision.

WSPA RECLAIM SOx Proposal: September 16, 2010

- Emission Reductions (RTC): 4.7 TPD reduced
- Universe of Sources: 11.77 TPD
- Percent Shave: 4.7 /11.77 = 40%

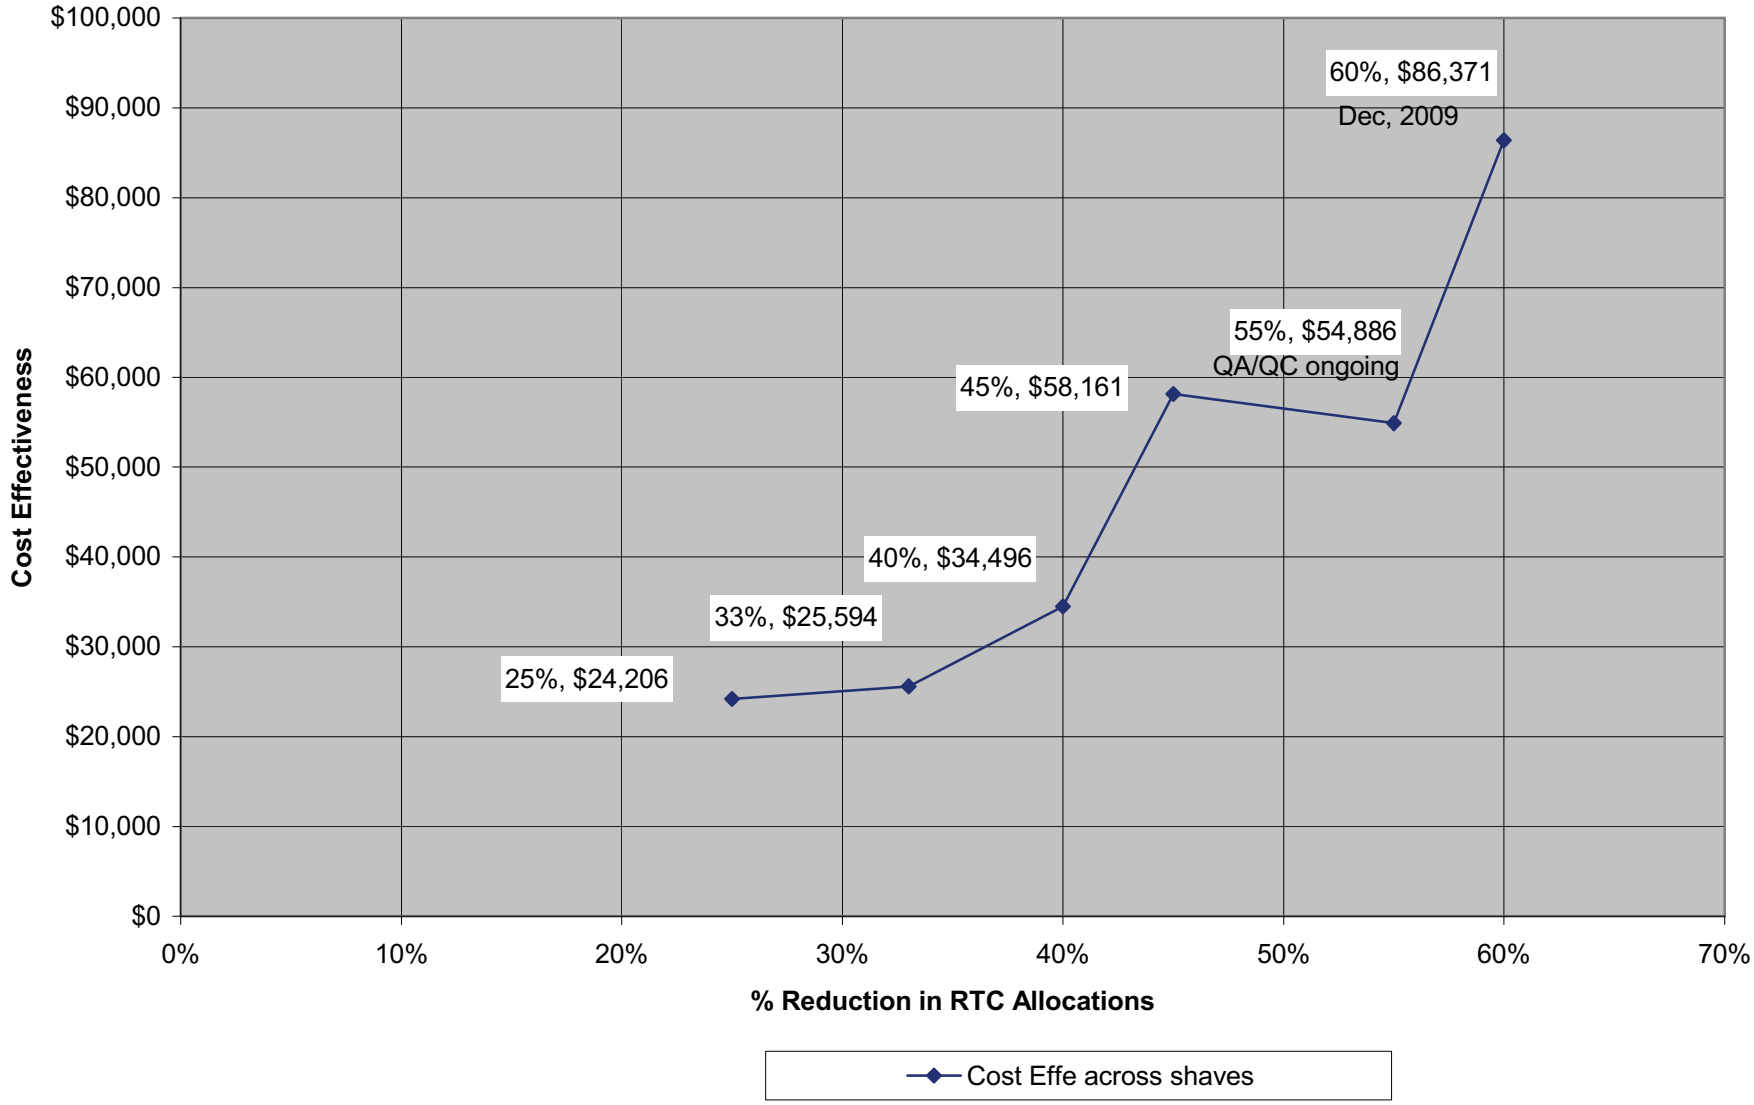
Underlying Facts

- RTC's: 1.98 TPD of RTC's (comprised of ERC's converted to RTC's and Clean Fuels Credits not subject to shave)
- Emission Reductions achieved as follows:
  - 3 TPD by end of 2014 (2007 AQMP)
  - Remainder of 1.7 TPD achieved by end of 2019
- Shave is across the board
  - Small sources and sources already at BARCT are included in shave
- Source Categories included in shave:
  - FCCU, SRU/TGU, Acid Plants, Glass Plants, Coke Calciner, Cement Plants
- Source Category excluded from shave:
  - Refinery Heaters and Boilers

WSPA Environ Cost Survey

- Initial Survey September-November, 2009
  - Final QA/QC completed – February, 2010
  - Presented to SCAQMD – April, 2010
- July 2010 Survey results updated presented to SCAQMD
- September 2010 re-survey to determine cost at SCAQMD 55% shave level and re-examine costs for other shave levels. Presenting to the District September 23, QA/QC still on-going
  - November-December, 2009:
    - 60%: $2,857,000,000
  - July, 2010:
    - 60%: $2,580,000,000
  - September, 2010
    - 55%: $1,516,000,000
- Why did cost change?
  - Change is expected as companies continue to refine their cost estimates with the regulation as AQMD proposals evolve
  - Some high-cost projects associated with more aggressive reductions in RTC allocations have been eliminated – lower cost alternatives used (e.g. WGS vs. Catalyst)

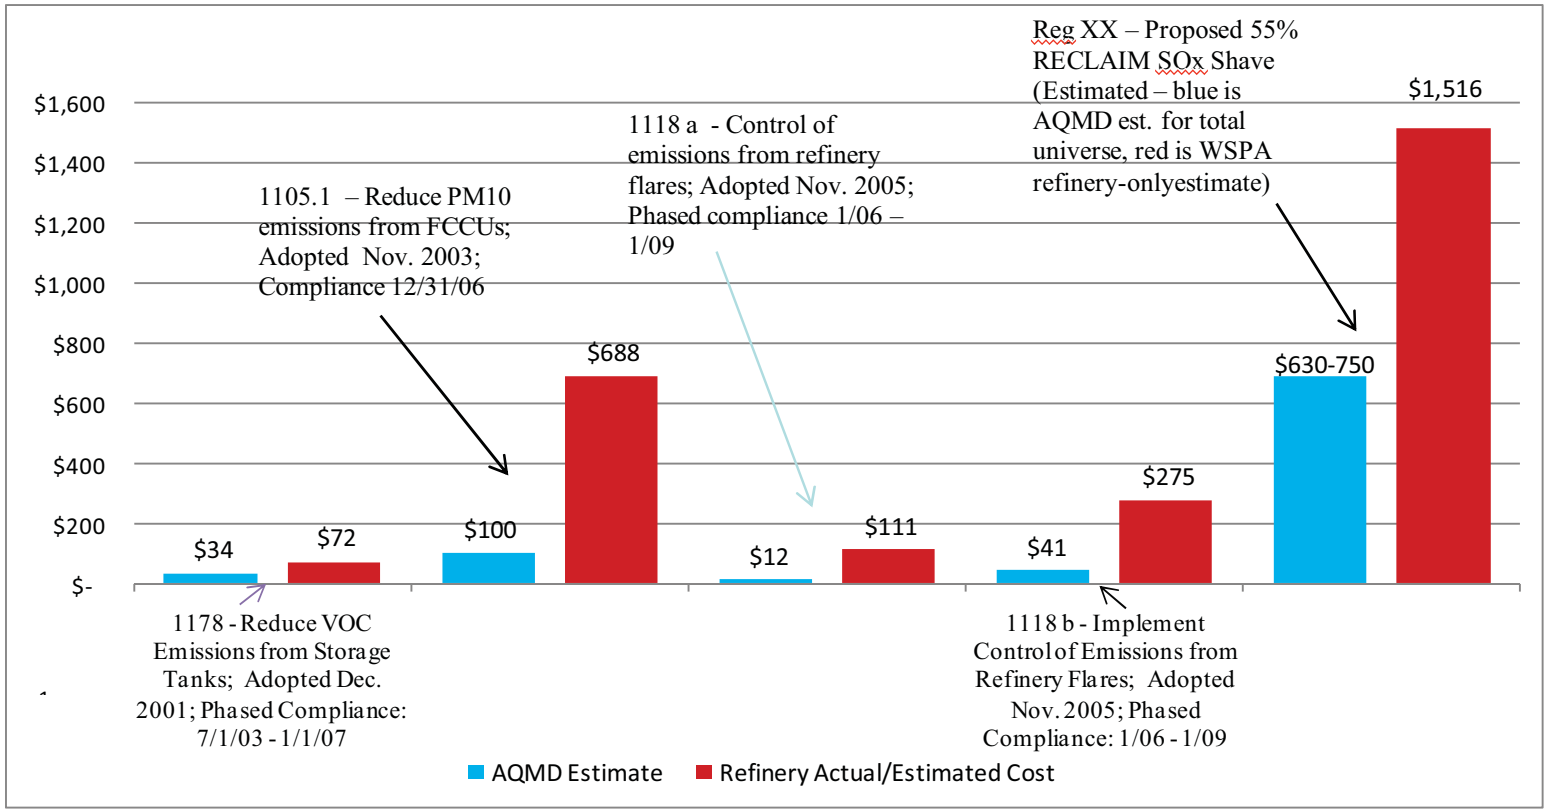
Cost Effectiveness for Refineries Across Shaves



Source: Environ

Western States Petroleum Association

SCAQMD estimated cost versus actual cost by rule



Norton Engineering Consultants (NEC)
SOx RECLAIM BARCT Report

- **NEC's capital and operating cost report was sent to WSPA on June 15, 2010.**
- **Report highlights errors and omissions underlying Staff Proposal key findings**
  - "As a result of the operating and capital cost differences noted in this report, we recommend AQMD recalculate SOx Control Cost Effectiveness Values with updated capital and operating costs were available. Some additional work is required to generate new capital and operating costs for allocations of alternative technologies on some units."
  - "Therefore we believe that the cost of control technology applications at these locations has been underestimated. A reasonable contingency to be added to the project costs for these facilities would be 50% of total direct plus indirect project cost."
  - "It appears that this single budget quote (FCCU wet gas scrubber) was used to develop costs for all five FCU scrubber installations. The Vendor D system consist only of a wet scrubber and a PTU purge water treatment plant. All other costs are excluded. NEC normally would have obtained a quote for each of the facilities or at a minimum quotes for three units to more accurately develop a size scaling factor."
  - "In general, the NEC estimates approximately doubled the cost of the ductwork and knife gate valves included in the original FCCU control technology estimates."
  - "NEC did not recalculate original cost effectiveness factors. However, in reviewing the consultants' operating cost work-up, we felt the annual maintenance costs were significantly underestimated."

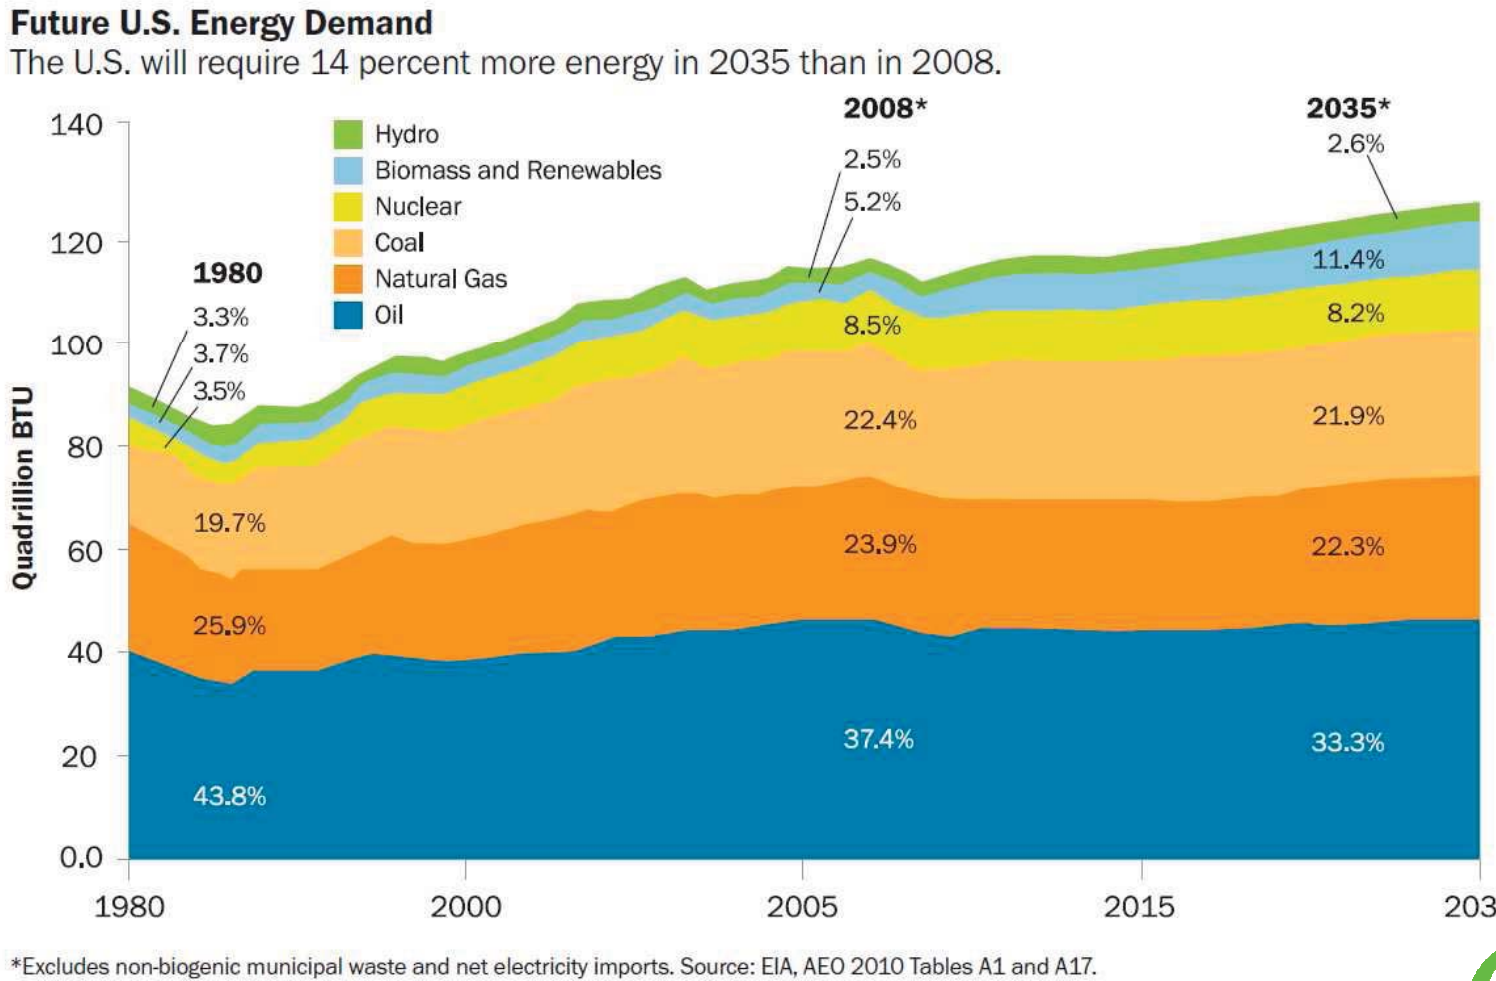
Several hundred million gallons of additional water annually

- Statewide drought, new era of limitations, allocations and mandatory conservation
- SB 7 Statewide 20% reduction in urban water use and requires urban water suppliers to set an interim urban water use target (December 31, 2015), and meet the overall target by December 31, 2020.
- Statewide Water Districts have taken actions such as: 1) asking for voluntary reductions; 2) imposing mandatory restrictions or declaring a local emergency; 3) imposing agricultural rationing; 4) imposing drought rates, surcharges and fines; 5) limiting new development
- Three out of six Refineries currently do not have access to recycled water
- Consideration needs to be given to all of the following issues:
  - Additional capital costs to construct and permit the infrastructure and who pays?
  - Can recycled water can be supplied within the timeframe required for compliance?
  - Water purveyor indicated a current water price ($800 per acre-foot) and the costs for higher quality water (such as boiler feed water) is more than $1,250 per acre-foot.
  - Availability and reliability of water delivery?
- The District's assertion that reclaimed water use can cost-effectively displace an increase in water requirements in the face of mandated reductions of 20% in potable water needs to be substantiated through an analysis - an analysis that has never been conducted.

Cumulative Rules
SCAQMD, LA/LB Port, CARB, EPA

- Southern California refineries are the world's cleanest
- SCAQMD requirements since the 1980s have reduced emissions from most sources by more than 90%
- 47 recently adopted or planned near-term rules will impact directly emitted particulate matter (PM) or principal PM precursors (SOx and NOx)
- A quarter of the SCAQMD's 47 rules impact petroleum industry (primarily refineries) for emissions and stationary sources or producers of transportation fuels
- Federal RFS2; AB 32; LFCS; fuel reformulation; Clean Fuels Outlet regulation

Future U.S. energy supply projections



*Excludes non-biogenic municipal waste and net electricity imports. Source: EIA, AEO 2010 Tables A1 and A17.

Renewable and Alternative Energy Projects

- California refiners added close to 1 billion gallons of ethanol to gasoline last year, making California the largest ethanol consuming state in U.S.

- Shell: wind farm displaces 85,000 tons of carbon dioxide
- BP: $500 million research to UC Berkeley
- BP: Occidental First of its kind Hydrogen energy project
- Chevron: photovoltaic facility to help power operations
- ConocoPhillips: developing hydrogen infrastructure and animal fat to renewable diesel process
- ExxonMobil: exploring new approaches to internal combustion engine technology
- Valero: implemented efficiencies that will reduce greenhouse gas emissions
- Tesoro: flare gas compressors to reduce flaring
- Occidental and AERA: cogeneration facilities produce electric power and steam
- Chevron, and Shell: members of the California Fuel Cell Partnership

Working together

- Continue working toward a constructive solution
- Support a cost-effective shave
- Include WSPA consultant's cost information in Socioeconomic Report
- Schedule follow-up meeting of Refinery Committee to review Final Program Environmental Assessment, Socioeconomic Report and other pertinent information
- Provide information to Stationary Source Committee Friday, September 24
- Offer refinery tours to Board members

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 29B

REPORT: Refinery Committee

SYNOPSIS: The Refinery Committee met Thursday, October 14, 2010. Following is a summary of that meeting.

RECOMMENDED ACTION:
Receive and file

Jane Carney, Chair
Refinery Committee

EC:LT:JC:GQ:KO

Attendance

Jane Carney, Committee Chair, called the meeting to order at approximately 1:30 PM. Present were Committee Members Judith Mitchell and Dr. Joseph Lyou.

Overview of Proposed Amendments to SOx RECLAIM Program

Dr. Laki Tisopulos, Assistant Deputy Executive Officer with Planning, Rule Development and Area Sources, gave a presentation highlighting a cost comparison between the AQMD and WSPA proposals for the SOx RECLAIM Trading Credit (RTC) reductions. In addition, water demand/supply, market safety valves, and the District's Socioeconomic analysis were discussed. Dr. Tisopulos stated that the costs for the refineries in achieving the necessary SOx reductions under the staff proposal should be far less than the 1.6 billion dollars WSPA is claiming. He indicated that most of WSPA's cost-ineffective strategies listed in its "others" category (or $700 million) may not need to be utilized since emission reductions from the remaining strategies submitted by WSPA are more than adequate to meet the proposed shave target. Dr. Tisopulos also stated that additional reductions from both the refinery and non-refinery sectors could potentially be available, providing an additional margin of safety.

Some industry representatives were concerned about the value of the future RTC prices. Dr. Tisopulos explained that the cost of future RTCs will depend on the cost of controls and supply and demand of RTC's. Industry representatives also were concerned about the reasoning and criteria for the District's selection of $50,000 per ton of SOx RTCs as the safety valve threshold. Dr. Tisopulos responded that there was a natural break in the proposed control costs. Dr. Wallerstein, AQMD Executive Officer, also responded that the PM impacts of SOx and effectiveness of SOx relative to other PM2.5 precursors are also factored into the threshold selected, as was done in the NOx RECLAIM program and the 2007 Air Quality Management Plan (AQMP). A refinery representative asked if the affected facilities should rely on this as a safety valve. Dr. Wallerstein stated that the District may be open to other safety valve criteria.

In the District's presentation, it was stated that recycled water supplies would be available to supply the wet gas scrubbers under the proposed project. Three of the six major refineries are currently receiving recycled water. The District's presentation also showed that the existing recycled water infrastructure is being expanded to supply recycled water to the remaining three refineries and possibly other facilities. The off-site infrastructure expansion cost (about $150 million) is born by ratepayers in Los Angeles; while the on-site (within the facility) costs will likely be subsidized by LADWP. Dr. Tisopulos stated that the consultants' analyses had also accounted for the on-site costs. LADWP representative affirmed this statement by saying that recycled water use is currently being evaluated and assessed for each facility. After the assessment, LADWP will evaluate the cost effectiveness of delivery and then set a rate to make it attractive to each facility. WSPA emphasized the point that the recycled water infrastructure costs are currently being evaluated by LADWP, not that the funds have already been subsidized. Dr. Tisopulos explained that potable water will be the backup water supply in the event that there are any temporary issues with recycled water delivery, once it is provided.

The District's Socioeconomic analysis found that the staff proposal would result in job creation during the initial years of the programs and job losses during the outer years averaging in annual loss of 3 to 9 jobs. On the other hand, staff's analysis of WSPA's cost estimate of the staff proposal resulted in 202 jobs created annually. The proposed project would initially produce jobs during the construction period and result in some job losses afterward. WSPA representatives stated that the District did not factor in the impacts of a refinery shutting down in the analysis. Dr. Wallerstein stated that the range of job losses is within the acceptable range for job losses and economic impacts of past rulemakings.

WSPA representatives (Cathy Reheis-Boyd and Joe Sparano) presented to the Committee a slide presentation outlining WSPA's SOx RTC shave proposal and the associated costs of meeting BARCT and shave requirements. WSPA conducted an

economic analysis evaluating the possible impacts of a median-sized refinery shutting down. Dr. Wallerstein stated his concern in trying to grasp this scenario and added that if a refinery were to shut down, the cleanup and land reuse would cause a possible positive ripple effect to the local economy. Additionally, Dr. Wallerstein posed the question of which refineries would pick up the slack for the lost jobs, fuel, etc. Furthermore, Dr. Wallerstein stated that AQMD staff does not agree with WSPA's presentation on additional money that needs to be invested by the refineries to meet the shave. Elaine Chang, AQMD Deputy Executive Officer, added that all of the extra costs would be appropriate for a command and control regulation, not for cap and trade.

Board Member Carney stated that she is pleased with the progress of the rulemaking. Cathy Reheis-Boyd and Dr. Wallerstein both stated that they are hopeful that the District and WSPA will come to an agreement. Board Member Mitchell stressed that the philosophical differences in the RTC reduction approaches need to be resolved. Dr. Wallerstein requested another Refinery Committee before the November 5th Governing Board Meeting. Dr. Lyou requested that the Committee discuss the ERCs to RTCs portion of the shave in addition to the legal requirements at the next meeting.

PUBLIC COMMENTS

The Committee then opened the floor to comments from the public. These comments focused on concerns regarding the impacts on jobs and business with this regulation, particularly outside the refineries, and with the necessity to move forward and approve the staff proposal.

Meeting adjourned at 4:00 pm.

2 – WSPA Presentation

SOx RECLAIM
Refinery Committee Meeting

October 14, 2010

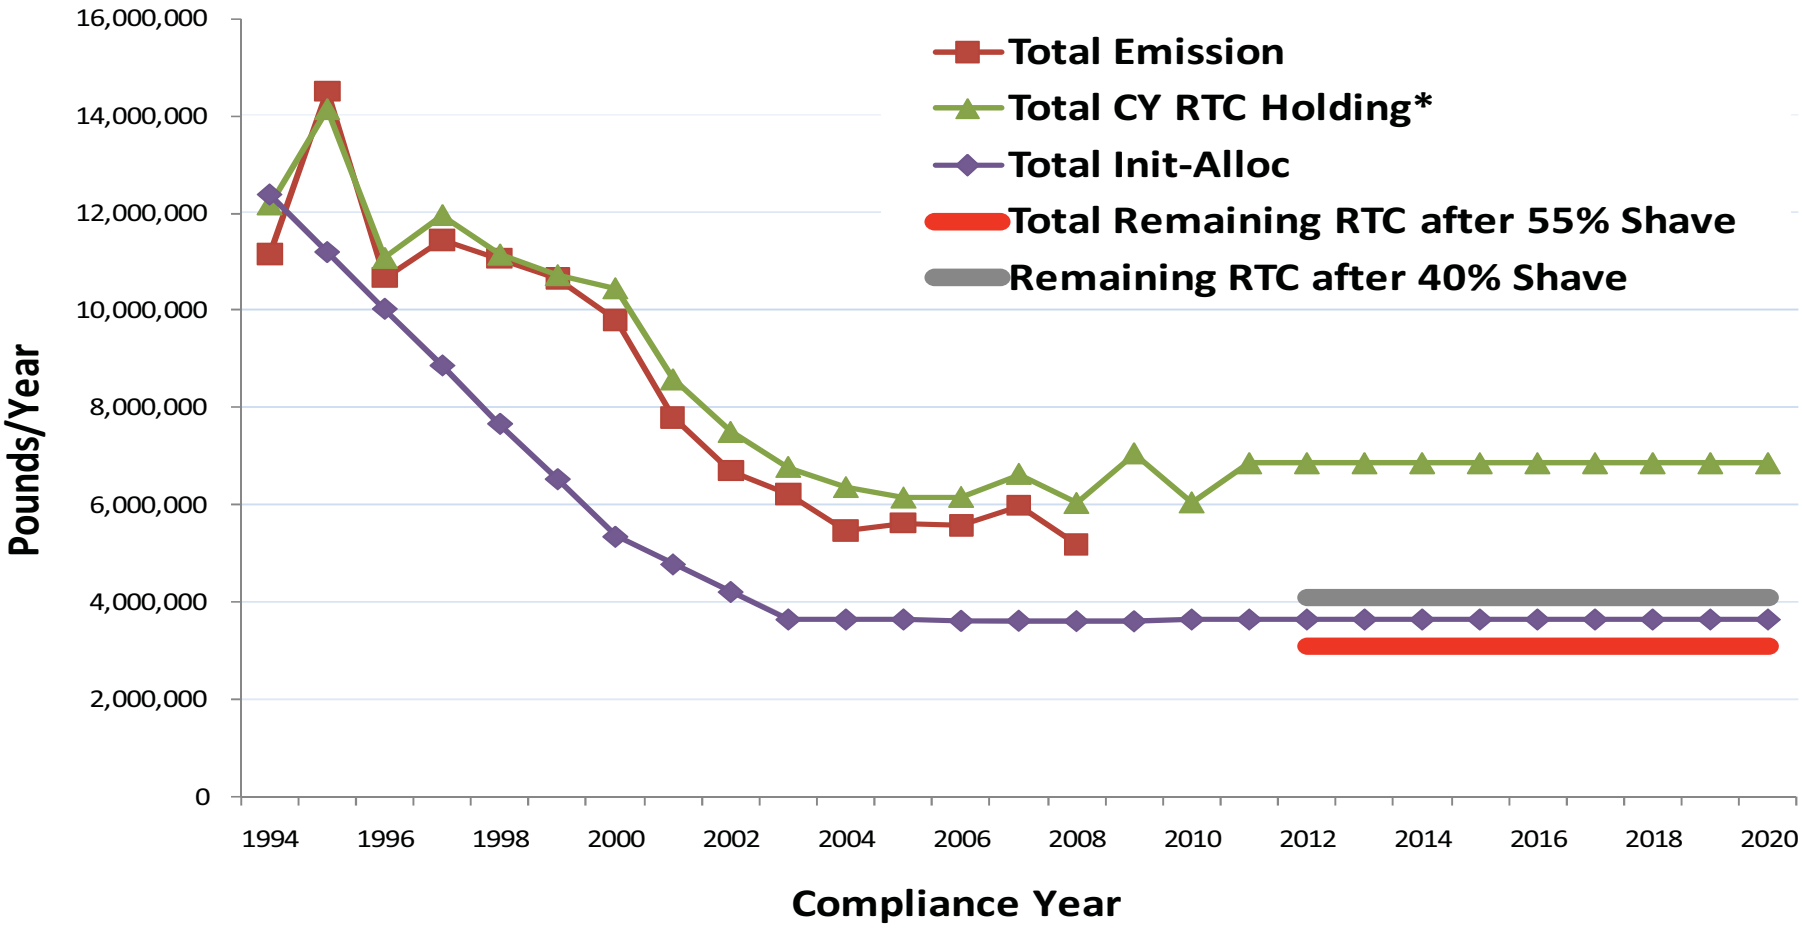
Outline

- Staff Proposal
- Cost Comparison (AQMD versus WSPA)
- Safety Valves
- Cost Effectiveness versus Percent Shave
- Water Demand & Supply
  - —Recycled Water Infrastructure
- Socioeconomic Analysis

Staff Proposal

- Total RTC reductions = 6.1 TPD (55% Shave; 5.4 TPD actual emission reductions)
- Two-phased reductions: 4.5 TPD by 2014, Remaining 1.6 TPD by 2019
- Limited exemption for certain small emitters
- Provisions for market viability
  - Set-aside RTC amounts similar to NOx RECLAIM
  - Board review if SOx RTC price greater than $50,000 per ton SOx

Refineries under RECLAIM



Cost Comparison

AQMD's Main Strategy						
		Limit	Reduction (TPD)	Range of Costs ($Million)		CE ($/ton)
FCCU	4 WGS	5 ppmv	2.01	360	389	$20K - $21K
SRU	3 WGS	5 ppmv	0.60	174	187	$31K - $44K
Other Units	1 WGS and other process modification	10 ppmv	0.31	27	62	$9K - $22K
Early Reductions (FCCU, SRU)	1 WGS and other process modification	5 ppmv	1.00	-	-	
Sub Total			3.92	561	638	$16K-$18K

WSPA's Main Strategy					
		Limit	Reduction (TPD)	Costs ($Million)	CE ($/ton)
FCCU	2 WGS	5 ppmv	1.60	328	$22K
	3 DeSOx	6-35 ppmv			
SRU	2 WGS and other process modification	5-25 ppmv	0.36	331	$101K
Other Units	1 WGS and other process modification	Not specified	0.98	177	$20K
Early Reductions (FCCU)	1 WGS	5 ppmv	0.87	-	
Sub Total			3.81	836	$24K

Costs for WSPA's "Other" Strategies

Project		Reduction (TPD)	Costs ($Million)	Cost Effectiveness ($/Ton)
SRUs	15 ppmv	0.13	253	213,277
Fuel Gas Treatment	<40 ppmv	0.49	467	104,445
CEMS Improvements	3 projects	0.26	4	1,686
RTCs		1.24	77	6,805
Total for Others		**2.12**	**801**	**41,406**
Total for Others (excluding cost-ineffective projects)		**1.5**	**81**	**5,918**

Likely Refinery Compliance Strategy

RTCs Needed for 55% Shave = 5.17 TPD

WSPA Strategies	Reduction (TPD)	Costs ($Million)
1. WSPA's Main Strategy	3.81	836
2. "Other" Cost-Effective WSPA Strategies	1.5	81
Total Actual Reductions & Costs	**5.31**	**917**
Average Cost Effectiveness = $18,925 Per Ton		

Other Potentially Available RTCs = 1.44 TPD

- Rem. Unused RTCs by Refineries = 0.37 TPD (2005)
- Investor-Owned RTCs = 0.002 TPD (Current)
- RTCs from Non-Refinery Sector = 0.54 TPD
- RTCs from Refinery Sector = 0.53 TPD ?

Grand Total Available = 5.31 + 1.44 = 6.75 TPD

Surplus = 6.75 – 5.17 =1.6 TPD

Key Question

IS WSPA's ASSUMPTION FOR ADDITIONAL COSTS AND REDUCTIONS ($801 MILLION, 2.12 TPD) REASONABLE?

- Not reasonable under a market based program such as RECLAIM
- Relies on getting reductions at each facility (similar to Command-and-Control program)
- Discounts key principle and benefits of a cap and trade program that cost-effective off-site reductions will substitute for cost-ineffective on-site controls

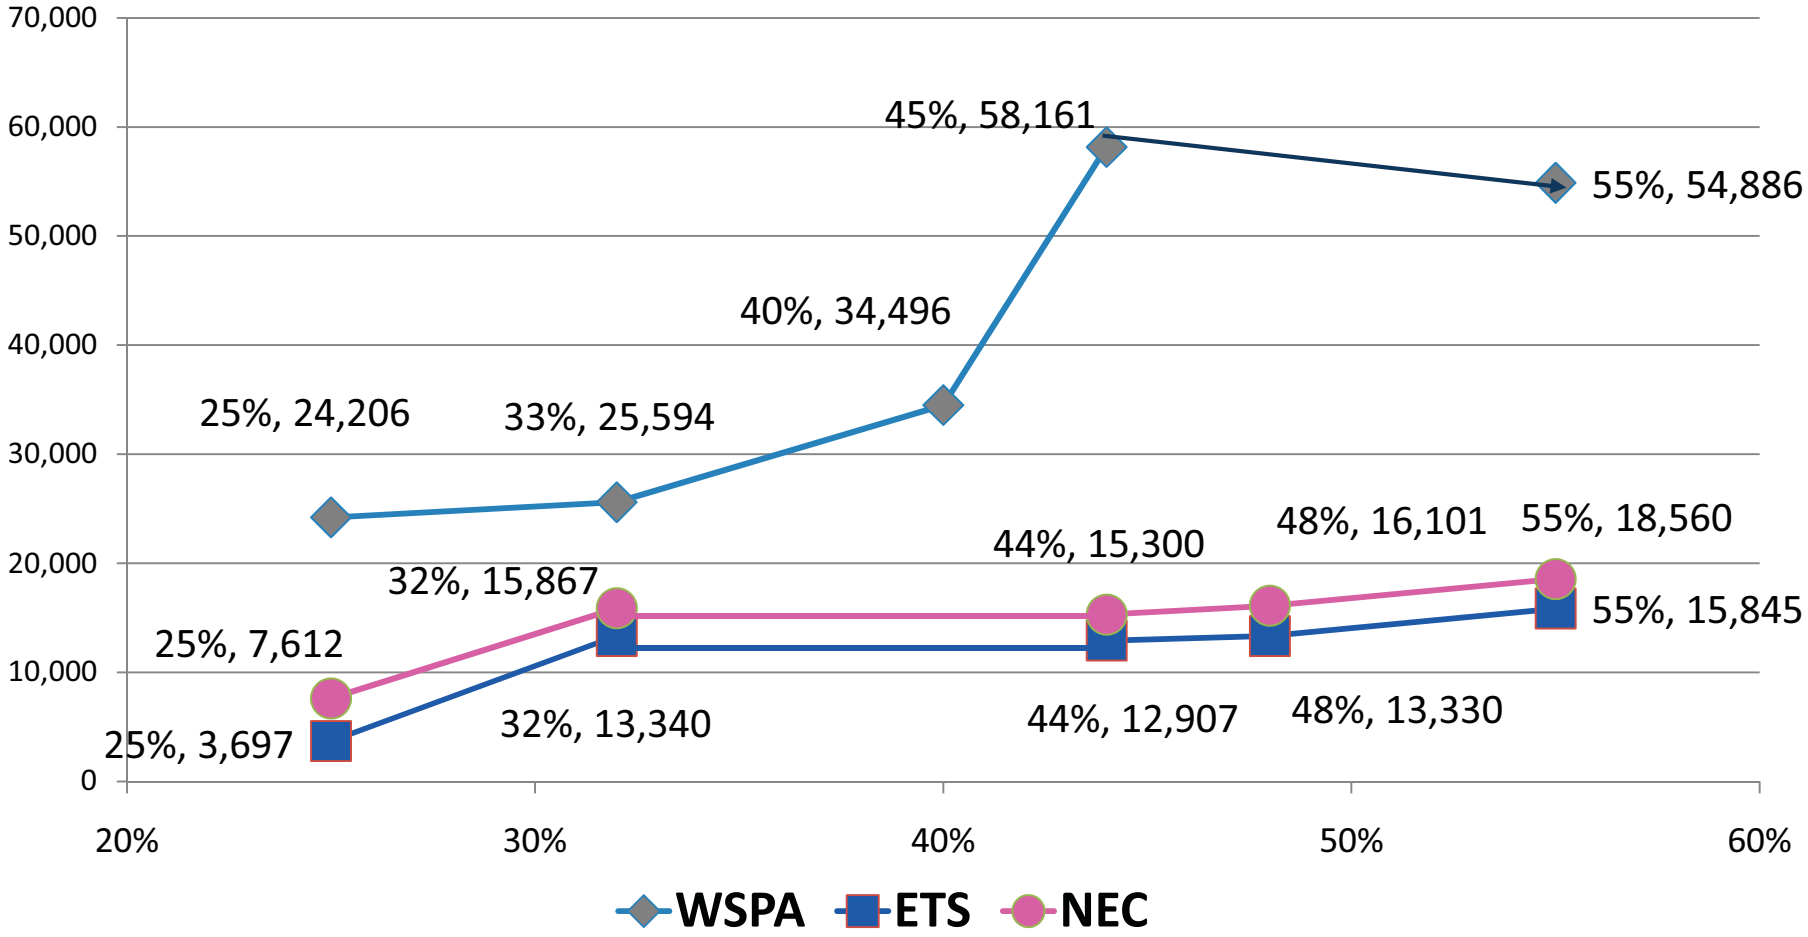
Key Question (Cont.)

- Underestimates reduction potential of main strategies:
  - —DESOX CATALYSTS CAN ACHIEVE 5 ppmv. (WSPA assumes 6 ppmv – 35 ppmv)
  - —WGS CAN ACHIEVE 5 PPMV (WSPA assumes 5 – 25 ppmv)
- Cost-effective reductions from other non-refinery facilities/sectors and investors will be available, will be used , and MUST be considered
- Staff Proposal Provides Other Safety Valves

Safety Valves
(Included in Staff Proposal)

- Gradual annual reductions with extended compliance schedule (2012-2019)
- Staff to begin monitoring RTC price trends (12-month rolling average)
- Hold Public Hearing if RTC price exceed $50,000 per ton (discrete price)
- Ability for Board to set-aside (give back) up to 100% of RTC reductions for any year when RTC price exceeds $50,000 per ton

Cost Effectiveness versus Percent Shave



AQMD & Consultants

55% - Staff's proposal

48% - Exclude SRU/TG control, **44%** - Exclude SRU/TG and cement control

32% - Exclude SRU/TG, cement and glass, **25%** - only coke calciner and sulfuric acid control

WATER
DEMAND & SUPPLY

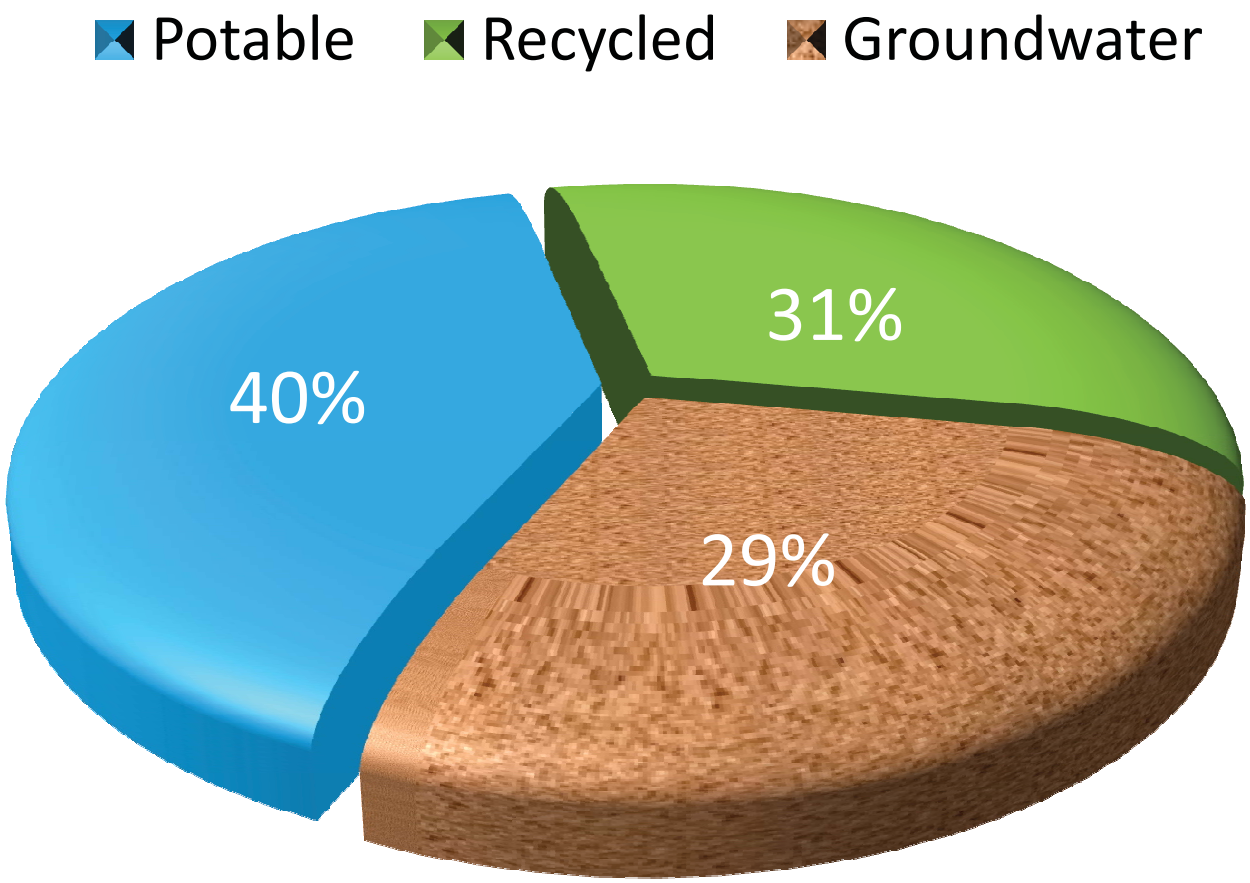
Water Demand

Facility	Baseline (Million Gals/Day)	Increase (Million Gals/Day)	% Increase
Refinery 1	2	0.04	2%
Refinery 2	9	0.2	2%
Refinery 3	10	0.2	2%
Refinery 4	6	0.06	1%
Refinery 5*	9	0.02	<1%
Refinery 6	12	0.2	2%
Sulf. Acid	0.7	0.02	3%
Coke	1	0.04	4%
Glass	0.1	0.06	48%
Cement	3	0.1	3%
Total	53 Million Gals/Day 163 Acre-Ft/Day 59 Thousand Acre-Ft/Yr	1 Million Gals/Day 3 Acre-Ft/Day 1 Thousand Acre-Ft/Yr	2%

Water Demand

- South Coast Regional Water Demand = 6.37 Million Acre-Ft Per Year
- Total Water Increase for SOx RECLAIM = 1,000 Acre-Ft Per Year. Only 0.02% of South Coast Water Demand
- Water Suppliers Can Meet Demand for Next 20 Years (2005 Urban Water Management Plans)
- Potable Water Increase = 0.3 Acre-Ft per Day = 110 Acre-Ft per Year. Negligible Effect on Governor's Goal of 20% Potable Water Reduction by 2020
- Recycled Water & Well Water Available

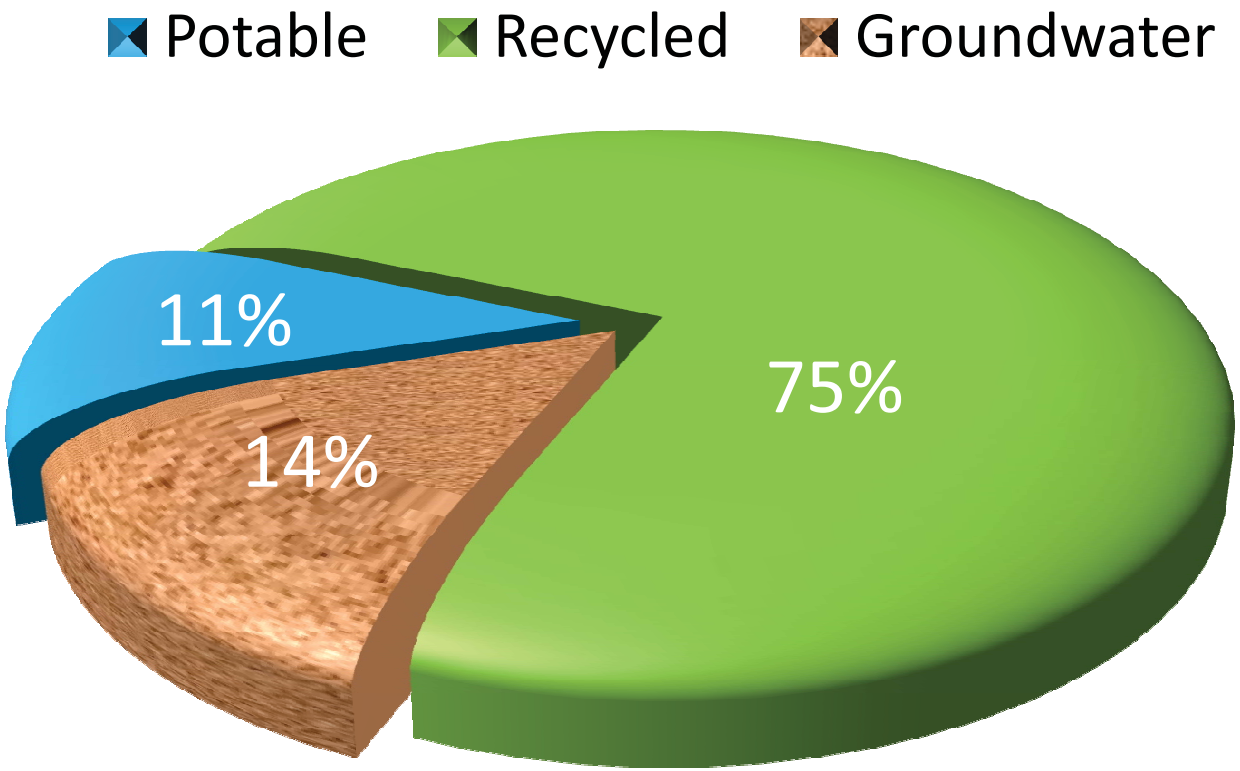
Current Water Demand



Total Baseline Water Use in CEQA = 57,790,000 gallons per day (based on previous CEQA documents)

Future Water Demand

With Wet Gas Scrubbers (Option 1) If Future Supplies of Recycled Water ARE Available

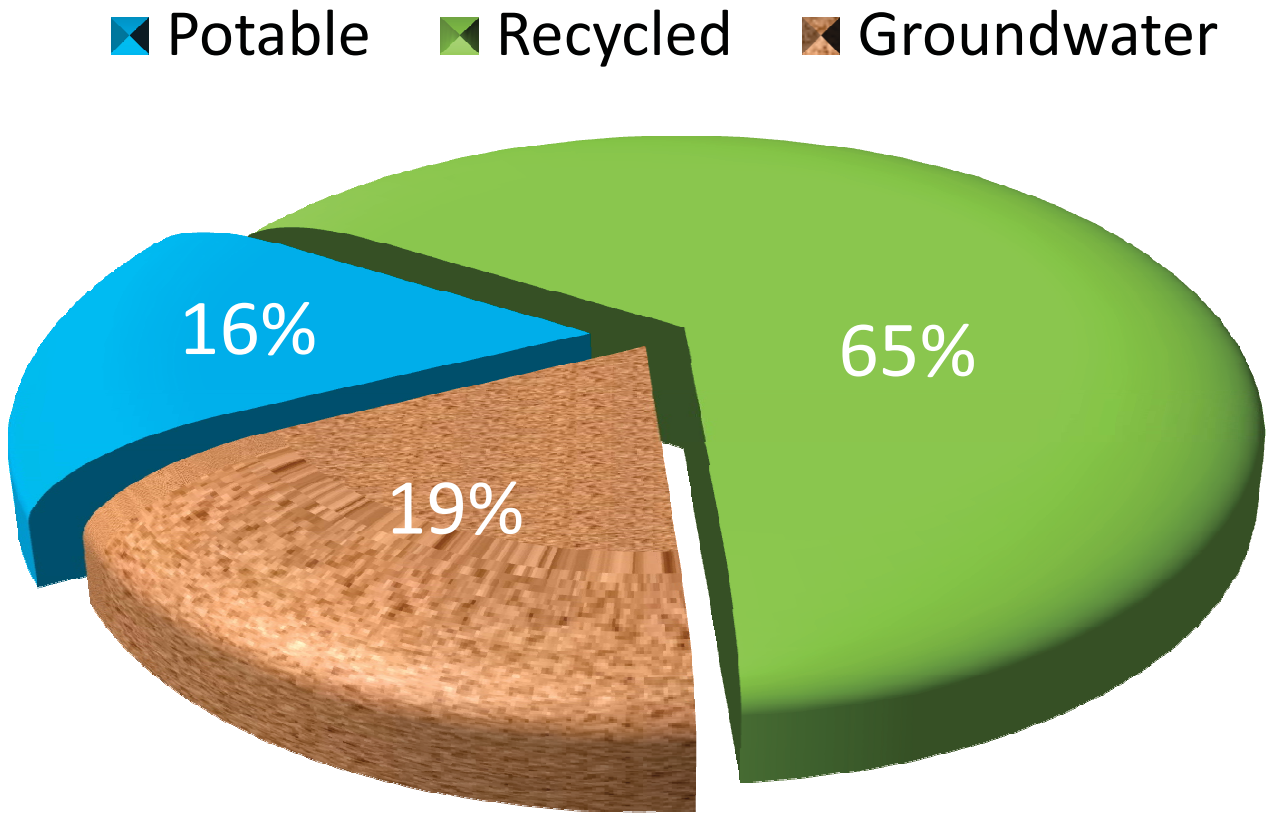


Increase in Water Use = 883,368 gallons per day

Potable water projected increase is below CEQA Significance Threshold

Future Water Demand

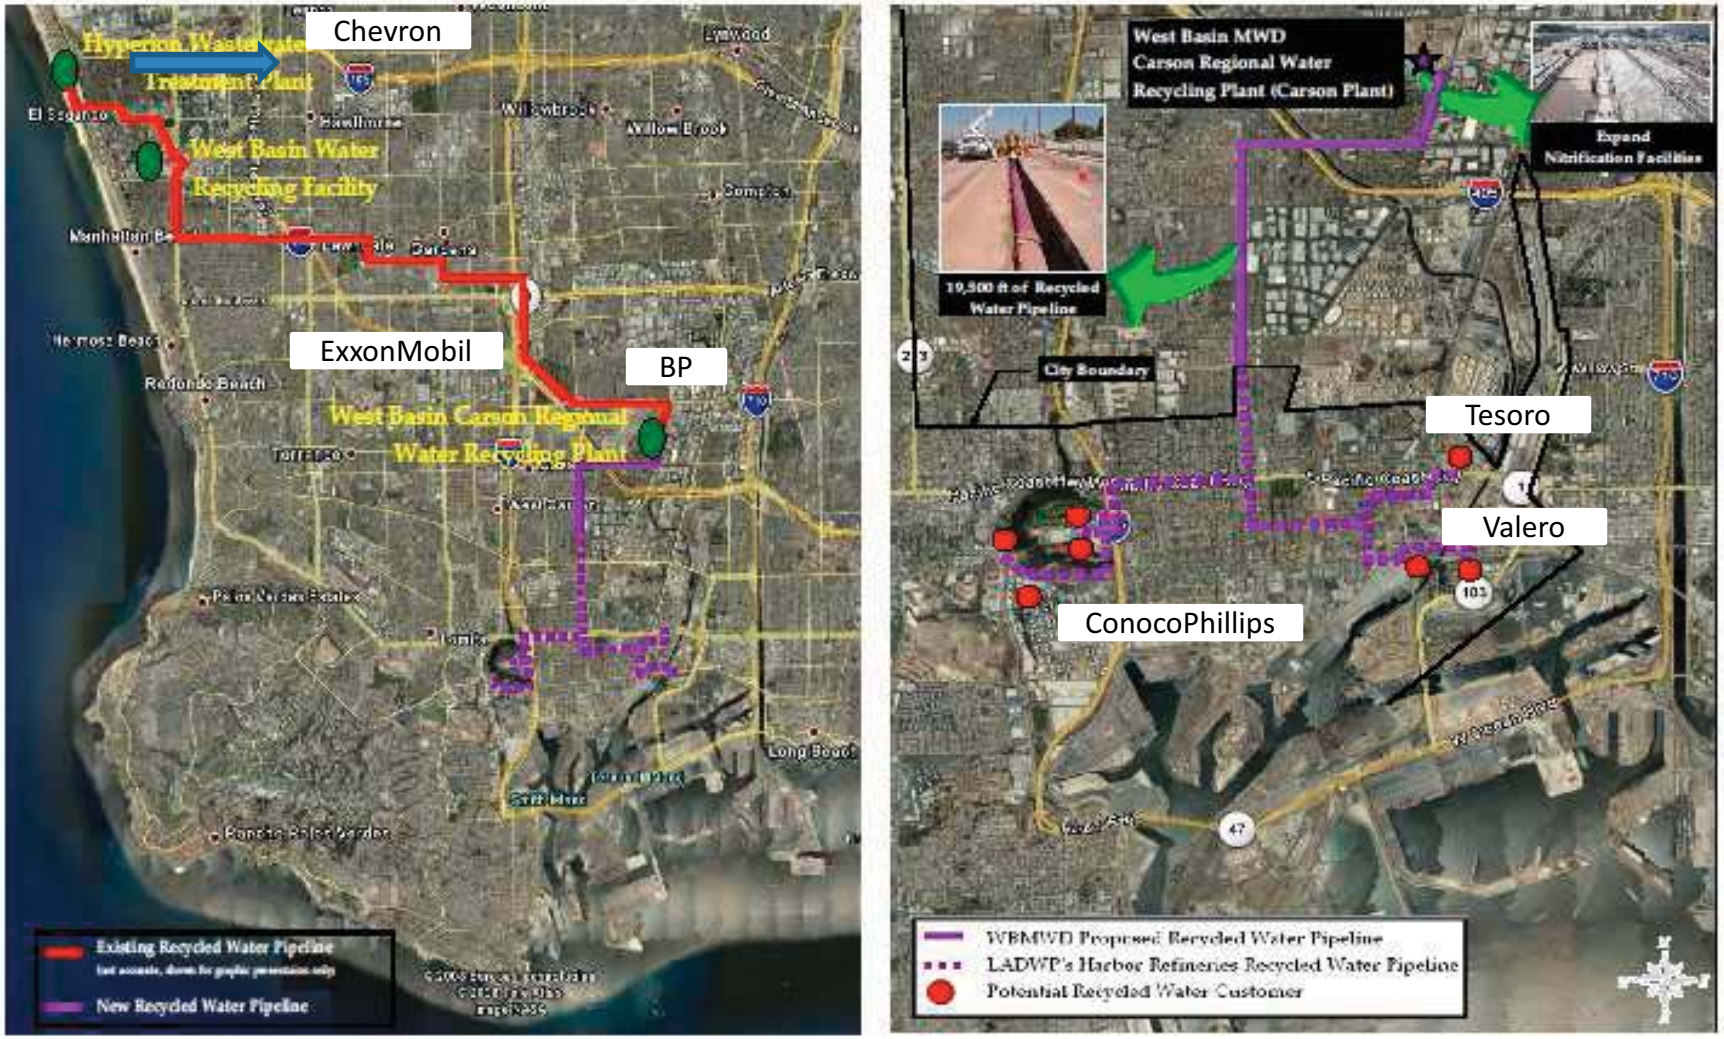
With SOx Reducing Catalysts (Option 2) If Future Supplies of Recycled Water ARE Available



Increase in Water Use = 642,272 gallons per day

Potable water projected increase is below CEQA Significance Threshold

Recycled Water Infrastructure



Reference: LADWP/West Basin Recycled Water System Serving Los Angeles Harbor Area

Recycled Water Project

Reference: LADWP/West Basin Recycled Water System Serving Los Angeles Harbor Area

Recycled Water Infrastructure Costs
(Outside Refinery's Boundary)

- **Expansion Cost: ~ $150 Million**
- **Costs of delivering recycled water to the refineries to be born out by all rate payers in Los Angeles**
- **Onsite costs of conversion to be subsidized by LADWP**
- **Cost for recycled water not to exceed potable water cost**
- **Future piping structure has capacity to displace all types of water usage at refineries**

Water Infrastructure Costs
(Inside Refinery's Boundary)

- **Consultants did include costs of piping infrastructure**
- **ETS/AEC** " … include in the cost estimates all the monies required to construct and/or supply utilities (such as steam, electricity, and water), as well as infrastructure (e.g., sewer and wastewater treatment), associated with each measure……." (p.33 Module 2 Report)

  "… Costs to obtain additional water either from an external source or by reallocating the water already used in a given refinery are one of the items covered in the contingency." (p. 51 Module 3 Report)
- **NEXIDEA** "It must be pointed out that (to handle) … utility upgrades that might be required to supply power and water….a 35% contingency was added to the base costs…. (p.11 Report for Sulfuric Acid Plants and Coke Calciner)
- **NEC** "… The original project estimate included an allowance for getting this water to the refinery and further to the new scrubber … The water allowance developed by the consultants was not intended to reflect the total cost of running new offsite water feed lines to the refinery but was intended to cover a prorata share of these costs… " (p.9 of Final Report)

SOCIOECONOMIC ANALYSIS

Scope of Socioeconomic Analysis

- **Analyzed Cost Input from:**
  - **ETS, Inc./NEXIDEA, Inc. (Present Value of $630 Million)**
  - **NEC**
    - **Developed Cost Adjustment Factors by Equipment by Facility Relative to ETS/NEXIDEA (Present Value $738 Million)**
  - **WSPA**
    - **Cost of Compliance is 3 times that of ETS/NEXIDEA (Present Value of $1.5 Billion)**
- **Evaluated Impacts of:**
  - **Staff Proposal**
  - **CEQA Alternatives**

Affected Facilities and Industries

- **11 Facilities**
  - **Petroleum Product Manufacturing**
    - **Six Refineries**
    - **One Coke Calciner Plant**
    - **One Sulfuric Acid Plant**
  - **Chemical Manufacturing**
    - **One Sulfuric Acid Plant**
  - **Non-Metallic Mineral Product Manufacturing**
    - **One Cement Plant**
    - **One Glass Plant**

Compliance Cost

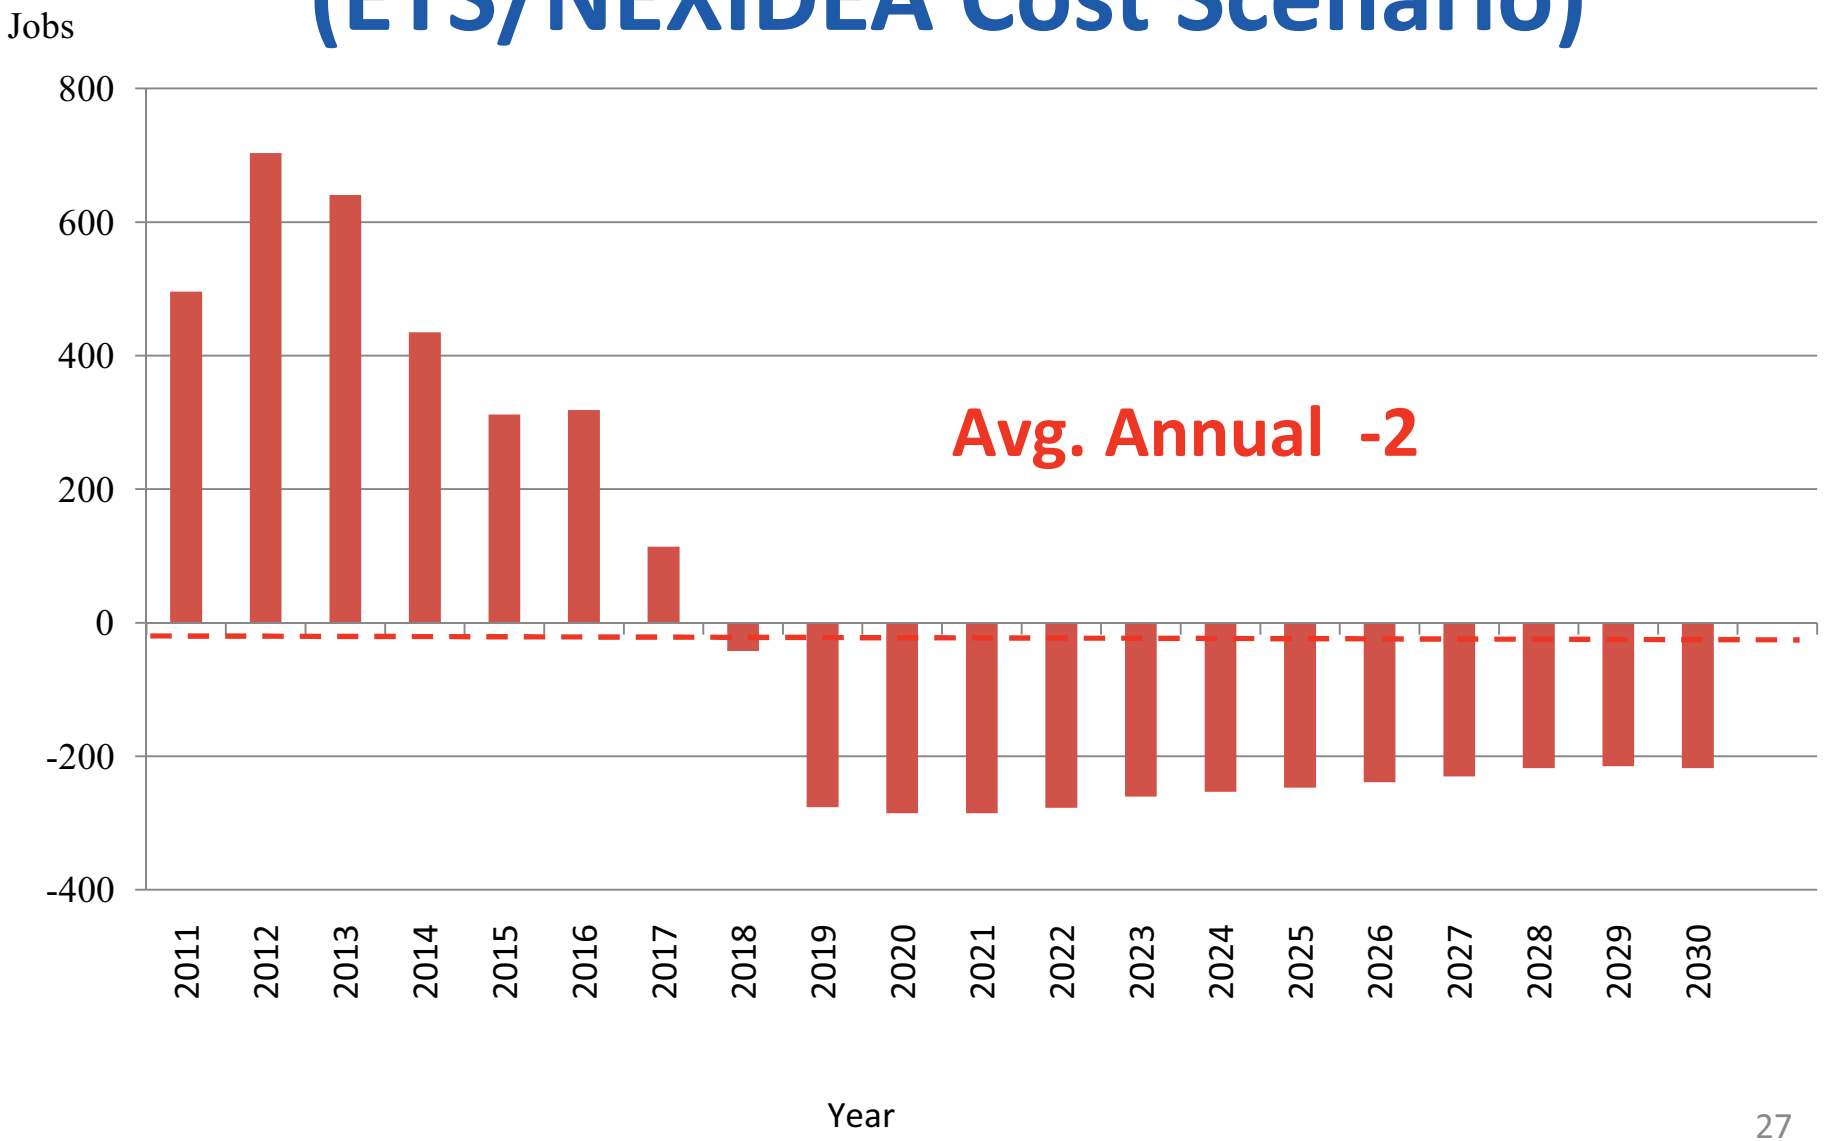
- One-Time Cost*
  - Capital Costs
    - Wet and Dry Gas Scrubbers
    - Emerachem ESX Catalyst
    - Consolv Upgrade
  - Installation Cost
    - Demolition, Concrete, Structure, etc.
    - Piping, Electrical, Contractor, etc.
- Operating and Maintenance Costs
  - Utilities
  - Labor and Materials

*Annualized @ 4% interest rate and 25-year equipment life

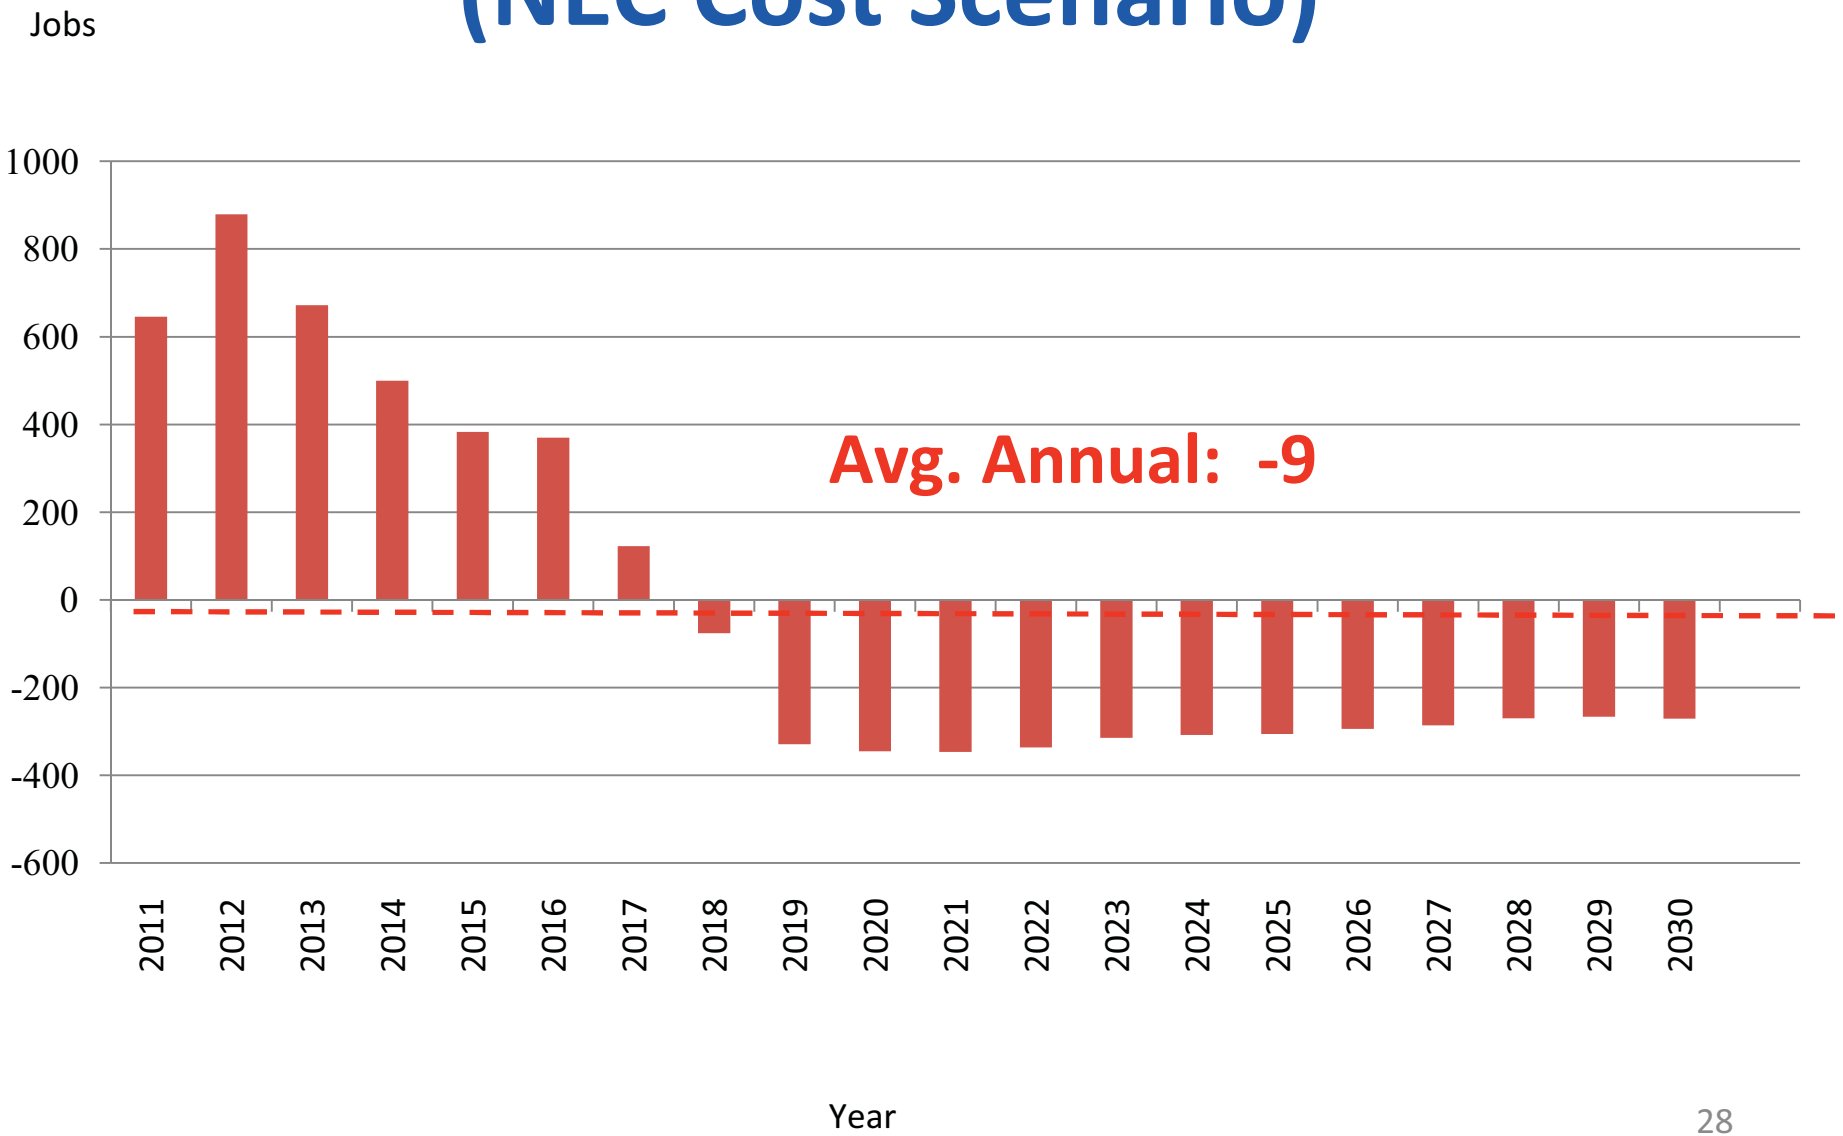
Average Annual Cost and Job Impacts (2011-2030)

Scenario	Cost (in millions)	Job Impact
ETS/NEXIDEA	$32	-2
NEC	$42	-9
WSPA	$85	+202

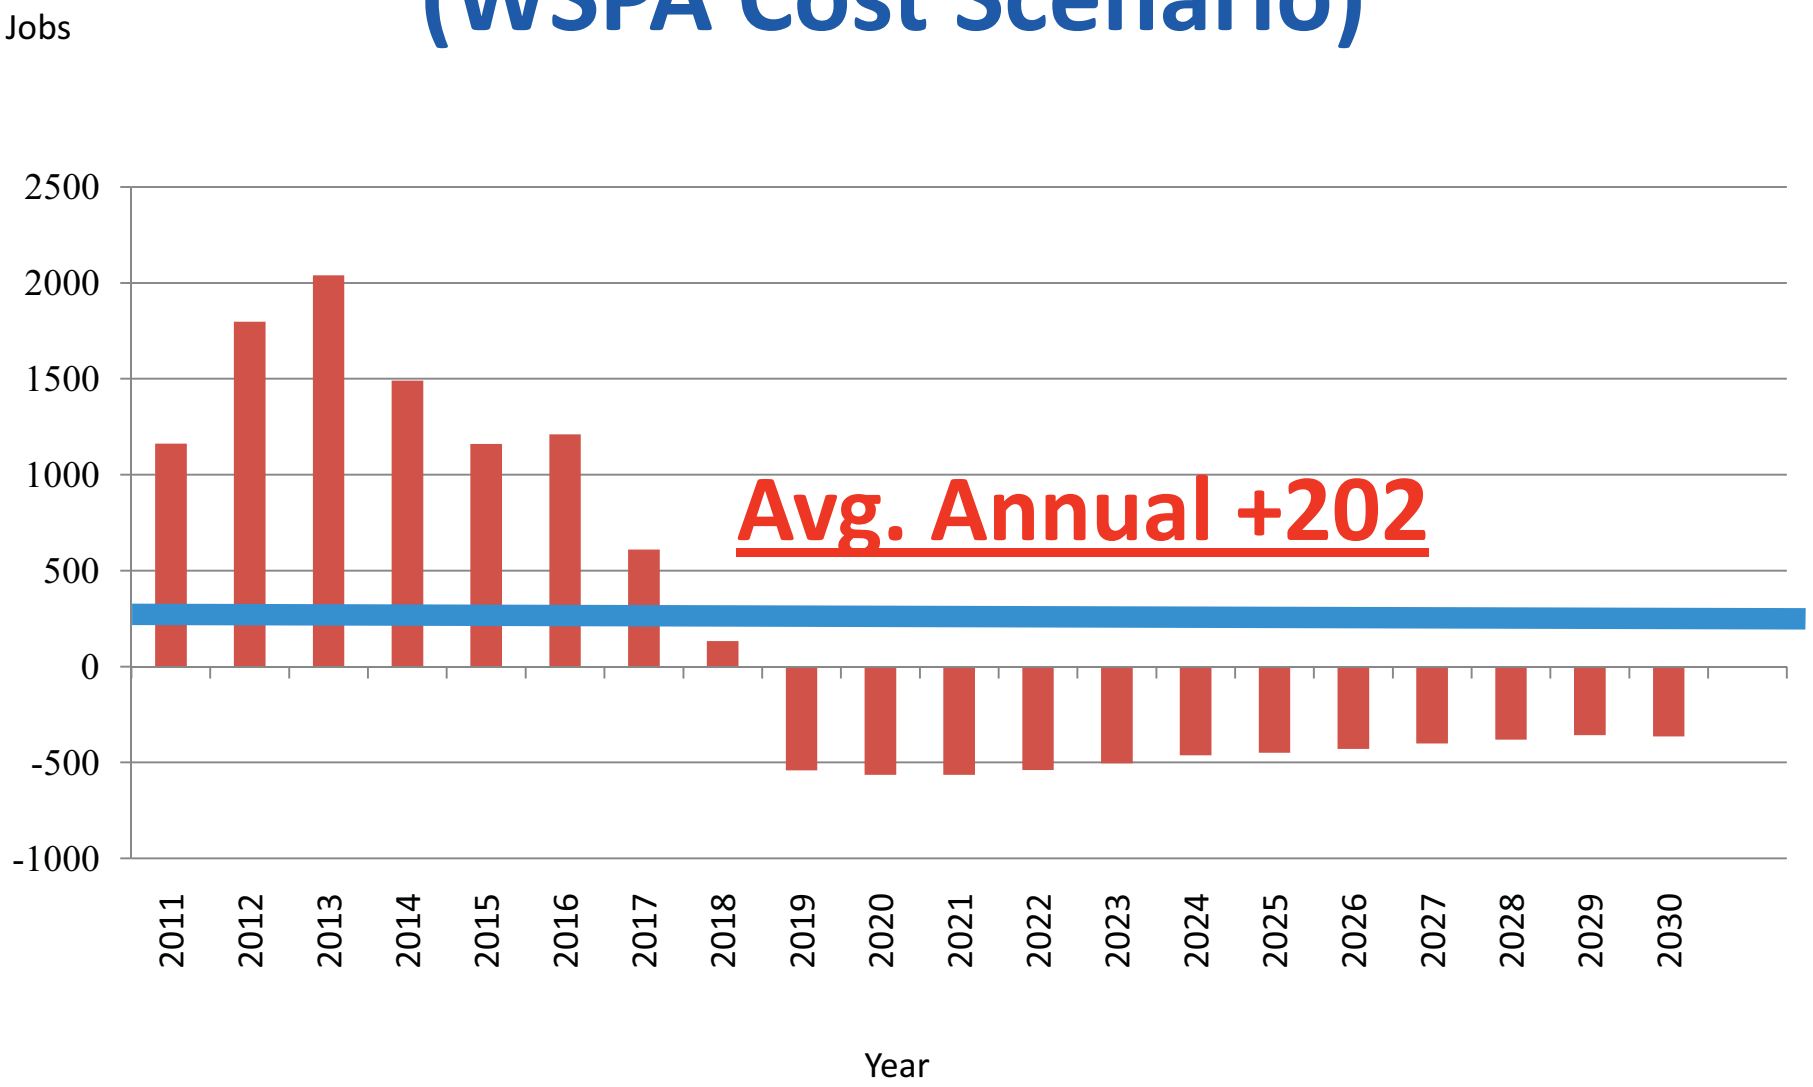
Annual Job Impacts (ETS/NEXIDEA Cost Scenario)



Annual Job Impacts (NEC Cost Scenario)



Annual Job Impacts (WSPA Cost Scenario)



Impacts on Petroleum Product Prices (in % Relative to U.S.)

Scenario	2014	2019	2030
ETS/NEXIDEA	0.06%	0.12%	0.11%
NEC	0.07%	0.15%	0.14%
WSPA	0.18%	0.36%	0.33%

CEQA Alternatives

- **Alternative A (No Project Alternative)**
  - **Existing SOx RECLAIM**
- **Alternative B**
  - **Only Sulfuric Acid, Coke Calciner, and Glass Plants are Affected (AQMP Scenario)**
- **Alternative C**
  - **Excludes Sulfur Recovery Units from the Proposed Amendments**

Average Annual Impact of CEQA Alternatives

Alternative	Cost (in millions)	Job Impact
Proposed Project	$32 to $42	-2 to -9
Alternative A	$0	0
Alternative B	$3 to $6	-29 to -36
Alternative C	$23 to $29	-37 to -69

Next Steps

- Draft revised Staff Reports & Socioeconomic Analysis released on October 5th, 2010 (30-day review). Comments due by October 26
- Three comment letters received on Draft PEA. Response to comment letters on-going.
- Continue discussion with stakeholders
- Public Hearing – November 2010

Western States Petroleum Association

WSPA Presentation – RECLAIM SOx Shave

SCAQMD Refinery Committee

Presented by
Cathy Reheis-Boyd
President, WSPA

October 14, 2010

The RECLAIM Journey
Emission Reductions and Percents

	December, 2009	August 18 Refinery Committee	September 16/September 22 Refinery Committee	October 14
WSPA Position (TPD Reduction)	3 TPD (Meet 2007 AQMP)	3.9 TPD: 3 TPD by end of 2014; additional 0.9 TPD by end of 2019 **+ 0.9 TPD**	4.7 TPD:3 TPD by end of 2014; additional 1.7 TPD by end of 2019 **+1.7 TPD**	?
% Reduction (based on 11.77 TPD)	Approx. 25%	33% **+8%**	40% **+15%**	?
SCAQMD Position (TPD Reduction)	7.4 TPD	6.1 TPD: 4.5 TPD by end of 2014 – 1.5 TPD each year; additional 1.6 TPD by end of 2019 **-1.3 TPD**	?	?
% Reduction (based on 11.09 TPD)	67%	55% **-12%**	?	?

Progress to Date

- **July 30, 2010 WSPA proposed an alternate shave methodology to District Staff**

- **August 18, 2010 Refinery Committee meeting:**
  - WSPA 25%/3 TPD shave by end of 2014 required by AQMP to 33% (3.9 TPD) by end of 2019
  - District 41% by end of 2014 and 55% (6.1 TPD) by 2019
  - Compliance costs and RTC's unresolved issues

- **September 16, 2010 WSPA President presented a revised proposal to Dr. Wallerstein; discussed by phone on September 17**
  - WSPA moved to 40% (4.7 TPD) shave, with 3 TPD achieved by end of 2014 **(**AQMP**)** and remaining 1.7 TPD shaved by end of 2019
  - District remained at 55%

- **September 21, 2010 WSPA President and team and Barry Wallerstein and Staff met**
  - Continue to discuss differences for treatment of RTC's and cost**;** no movement on shave proposal

- **September 22, 2010 Refinery committee meeting**
  - WSPA reiterated 40% proposal - District remained at 55%
  - Agreement to develop a cost matrix to detail the difference in estimated cost

- **Open issues from past Refinery Committee meetings:**

  Staff was asked by Board members at the last two Refinery Committee meetings for legal analysis, total number of rules impacting Refineries, industrial water use analysis, and to find a middle ground on the shave requirement.

TABLE 13-1 - RTC Reductions Estimated From 1997 Baseline

Equipment Type	AQMP Method - Projected to 2019											
	Audited 97-98 Fiscal tpd	Growth Factor 1997-2019	2019 with growth	Scenario 3 - Staff's Proposal			Scenario 4 - Intermediate			Scenario 5 - AQMP

Total Major Equipment	**18.42**	1.10	20.33		3.99	16.34		4.74	15.59		6.23	14.10
Others	**1.06**	1.11	1.18		1.18			1.18			1.18	
Total Remaining In Year 2019 With Growth (Minus 0.054 tpd reductions from R431.1 & R431.2 for AQMP Method)				**5.12**			5.87			7.36		
1.1 x (Total Remaining)				**5.63**			6.45					
RTC Reduction in Yr 2019 w 1.1 Factor = 11.77 - (1.1xTotal Remaining)				**6.14**			5.32					
For alternative shave, % reduction w 1.1 = (shave/11.09)				**55%**			48%					
RTC Reduction in Year 2019 w/o 1.19 Factor = 11.77 - (1.19*Remaining)										3.00		
% Reduction Across Universe w/o 1.1 to compare w AQMP = (shave/11.78)										25%		

WSPA RECLAIM SOx Proposal: September 16, 2010

- Emission Reductions (RTC): 4.7 TPD reduced
- Universe of Sources: 11.77 TPD
- Percent Shave: 4.7 /11.77 = 40%

Underlying Facts

- RTC's: 1.98 TPD of RTC's (comprised of ERC's converted to RTC's and Clean Fuels Credits not subject to shave)

- Emission Reductions achieved as follows:
  - 3 TPD by end of 2014 (2007 AQMP)
  - Remainder of 1.7 TPD achieved by end of 2019

- Shave is across the board
  - Small sources and sources already at BARCT are included in shave

- Source Categories included in shave:
  - FCCU, SRU/TGU, Acid Plants, Glass Plants, Coke Calciner, Cement Plants

- Source Category excluded from shave:
  - Refinery Heaters and Boilers

WSPA – Socioeconomic Report Perspectives

- District's analysis included WSPA's estimated cost to comply; did not incorporate possible facility shutdown scenario and possible job loss data
- WSPA's economic analysis provided possible impacts if a hypothetical median-sized facility were to cease operation in response to the RECLAIM program – part of a huge regulatory burden being placed on the refining industry
- District estimated costs for installation of BARCT on affected sources – not costs of compliance with the shave
- Positive job growth is in temporary construction sector – jobs will disappear once construction is complete; jobs lost are the permanent facility positions as the result of high cost of compliance
- District used the same flawed cost estimates from the original consultant reports; 2x to 6x low for FCCU capital costs and 50% to 200% low for operating costs
- Report did not take into consideration site specific issues nor if a technology was proven for that source category
- Not clear that revised cost estimates fully take into consideration WSPA's concerns nor those of the peer review Norton Engineering Report
- Continued operation of a facility is not a guarantee – many facilities (aerospace, furniture manufacturing, refineries) in the basin have ceased operation
- Current adverse economic climate cannot be ignored – investigating down-side risk of proposed RECLAIM amendment is reasonable and in the public interest

WSPA BARCT Equivalency/ 55% Shave Analysis Summary

Project Type	SCAQMD PV	Number of WSPA Projects / Concentration Range	WSPA BARCT Reductions (Tons/Day)	WSPA BARCT PV	WSPA Additional Reductions to Get to BARCT (Tons/Day)	WSPA Additional PV Costs to Get to BARCT	RTCs or Other Emission Reductions to get to Shave (Tons/Day)	Cost of RTCs or Other Projects to get to Shave	WSPA Total Tons/Day	WSPA Total Cost	Cumulative Total	Project Type	Additional WSPA Cost vs. SCAQMD

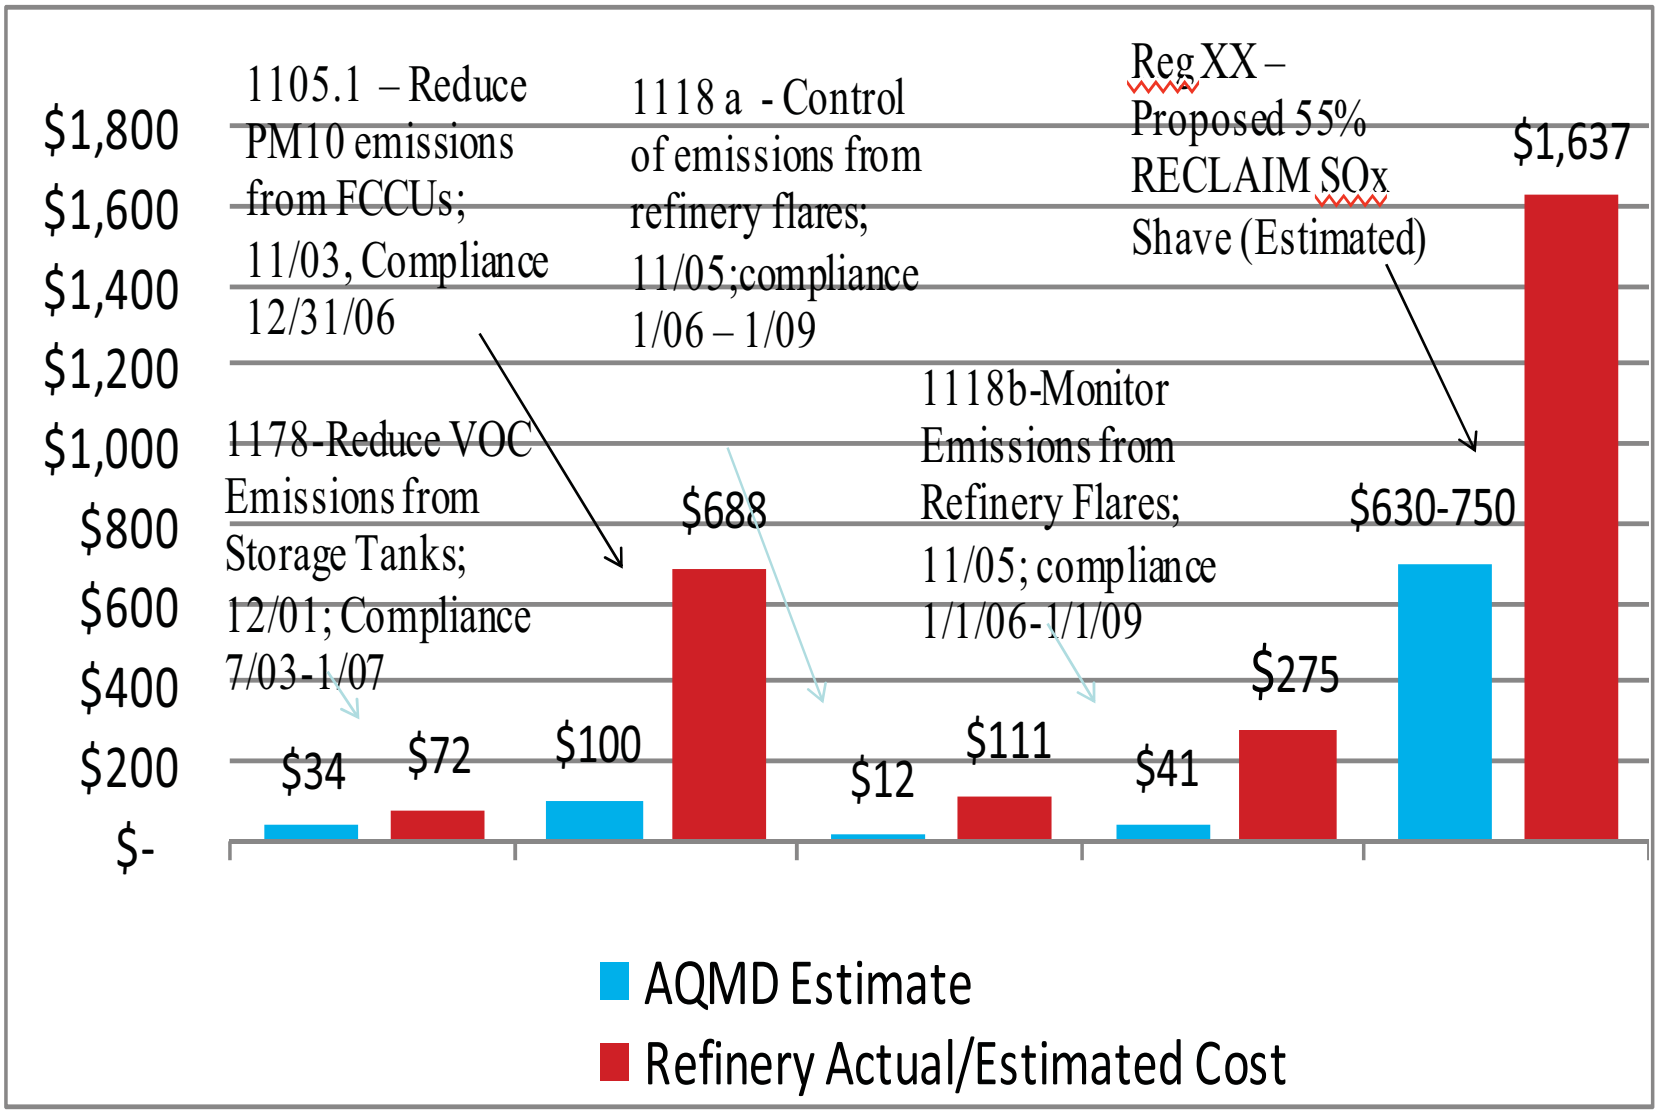
(1) Avg of $174M-$187M

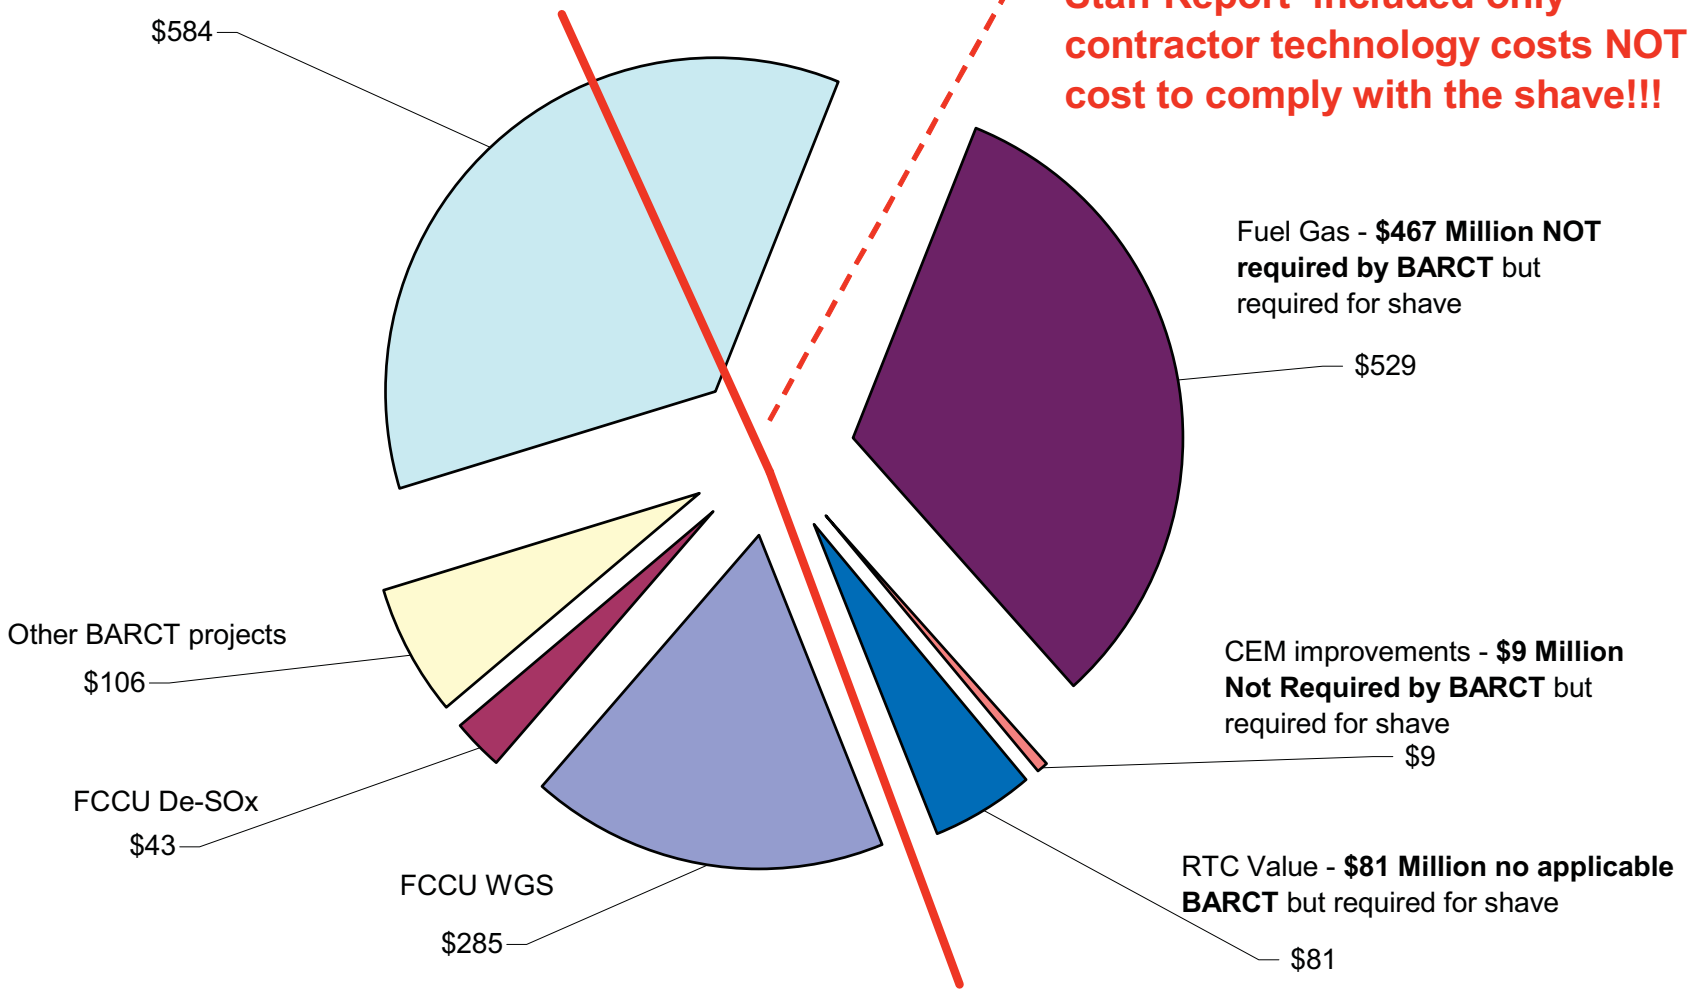
Half of the costs or $801million are associated with emissions beyond what is required for BARCT.

SCAQMD estimated cost versus actual cost
District historically wrong by 3-5X with estimated cost



Refinery Costs - RECLAIM
$ Millions

Area to right of solid line shows EXTRA COSTS FOR REDUCTIONS BEYOND BARCT - approx. $800 Million. SCAQMD Staff Report included only contractor technology costs NOT cost to comply with the shave!!!



SOx RECLAIM Legal Requirements

- SOx RECLAIM is being implemented as a PM measure

- Requirements are not the same for PM as for Ozone, CO and NOx (see Health & Safety Code §40910 et seq.)
  - No specific state law AQMP requirements
  - No requirement for "all feasible measures"

- §39616 "equivalent or greater level of emission reductions at an equivalent or lower cost"

BARCT Requirement

- Emission limitation – maximum reductions
- Must consider cost for entire source category
  - Exclusion of a single unit based on excessive cost lowers the average cost-effectiveness for the category
  - Not to be confused with rule cost-effectiveness
- If the limitation is not cost-effective, then it is not BARCT

Significant Impediments (open issues)

District's proposed safety valve (non tradable RTC account)

- Projects take several years to plan, design, permit and build
- Companies can't wait until the end of the year to put in a scrubber
- You can't plan with uncertainty – companies need perpetuity credits

Requires several hundred million gallons of additional water annually

- 3 out of 6 Refineries do not have access to recycled water
- Capital cost to construct and permit; can water be supplied by compliance date? availability and reliability of water delivery
- Current water price ($800 per acre-foot); cost for higher quality water (such as boiler feed water) is more than $1,250 per acre-foot

Need for future reductions not analyzed

- Need to account for implementation of all rules and regulations, including CARB SOx and PM measures
- Arbitrary/Speculative

Board Policy Decision

- Avoid additional shave beyond BARCT – not required by law
- Preserve market viability and do not create structural buyers
- Ensure cost-effective shave methodology
- Do not penalize early reductions
- Avoid shaving ERC-based RTC's needed for future growth
- Maintain opportunity to Trade
  - Proposed reductions are so large that market is constrained and lower-cost options are precluded

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 30

REPORT: Stationary Source Committee

SYNOPSIS: The Stationary Source Committee met Friday, October 15, 2010. Following is a summary of that meeting. The next meeting will be November 19, at 10:30 a.m., in Conference Room CC8.

RECOMMENDED ACTION:
Receive and file.

Dennis Yates, Chair,
Stationary Source Committee

MN:am

Attendance
The meeting began at 10:00 a.m. Present were Chair Dennis Yates, Board Members Jane Carney, Josie Gonzales, and Judith Mitchell. Absent were Board Members Bill Campbell and Ronald Loveridge.

INFORMATIONAL ITEMS

1. **Adopt Rule 320 – Automatic Adjustment Based on Consumer Price Index for Regulation III Fees**
   Barbara Baird, District Counsel, gave the staff presentation on Proposed Rule 320. The rule would require that most Regulation III fees be automatically adjusted each year to reflect the change in the California CPI for the previous calendar year. At least eight (8) air districts already have similar automatic adjustments in their fee rules. The Board would retain the ability to adopt a different lower fee adjustment or no adjustment for any given year, but the automatic adjustment would then resume the following year unless the Board decided to do something different. In response to a question from Board Member Judith Mitchell, Ms. Baird clarified that as currently drafted, the fee rate would go down if the CPI for a given year was negative. There were no public comments at the

committee meeting but two e-mails opposing the proposal were distributed, and Mayor Yates read them into the record.

2. Reg. XXX – Title V Permits
Reg. XVII – Prevention of Significant Deterioration

Jill Whynot, Director of Strategic Initiatives, provided a briefing on proposed amendments to Regulation XXX – Title V permits and a new rule for Regulation XVII – Prevention of Significant Deterioration (PSD). These rules will go to the Board for consideration in November.

Ms. Whynot summarized what these programs entail and how GHGs will be added. Of 500 current Title V permits, approximately 50-60 may be large enough to trigger the thresholds established in U.S. EPA's "Tailoring Rule." Title V permits would need to include applicable requirements, which are currently only those related to BACT and/or permit conditions resulting from PSD review.

PSD requirements for GHGs include BACT and public notice. BACT for GHGs will be a case-by-case review. A U.S. EPA document for BACT for several categories of equipment is expected to be released in the next 2-3 weeks. If AQMD did not amend these rules, U.S. EPA would implement PSD and Title V, which could have potential for conflicting BACT determinations. Many of the comments from stakeholders have been resolved. There remains concern about the uncertainty of future BACT determinations.

There are also numerous lawsuits that could stop these federal permitting programs for GHGs. If this occurs, AQMD rules would be amended. However, "applicable requirements" as defined under Title V are only those related to PSD, which is being incorporated by reference.

Mohsen Nazemi, Deputy Executive Officer of Engineering and Compliance, added that CAPCOA has developed some guidance on BACT for GHGs. Barbara Baird noted that for the first six months, only facilities already required to have a PSD permit action for other reasons would need to have GHG review. That should be just a few facilities. That gives us an additional six months to better understand BACT for GHGs. In response to a Board Member question, Mr. Nazemi stated that only 1-2 dozen projects per year are expected to be over the PSD thresholds. Facilities can also reduce emissions or take a cap to stay out of PSD and Title V.

3. **Rule 1143 – Consumer Paint Thinners and Multi-Purpose Solvents**
Naveen Berry, Planning & Rules Manager, presented a summary on Proposed Amended Rule (PAR) 1143. The amendment will propose an exemption for artist solvents and thinners that will make the rule more consistent with the state consumer products regulation by: (1) exempting artist solvents and thinners that are properly labeled and sold in containers that are one liter or less from applicable VOC limits; (2) defining artist solvents and thinners; and (3) making changes to the rule to clarify that all exempt products shall be subject to recordkeeping and reporting. The proposed amendment will result in 114 pounds of VOC emission reductions foregone per day. No public comments were received following the presentation

Ms. Carney indicated that she would not participate in agenda #4 due to conflict of interest as U.S. Battery is a source of income for her, at which time she left the meeting.

4. Rule 1420.1 – Emissions Standard for Lead from Large Lead-Acid Battery Recycling Facilities
Susan Nakamura, Planning and Rules Manager, summarized Proposed Rule 1420.1. Staff explained that the focal point of the proposal is to comply with the new U.S. EPA's ambient concentration, which is 0.15 ug/m3. The proposed rule limits stack emissions at the facility to 0.045 lbs/hr to support achievement of the ambient concentration. The key issue remains should the emission limitation be lowered to 0.003 lbs/hr. In response to the Board's interest, staff released two alternatives at the October 1, 2010 hearing that incorporated a 0.003 lb/hr emission limit for stack emissions. Staff concluded that these alternatives would require additional analysis. As a result, staff recommended a new alternative that would be to require a feasibility analysis for reaching 0.003 lb/hr as part of the compliance plan.

Mike Buckantz, RSR Corporation, spoke on behalf of Quemetco and handed out a chart and a table showing lead reductions achieved at the facility and stated this is also an air toxics rule and all possible reductions of lead emissions should be made. Quemetco has committed $40 million to installing controls similar to Quemetco at two other plants. They have shown that the technology is achievable and affordable to reduce total facility point source emissions to 0.003 lb/hr. Joe Dowd, Exide Technologies Vice President and General Manager, stated that there are only two lead acid battery recycling facilities west of Dallas. If one of those went out of business, it would remove part of the incentive to recycle. Exide intends to comply with the ambient lead standard controlling both stack and

fugitive emissions. By controlling stack emissions to 0.003 lb/hr which is very expensive, they may not have the resources to properly address fugitive which may be the larger problem.

WRITTEN REPORTS

All written reports were acknowledged by the Committee.

PUBLIC COMMENTS

There were no public comments.

The meeting was adjourned at 11:20 a.m.

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 31

REPORT: Technology Committee

SYNOPSIS: The Technology Committee met on October 15, 2010. Major topics included Technology Advancement items reflected in the regular Board Agenda for the November Board meeting. A summary of these topics with the Committee's comments is provided. The next Technology Committee meeting will be on November 19, 2010 at 12 p.m. in CC-8.

RECOMMENDED ACTION:
Receive and file.

Josie Gonzales
Technology Committee Chair

CSL:pmk

Attendance: Committee Chair Josie Gonzales and Committee Member Judith Mitchell were in attendance at District headquarters. Committee Member John Benoit participated by video-teleconference. Committee Members William Burke, Miguel Pulido, and Dennis Yates were absent due to a conflict with their schedules.

NOVEMBER BOARD AGENDA ITEMS

1. **Execute Contracts to Conduct Conceptual Feasibility Studies for Reduction of Near Roadway Pollutant Exposures**
   Numerous air monitoring and health studies document elevated pollution levels and health risks in areas immediately adjacent to busy roadways and freeways. In addition to reducing on-road tailpipe emissions, other mitigation measures may be effective in reducing the pollution exposure of those living, working or playing in these affected areas. On March 5, 2010, an RFP was released for conceptual research studies to assess the feasibility and cost-effectiveness of roadside pollution mitigation measures, and six proposals were received. Based on the results of the technical evaluation process, this action is to execute three contracts in a total amount not to exceed $250,000 to study the reduction of pollutant exposures using near roadway mitigation measures.

Staff presented the proposal to fund three conceptual feasibility studies looking at exposure mitigation measures next to busy roadways. Committee Member Mitchell stated that while there might be some repetition in the studies, and that she would eventually like to see additional active filtration measures studied, that this was a good start. Committee Chair Gonzales also stated that she would like to see additional "out of the box" solutions assessed, and not stick to what we know or traditional techniques. She mentioned that staff should look at approaches being taken elsewhere in the world to address this issue. Staff replied that while research on the effects of barriers has been conducted, there have been conflicting results. These proposed projects will help develop better, validated models to better assess new roadside measures, including active measures. It was also stated that the Planning Center proposal is flexible, and assessment of the active approaches can be accomplished within that project.

Moved by Mitchell; seconded by Benoit; unanimously approved.

2. Execute Sole Source Contract for Buy-Down Incentive Program for CNG Home Refueling Appliance

Since May 6, 2005, the AQMD has implemented a buy-down incentive program for the *Phill* natural gas home refueling appliance (HRA) manufactured by FuelMaker Corporation to broaden the consumer base of light-duty natural gas vehicles. In April 2009, FuelMaker Corporation filed bankruptcy and was acquired by Fuel Systems Solutions, Inc. In July 2010, sale of the HRA in California resumed through an exclusive distributor, Gas Equipment Systems, Inc. (GESI). This action is to execute a sole source contract with GESI for an amount not to exceed $60,000 from the Clean Fuels Fund to provide a buy-down incentive of $1,000 per HRA.

Council Member Mitchell asked about the cost of the unit. Staff answered $4500.

Moved by Mitchell; seconded by Benoit; unanimously approved.

3. Execute Contract To Provide Technical Assistance for Alternative- Fueled Trucks Funded Under AQMD's Heavy-Duty Diesel Truck Replacement Program

The AQMD has received grant awards from the Department of Energy and Environmental Protection Agency for LNG truck projects approved under AQMD's Heavy-Duty Diesel Truck Replacement Program, including administrative funds. AQMD's administration of the program consists of project outreach and solicitation, project evaluation, inspections, contracting, invoice processing, project monitoring and other activities to comply with all program requirements. AQMD is required to monitor the operation of each LNG truck on a quarterly basis for a period of two years. This action is to execute a contract with Clean Fuel Connection to provide

technical assistance for quarterly reporting and other program administrative activities in an amount not to exceed $80,000.

Moved by Benoit; seconded by Mitchell; unanimously approved.

4. Execute Contracts to Support Electric Charging Infrastructure

Southern California has an established but obsolete network of public charging for electric vehicles. State and federal funds are being invested in our region to support the deployment of plug-in electric vehicles including charging infrastructure. These awards, however, do not include installation costs or coordination among awardees. This action is to help coordinate charging infrastructure rollout by executing contracts with Clipper Creek, Coulomb Chargepoint and ETEC ECOtality to replace existing chargers and install new chargers in high priority locations for a total cost not to exceed $210,000 from the Clean Fuels Fund.

Committee Chair Gonzales requested staff provide updates on the program and criteria to be used in site selection as chargers are installed and further ensure the hardware will be upgradeable in the future.

Moved by Mitchell; seconded by Benoit; unanimously approved.

5. Execute Contracts to Cofund Electric and Natural Gas Hybrid Heavy-Duty Trucks

Battery electric and hybrid heavy-duty trucks represent potential near-term opportunities for zero- and low-emission technologies for goods movement activities. The challenges remain in demonstrating the durability and capability of these new technologies on various heavy-duty applications. In July 2010, the California Energy Commission awarded $2,100,000 to Daimler Trucks to develop ten natural gas hybrid Class 8 trucks under the AB 118 program and $1,000,000 to TransPower to develop up to two Class 8 battery electric trucks. Both projects, however, are still in need of additional support to proceed. This action is to execute contracts with Daimler Trucks in an amount not to exceed $900,000 and with TransPower in an amount not to exceed $497,000 from the Clean Fuels Fund for the above-mentioned battery electric and natural gas hybrid heavy-duty truck demonstration projects.

This item was withdrawn by staff.

INFORMATIONAL ITEM ONLY

6. Clean Fuels Program Draft Plan Update *(presentation only)*

At the October 2010 Board meeting, the Board provided comments and input on the staff's proposed priorities for the Clean Fuels Program Draft Plan Update for 2011. Staff has addressed these comments and proposes adjustments to the funding priorities. Major emphasis remains on electric and plug-in hybrid electric vehicles, their infrastructure and expanding their market deployment, development and demonstration of clean engine systems, and expansion of alternative fuel infrastructure.

Public Comment Period – There was no public comment.

Other Business – There was no other business.

The next meeting will be November 19.

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 32

REPORT: Mobile Source Air Pollution Reduction Review Committee

SYNOPSIS: Below is a summary of key issues addressed at the MSRC's meeting on October 21, 2010. The MSRC's next meeting is Thursday, November 18, 2010, at 2:00 p.m. in Conference Room CC8.

RECOMMENDED ACTION:
Receive and file.

Michael D. Antonovich
AQMD Representative on MSRC

CSL:HH:DAH

Additional Funds Approved for Alternative Fuel School Bus Incentives
For its FY 2008-09 Alternative Fuel School Bus Incentives Program, the MSRC allocated $3 million for incentives to public schools purchasing CNG or propane buses. To date, $2,520,000 has been awarded to A-Z Bus Sales and $240,000 to BusWest, the two qualified vendors administering this program, leaving $240,000 available for allocation. At its October 21, 2010 meeting, the MSRC unanimously awarded the remaining $240,000 to BusWest to provide incentives to the Rowland Unified School District for four CNG buses at $60,000 per bus incentive. The AQMD Board will consider this contract modification at its November 5, 2010 Board meeting.

Approve New/Replacement Contract for Riverside County Transportation Commission
As part of the FY 2003-04 Work Program, the Riverside County Transportation Commission (RCTC) was awarded $225,000 to enhance the region's rideshare database systems through the creation of a direct communications link between RCTC's RidePro and Metro's TripMaster. Among other features, the communications link will facilitate the access of transit itineraries through the CommuteSmart.info website. This contract expired recently before a modification to extend the term could be executed. At its October 21, 2010 meeting, the MSRC unanimously approved a new/replacement contract

for RCTC with a 12-month term in the amount of $225,000. The AQMD Board will consider this new/replacement contract at its November 5, 2010 Board meeting.

MSRC Website Upgrades to Include Pilot Project for Online Proposal Submission
The MSRC maintains a website (www.cleantransportationfunding.org) which was designed and continues to be maintained and hosted by HiP Design on behalf of the MSRC. The website acts as an outreach tool, promoting the MSRC's programs and providing assistance to contractors, proposers and others interested in clean transportation. Although the MSRC previously authorized HiP Design to develop a website feature to allow online submissions of proposals and applications, the feature was not activated because the AQMD does not currently have online submission of proposals as part of the procurement process. After consulting with AQMD's Finance and Legal staff, two areas for improvement were identified to ensure the integrity of the online submissions: 1) build in an additional level of password protection for proposal submission in the back-end; and 2) add an email notification and attachment mechanism. As a pilot project, AQMD's Finance and Legal staff have agreed to allow online submissions for the MSRC's FY 2010-11 Local Government Match Program, if desired by the MSRC. At its October 21, 2010 meeting, the MSRC unanimously elected to require mandatory online submissions for its FY 2010-11 Local Government Match Program. To facilitate this pilot project, the MSRC awarded an additional $1,500 to HiP Design to modify the website accordingly. The AQMD Board will consider this contract modification at its November 5, 2010 Board meeting. The Program Announcement for the FY 2010-11 Local Government Match Program is still being developed, but will include mandatory online submission procedures. Once the PA has been approved by the MSRC, approval to release it will be sought from the AQMD Board. It is anticipated this will occur in early 2011.

Development of New MSRC Website and Maintenance Services as Part of FY 2010-11 Work Program
As mentioned above, the MSRC maintains a website. This website, however, was developed in 2005 by HiP Design on the MSRC's behalf. Over the last five years, a variety of new options for content management system platforms and hosting have become available. The newer platforms provide for more flexibility and smoother processing. Additionally, much of the current hosting hardware, although still operational, is outdated and needs replacement. And finally the website's appearance needs to be refreshed and updated. It has been determined that the existing MSRC database and its contents can be smoothly moved to newer platforms if a new website is desired. At its October 21, 2010 meeting, the MSRC authorized preparation of a solicitation in the amount of $100,000 as part of its FY 2010-11 Work Program to identify and retain a company to develop a new website and provide maintenance, hosting and upgrade services for the first two years of operation. Once the MSRC has

considered and approved the solicitation for these services, approval to release it will be sought from the AQMD Board. It is anticipated this will occur in early 2011.

Off-Road Diesel Exhaust After-Treatment Demonstration Program as Part of FY 2010-11 Work Program

In October 2007, as part of its FY 2006-07 Work Program, the MSRC in partnership with CARB and the AQMD launched the "Showcase" Program to demonstrate diesel exhaust after-treatment devices on off-road construction vehicles. The Showcase Program sought to facilitate the verification of multiple devices across the broadest possible range of off-road vehicle sizes and types, and was originally intended to demonstrate devices on 230 vehicles. A primary goal of the "Showcase" Program was to provide essential in-use operations data necessary to support the verification of off-road retrofit devices and assist CARB with enforcement of its statewide "In-Use Off-Road Diesel Vehicles" regulation.

Due to a number of factors, including the economy, vehicle/device rematches, cost issues, staff shortages and Cal-OSHA requirements, the number of vehicles participating fell dramatically to the current level of 107, of which only 44 have been retrofitted to date. This reduction includes devices which were to be demonstrated on 59 of Caltrans' off-road vehicles. Recently, however, Caltrans decided it could not participate in the program. At its October 21, 2010 meeting, the MSRC directed staff to terminate negotiations with several manufacturers who were proposing to place the devices on Caltrans' vehicles. The value of these awards was $1,037,495. All other contracts in the original program have been effectuated either via executed contracts or previously declined and or canceled and the funding reverted back to the AB 2766 Discretionary Fund.

Nonetheless, there clearly remains a need for additional after-treatment devices to be verified for use on off-road vehicles. Providing fleets with more than one option should help keep prices down, and there are still engine types without verified devices. A need has also been identified for demonstration of installation designs which meet OSHA visibility requirements. On October 21, 2010, the MSRC as part of its FY 2010-11 Work Program approved a follow-on Showcase Program which would utilize an extended solicitation process with broad eligibility criteria to allow either fleets or vendors to be project proponents. The MSRC allocated $2,250,000 for this follow-on Showcase Program. The funds will come from the following sources: 1) the $1,037,495 previously allocated to vendors to retrofit Caltrans' vehicles; 2) $1,000,000 previously allocated, but not awarded, as part of the FY 2007-08 Work Program for an on-road retrofit demonstration program; and 3) $250,000 previously allocated, but not awarded, as part of the FY 2007-08 Program for a Showcase gap-filler program. Once the MSRC has considered and approved solicitation(s) for the follow-on Showcase Program, approval to release it will be sought from the AQMD Board. It is anticipated this will occur in early 2011.

FY 2010-11 Work Program Development
MSRC staff reported that the five subcommittees –Vehicles; Infrastructure; Local Government Match; Transportation Control Measures; and Showcase – have continued their deliberations toward development of FY 2010-11 Work Program elements. In addition to the website upgrades, new website and follow-on Showcase Program, approved as part of the FY 2010-11 Work Program at the MSRC's October 21, 2010 meeting, MSRC staff briefly outlined overall concepts for several additional proposed elements, including a Local Government Match Program (with the mandatory online submission requirement); an Alternative Fuels Infrastructure Program; several potential vehicle programs including incentives to exhilarate retirement of light-duty vehicles, clean up of off-road emissions; and zero-emission vehicles; an Alternative Fuels School Bus Incentives Program; and transportation control measure programs such as an event center shuttle service, multi-mobility hubs and networks, a 511 mobile "smart phone" app and development of adaptive real-time transit schedules. Additional information including more specific details and proposed funding targets will be presented to the MSRC for consideration at its November 18, 2010 meeting. It is estimated that more than $20 million will be available for the FY 2010-11 AB 2766 Discretionary Fund Work Program.

Contract Modification Request
The MSRC considered one contract modification for City of Redondo Beach Contract #ML07043, which provides $125,000 towards the purchase of five heavy-duty CNG vehicles. They unanimously approved a two-year contractual term extension and a modified statement of work to allow substitution of vehicles.

Contracts Administrator's Report
The MSRC's AB 2766 Contracts Administrator provides a written status report on all open contracts from FY 2002-03 through the present. The Contracts Administrator's Report for October 2010 is attached for your information.

MSRC Agenda Item No. 2

DATE: October 21, 2010

FROM: Cynthia Ravenstein

SUBJECT: AB 2766 Contracts Administrator's Report

SYNOPSIS: This report covers key issues addressed by MSRC staff, status of open contracts, and administrative scope changes from August 26 through September 28, 2010.

RECOMMENDATION Receive and file report

WORK PROGRAM IMPACT: None

Contract Execution Status

2009-10 Work Program

On September 11, 2009, the AQMD Governing Board approved 27 awards under the Local Government Match Program as part of the MSRC's FY 2009-10 Work Program. All these projects also received partial funding as part of the MSRC's FY 2008-09 Work Program (see below). These contracts are with the prospective contractor for signature or executed.

On November 6, 2009, the AQMD Governing Board approved 11 additional awards, as well as 1 augmentation for a project which previously received a partial award, under the Local Government Match Program as part of the MSRC's FY 2009-10 Work Program. These contracts are awaiting responses from the prospective contractor, with the prospective contractor for signature, or executed.

On March 5, 2010, the AQMD Governing Board approved an award to the Coachella Valley Association of Governments for the Coachella Valley Regional PM10 Street Sweeping Program. Also on March 5, 2010, the Board approved an award to the Los Angeles County Metropolitan Transportation Authority to provide clean fuel transit service to Dodger Stadium. Both awards were part of the MSRC's FY 2009-10 Work Program and both contracts are executed.

On July 9, 2010, the AQMD Governing Board approved 21 awards under the Heavy-Duty Alternative Fuel Engines for On-Road Vehicles Program as part of the FY 2009-10 Work Program. These contracts are under development, undergoing internal review, or with the prospective contractor for signature.

2008-09 Work Program

On July 11, 2008, the AQMD Governing Board approved six augmentations for projects which previously received partial awards under the FY 2007-08 Work Program, as well as six additional awards, for the Alternative Fuel Heavy-Duty Engines for On-Road Vehicles Program as part of the MSRC's FY 2008-09 Work Program. Also on July 11, 2008, the Board approved 26 awards under the Local Government Match Program and 22 awards under the Alternative Fuel Infrastructure Funding Opportunities Program as part of the MSRC's FY 2008-09 Work Program. Some of these projects also received partial funding as part of the MSRC's FY 2007-08 Work Program (see below). Lastly, on this date the Board approved a sole-source award to Administrative Services Co-Op/Long Beach Yellow Cab to place into service up to 15 dedicated CNG taxicabs. Except as detailed below, these contracts are executed:

- One of the augmented awards was to Diversified Truck Rental and Leasing for the purchase of ten natural gas refuse trucks. MSRC staff has been informed that the company was sold. After multiple attempts to obtain a response from the purchasing entity, they were informed that they must respond by July 16, 2010 or MSRC staff would recommend that the MSRC terminate negotiations. Diversified subsequently responded and MSRC staff is making final attempts to negotiate a contract.
- One of the Infrastructure awards was to the Regents of the University of California for the installation of a hydrogen fueling station at UCLA. Negotiations with UCLA have been productive and the contract is currently undergoing internal review.

On September 5, 2008, the AQMD Governing Board approved an augmented award under the Local Government Match Program for an application which had been misplaced and thus not considered with the original awards. This contract is executed. Also on September 5, 2008, the MSRC approved a sole-source award to FuelMaker Corporation to provide incentives for natural gas home refueling units. This contract was under development when MSRC staff learned that FuelMaker Corporation had been adjudged bankrupt by the Ontario (Canada) Superior Court. Subsequently, FuelMaker was purchased by IMPCO. MSRC staff is currently awaiting responses from IMPCO to determine what actions may be necessary to continue implementation of the Program.

On January 9, 2009, the AQMD Governing Board approved an award for a replacement CNG refueling station vendor in support of the Mountain Area CNG School Bus Demonstration Program. At their March 19, 2009 meeting, the MSRC approved an augmentation to this award, and the AQMD Board approved the increase on May 1, 2009; this contract is executed.

On March 6, 2009, the AQMD Governing Board approved two augmented awards under the Local Government Match Program for applications which had been misplaced and thus not considered with the original awards. These contracts are executed.

On September 11, 2009, the AQMD Governing Board approved 29 awards under the MSRC's FY 2008-09 Local Government Match Program. Some of these projects also received funding as part of the MSRC's FY 2009-10 Work Program (see above). Also on September 11, 2009, the Board approved modifications to the 511 Commuter Services Outreach and Public Awareness Campaign, reflecting the bifurcation of outreach efforts, as part of the MSRC's FY 2006-07 Work Program. These included a modified award changing the original contractor name to LA SAFE and reducing the award amount from $1,000,000 to $700,000, as well as new sole-source

awards to Riverside County Transportation Commission and the Better World Group. These contracts are with the prospective contractor for signature or executed.

2007-08 Work Program

Except as discussed below, contracts for this Work Program are executed or declined.

On December 7, 2007, the AQMD Governing Board approved two sole-source awards to implement Big Rig Freeway Service Patrol as part of the MSRC's FY 2007-08 Work Program. These contracts are under development or undergoing internal review.

On May 2, 2008, the Board approved nine awards for the Alternative Fuel Heavy-Duty Engines for On-Road Vehicles Program. As noted above, MSRC staff is making final attempts to conclude negotiations with the entity which purchased Diversified Truck Rental and Leasing.

On July 11, 2008, the AQMD Governing Board approved seven awards under the Alternative Fuel Infrastructure Funding Opportunities Program. As noted above, this contract is undergoing internal review.

2006-07 Work Program

Except as discussed below, contracts for this Work Program are executed or declined.

On October 5, 2007, the AQMD Governing Board approved 18 awards under the "Showcase" Program. Caltrans' contract is not executed as it was superseded by the MSRC's approval of an alternative contracting procedure—see below.

On December 5, 2008, the AQMD Board approved ten awards to manufacturers of diesel emission control systems under the "Showcase" Off-Road Diesel Construction Equipment Retrofit Program. These awards reallocated funding which was originally awarded to Caltrans in October 2007. Two awards have been declined; the remaining contracts have been awaiting confirmation of Caltrans' willingness to participate in accordance with Program terms. In July 2009, Caltrans suggested that they might want to try another approach, but they have not yet provided necessary information which would allow the contract process to move forward. Caltrans has recently indicated that they cannot participate in the Showcase Program at this time, and MSRC staff are recommending that negotiations with the manufacturers be terminated.

Work Program Status

Contract Status Reports for work program years with open and pending contracts are attached. MSRC or MSRC-TAC members may request spreadsheets covering any other work program year.

FY 2002-03 Work Program Contracts

One regular contract from this work program year is open. All Local Government Match Program contracts are now closed.

FY 2002-03 Regular Work Program Invoices Paid

One invoice in the amount of $22,953.00 was paid during this period.

FY 2003-04 Work Program Contracts

One regular contract from this work program year is open. However, the MSRC also authorized a replacement contract which is currently with the prospective contractor for signature.

FY 2003-04 Regular Work Program Invoices Paid
No invoices were paid during this period.

FY 2004-05 Work Program Contracts

One regular and five Local Match contracts from this work program year are open.

FY 2004-05 Regular Work Program Invoices Paid
One invoice in the amount of $300.00 was paid during this period.

FY 2004-05 Local Government Match Program Invoices Paid
No invoices were paid during this period.

FY 2004-05 Diesel Exhaust After-treatment Program Invoices Paid
No invoices were paid during this period.

FY 2005-06 Work Program Contracts

6 regular, 11 Local Match, and one Diesel Exhaust After-treatment contracts from this work program year are open; and 9 regular and 24 Local Match contracts are in "Open/Complete" status, having completed all obligations save ongoing operation.

FY 2005-06 Regular Work Program Invoices Paid
No invoices were paid during this period.

FY 2005-06 Local Government Match Program Invoices Paid
No invoices were paid during this period.

FY 2005-06 Diesel Exhaust After-treatment Program Invoices Paid
No invoices were paid during this period.

FY 2006-07 Work Program Contracts

25 regular and 13 Local Match contracts from this work program year are open; and 13 regular and 8 Local Match contracts are in "Open/Complete" status, having completed all obligations save ongoing operation. One contract passed into "Open/Complete" status during this period: CR&R, Contract #MS07057 – Purchase 28 Natural Gas Refuse Trucks. One contract closed during this period: City of Los Angeles, General Services Dept., Contract #MS07012 – Modify Maintenance Facility.

FY 2006-07 Regular Work Program Invoices Paid
Three invoices totaling $1,045,855.97 were paid during this period.

FY 2006-07 Local Government Match Program Invoices Paid
Two invoices totaling $358,224.26 were paid during this period.

FY 2007-08 Work Program Contracts

32 regular and 18 Local Match contracts from this work program year are open; and 6 regular and 7 Local Match contracts are in "Open/Complete status, having completed all obligations

save ongoing operation. Two contracts passed into "Open/Complete" status during this period: Hemet Unified School District, Contract #MS08064 – Expand Existing CNG Infrastructure, and City of Paramount, Contract #ML08046 – Purchase One Heavy-Duty CNG Vehicle. One contract was cancelled during this period: City of Irvine, Contract #ML08032 – Purchase Remote Diagnostic Devices for 36 vehicles.

FY 2007-08 Regular Work Program Invoices Paid
Four invoices totaling $690,419.89 were paid during this period.

FY 2007-08 Local Government Match Program Invoices Paid
One invoice in the amount of $97,500.00 was paid during this period.

FY 2008-09 Work Program Contracts

Four regular and 19 Local Match contracts from this work program year are open; and two Local Match contracts are in "Open/Complete" status.

FY 2008-09 Regular Work Program Invoices Paid
Three invoices totaling $200,000.00 were paid during this period.

FY 2008-09 Local Government Match Program Invoices Paid
No invoices were paid during this period.

FY 2009-10 Work Program Contracts

Two regular contracts from this work program year are open.

FY 2009-10 Regular Work Program Invoices Paid
No invoices were paid during this period.

Administrative Scope Changes

Two administrative scope changes were initiated during the period of August 26 through September 28, 2010.

- MS10019 (pending) – EDCO Disposal: Purchase 11 Heavy-Duty Natural Gas Refuse Trucks – allow truck location to be in either Los Angeles or Orange County
- ML06028 – City of Pasadena: Install CNG Station and Modify Maintenance Facility – modify project schedule to allow six additional months for maintenance facility (no change to contract term)

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 33

REPORT: California Air Resources Board Monthly Meeting

SYNOPSIS: The California Air Resources Board met on October 21, 2010. The following is a summary of this meeting.

RECOMMENDED ACTION:
Receive and file.

Ronald O. Loveridge, Member
SCAQMD Governing Board

sm

The Air Resources Board's (ARB or Board) October meeting was held in Sacramento. Key items presented are summarized below.

1. Research Update: Air Pollution Research, Fiscal Year 2010-2011

ARB approved the 2010-11 Annual Research Plan, allocating approximately $6.5 million toward 25 projects in five general categories as shown in the following table.

Research Category	Budget (millions)
Health Effects and Exposure	$1.5
Emissions Reductions	$2.8
Climate Change, Energy Efficiency, & Conservation	$1.3
Economic Analysis	$0.5
Technology Research & Development	$0.4
TOTAL*	$6.5

* Categories do not add to total shown due to rounding

The Research Plan also identifies four additional projects to be considered if additional funding becomes available; total recommended ARB support for these projects would be $1.3 million.

2. Legislative Update

ARB Legislative Director Rob Oglesby reviewed the fate of air quality legislation considered in the recently concluded 2009-2010 legislative session. The Legislature was focused on the State's economy and introduced few air quality or climate change bills, although it did hold 13 special hearings on air quality topics ranging from AB 32 Climate Change program implementation to carpool lanes. Significantly, the Legislature rejected several bills designed to roll back or delay climate change and diesel emission reduction programs.

The Governor signed into law the following major air quality bills:

- AB 2289 (Eng), which will provide for faster, more effective, and less expensive smog checks for passenger vehicles equipped with advanced on-board diagnostic system (OBD II). Over 70 percent of cars subject to Smog Check are equipped with the OBD II on-board computer system, which was pioneered by ARB. The on-board computers provide detailed engine performance data that allow Smog Check technicians to better assess each vehicle's emissions and diagnose emission system problems. AB 2289 will provide 70 tons per day emission reductions, equivalent to removing 800,000 vehicles from the road.
- AB 1500 (Lieu) and SB 535 (Yee), which extends high occupancy vehicle (HOV) lane access for alternate fuel and hybrid vehicles.
- SB 1402 (Dutton), which requires ARB to provide written information on how ARB-imposed penalties are determined, and requires the Board to adopt a written penalty policy.
- SB 855, the Budget Trailer Bill, which requires each State agency implementing the AB 32 climate change program to prepare a zero-based AB 32 budget for fiscal year 2011-12, and to submit that budget to the Legislature by April 1, 2011.
- AB 1507 (Lieu), which expands the Carl Moyer emission reduction incentive program to include mobile source projects that provide greenhouse gas (GHG) benefits, provided the GHG controls do not reduce criteria pollutant benefits.

Governor Schwarzenegger vetoed AB 1405 (De Leon), which would have established the California Climate Change Community Benefits fund to distribute ten percent of the proceeds from any cap-and-trade program adopted by ARB to

projects in environmental justice communities, noting that ARB is still designing the cap-and-trade program.

3. Report on the Implementation of the AB 32 Scoping Plan

Staff provided an update to the Board on implementation of the AB 32 Climate Change Scoping Plan measures and other climate change program activities. With last month's approval of the Renewable Electricity Standard and SB 375 regional GHG reduction targets, ARB and other State agencies have enacted measures that achieve over half of the reductions needed to meet the 2020 GHG emission reduction target established in AB 32. ARB staff is preparing two major regulations for the near-term consideration: the GHG cap-and-trade regulation and the Advanced Clean Cars program. These regulations are tentatively scheduled for Board consideration in December 2010 and January 2011, respectively. ARB staff is also evaluating the impact of the economic downturn on the GHG inventory and progress towards meeting the AB 32 GHG reduction goals.

Staff reported that the U.S. Environmental Protection Agency (U.S. EPA) is developing GHG emission requirements for the largest industrial GHG emission sources. U.S. EPA staff is working on GHG requirements that would be incorporated into the Clean Air Act's New Source Review (NSR) and Title V reporting requirements, and would be phased in over several years. The NSR changes would mandate the use of best available control technology to reduce GHG emissions from new and significantly modified sources.

On the international front, Governor Schwarzenegger will co-host the third international Governors' Global Climate Summit with the United Nations Development and Environment Program at U.C. Davis on November 15 and 16. Among other issues, attendees will discuss carbon trading market design issues with the goal of ensuring that markets are compatible across borders.

4. Update on Recent Federal and ARB Activities to Support Development of More Stringent Greenhouse Gas Emission Standards for Model Year 2017-2025 Passenger Vehicles

Chief Deputy Executive Officer Tom Cackette summarized the findings of the "Interim Joint Technical Assessment Report on Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards for Model Years 2017-2025" that was developed jointly by U.S. EPA, the National Highway Traffic Safety Administration (NHTSA) and ARB. The technical assessment included meetings with stakeholders, studies to evaluate new technologies, and modeling to identify the costs, fuel savings and GHG emission

reductions from various mixes of technologies. The proposed technologies include mass reduction, improved gasoline engines, increased numbers of hybrids (conventional and plug-in), and increased numbers of zero emission vehicles (battery and fuel cell). These advanced technology vehicles will cost more to purchase, but these costs will be offset by significant fuel savings. ARB is tentatively scheduled to present an Advanced Clean Cars regulation to the Board in early 2011. U.S. EPA and NHTSA are expected to release more stringent GHG emission standards for model year 2017- 2025 vehicles in early 2012. ARB staff will evaluate the federal standards at that time and consider harmonization with them.

5. Proposed Amendments to the Airborne Toxic Control Measure for Stationary Compression Ignition Engines

The Board approved proposed amendments to ARB's Airborne Toxic Control Measure (ATCM) for Stationary Compression Ignition (Diesel) Engines, adopted in 2004, to align the requirements more closely with U.S. EPA's New Source Performance Standards for this source category, promulgated in 2006. The amendments primarily affect the requirements for new diesel engines used on a stand-by basis in non-agricultural operations. These engines are typically operated for less than 30 hours per year. The amendment will save businesses and public agencies approximately $46 million through 2020 without significantly impacting the steep emission reductions provided by the ATCM. The ATCM also allows local air districts to establish more stringent requirements either through local rulemaking, or on a site-specific basis through the district permitting process.

6. Proposed Minor Amendments to the Periodic Smoke Inspection Program in Response to the Inclusion of Diesel Vehicles in Smog Check (Assembly Bill 1488, Mendoza 2007)

ARB staff presented proposed revisions to ARB's Periodic Smoke Inspection Program (PSIP) for diesel trucks that would remove some smoke inspection requirements for trucks that are also subject to the Diesel Smog Check program established by AB 1488 (Mendoza, 2008). The PSIP, which was implemented by the Board in 1998, requires truck fleets to perform annual smoke opacity inspections, and to repair or remove from service failing trucks. AB 1488 requires all 1998 and newer diesel trucks that weigh 14,000 pounds and less (generally light- and medium-duty pick-up trucks) to undergo biennial Smog Check inspections, including a visual tamper inspection, an OBD check, and a visual smoke test.

The ARB staff proposed to waive the PSIP smoke opacity inspections for trucks subject to the new Diesel Smog Check program during the years when the trucks

are required to go through the Smog Check program. The Board elected to enact an alternative presented by staff, which would exempt trucks subject to the Diesel Smog Check program from the PSIP entirely. In aggregate the smaller diesel trucks that are subject to Diesel Smog Check requirements account for less than one percent of the particulate matter emissions from all diesel trucks; ARB staff estimated that eliminating the PSIP requirement for this class of trucks would increase diesel particulate matter emissions by 0.01 ton per day statewide. The amendment will save truck fleets an estimated $4.2 million per year.

(This facility is accessible to persons with disabilities.)

TO SUBMIT WRITTEN COMMENTS ON AN AGENDA ITEM IN ADVANCE OF THE MEETING GO TO:

http://www.arb.ca.gov/lispub/comm/bclist.php

October 21, 2010
9:00 a.m.

CONSENT CALENDAR:

All items on the consent calendar will be voted on by the Board immediately after the start of the public meeting. Any item may be removed from the consent calendar by a Board member or if someone in the audience wishes to speak on that item. The following item is on the consent calendar:

Consent Item #	Agenda Topic
	None.

DISCUSSION ITEMS:

Note: The following agenda items may be heard in a different order at the Board meeting.

Agenda Item #	Agenda Subject/Topic

10-9-1 **Public Meeting to Hear a Staff Presentation on the Draft Planned Air Pollution Research, Fiscal Year 2010-2011**

Staff will present the portfolio of proposed research projects for FY 2010-2011. Research has been selected to support the Board's decision-making, support effective implementation of our regulatory programs, and address knowledge gaps critical to the Board's mission.

More Information Staff Presentation

10-9-4 **Public Meeting to Hear the 2010 Legislative Update**

ARB Legislative Director and staff will present a review of legislation from the recently concluded 2009-2010 legislative session.

Staff Presentation

10-8-3 **Public Meeting To Update the Board on the Implementation of the AB 32 Scoping Plan**

Staff will update the Board on implementation of the Scoping Plan measures and other climate change program activities.

More Information Staff Presentation

10-9-5 **Public Meeting to Hear an Informational Update on Recent Federal and ARB Activities to Support Development of More Stringent Greenhouse Gas Emission Standards for Model Year 2017-2025 Passenger Vehicles**

Staff will report on the recent publication of a Technical Assessment Report, jointly prepared by ARB, U.S. EPA, and U.S. DOT, on greenhouse gas emission reduction standards for model year 2017-2025 passenger vehicles and the related federal Notice of Intent to conduct a rulemaking.

Staff Presentation

10-9-2 **Public Hearing to Consider Proposed Amendments to the Airborne Toxic Control Measure for Stationary Compression Ignition Engines**

Staff will propose amendments to the Airborne Toxic Control Measure for Stationary Compression Ignition Engines (ATCM) to more closely align the requirements in the ATCM with those in the federal Standards of Performance for Stationary Compression-Ignition Internal Combustion Engines that was promulgated on July 11, 2006, help clarify provisions in the ATCM, address new information, and remove provisions no longer needed.

More Information Staff Presentation

10-9-3 **Public Hearing to Consider Minor Amendments to the Periodic Smoke Inspection Program in Response to the Inclusion of Diesel Vehicles in Smog Check (Assembly Bill 1488, Mendoza 2007**)

Staff will present to the Board minor amendments to the Periodic Smoke Inspection Program (PSIP) to mitigate the duplicative testing requirements resulting from the implementation of the statutory requirements of AB 1488 and the existing testing requirements of PSIP. This action will eliminate duplicative emissions tests thereby lowering administrative costs to affected California fleets with diesel vehicles.

More Information Staff Presentation

CLOSED SESSION – LITIGATION

The Board will hold a closed session, as authorized by Government Code section 11126(e), to confer with, and receive advice from, its legal counsel regarding the following pending or potential litigation:

Pacific Merchant Shipping Association v. Goldstene, U.S. District Court (E.D. Cal Fresno), Case No. 2:09-CV-01151-MCE-EFB.

American Trucking Associations, et al. v. U.S. Environmental Protection Agency, et al., U.S. Court of Appeals, District of Columbia Circuit, Case No. 09-1090.

POET, LLC, et al. v. Goldstene, et al., Superior Court of California (Fresno County), Case No. 09CECG04850.

Rocky Mountain Farmers Union, et al. v. Goldstene, U.S. District Court (E.D. Cal. Fresno), Case No. 1:09−cv−02234−LJO−DLB.

National Petrochemical & Refiners Association, et al. v. Goldstene, et al., U.S. District Court (E.D. Cal. Fresno) Case No. 1:10-cv-00163-AWI-GSA.

OPPORTUNITY FOR MEMBERS OF THE BOARD TO COMMENT ON MATTERS OF INTEREST

Board members may identify matters they would like to have noticed for consideration at future meetings and comment on topics of interest; no formal action on these topics will be taken without further notice.

OPEN SESSION TO PROVIDE AN OPPORTUNITY FOR MEMBERS OF THE PUBLIC TO ADDRESS THE BOARD ON SUBJECT MATTERS WITHIN THE JURISDICTION OF THE BOARD

Although no formal Board action may be taken, the Board is allowing an opportunity to interested members of the public to address the Board on items of interest that are within the Board's jurisdiction, but do not specifically appear on the agenda. Each person will be allowed a maximum of three minutes to ensure that everyone has a chance to speak.

TO SUBMIT WRITTEN COMMENTS ON AN AGENDA ITEM IN ADVANCE OF THE MEETING GO TO:

http://www.arb.ca.gov/lispub/comm/bclist.php

IF YOU HAVE ANY QUESTIONS, PLEASE CONTACT THE CLERK OF THE BOARD

1001 I Street, 23rd Floor, Sacramento, CA 95814, (916) 322-5594

ARB Homepage: http://www.arb.ca.gov

SPECIAL ACCOMMODATION REQUEST

Special accommodation or language needs can be provided for any of the following:

- An interpreter to be available at the hearing;
- Documents made available in an alternate format (i.e., Braille, large print, etc.) or another language;
- A disability-related reasonable accommodation.

To request these special accommodations or language needs, please contact the Clerk of the Board at (916) 322-5594 or by facsimile at (916) 322-3928 as soon as possible, but no later than 10 business days before the scheduled Board hearing. TTY/TDD/Speech to Speech users may dial 711 for the California Relay Service.

Comodidad especial o necesidad de otro idioma puede ser proveído para alguna de las siguientes:
- Un intérprete que esté disponible en la audiencia;
- Documentos disponibles en un formato alterno (por decir, sistema Braille, o en impresión grande) u otro idioma;
- Una acomodación razonable relacionados con una incapacidad.

Para solicitar estas comodidades especiales o necesidades de otro idioma, por favor llame a la oficina del Consejo al (916) 322-5594 o envíe un fax a (916) 322-3928 lo más pronto posible, pero no menos de 10 días de trabajo antes del día programado para la audiencia del Consejo. TTY/TDD/Personas que necesiten este servicio pueden marcar el 711 para el Servicio de Retransmisión de Mensajes de California.

SMOKING IS NOT PERMITTED AT MEETINGS OF THE CALIFORNIA AIR RESOURCES BOARD

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 34

PROPOSAL: Proposed Rule 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities

SYNOPSIS: On October 15, 2008 the U.S. EPA amended the National Ambient Air Quality Standard (NAAQS) for Lead. The standard has been lowered from 1.5 µg/m^3 to 0.15 µg/m^3 in order to provide an adequate margin of safety that would ensure the protection of public health. Based on current monitoring data, large lead-acid battery recycling facilities are one of the largest sources of lead. Proposed Rule 1420.1 establishes additional requirements for large lead-acid battery recycling facilities to meet attainment of the new NAAQS for lead.

COMMITTEE: Stationary Source, November 20, 2009, April 16, 2010, May 21, 2010, June 18, 2010, July 23, 2010, September 24, 2010, October 15, 2010, Reviewed

RECOMMENDED ACTION:
Adopt the attached resolution:
1. Certifying the Final Environmental Assessment (EA) for Proposed Rule 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities; and
2. Adopting Proposed Rule 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities.

Barry R. Wallerstein, D.Env.
Executive Officer

EC:LT:SN:CAM: EK

Background
The federal Clean Air Act requires the U.S. Environmental Protection Agency (U.S. EPA) to set National Ambient Air Quality Standards (NAAQS) for criteria pollutants. On October 15, 2008, the U.S. EPA amended the NAAQS for lead from 1.5 $\mu g/m^3$ to 0.15 $\mu g/m^3$. Based on review of new health studies, the U.S. EPA has determined that a primary and secondary standard of 0.15 $\mu g/m^3$ is requisite to provide an adequate margin of safety that would ensure the protection of the environment and public health regarding health effects from lead exposure.

In 1992, the AQMD's Governing Board adopted Rule 1420 – Emissions Standard for Lead which applies to facilities that use or process lead, including large lead acid-battery recycling facilities. Rule 1420 requires affected facilities to meet a lead emission standard of 1.5 $\mu g/m^3$, vent point sources to an emissions collection system, and to submit a compliance plan providing information about the amount of lead processed and emission estimates.

Basin's Attainment Status
The California Air Resources Board has recommended to U.S. EPA that the South Coast Air Basin (Basin) portion of Los Angeles County be designated as non-attainment for the 2008 lead NAAQS based on data from monitors near lead-acid battery recycling facilities in the Basin. Final designation of attainment status for the Basin by the U.S. EPA is expected by October 15, 2010. The 2008 lead NAAQS requires attainment by each state no later than five years with three years of clean data after final designations are received.

Health Effects of Lead
Over the past two decades, more than 6,000 new studies on lead health effects have been published showing that adverse effects occur at much lower levels of lead in the blood than previously thought. Lead is a criteria pollutant and is also identified as a carcinogenic toxic air contaminant by the Office of Environmental Health Hazard Assessment. Chronic health effects include problems such as nervous and reproductive system disorders, neurological and respiratory damage, cognitive and behavioral changes, and hypertension. Exposure to lead can also potentially increase the risk of contracting cancer or result in other adverse health effects. Young children are especially susceptible to the effects of environmental lead, both from inhalation and ingestion, because their bodies accumulate lead more readily than do those of adults, and because they are more vulnerable to certain biological effects of lead including learning disabilities, behavioral problems, and deficits in IQ.

Affected Industry
Based on annual facility reports for lead emissions received for AQMD's Annual Emissions Reporting Program, the AQMD staff has determined that the lead-acid battery recycling industry is the highest stationary source of lead emissions in the Basin.

Based on available monitoring data, staff's analysis has also shown that this industry currently demonstrates ambient air lead concentration measurements that cause non-attainment with the new lead NAAQS. Pursuant to California Health & Safety Code §40001(a), the AQMD is required to adopt and enforce rules and regulations to achieve and maintain federal ambient air quality standards in all areas affected by emission sources under their jurisdiction. Therefore, the purpose of Proposed Rule 1420.1 (PR 1420.1) is to set additional requirements for large lead-acid battery recycling facilities to address the amended NAAQS for lead and help ensure that the Basin can achieve the revised standard.

PR 1420.1 applies to large lead-acid battery recycling facilities. There are currently two facilities within the AQMD that the proposed rule will apply to: Exide Technologies in the city of Vernon and Quemetco, Inc. in the City of Industry. These two facilities are the only large lead-acid battery recyclers in the state of California and in the western United States, with the next nearest large lead-acid battery recycling facility located in Texas. These facilities receive spent lead-acid batteries and other lead-bearing materials, recycle them, and recover the lead.

The provisions of PR 1420.1 are in addition to Rule 1420 – Emissions Standard for Lead. Rule 1420 is planned for a future amendment to address other lead sources in the Basin and the 2008 NAAQS for lead.

Proposal

PR 1420.1 applies to lead-acid battery recycling facilities that process or have ever processed 50,000 tons of lead annually. The purpose of the proposed rule is to protect public health and establish requirements that will help ensure that the Basin meets attainment status with the 2008 NAAQS for lead. As a result, the rule proposes:

- An ambient air lead concentration standard of 0.15 µg/m^3 averaged over any 30 consecutive days effective January 1, 2012;
- Requirements to reduce lead point source emissions through:
  - a total facility mass lead emission rate of 0.045 lb/hr;
  - a maximum lead emission rate of 0.01 lb/hr for any lead point source;
  - secondary lead control devices on dryers; and
  - use of high efficiency bags and filters for lead control devices;
- Requirements to reduce fugitive lead emissions through:
  - total enclosures of process areas used in the lead-acid battery recycling operation;
  - housekeeping requirements including periodic cleanings of facility grounds, rooftops, and surface impoundments; storage and transport requirements for lead-containing materials; and
  - requirements for lead abatement procedures when conducting specific types of maintenance activity;

- Submittal of a "Contingency" Compliance Plan if the facility approaches 80 percent of the ambient air lead concentration standard on and after July 1, 2011, containing additional lead emission reduction measures. The plan would only be implemented if the facility exceeds an ambient air lead concentration of 0.15 $\mu g/m^3$;
- Public notification of unplanned shutdown of any lead control device, planned turnaround or shutdown, and specific maintenance activities; and
- Additional requirements for source testing, ambient air concentration monitoring, siting for new facilities, public notifications, reporting, and recordkeeping.

Public Process

A PR 1420.1 Working Group was formed to provide an opportunity to discuss the proposed rule in greater detail and provide input to the AQMD staff throughout the rule development process. The working group was comprised of a variety of stakeholders including representatives and consultants for the regulated industry; other agency representatives; environmental and community representatives; and other interested parties. The Working Group met three times during the rule development process on April 22, 2010, May 18, 2010, and August 24, 2010. In addition, a Public Workshop was held on April 14, 2010, and updates to the Stationary Source Committee were presented throughout the rule development process.

Key Outstanding Issues

Proposed Rule 1420.1 Approach

One PR 1420.1 facility has commented that the approach of the proposed rule should be based on a compliance plan with no core requirements. This approach would be similar to Rule 1420. Facilities would implement a compliance plan and be required to achieve the ambient air quality standard. Past experience with Rule 1420 shows that a compliance plan approach alone is not sufficient to demonstrate compliance with the lead ambient air quality standard. Moreover, with the more stringent lead standard, even greater assurances in the specificity of the control measures is needed.

Lower Lead Point Source Emission Rate from 0.045 lbs/hr to 0.003 lbs/hr

One PR 1420.1 facility has requested that the lead point source emission rate be lowered from 0.045 lbs/hr to 0.003 lbs/hr. The AQMD staff appreciates the investment in pollution control equipment that this facility has installed. This facility is located approximately one-tenth of a mile from a densely populated residential neighborhood. Pollution control equipment was installed primarily for compliance with the AB2588 Toxics Hot Spots program to control other toxic metals to reduce their cancer burden, which concurrently reduced lead emissions.

Based on point source modeling, the AQMD staff believes that the other lead-acid battery recycling facility can achieve the new lead standard through controlling lead point source emissions to 0.045 lbs/hr and strict adherence to housekeeping provisions

of PR 1420.1. At this point, there is not sufficient information to substantiate the need to require this facility to go beyond an expected 99% point source reduction at an additional cost of $15 to $20 million. The ambient monitors will be the ultimate test of compliance. If this facility's lead concentration approaches 80% of the new standard, they will be required to submit a Compliance Plan that will identify additional lead point source controls and housekeeping provisions.

The Staff Report, Environmental Analysis and Socioeconomic Analysis are based on PR 1420.1, which requires a total stack mass emission rate of 0.045 lbs/hr from all point sources of lead emissions at a facility. If the Governing Board were to direct staff to incorporate a total stack emission rate of 0.003 lbs/hr of lead, either as a core requirement, or in the contingency Compliance Plan, additional environmental and economic analyses would be needed. The Board could, however, select an option that would require the facility to evaluate the feasibility of a total stack emission rate of 0.003 lb/hr of lead if the facility triggered the need for a compliance plan. If it is determined that it is both feasible and necessary to lower the total stack emission rate, Rule 1420.1 could be amended and the appropriate environmental and socioeconomic analyses would be conducted.

Allow Use of Alternative Stack Geometries to Achieve Lead Point Source Emission Rate
One PR 1420.1 facility has expressed concern that the facility-wide lead emission rate of 0.045 lbs/hr only considers alternate emission rate scenarios to achieve compliance and does not allow the possibility of alternate stack geometries. This facility believes that "the *problem* with these stacks is NOT that their emissions are too great or any way indicative of inadequate control effectiveness, but that they are simply too short."

Based on careful review of source tests from this facility, the AQMD staff believes that the "problem" is that emissions are too great from some of the lead point sources. It is the AQMD staff's understanding that this facility would like to have the flexibility of reducing their fence line lead concentration by increasing their stack height to increase dispersion of emissions. The AQMD staff disagrees with this approach as it does not reduce lead emissions. In addition, lead accumulates on the ground and may be re-entrained into the air. Additional lead controls will be needed to achieve the new lead standard of 0.15 $\mu g/m^3$. Also, Clean Air Act Section 123 prohibits the use of excessive stack height or other dispersion technique in lieu of reducing emissions.

PR 1420.1 Violation Funds for Mitigation in Impacted Community
Environmental and community groups requested that monies collected from violations of PR 1420.1 be used for mitigation projects in communities impacted by the violation. Traditionally the AQMD staff seeks to implement programs and projects in highly impacted areas. To the extent feasible, the AQMD staff will continue to seek opportunities to use monies to fund programs and projects in highly impacted areas.

Requirement for Additional Monitors Funded by Affected Facility and Operated by the AQMD

One PR 1420.1 facility has requested that the proposed rule include a provision that would require facilities to fund the installation, operation, and maintenance of three to four additional monitors that would be operated by the AQMD. These monitors would be in addition to the monitors operated by the affected facilities and the monitors managed by the AQMD staff for compliance with the NAAQS. The AQMD staff appreciates this request, however, the AQMD staff believes that the existing monitoring network for both affected facilities is sufficient. There are currently four facility-operated monitors and one AQMD-operated monitor at Quemetco, and six facility-operated monitors and two AQMD-operated monitors at Exide. If new information shows a need, additional monitors can be installed.

AQMP and Legal Mandates

Pursuant to Health & Safety Code Section 40460 (a), the South Coast Air Quality Management District (AQMD) is required to adopt an Air Quality Management Plan (AQMP) demonstrating compliance with all federal regulations and standards such as the lead NAAQS for the Basin. The AQMD is required to adopt rules and regulations that carry out the objectives of the AQMP. Currently, there are no AQMD measures for lead. However, the proposed rule will be submitted as a part of the State Implementation Plan that outlines the strategy to demonstrate attainment with the lead NAAQS. The lead emission reductions from this proposed rule will help achieve compliance with the 2008 federal ambient air quality standard for lead.

California Environmental Quality Act (CEQA)

The AQMD, as lead agency, prepared a Draft Environmental Assessment (EA) pursuant to CEQA Guidelines §15252 for Proposed Rule 1420.1. No significant adverse environmental impact was identified. The Draft EA was released for a 30-day public review and comment period beginning on April 27, 2010 and ending on January May 26, 2010. No comments were received.

Subsequent to the public circulation of the Draft EA for proposed project, Proposed Rule 1420.1 was modified. The modifications were analyzed and AQMD staff concluded that recirculation was not necessary per CEQA Guidelines §15073.5, because the modifications were determined not to be a substantial revision (i.e., a new, avoidable significant effect that requires mitigation measure or project revisions to reduce the effect to insignificance or that project effects cannot be reduced to insignificant and new measures or project revisions are required).

Socioeconomic Assessment

PR 1420.1 will help achieve the latest amendments to the federal NAAQS for Lead, as adopted by the U.S. EPA on October 15, 2008. PR 1420.1 also proposes to include total enclosures, installation of secondary lead control devices on dryers, detailed housekeeping requirements, increased monitoring, and annual emissions testing of lead

control devices. The total annual cost for both facilities to comply with PR 1420.1 is estimated at $0.41 million for the first year, and $0.32 million annually thereafter. Some requirements of PR 1420.1 are currently being implemented by both facilities due to conditions found in Rule 1420 compliance plans or orders for abatement, and the costs assessed for compliance with these requirements are not included in the assessment. The socioeconomic assessment was made available to the public at least 30 days prior to the Public Hearing and is included as part of the Public Hearing package.

Implementation and Resource Impact

Existing AQMD resources will be used to implement Proposed Rule 1420.1.

SUMMARY OF PROPOSAL

Proposed Rule 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities
Proposed Rule 1420.1 establishes requirements for large lead-acid battery recycling facilities in order to help ensure attainment status with the 2008 NAAQS for lead in the Basin. The proposed rule establishes the following requirements: • Prior to January 1, 2012, meet an ambient air lead concentration of 1.5 µg/m^3 averaged over 30 days as required under Rule 1420; • On and after January 1, 2012, meet an ambient air lead concentration standard of 0.15 µg/m^3 averaged over any 30 consecutive days; • Reduce lead point source emissions through: o Total facility mass lead emission rate of 0.045 lb/hr; o Maximum lead emission rates for lead point sources of 0.01 lb/hr; o Secondary lead control devices on dryers; and o Use of high efficiency bags and filters for lead control devices; • Reduce fugitive lead-dust emissions through: o Total enclosures of process areas used in the lead-acid battery recycling operation; o Housekeeping requirements including periodic cleanings of facility grounds, rooftops, and surface impoundments; storage and transport requirements for lead-containing materials; and o Requirements for lead abatement procedures when conducting specific types of maintenance activity; • Submittal of a "Contingency" Compliance Plan if the facility approaches 80 percent of the ambient air lead concentration standard, containing additional lead emission reduction measures. The plan would only be implemented if the facility exceeds an ambient air lead concentration of 0.15 µg/m^3; • Public notification of unplanned shutdown of any lead control device, planned turnaround or shutdown, and specific maintenance activities; and • Source testing, ambient air concentration monitoring, siting for new facilities, public notifications, reporting, and recordkeeping.

KEY ISSUES AND RESPONSES

Proposed Rule 1420.1 – Emissions Standard of Lead for Large Lead-acid Battery Recycling Facilities
• Issue: One PR 1420.1 facility has commented that the approach of the proposed rule is too prescriptive and that instead, PR 1420.1 should be based on the lead emission standard with a compliance plan with no core requirements. Response: The suggested approach would be similar to Rule 1420. Facilities would implement a compliance plan and be required to achieve the ambient air quality standard. Past experience with Rule 1420 shows that a compliance plan approach is not sufficient to demonstrate compliance with the lead ambient air quality standard. Moreover, with the more stringent lead standard, even greater assurances in the specificity of the control measures is needed. • Issue: One PR 1420.1 facility has requested to lower the lead point source emission rate from 0.045 lbs/hr to 0.003 lbs/hr. Response: The AQMD staff appreciates the investment in pollution control equipment that this facility has installed. Pollution control equipment was installed primarily for compliance with the AB2588 Toxics Hot Spots program to control other toxic metals to reduce their cancer burden, which concurrently reduced lead emissions. Based on point source modeling, the AQMD staff believes that it is possible that the other lead-acid battery recycling facility can achieve the new lead standard through controlling lead point source emissions to 0.045 lbs/hr and strict adherence to housekeeping provisions of PR 1420.1. At this point, there is not sufficient information to substantiate the need to require this facility to go beyond an expected 99% reduction at an additional investment in pollution controls of $15 to $20 million. The ambient monitors will be the ultimate test of compliance. If this facility's lead concentration approaches 80% of the new standard, they will be required to submit a Compliance Plan that will identify additional lead point source controls and housekeeping provisions. • Issue: One PR 1420.1 facility has expressed concern that the facility-wide lead emission rate of 0.045 lbs/hr only considers alternate emission rate scenarios to achieve compliance and does not allow the possibility of alternate stack geometries. This facility believes that "the "problem" with these stacks is NOT that their emissions are too great or any way indicative of inadequate control effectiveness, but that they are simply too short."

Response: Based on review of source tests from this facility, the AQMD staff believes that the "problem" is that emissions are too great from some of the lead point sources. It is the AQMD staff's understanding that this facility would like to have the flexibility of reducing their fence line lead concentration by increasing their stack height to increase dispersion of emissions. The AQMD staff disagrees with this approach as it does not reduce lead emissions. Additional lead controls will be needed to achieve the new lead standard of 0.15 $\mu g/m^3$.

- Issue: Environmental and community groups requested funding for mitigation.

  Response: Traditionally the AQMD staff seeks to implement programs and projects in highly impacted areas. To the extent feasible, the AQMD staff will continue to seek opportunities to use monies to fund programs and projects in highly impacted areas.

- Issue: PR 1420.1 should require that facilities fund the installation, operation, and maintenance of three to four additional monitors that would be run by the AQMD and used for compliance with the ambient air lead concentration, ambient air monitoring, and Compliance Plan requirements of PR 1420.1.

  Response: These monitors would be in addition to the monitors operated by the affected facilities and the monitors managed by the AQMD staff for compliance with the NAAQS. The AQMD staff appreciates this request, however, the AQMD staff believes that the existing monitoring network for both affected facilities is sufficient. There are currently four facility-operated monitors and one AQMD-operated monitor at Quemetco, and six facility-operated monitors and two AQMD-operated monitors at Exide. If new information shows a need, additional monitors can be installed.

RESOLUTION NO. 10-_____

A Resolution of the Governing Board of the South Coast Air Quality Management District (AQMD) certifying the Final Environmental Assessment (EA) for Proposed Rule 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities.

A Resolution of the AQMD Governing Board Adopting Proposed Rule 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities.

WHEREAS, the AQMD Governing Board finds and determines that Proposed Rule 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities (PR 1420.1) is considered a "project" pursuant to the California Environmental Quality Act (CEQA); and

WHEREAS, the AQMD has had its regulatory program certified pursuant to Public Resources Code §21080.5 and has conducted CEQA review and analysis pursuant to such program (AQMD Rule 110); and

WHEREAS, AQMD staff has prepared a Draft EA pursuant to its certified regulatory program and CEQA Guidelines §15168 and §15252, setting forth the potential environmental consequences of PR 1420.1; and

WHEREAS, the Draft EA determined the proposed project would result in no significant adverse environmental impacts; and

WHEREAS, the Draft EA was circulated for 30-day public review and comment period, no comments were received, and the Draft EA has been revised such that it is now a Final EA; and

WHEREAS, it is necessary that the adequacy of the Final EA be determined by the AQMD Governing Board prior to its certification; and

WHEREAS, the Governing Board prior to voting on PR 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities, has reviewed and considered the Final EA; and

WHEREAS, a Mitigation Monitoring Plan pursuant to Public Resources Code §21081.6, has not been prepared since no mitigation measures are necessary; and

WHEREAS, the AQMD Governing Board finds and determines, taking into consideration the factors in §(d)(4)(D) of the Governing Board Procedures, that the modifications adopted which have been made to PR 1420.1 since notice of public hearing was published do not significantly change the meaning of the proposed project within the meaning of Health and Safety Code §40726 and would not constitute significant new information requiring recirculation of the Draft CEQA document pursuant to CEQA Guidelines §15073.5; and

WHEREAS, lead has been identified as a toxic air contaminant by the Office of Environmental Health Hazard Assessment (OEHHA); and

WHEREAS, lead has been identified by the U.S. Environmental Protection Agency (U.S. EPA) as a criteria air pollutant for national ambient air quality standards, and the South Coast Air Basin has been recommended for designation by U.S. EPA as non-attainment status for the 2008 lead NAAQS; and

WHEREAS, California Health & Safety Code §40001(c) requires districts, prior to adopting any rule or regulation to reduce criteria pollutants, to determine that there is a problem that the proposed rule or regulation will alleviate and that the rule or regulation will promote the attainment or maintenance of federal ambient air quality standards; and

WHEREAS, the AQMD staff conducted a public workshop regarding PR 1420.1; and

WHEREAS, California Health and Safety Code §40727 requires that prior to adopting, amending or repealing a rule or regulation, the AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the public hearing and in the staff report; and

WHEREAS, the AQMD Governing Board has determined that a need exists to adopt PR 1420.1 in order to 1) achieve the 2008 National Ambient Air Quality Standard for Lead, 2) impose requirements intended to reduce lead emissions from the source category that has caused non-attainment designation of the Los Angeles County portions of the South Coast Air Basin, and 3) protect public health by reducing cancer risk and other health effects from exposure to lead; and

WHEREAS, the AQMD Governing Board obtains its authority to adopt, amend or repeal rules and regulations from sections 39002, 39650 et. seq., 39669.5,

40000, 40001, 40440, 40702, 40725 through 40728, 41508, 41700, 41706, 44365, and 44390 through 44394 of the Health and Safety Code; and

WHEREAS, the AQMD Governing Board has determined that PR 1420.1 is written and displayed so that the meaning can be easily understood by persons directly affected by it; and

WHEREAS, the AQMD Governing Board has determined that PR 1420.1 is in harmony with, and not in conflict with, or contradictory to, existing statutes, court decisions, or state or federal regulations; and

WHEREAS, the AQMD Governing Board has determined that PR 1420.1 does not impose the same requirements as any existing state or federal regulations, and the proposed project is necessary and proper to execute the powers and duties granted to, and imposed upon, the AQMD; and

WHEREAS, by adopting PR 1420.1, the AQMD Governing Board will be implementing, interpreting or making specific the provisions of the California Health and Safety Code Sections 40001 (rules to achieve and maintain ambient air quality standards), 41700 (nuisance), 41706(b) (emission standards for lead compounds from non-vehicular sources), Federal Clean Air Act Section 112 (Hazardous Air Pollutants), and the 2008 National Ambient Air Quality Standard for Lead; and

WHEREAS, pursuant to California Health and Safety §40001(c), the AQMD has determined that there is a lead problem that PR 1420.1 will alleviate, and that the proposed rule will promote the attainment and maintenance of the 2008 National Ambient Air Quality Standard for Lead; and

WHEREAS, PR 1420.1 is not a control measure in the 2007 Air Quality Management Plan (AQMP) and thus, was not ranked by cost-effectiveness relative to other AQMP control measures in the 2007 Air Quality Management Plan, and furthermore, pursuant to Health and Safety Code §40910, cost-effectiveness in terms of dollars per ton of pollutant reduced is only applicable to rules regulating ozone, carbon monoxide, sulfur dioxide, and nitrogen dioxide and does not apply to toxic air contaminants; and

WHEREAS, PR 1420.1 applies to lead and not ozone, CO, SOx, NOx, and their precursors, and thus the incremental cost effectiveness analysis required by California Health and Safety Code §40920.6 does not apply; and

WHEREAS, Health and Safety Code §40727.2 requires the AQMD to prepare a written analysis of existing federal air pollution control requirements applicable to the same source type being regulated whenever it adopts, or amends a rule,

and that the AQMD's comparative analysis of PR 1420.1 is included in the staff report; and

WHEREAS, the AQMD Governing Board has determined that the Socioeconomic Impact Assessment of PR 1420.1 is consistent with the March 17, 1989 and October 14, 1994 Governing Board Socioeconomic Resolutions for rule adoption; and

WHEREAS, the AQMD Governing Board has determined that PR 1420.1 will result in increased costs to the large lead-acid battery recycling facilities, yet are considered to be reasonable, with a total annualized cost as specified in the Socioeconomic Impact Assessment; and

WHEREAS, the affected facilities have been required to add air pollution controls and implement additional housekeeping and maintenance activities outside of PR 1420.1 and costs incurred to comply with these other requirements, such as revised Rule 1420 compliance plans, settlement agreements, orders for abatement, or AB2588 were not included in the Socioeconomic Impact Assessment of PR 1420.1; and

WHEREAS, the AQMD Board has actively considered the Socioeconomic Impact Assessment and has made a good faith effort to minimize such impacts; and

WHEREAS, the AQMD Governing Board has determined that the Socioeconomic Impact Assessment is consistent with the provisions of the California Health and Safety Code Sections 40440.8, 40728.5, 40920.6; and

WHEREAS, the AQMD Governing Board specifies the Manager of PR 1420.1 as the custodian of the documents or other materials which constitute the record of proceedings upon which the adoption of this proposed project is based, which are located at the South Coast Air Quality Management District, 21865 Copley Drive, Diamond Bar, California; and

WHEREAS, a public hearing has been properly noticed in accordance with all provisions of Health and Safety Code §40725; and

WHEREAS, the AQMD Governing Board has held a public hearing in accordance with all provisions of law; and

NOW, THEREFORE BE IT RESOLVED, that the AQMD Governing Board hereby certifies, pursuant to the authority granted by law, the Final EA for PR 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities; and

BE IT FURTHER RESOLVED, that because no significant adverse environmental impacts were identified as a result of implementing PR 1420.1, a Statement of Findings, a Statement of Overriding Considerations, and a Mitigation Monitoring Plan are not required; and

BE IT FURTHER RESOLVED, that the AQMD staff will work with PR 1420.1 impacted communities to develop a list of email addresses of those interested in receiving public notifications from PR 1420.1 facilities regarding shutdowns, turnarounds, and specific maintenance activities, and provide the list to the appropriate PR 1420.1 facility; and

BE IT FURTHER RESOLVED, that the AQMD Governing Board does hereby adopt, pursuant to the authority granted by law, PR 1420.1 as set forth and incorporated herein by this reference.

CLERK OF THE BOARDS

PROPOSED RULE 1420.1. EMISSIONS STANDARD FOR LEAD FROM LARGE LEAD-ACID BATTERY RECYCLING FACILITIES

(a) Purpose

(1) The purpose of this rule is to protect public health by reducing exposure and emissions of lead from large lead-acid battery recycling facilities, and to help ensure attainment of the National Ambient Air Quality Standard for Lead.

(b) Applicability

(1) This rule applies to all persons who own or operate a lead-acid battery recycling facility that has processed more than 50,000 tons of lead a year in any one of the five calendar years prior to [*Date of Adoption*], or annually thereafter, hereinafter a large lead-acid battery recycling facility. Applicability shall be based on facility lead processing records required under subdivision (m) of this rule, and Rule 1420 – Emissions Standards for Lead. Compliance with this rule shall be in addition to other applicable rules such as Rule 1420.

(c) Definitions

For the purposes of this rule, the following definitions shall apply:

(1) AGGLOMERATING FURNACE means a furnace used to melt flue dust that is collected from a lead control device, such as a baghouse, into a solid mass.

(2) AMBIENT AIR for purposes of this rule ~~is~~means outdoor air.

(3) BATTERY BREAKING AREA means the plant location at which lead-acid batteries are broken, crushed, or disassembled and separated into components.

(4) DRYER means a chamber that is heated and that is used to remove moisture from lead-bearing materials before they are charged to a smelting furnace.

(5) DRYER TRANSITION PIECE means the junction between a dryer and the charge hopper or conveyor, or the junction between the dryer and the smelting furnace feed chute or hopper located at the ends of the dryer.

(6) DUCT SECTION means a length of duct including angles and bends which is contiguous between two or more process devices (e.g., between a furnace and heat exchanger; baghouse and scrubber; scrubber and stack; etc.).

(7) EMISSION COLLECTION SYSTEM ~~is~~means any equipment installed for the purpose of directing, taking in, confining, and conveying an air contaminant, and which at minimum conforms to design and operation specifications given in the most current edition of *Industrial Ventilation, Guidelines and Recommended Practices,* published by the American Conference of Government and Industrial Hygienists, at the time a complete permit application is on file with the District.

(8) FUGITIVE LEAD-DUST means any solid particulate matter containing lead that is in contact with ambient air and has the potential to become airborne.

(9) FURNACE AND REFINING/CASTING AREA means any area of a large lead-acid battery recycling facility in which:

(a) Smelting furnaces or agglomerating furnaces are located; or

(b) Refining operations occur; or

(c) Casting operations occur.

(10) LEAD-ACID BATTERY RECYCLING FACILITY ~~is~~means any facility, operation, or process in which lead-acid batteries are disassembled and recycled into elemental lead or lead alloys through smelting.

(11) LEAD means elemental lead, alloys containing elemental lead, or lead compounds, calculated as elemental lead.

(12) LEAD CONTROL DEVICE means any equipment installed in the ventilation system of a lead point source or emission collection system for the purposes of collecting and containing lead emissions.

(13) LEAD POINT SOURCE means any process, equipment, or total enclosure used in the lead-acid battery recycling operation, including, but not limited to, agglomerating furnaces, dryers, and smelting furnaces, that pass through a stack or vent designed to direct or control its exhaust flow prior to release to the atmosphere.

(14) LEEWARD WALL means the furthest exterior wall of a total enclosure that is opposite the windward wall.

(15) MAINTENANCE ACTIVITY means any of the following activities conducted outside of a total enclosure that generates fugitive lead-dust:

(a) building construction, renovation, or demolition;

(b) replacement or repair of refractory, filter bags, or any internal or external part of equipment used to process, handle, or control lead-containing materials;

(c) replacement of any duct section used to convey lead-containing exhaust;

(d) metal cutting or welding that penetrates the metal structure of any equipment, and its associated components, used to process lead-containing material, such that lead dust within the internal structure or its components can become fugitive lead-dust; or

(e) resurfacing, repair, or removal of ground, pavement, concrete, or asphalt.

(16) MATERIALS STORAGE AND HANDLING AREA means any area of a large lead-acid battery recycling facility in which lead-containing materials including, but not limited to, broken battery components, reverberatory furnace slag, flue dust, and dross, are stored or handled between process steps. Areas may include, but are not limited to, locations in which materials are stored in piles, bins, or tubs, and areas in which material is prepared for charging to a smelting furnace.

(17) MEASURABLE PRECIPITATION means any on-site measured rain amount of greater than 0.01 inches in any complete 24-hour calendar day (i.e., midnight to midnight).

(18) PARTIAL ENCLOSURE for purposes of this rule ~~is~~means a structure comprised of walls or partitions on at least three sides or three-quarters of the perimeter that surrounds areas where maintenance activity is conducted, in order to prevent the generation of fugitive lead-dust.

(19) PROCESS means using lead or lead-containing materials in any operation including, but not limited to, the charging of lead-containing materials to smelting furnaces, lead refining and casting operations, and lead-acid battery breaking.

(20) RENOVATION for purposes of this rule ~~is~~means the altering of a building or permanent structure, or the removal of one or more of its components that generates fugitive lead-dust emissions.

(21) SENSITIVE RECEPTOR means any residence including private homes, condominiums, apartments, and living quarters; education resources such as preschools and kindergarten through grade twelve (k-12) schools;

daycare centers; and health care facilities such as hospitals or retirement and nursing homes. A sensitive receptor includes long term care hospitals, hospices, prisons, and dormitories or similar live-in housing.

(22) SLAG means the inorganic material by-product discharged, in molten state, from a lead smelting furnace that has a lower specific gravity than lead metal and contains lead compounds. This shall include, but not limited to, lead sulfate, lead sulfide, lead oxides, and lead carbonate consisting of other constituents charged to a smelting furnace which are fused together during the pyrometallurgical process.

(23) SMELTING means the chemical reduction of lead compounds to elemental lead or lead alloys through processing in high temperatures greater than 980° C.

(24) SMELTING FURNACE means any furnace where smelting takes place including, but not limited to, blast furnaces, reverberatory furnaces, rotary furnaces, and electric furnaces.

(25) TOTAL ENCLOSURE means a permanent containment building/structure, completely enclosed with a floor, walls, and a roof to prevent exposure to the elements, (e.g., precipitation, wind, run-on), with limited openings to allow access and egress for people and vehicles, that is free of cracks, gaps, corrosion, or other deterioration that could cause or result in fugitive lead-dust.

(26) WINDWARD WALL means the exterior wall of a total enclosure which is most impacted by the wind in its most prevailing direction determined by a wind rose using data required under paragraph (j)(5) of this rule, or other data approved by the Executive Officer.

(d) General Requirements

The owner or operator of a large lead-acid battery recycling facility shall be subject to the following requirements:

(1) Prior to January 1, 2012, emissions shall not be discharged into the atmosphere which contribute to ambient air concentrations of lead that exceed 1.5 micrograms per cubic meter ($\mu g/m^3$) pursuant to District Rule 1420.

(2) On and after January 1, 2012, emissions shall not be discharged into the atmosphere which contribute to ambient air concentrations of lead that exceed 0.15 $\mu g/m^3$ averaged over any 30 consecutive days. The ambient

air concentrations of lead shall be determined by monitors pursuant to subdivision (j) or at any District-installed monitor.

(3) No later than July 1, 2011, install, maintain, and operate total enclosures pursuant to subdivision (e) and lead point source emission control devices pursuant to subdivision (f). The owner or operator of a large lead-acid battery recycling facility shall comply with both subparagraphs (d)(3)(A) and (d)(3)(B):

(A) Submit complete permit applications for all construction and necessary equipment within 30 days of [*Date of Adoption*].

(B) Complete all construction within 180 days of receiving Permit to Construct approvals from the Executive Officer, or by July 1, 2011, whichever is earlier.

(C) The Executive Officer may approve a request for an extension of the compliance deadline date if the facility can demonstrate that it timely filed all complete permit applications and is unable to meet the deadline due to reasons beyond the facility's control. The request shall be submitted to the Executive Officer no less than 30 days before the compliance deadline date.

(4) On and after July 1, 2011 submit a Compliance Plan pursuant to subdivision (g) if emissions are discharged into the atmosphere which contribute to ambient air concentrations of lead that exceed 0.12 ($\mu g/m^3$) averaged over any 30 consecutive days determined by monitors pursuant to subdivision (j) or at any District-installed monitor.

(e) Total Enclosures

(1) Enclosure Areas

The owner or operator of a large lead-acid battery recycling facility shall enclose within a total enclosure the following areas in groups or individually:

(A) Battery breaking areas;

(B) Materials storage and handling areas, excluding areas where unbroken lead-acid batteries and finished lead products are stored;

(C) Dryer and dryer areas including transition pieces, charging hoppers, chutes, and skip hoists conveying any lead-containing material;

(D) Smelting furnaces and smelting furnace areas charging any lead-

containing material;

(E) Agglomerating furnaces and agglomerating furnace areas charging any lead-containing material; and

(F) Refining and casting areas.

(2) Total Enclosure Lead Emissions Control

The owner or operator of a large lead-acid battery recycling facility shall vent each total enclosure to an emission collection system that ducts the entire gas stream to a lead control device pursuant to subdivision (f).

(3) Total Enclosure Ventilation

Ventilation of the total enclosure at any opening including, but not limited to, vents, windows, passages, doorways, bay doors, and roll-ups shall continuously be maintained at a negative pressure of at least 0.02 mm of Hg (0.011 inches H_2O) measured pursuant to paragraph (e)(4).

(4) Digital Differential Pressure Monitoring Systems

The owner or operator of a large lead-acid battery recycling facility shall install, operate, and maintain a digital differential pressure monitoring system for each total enclosure as follows:

(A) A minimum of one building digital differential pressure monitoring system shall be installed and maintained at each of the following three walls in each total enclosure having a total ground surface area of 10,000 square feet or more:

(i) The leeward wall;

(ii) The windward wall ; and

(iii) An exterior wall that connects the leeward and windward wall at a location defined by the intersection of a perpendicular line between a point on the connecting wall and a point on its furthest opposite exterior wall, and intersecting within plus or minus ten ($\pm$10) meters of the midpoint of a straight line between the two other monitors specified in clauses (e)(4)(A)(i) and (e)(4)(A)(ii). The midpoint monitor shall not be located on the same wall as either of the other two monitors described in clauses (e)(4)(A)(i) or (e)(4)(A)(ii).

(B) A minimum of one building digital differential pressure monitoring system shall be installed and maintained at the leeward wall of each total enclosure that has a total ground surface area of

less than 10,000 square feet.

(C) Digital differential pressure monitoring systems shall be certified by the manufacturer to be capable of measuring and displaying negative pressure in the range of 0.01 to 0.2 mm Hg (0.005 to 0.11 inches H_2O) with a minimum accuracy of plus or minus 0.001 mm Hg (0.0005 inches H_2O).

(D) Digital differential pressure monitoring systems shall be equipped with a continuous strip chart recorder or electronic recorder approved by the Executive Officer. If an electronic recorder is used, the recorder shall be capable of writing data on a medium that is secure and tamper-proof. The recorded data shall be readily accessible upon request by the Executive Officer. If software is required to access the recorded data that is not readily available to the Executive Officer, a copy of the software, and all subsequent revisions, shall be provided to the Executive Officer at no cost. If a device is required to retrieve and provide a copy of such recorded data, the device shall be maintained and operated at the facility.

(E) Digital differential pressure monitoring systems shall be calibrated in accordance with manufacturer's specifications at least once every 12 calendar months or more frequently if recommended by the manufacturer.

(F) Digital differential pressure monitoring systems shall be equipped with a backup, uninterruptible power supply to ensure continuous operation of the monitoring system during a power outage.

(5) In-draft Velocity

The in-draft velocity of the total enclosure shall be maintained at $\geq$ 300 feet per minute at any opening including, but not limited to, vents, windows, passages, doorways, bay doors, and roll-ups. In-draft velocities for each total enclosure shall be determined by placing an anemometer, or an equivalent device approved by the Executive Officer, at the center of the plane of any opening of the total enclosure.

(f) Lead Point Source Emissions Controls

(1) The owner or operator of a large lead-acid battery recycling facility shall vent emissions from each lead point source to a lead control device that

meets the requirements of this subdivision and is approved by the Executive Officer.

(2) The total facility mass lead emissions from all lead point sources shall not exceed 0.045 pounds of lead per hour. The maximum emission rate for any single lead point source shall not exceed 0.010 pounds of lead per hour. The total facility and maximum emission rates shall be ~~based on~~determined using the most recent source tests conducted by the facility or the District~~pursuant to subdivision (k)~~.

(3) The owner or operator of a large lead-acid battery recycling facility shall install a secondary lead control device that controls lead emissions from the exhaust of the primary lead control device used for a dryer. ~~If t~~The secondary lead control device shall be~~is~~ fitted with dry filter media, and the secondary lead control device shall only be used to vent the primary lead control device used for the dryer. An alternative secondary lead control method that is equally or more effective for the control of lead emissions may be used if a complete application is submitted as part of the permit application required under paragraph (d)(3) and approved by the Executive Officer.

(4) For any lead control device that uses ~~HEPA and/or cartridge type~~ filter media other than a filter bag(s), including, but not limited to, HEPA and cartridge-type filters, the filter(s) used shall be rated by the manufacturer to achieve a minimum of 99.97% capture efficiency for 0.3 micron particles.

(5) For any lead control device that uses a filter bag(s), the filter bag(s) used shall be polytetrafluoroethylene membrane-type, or any other material that is equally or more effective for the control of lead emissions, and approved for use by the Executive Officer.

(6) Each emission collection system and lead control device shall, at minimum, be inspected, maintained, and operated in accordance with the manufacturer's specifications.

(g) Compliance Plan

On and after July 1, 2011 ~~T~~the owner or operator of a large lead-acid battery recycling facility shall submit a Compliance Plan ~~that~~if emissions are discharged~~s~~ into the atmosphere ~~emissions~~ which contribute to ambient air ~~lead~~ concentrations of lead that exceed 0.12 $\mu g/m^3$ averaged over any 30 consecutive

days ~~measured at any~~ determined by monitors pursuant to subdivision (j) or at any District-installed monitor shall:

(1) Notify the Executive Officer in writing within 72 hours of when the facility knew or should have known of exceeding an ambient air lead concentration of 0.12 µg/m^3 averaged over any 30 consecutive days. Notification shall only be required for the first time the ambient air lead concentration of 0.12 µg/m^3 is exceeded;

(2) Submit, within 30 calendar days of exceeding an ambient air lead concentration of 0.12 µg/m^3 averaged over any 30 consecutive days, a complete Compliance Plan to the Executive Officer for review and approval, subject to plan fees as specified in Rule 306. The Compliance Plan shall, at a minimum, include the following:

(A) A description of additional lead emission reduction measures to achieve the ambient lead concentration of 0.15 µg/m^3 averaged over any 30 consecutive days, as required under paragraph (d)(2). including, but not limited to, requirements for the following:

(i) Housekeeping, inspection, and maintenance activities;

(ii) Additional total enclosures;

(iii) Modifications to lead control devices;

(iv) Installation of multi-stage lead control devices;

(v) Process changes including reduced throughput limits; and

(vi) Conditional curtailments including, at a minimum, information specifying the curtailed processes, process amounts, and length of curtailment.

(B) The locations within the facility and method(s) of implementation for each lead reduction measure of subparagraph (g)(2)(A); and

(C) An implementation schedule for each lead emission reduction measure of subparagraph (g)(2)(A) to be implemented if lead emissions discharged from the facility contribute to ambient air concentrations of lead that exceed 0.15 µg/m^3 averaged over any 30 consecutive days measured at any monitor pursuant to subdivision (j) or at any District-installed monitor. The schedule shall also include a list of the lead reduction measures of subparagraph (g)(2)(A) that can be implemented immediately prior to plan approval.

(3) The Executive Officer shall notify the owner or operator in writing

whether the Compliance Plan is approved or disapproved. Determination of approval status shall be based on, at a minimum, submittal of information that satisfies the criteria set forth in paragraph (g)(2). If the Compliance Plan is disapproved, the owner or operator shall resubmit the Compliance Plan, subject to plan fees specified in Rule 306, within 30 calendar days after notification of disapproval of the Compliance Plan. The resubmitted Compliance Plan shall include any information necessary to address deficiencies identified in the disapproval letter. If the resubmitted Compliance Plan is denied, the operator or owner may appeal the denial by the Executive Officer to the Hearing Board under Rule 216 – Appeals and Rule 221 - Plans.

(4) The owner or operator shall implement measures based on the schedule in the approved Compliance Plan if lead emissions discharged from the facility contribute to ambient air concentrations of lead to exceed 0.15 $\mu g/m^3$ averaged over any 30 consecutive days measured at any monitor pursuant to subdivision (j) or at any District-installed monitor.

(5) The owner or operator may make a request to the Executive Officer to modify or update an approved Compliance Plan.

(h) Housekeeping Requirements

No later than 30 days after [*Date of Adoption*], the owner or operator of a large lead-acid battery recycling facility shall control fugitive lead-dust by conducting all of the following housekeeping practices:

(1) Clean by wet wash or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles in a manner that does not generate fugitive lead-dust, the following areas at the specified frequencies, unless located within a total enclosure vented to a lead control device. Days of measurable precipitation in the following areas occurring within the timeframe of a required cleaning frequency may be counted as a cleaning:

(A) Monthly cleanings of roof tops on structures $\leq$ 45 feet in height that house areas associated with the storage, handling or processing of lead-containing materials; and

(B) Quarterly cleanings, no more than 3 calendar months apart, of roof tops on structures > 45 feet in height that house areas associated with the storage, handling or processing of lead-containing

materials; and

(C) Weekly cleanings of all areas where lead-containing wastes generated from housekeeping activities are stored, disposed of, recovered or recycled.

(D) Initiate immediate cleaning, no later than one hour, after any maintenance activity or event including, but not limited to, accidents, process upsets, or equipment malfunction, that causes deposition of fugitive lead-dust onto areas specified in subparagraph (h)(1)(A) through (h)(1)(C). Immediate cleanings of roof tops shall be completed within 72 hours if the facility can demonstrate that delays were due to safety or timing issues associated with obtaining equipment required to implement this requirement.

(2) Inspect all total enclosures and facility structures that house, contain or control any lead point source or fugitive lead-dust emissions at least once a month. Any gaps, breaks, separations, leak points or other possible routes for emissions of lead or fugitive lead-dust to ambient air shall be permanently repaired within 72 hours of discovery. The Executive Officer may approve a request for an extension beyond the 72-hour limit if the request is submitted before the limit is exceeded.

(3) Upon receipt, any lead-acid battery that is cracked or leaking shall be immediately sent to the battery breaking area for processing or stored pursuant to paragraph (h)(6).

(4) Pave, concrete, asphalt, or otherwise encapsulate all facility grounds as approved by the Executive Officer. Facility grounds used for plant life that are less than a total surface area of 100 square feet shall not be subject to encapsulation. Facility grounds requiring removal of existing pavement, concrete, asphalt or other forms of encapsulation, necessary for maintenance purposes shall not require encapsulation while undergoing work, and shall be re-encapsulated immediately after all required work is completed. All work shall be conducted in accordance with subdivision (i).

(5) Remove any weather cap installed on any stack that is a source of lead emissions.

(6) Store all materials capable of generating any amount of fugitive lead-dust including, but not limited to, slag and any other lead-containing waste

generated from housekeeping requirements of subdivision (h) and maintenance activities of subdivision (i), in sealed, leak-proof containers, unless located within a total enclosure.

(7) Transport all materials capable of generating any amount of fugitive lead-dust including, but not limited to, slag and any other waste generated from housekeeping requirements of subdivision (h), within closed conveyor systems or in sealed, leak-proof containers, unless located within a total enclosure.

(8) Initiate ~~R~~removal~~e~~ of any lead-containing material, including sludge, from the entire surface area of any surface impoundment pond or reservoir holding storm water runoff or spent water from housekeeping activities within 1~~2~~24 hour~~s~~ after the water level is ≤ 1 inch at any point above the bottom of the pond or reservoir. Thereafter, surfaces shall be washed down weekly in a manner that does not generate fugitive lead-dust until the pond or reservoir is used again for holding water.

(9) Maintain and Use an Onsite Mobile Vacuum Sweeper or Vacuum

The owner or operator of a large lead-acid battery recycling facility shall maintain an onsite mobile vacuum sweeper that is in compliance with District Rule 1186, or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles to conduct the following sweeping activities:

(A) Vacuum sweep all paved, concreted or asphalted facility areas subject to vehicular or foot traffic three times per day and occurring at least once per operating shift with each event not less than four hours apart, unless located within a total enclosure vented to a lead control device.

(B) Immediately vacuum sweep any area specified in subparagraph (h)(9)(A), no later than one hour after any maintenance activity or event including accidents, process upsets, or equipment malfunction that results in the deposition of fugitive lead-dust.

(C) Vacuum sweeping activities specified in paragraph (h)(9) shall not be required during days of measurable precipitation.

(i) Maintenance Activity

(1) Beginning [*Date of Adoption*], the owner or operator of a large lead-acid battery recycling facility shall conduct any maintenance activity in a

negative air containment enclosure, vented to a permitted negative air machine equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles, that encloses all affected areas where fugitive lead-dust generation potential exists, unless located within a total enclosure or approved by the Executive Officer. Any maintenance activity that cannot be conducted in a negative air containment enclosure due to physical constraints, limited accessibility, or safety issues when constructing or operating the enclosure shall be conducted:

(A) In a partial enclosure, barring conditions posing physical constraints, limited accessibility, or safety issues;

(B) Using wet suppression or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles, at locations where the potential to generate fugitive lead-dust exists prior to conducting and upon completion of the maintenance activity. Wet suppression or vacuuming shall also be conducted during the maintenance activity barring safety issues;

(C) While collecting 24-hour samples~~In conjunction with sample collections~~ at monitors ~~pursuant to subdivision (j)~~ for every day that maintenance activity is occurring notwithstanding paragraph (j)(2); and

(D) Shall be stopped immediately when instantaneous wind speeds are ≥ 25 mph. Maintenance work may be continued if it is necessary to prevent the release of lead emissions.

(2) Store or ~~C~~clean by wet wash or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles, all lead-contaminated equipment and materials used for any maintenance activity immediately after completion of work in a manner that does not generate fugitive lead-dust.

(j) Ambient Air Monitoring and Sampling Requirements

Prior to January 1, 2011, ambient air monitoring and sampling shall be conducted pursuant to District Rule 1420. No later than January 1, 2011, the owner or operator of a large lead-acid battery recycling facility shall conduct ambient air monitoring and sampling as follows:

(1) Collect samples from a minimum of four sampling sites. Locations for sampling sites shall be approved by the Executive Officer.

(A) Locations for sampling sites shall be based on maximum expected ground level lead concentrations, at or beyond the property line, as determined by Executive Officer-approved air dispersion modeling calculations and emission estimates from all lead point sources and fugitive lead-dust sources, and other factors including, but not limited to, population exposure and seasonal meteorology.

(B) The Executive Officer may require one or more of the four sampling sites to be at locations that are not based on maximum ground level lead concentrations, and that are instead at locations at or beyond the property line that are representative of upwind or background concentrations.~~Sampling sites at the property line may be located just inside the fence line on facility property if logistical constraints preclude placement outside the fence line at the point of maximum expected ground level lead concentrations.~~

(C) Sampling sites at the property line may be located just inside the fence line on facility property if logistical constraints preclude placement outside the fence line at the point of maximum expected ground level lead concentrations.~~The Executive Officer may require one or more of the four sampling sites to be at locations that are not based on maximum ground level lead concentrations, and that are instead at locations representative of upwind or background concentrations.~~

(2) Collect 24-hour, midnight-to-midnight, samples at all sites for 30 consecutive days from the date of initial sampling, followed by one 24-hour, midnight-to-midnight, sample collected at least once every three calendar days, on a schedule approved by the Executive Officer.

(3) Submit samples collected pursuant to paragraphs (j)(1) and (j)(2) to a laboratory approved under the SCAQMD Laboratory Approval Program for analysis within three calendar days of collection and calculate ambient lead concentrations for individual 24-~~-~~hour samples within 15 calendar days of the end of the calendar month in which the samples were collected. Duplicate samples shall be made available and submitted to the District upon request by the Executive Officer.

(4) Sample collection shall be conducted using Title 40, CFR 50 Appendix B

- *Reference Method for the Determination of Suspended Particulate Matter in the Atmosphere (High Volume Method)*, or U.S. EPA-approved equivalent methods, and sample analysis shall be conducted using Title 40, CFR 50 Appendix G - *Reference Method for the Determination of Lead in Suspended Particulate Matter Collected from Ambient Air*, or U.S. EPA-approved equivalent methods.

(5) Continuously record wind speed and direction data at all times using equipment approved by the Executive Officer at a minimum of one location and placement approved by the Executive Officer.

(6) Ambient air quality monitoring shall be conducted by persons approved by the Executive Officer and sampling equipment shall be operated and maintained in accordance with U.S. EPA-referenced methods.

(7) All ambient air quality monitoring systems required by this subdivision shall be equipped with a backup, uninterruptible power supply to ensure continuous operation of the monitoring system during a power outage.

(8) Cleaning activities including, but not limited to, wet washing and misting, that result in damage or biases to samples collected shall not be conducted within 10 meters of any sampling site required under this subdivision.

(9) On and after January 1, 2012, if the owner or operator of a large lead-acid battery recycling facility exceeds an ambient air lead concentration 0.15 $\mu g/m^3$ measured pursuant to paragraph (d)(2), the owner or operator shall:

(A) Begin daily ambient air monitoring and sampling no later than three calendar days of the time the facility knew or should have known of the exceedance. Conduct daily ambient air monitoring and sampling for sixty (60) consecutive days at each sampling site that measured an exceedance with paragraph (d)(2).

(B) The 60 consecutive-day period shall be restarted for any subsequent exceedance.

(k) Source Tests

(1) The owner or operator of a large lead-acid battery recycling facility shall conduct a source test of all lead point sources at least annually to demonstrate compliance with the control standards specified in subdivision (f). If the results of the most recent source test for a lead point source demonstrating compliance with the lead emission standard of subdivision (f) ~~indicate~~ demonstrate emissions of 0.0025 pounds of lead

per hour or less, the next test for that lead point source shall be performed no later than 24 months after the date of the most recent test.

(2) The owner or operator of a large lead-acid battery recycling facility with an existing lead control device in operation before [*Date of Adoption*] shall conduct a source test for it no later than January 1, 2011. The owner or operator of a large lead-acid battery recycling facility with a new or modified lead control device with initial start-up on or after [*Date of Adoption*] shall conduct the initial source test for it within 60 calendar days after initial start-up.

(3) Prior to the owner or operator of a large lead-acid battery recycling facility conducting a source test pursuant to paragraph (k)(1) or (k)(2), shall submit a pre-test protocol to the Executive Officer for approval at least 60 calendar days prior to conducting the source test. The pre-test protocol shall include the source test criteria of the end user and all assumptions, required data, and calculated targets for testing the following:

(A) Target lead control standard;

(B) Preliminary lead analytical data;

(C) Planned sampling parameters; and

(D) Information on equipment, logistics, personnel, and other resources necessary for an efficient and coordinated test.

(4) The owner or operator of a large lead-acid battery recycling facility shall notify the Executive Officer in writing one week prior to conducting any source test required by paragraph (k)(1) or (k)(2).

(5) The owner or operator of a large lead-acid battery recycling facility shall notify the Executive Officer within ~~72 hours~~three business days, including Mondays, of when the facility knew or should have known of any source test result that exceeds any of the emission standards specified in paragraph (f)(2). Notifications shall be made to 1-800-CUT-SMOG.

(6) Source tests shall be conducted while operating at a minimum of 80% of equipment maximum capacity and in accordance with any of the following applicable test methods:

(A) SCAQMD Method 12.1 - *Determination of Inorganic Lead Emissions from Stationary Sources Using a Wet Impingement Train*

(B) ARB Method 12 – *Determination of Inorganic Lead Emissions*

from Stationary Sources

(C) EPA Method 12 – *Determination of Inorganic Lead Emissions from Stationary Sources*

(D) ARB Method 436 – *Determination of Multiple Metal Emissions from Stationary Sources*

(7) The average of triplicate samples, obtained according to approved test methods specified in paragraph (k)(6), shall be used to determine compliance.

(8) The operator may use alternative or equivalent source test methods as defined in U.S. EPA 40 CFR 60.2, approved in writing by the Executive Officer, the Air Resources Board, and the U.S. EPA.

(9) The operator shall use a test laboratory approved under the SCAQMD Laboratory Approval Program for the source test methods cited in this subdivision. If there is no approved laboratory, then approval of the testing procedures used by the laboratory shall be granted by the Executive Officer on a case-by-case basis based on SCAQMD protocols and procedures.

(10) When more than one source test method or set of source test methods are specified for any testing, the application of these source test methods to a specific set of test conditions is subject to approval by the Executive Officer. In addition, a violation established by any one of the specified source test methods or set of source test methods shall constitute a violation of the rule.

(11) An existing source test conducted on or after January 1, 2009 for lead control devices existing before [*Date of Adoption*] may be used as the initial source test specified in paragraph (k)(1) to demonstrate compliance with the control standard of subdivision (f) upon Executive Officer approval. The source test shall meet, at a minimum, the following criteria:

(A) The test is the most recent conducted since January 1, 2009;

(B) The test demonstrated compliance with the control standard of subdivision (f); and

(C) The test is representative of the method to control emissions currently in use; and

(D) The test was conducted using applicable and approved test methods specified in paragraphs (k)(6), (k)(8), or (k)(9).

(l) New Facilities

The owner or operator of a large lead-acid battery recycling facility beginning construction or operations on or after [*Date of Adoption*] shall:

(1) Demonstrate to the satisfaction of the Executive Officer that the facility is not located in an area that is zoned for residential or mixed use; and

(2) Demonstrate to the satisfaction of the Executive Officer that the facility is not located within 1,000 feet from the property line of a sensitive receptor, a school under construction, park, or any area that is zoned for residential or mixed use. The distance shall be measured from the property line of the new facility to the property line of the sensitive receptor.

(3) Submit complete permit applications for all equipment required by this rule prior to beginning construction or operations, and otherwise on or before the time required by District rules.

(m) Recordkeeping

(1) The owner or operator of a large lead-acid battery recycling facility shall keep records of the following:

(A) Daily records indicating amounts of lead-containing material processed, including, but not limited to, purchase records, usage records, results of analysis, or other District-approved verification to indicate processing amounts;

(B) Results of all ambient air lead monitoring, meteorological monitoring, and other data specified by subdivision (j); and

(C) Records of housekeeping activities completed as required by subdivision (h), maintenance activities of subdivision (i), and lead control device inspection and maintenance requirements of paragraph (f)(6), including the name of the person performing the activity, and the dates and times on which specific activities were completed.

(D) Records of unplanned shutdowns of any smelting furnace including the date and time of the shutdown, description of the corrective measures taken, and the re-start date and time.

(2) The owner or operator of a large lead-acid battery recycling facility shall maintain all records for five years, at least two years onsite.

(n) Reporting

(1) Ambient Air Monitoring Reports

(A) Beginning no later than January 1, 2011, the owner or operator of a large lead-acid battery recycling facility shall report by the 15th of each month to the Executive Officer, the results of all ambient air lead and wind monitoring for each preceding month, or more frequently if determined necessary by the Executive Officer. The report shall include the results of individual 24-hour samples and 30-day averages for each day within the reporting period.

(B) Any exceedances of ambient air lead concentrations specified in paragraph (d)(2) shall be reported with a notification made to the 1-800-CUT-SMOG within 24 hours of receipt of the completed sample analysis required in paragraph (j)(3), followed by a written report to the Executive Officer no later than three calendar days after the notification. The written report shall include the causes of the exceedance and the specific corrective actions implemented.

(2) Shutdown, Turnaround, and Maintenance Activity Notification

The owner or operator of a large lead-acid battery recycling facility shall:

(A) Notify the Executive Officer and the public within one hour after an unplanned shutdown of any lead control device has occurred. The notification shall include the associated processes or equipment vented by the shutdown lead control device. If the unplanned shutdown involves a breakdown pursuant to Rule 430, the breakdown notification report required by Rule 430 shall serve in lieu of this notification to the Executive Officer.

(B) Notify the Executive Officer and the public at least ten calendar days prior to a planned turnaround or shutdown of any smelting furnace, battery breaker, or lead control device that result in lead emissions. The notification shall specify the subject equipment and the start and end date of the turnaround or shutdown period.

(C) Notify the Executive Officer at least ten calendar days prior to the beginning of maintenance activity, as defined in paragraph (c)(15), that is conducted routinely on a monthly or less frequent basis. The notification and report required under subparagraph (n)(2)(E) shall include, at a minimum, the following:

(i) Dates, times, and locations of activities to be conducted;
(ii) Description of activities;
(iii) Name of person(s)/company conducting the activities;
(iv) Lead abatement procedures, including those specified in subdivision (i), to be used to minimize fugitive lead-dust emissions; and
(v) Date of expected re-start of equipment.

(D) Notify the public at least ten calendar days prior to the beginning of building construction, renovation, or demolition, and resurfacing, repair, or removal of ground pavement, concrete or asphalt if such activities are conducted outside of a total enclosure and generate fugitive lead-dust. The notification shall include, at a minimum, the following:
(i) Dates, times, and locations of activities to be conducted;
(ii) Description of activities;
(iii) Date of expected re-start of equipment.

(E) Provide the notification to the Executive Officer required under subparagraphs (n)(2)(A), (n)(2)(B), and (n)(2)(C) to 1-800-CUT-SMOG followed by a written notification report to the Executive Officer no later than three business days, including Mondays, after the unplanned shutdown occurred.

(F) Provide notification to the public required under subparagraphs (n)(2)(A), (n)(2)(B), and (n)(2)(D) through a facility contact or pre-recorded notification center that is accessible 24 hours a day, 7 days a week, and through electronic mail using a list of recipients provided by the Executive Officer. Another method of notification to the public may be used provided it is approved by the Executive Officer.

(G) Install a sign indicating the phone number for the facility contact or pre-recorded notification center that meets the following requirements, unless otherwise approved in writing by the Executive Officer:
(i) Installed within 50 feet of the main entrance of the facility and in a location that is visible to the public;
(ii) Measures at least 48 inches wide by 48 inches tall;
(iii) Displays lettering at least 4 inches tall with text contrasting

with the sign background; and

(iv) Located between 6 and 8 feet above grade from the bottom of the sign.

(3) Initial Facility Status Report

(A) Initial Facility Status Report Due Date

The owner or operator of a large lead-acid battery recycling facility existing before [*Date of Adoption*] shall submit an initial facility status report to the Executive Officer no later than January 1, 2011. Large lead-acid battery recycling facilities beginning construction or initial operations after [*Date of Adoption*] shall submit the initial compliance status report upon start-up.

(B) The initial facility status report shall contain the information identified in Appendix 1.

(4) Ongoing Facility Status Report

The owner or operator of a large lead-acid battery recycling facility shall submit a summary report to the Executive Officer to document the ongoing facility status.

(A) Frequency of Ongoing Facility Status Reports

The report shall be submitted annually on or before February 1 for all sources and shall include information covering the preceding calendar year.

(B) The content of ongoing facility status reports shall contain the information identified in Appendix 2.

(5) Adjustments to the Timeline for Submittal and Format of Reports

The Executive Officer may adjust the timeline for submittal of periodic reports, allow consolidation of multiple reports into a single report, establish a common schedule for submittal of reports, or accept reports prepared to comply with other state or local requirements. Adjustments shall provide the same information and shall not alter the overall frequency of reporting.

Appendix 1 – Content of Initial Facility Status Reports

Initial compliance status reports shall contain, at a minimum, the following information:

1. Facility name, District Facility ID number, facility address, owner/operator name, and telephone number.
2. The distance from the property line of the facility to the property line of the nearest commercial/industrial building and sensitive receptor.
3. Worker and sensitive receptor locations, if they are located within one-quarter mile from the center of the facility.
4. Building parameters
    - Stack heights in feet (point sources); or
    - Building area in square feet (volume sources).
5. A description of the types of lead processes performed at the facility.
6. The following information shall be provided for each of the last five calendar years prior to the [*Date of Adoption*]:
    - Annual amount of lead-containing material processed;
    - The maximum and average daily and monthly operating schedules;
    - The maximum and average daily and monthly lead-processing rates for all equipment and processes;
    - The maximum and average daily and annual emissions of lead from all emission points and fugitive lead-dust sources.
7. The approximate date of intended source tests for all lead control devices, as required by subdivision (k) of this rule.
8. Engineering drawings, calculations or other methodology to demonstrate compliance with paragraphs (d)(1) through (d)(3) and (k).
9. Air dispersion modeling calculations using procedures approved by the Executive Officer to determine the location of sampling sites as required by subdivision (j).
10. All information necessary to demonstrate means of compliance with subdivision (j).
11. The name, title, and signature of the responsible official certifying the accuracy of the report, attesting to whether the source has complied with the provisions of this rule.
12. The date of the report.

Appendix 2 – Content of Ongoing Facility Status Reports

Ongoing facility status reports shall, at a minimum, contain the following information:

1. Facility name, District Facility ID number, facility address, owner/operator name, and telephone number.
2. The beginning and ending dates of the calendar year for the reporting period.
3. The following information shall be provided for each of the last 12 calendar months of the reporting period:
    - Annual amounts of lead-containing material processed;
    - The maximum and average daily and monthly lead-processing rates for all equipment and processes;
    - The maximum and average daily and annual emissions of lead from all emission points and fugitive lead-dust sources.
4. Worker and sensitive receptor distances, if they are located within ¼ of mile from the center of the facility and facility maximum operating schedule, if changed since submittal of the initial compliance status report or prior year's ongoing compliance status and emission reports.
5. A description of any changes in monitoring, processes, or controls since the last reporting period.
6. The name, title, and signature of the responsible official certifying the accuracy of the report.
7. The date of the report.

EXECUTIVE SUMMARY

BACKGROUND

The South Coast Air Quality Management District (AQMD) is responsible for developing and enforcing air pollution control rules and regulations in the South Coast Air Basin (Basin). By state law, the AQMD is required to adopt an Air Quality Management Plan (AQMP) demonstrating compliance with all federal regulations and standards such as National Ambient Air Quality Standards (NAAQS) for the Basin [H&S Code Section 40460 (a)]. On October 15, 2008, the U.S. Environmental Protection Agency (U.S. EPA) amended both the primary and secondary NAAQS for lead from a level of 1.5 $\mu g/m^3$ to 0.15 $\mu g/m^3$ averaged over a rolling 3-month period, along with changes to monitoring and reporting requirements.

The purpose of Proposed Rule 1420.1 (PR 1420.1) is to propose a new rule for large lead-acid battery recycling facilities which are the highest stationary source emitters of lead in the Basin. In addition, PR 1420.1 is designed to address the amended NAAQS for lead to ensure the Basin can achieve the revised standard. Other lead-emitting sources will be addressed in a future amendment to AQMD Rule 1420 – Emission Standards for Lead.

PUBLIC PROCESS

PR 1420.1 was developed through a public process. A PR 1420.1 Working Group was formed to provide an opportunity to discuss the proposed rule in greater detail and provide input to the AQMD staff throughout the rule development process. The working group was comprised of a variety of stakeholders including representatives and consultants from the regulated industry, the DTSC and other agency representatives, environmental and community representatives, and other interested parties. A Public Workshop was also held to present the proposed rule and receive public comment. Throughout the process, comments received have been addressed in the staff report and changes made to the proposed rule where appropriate. Appendix A is a summary of comments from the Public Workshop and written comments received thus far.

LEAD

Lead is a naturally occurring metal found in the earth's crust. The metal is grayish in color and is soft, malleable, and ductile. It is also a limited electrical conductor and highly impervious to corrosion. This unique combination of physical properties has led to its many uses in industries such as construction, piping, roofing, and lead-acid storage battery manufacturing. Due to its value, some business operations are based solely on recovering lead from lead-bearing materials through secondary smelting operations.

Lead is classified as a "criteria pollutant" under the federal Clean Air Act. It is also identified as a carcinogenic toxic air contaminant (TAC) by the Office of Environmental Health Hazard Assessment (OEHHA). Chronic health effects include problems such as nervous and reproductive system disorders, neurological and respiratory damage, cognitive and behavioral changes, and hypertension. Exposure to lead can also potentially increase the risk of contracting cancer or result in other adverse health effects. Young children are especially susceptible to the effects of environmental lead because their bodies accumulate lead more readily than do those of

adults, and because they are more vulnerable to certain biological effects of lead including learning disabilities, behavioral problems, and deficits in IQ.

ATTAINMENT STATUS WITH 2008 NAAQS

The 2008 NAAQS for lead requires that each state install and operate a network of ambient air lead monitors in order to determine attainment status with the standard. Two types of monitors are required; those that are population-based referred to as "non-source-oriented," and those that are facility-based referred to as "source-oriented." The lead attainment assessment conducted by the state of California was based on data from both sets of monitoring networks. Data values from measurements made at non-source-oriented monitors in the Basin were reviewed for years 2007 through 2009 and showed concentrations well below the new lead NAAQS. For source-oriented monitors, the lead-acid battery recycling industry demonstrated exceedances with the new standard in 2005 at monitors for one facility, and all 3-month averages from February 2008 through January 2010 at monitors for another facility. Based on this data, in October 2009 the California Air Resources Board (CARB) recommended to the U.S. EPA that the South Coast portion of Los Angeles County be designated as non-attainment for the 2008 federal lead standard based. Final designation of attainment status by the U.S. EPA is expected by October 15, 2010 and would require the Basin to be in attainment with the new NAAQS no later than five years thereafter. A State Implementation Plan (SIP), outlining the strategy to demonstrate attainment with the lead NAAQS, must also be submitted by the AQMD within 18 months of the final designation date.

AFFECTED INDUSTRY

PR 1420.1 applies to large lead-acid battery recycling facilities. There are currently two facilities within the AQMD that the proposed rule will apply to: Exide Technologies and Quemetco, Inc. Exide and Quemetco are the only large lead-acid battery recyclers in the state of California and in the western United States, with the next nearest large lead-acid battery recycling facility located in Texas. These facilities receive spent (used) lead-acid batteries and other lead-bearing materials and recycle them, recovering the lead. Lead is recycled because of its value and is primarily used to manufacture new batteries.

Over the past several years, both facilities have been the subject of several legal actions resulting from violations of AQMD rules. Violations have led to modifications of facility compliance plans, permit conditions, and in some cases, additional conditions of orders for abatement. Many of the conditions have included additional housekeeping requirements, process changes, and more stringent monitoring. In addition to air quality regulations, the two facilities are subject to other toxics requirements under the California Department of Toxic Substances Control (DTSC).

Even with the recent modifications at both facilities, monitoring data shows that additional requirements are necessary in order to meet the ambient lead standard of 0.15 $\mu g/m^3$. PR 1420.1 incorporates many of the provisions currently being implemented at affected facilities with additional safeguards to help ensure that the Basin will achieve the 2008 federal lead standard.

OVERALL APPROACH FOR PROPOSED RULE 1420.1

During the rule development process, the AQMD staff considered the following three approaches for Proposed Rule 1420.1: (1) Compliance Plan; (2) Core Requirements with No Compliance Plan; and (3) Core Requirements with a "Contingency" Compliance Plan. The three approaches were evaluated with consideration of health effects of lead, potential causes of past exceedances, complaints received, and AQMD staff experience. In addition, the AQMD staff considered whether or not each approach would afford the public an opportunity to participate and provide input. The AQMD staff selected the hybrid approach of Core Requirements with a "Contingency" Compliance Plan as it is more proactive than the other two approaches, provides regulatory certainty for the affected facilities by establishing core requirements in the proposed rule, and the "Contingency" Compliance Plan is designed to minimize and/or eliminate potential delays to implement additional measures if the facility exceeds the ambient lead standard.

PROPOSED RULE 1420.1

PR 1420.1 is designed to address lead emissions from the lead-acid battery recycling industry in order to achieve attainment with the 0.15 $\mu g/m^3$ standard by as early as 2015 based on U.S. EPA timeframes. Currently, emissions of lead from stationary sources, including lead-acid battery recycling facilities, are regulated by AQMD Rule 1420 – Emissions Standard for Lead. Rule 1420 was adopted in August 1992 and controls emissions of lead from stationary sources which use or process lead-containing materials. The rule was adopted to help ensure that facilities would not discharge emissions which would cause ambient air concentrations of lead to exceed the 1978 federal and state ambient air quality standards for lead of 1.5 $\mu g/m^3$. Rule 1420 ensures that the standard is met through requirements for emission control systems, monitoring, and good housekeeping practices.

Although lead-acid battery recycling facilities are subject to Rule 1420, separate and more stringent requirements relating to operations and processes specific to lead-acid battery recycling facilities are necessary to ensure that the new standard is met. PR 1420.1 will require large lead-acid battery recycling facilities to:

- Meet an ambient air lead concentration of 0.15 $\mu g/m^3$ averaged over any 30-day period by January 2012;
- Install total enclosures of all areas used for the processing or storage of lead-containing materials associated with lead-acid battery recycling operations;
- Vent total enclosures and all other lead emission points to control devices capable of meeting a facility total emission rate of 0.045 pounds of lead per hour from all lead point sources, and a maximum emission rate of 0.010 pounds of lead per hour for any individual lead point source;
- Install specifically rated filters/bags for lead control devices;
- Install secondary controls on dryers;
- Submit a Compliance Plan containing additional lead emission reduction measures if ambient air lead concentrations exceed 0.12 $\mu g/m^3$ averaged over any 30-day period on or after July 1, 2011;

- Conduct more stringent housekeeping practices to minimize fugitive lead-dust emissions;
- Conduct annual source testing of all lead point source control devices;
- Conduct ambient air lead monitoring; and
- Conduct recordkeeping and reporting, including public notifications, for specific maintenance activity, turnarounds, and shutdowns.

IMPACT ASSESSMENT

A socioeconomic assessment has been conducted to analyze the costs associated with compliance under PR 1420.1. PR 1420.1 impacted facilities will be required to install additional digital differential pressure monitors for total enclosures. One facility will be required to install secondary lead controls on a dryer. Additional housekeeping practices will also be required. Annual source tests will need to be conducted for all lead point source control devices to meet proposed emission standards. The total annual cost for both facilities to comply with PR 1420.1 is estimated at $0.41 million for the first year, and $0.32 million annually thereafter.

Pursuant to California Environmental Quality Act Guidelines §15252 and AQMD Rule 110, the AQMD has prepared an Environmental Assessment for PR 1420.1. The Draft Environmental Assessment was released for a 30-day public review and comment period beginning April 27, 2010 and ending May 26, 2010. No comments were received.

PROCESS DESCRIPTION AND LEAD EMISSION POINTS

CONTROL STRATEGIES

INTRODUCTION

PR 1420.1 addresses exposure to lead emissions from lead-acid battery recycling facilities. The purpose of the proposed rule is to protect public health and help ensure attainment with the amended lead NAAQS. As required by the federal Clean Air Act, the U.S. EPA periodically reviews the standard to determine if changes are warranted. Based on review of health studies, the U.S. EPA has determined that the standard of 1.5 $\mu g/m^3$ set in 1978 was not sufficient to protect public health and welfare with an adequate margin of safety. The standard has been lowered to 0.15 $\mu g/m^3$ based on studies that demonstrate health effects at much lower levels of lead exposure than previously believed. The new standard provides increased protection for children and other at-risk populations against an array of health effects, most notably neurological effects in children, including neurocognitive and neurobehavioral effects.

The lead-acid battery recycling industry has been determined by AQMD staff to be the highest stationary source emitters of lead in the Basin. Staff's analysis has also shown this industry to be the only known source category that currently demonstrates ambient air lead concentration measurements that cause non-attainment with the new lead NAAQS. PR 1420.1 is in addition to Rule 1420 – Emissions Standard for Lead which addresses lead emissions from any stationary source that uses or processes lead-containing material. Rule 1420 applies to all non-vehicular lead sources and currently implements the existing lead NAAQS. Although Rule 1420 also applies to lead-acid battery recycling facilities, it does not contain specific and adequate control measures for this source category to minimize lead emission exposure such that ambient air lead concentrations will comply with the new lead NAAQS. Other lead-emitting sources in the Basin will be further analyzed and addressed in a future amendment to Rule 1420.

PUBLIC PROCESS

PR 1420.1 was developed through a public process. A PR 1420.1 Working Group was formed to provide an opportunity to discuss the proposed rule in greater detail and provide input to the AQMD staff throughout the rule development process. The working group was comprised of a variety of stakeholders including representatives and consultants for the regulated industry; the DTSC and other agency representatives; environmental and community representatives; and other interested parties who met with AQMD staff to discuss elements of the proposed rule in more detail. The Working Group met three times during the rule development process, on April 22, 2010, May 18, 2010, and August 24, 2010.

In addition, a Public Workshop was held on April 14, 2010 to present the proposed rule and receive public comment. PR 1420.1 progress reports and updates to the AQMD Governing Board's Stationary Source Committee, Environmental Justice Advisory Group, and Local Government and Small Business Assistance Advisory Group provided additional opportunities for public comment. Based on comments received at the Stationary Source Committee from residents and community representatives from the City of Commerce, Boyle Heights, and Maywood, the AQMD staff held a meeting with representatives of East Yard Communities for Environmental Justice to brief them on the proposed rule and receive additional input. The meeting was held at their offices in the City of Commerce which is near one of the lead-acid

battery recycling facilities. Throughout the process, comments received have been addressed in the staff report and changes made to the proposed rule where appropriate. Appendix A is a summary of comments from the Public Workshop and written comments received thus far.

HEALTH EFFECTS OF LEAD

Human exposure to lead occurs in a variety of ways with common routes being that of inhalation and ingestion. Ingestion of lead-containing paint chips and soil with deposited atmospheric lead is a source of concern for exposure for children. The most widely used indicator of lead exposure in many studies is the amount of lead measured in whole blood because of the direct relationship with blood lead (PbB) levels and health effects. Clinical effects resulting from high-level lead exposure include nervous and reproductive system disorders, neurological and physical developmental effects, cognitive and behavioral changes, and hypertension. Young children are especially susceptible to the effects of environmental lead because they are more vulnerable to certain biological effects of lead including learning disabilities, deficits in IQ, and behavioral problems.[1] Health & Safety Code Section 39669.5, "Special Provisions for Infants and Children," required CARB to identify up to five TACs that may cause infants and children to be especially susceptible to illness. The "Prioritization of Toxic Air Contaminants Under the Children's Environmental Health Protection Act" document released in 2001 by the Office of Environmental Health Hazard Assessment (OEHHA) lists lead as one of the original five toxic air contaminants.

Lead is classified as a probable human carcinogen by both the International Agency for Research on Cancer and the U.S. EPA. OEHHA classified lead as a carcinogenic toxic air contaminant and it was added to the AQMD Rule 1401 list of TACs in 1992. AQMD's "Risk Assessment Procedures for Rules 1401 and 212" Tier 1 screening value for lead indicates that a lifetime exposure (70 years for residential and sensitive receptors, 40 years for worker receptors) to 0.628 pounds of lead a year at 25 meters could potentially cause one additional case of cancer out of a one million population.

Under the federal Clean Air Act, lead is classified as a "criteria pollutant." Lead has observed health effects at ambient concentrations. The U.S. EPA has thoroughly reviewed the lead exposure and health effects research, and has prepared substantial documentation in the form of a Criteria Document to support the selection of the 2008 NAAQS for lead. The Criteria Document used for the development of the 2008 NAAQS for lead states that studies and evidence strongly substantiate that PbB concentrations in a range of 5-10 µg/dL, or possibly lower, could likely result in neurocognitive effects in children. The report further states that "there is no level of lead exposure that can yet be identified with confidence, as clearly not being associated with some risk of deleterious health effects." [2]

Based on studies conducted by the Clean Air Scientific Advisory Committee (CASAC), it was concluded that a "population loss of 1-2 IQ points" resulting from exposure to ambient air lead

[1] Environmental Protection Agency, "Lead in Air," (*http://www.epa.gov/air/lead/health.html*), June 12, 2009.

[2] Environmental Protection Agency, Office of Research and Development, "Air Quality Criteria Document for Lead, Volumes I-II," October 2006.

concentrations "is highly significant from a public health perspective." The U.S. EPA has determined that a primary and secondary standard of 0.15 $\mu g/m^3$ is requisite to provide an adequate margin of safety that would ensure the protection of public health and the environment regarding the aforementioned population IQ loss and other health effects from lead exposure. [3]

There have been several health studies conducted in communities around Quemetco, Inc. (Quemetco), located in the City of Industry. In 1994, the Los Angeles County Department of Health Services (DHS) conducted studies on the impact of lead emissions from Quemetco on PbB levels of children living in a nearby community and in 2002, the DHS conducted lead testing for students and community members within one mile of Quemetco. Although the results of the studies revealed that no detectable differences in PbB levels were exhibited in nearby communities when compared to a control community, soil lead levels were found to be higher. It should be noted that the distance between the nearest resident and lead emitting stack at the facility is approximately 700 feet. In 2002, the DHS conducted lead testing for students and community members within one mile of Quemetco. Of 169 children and 75 adults that were tested, one adult exhibited increased PbB levels which were attributed to occupational exposure. The Keck Cancer Surveillance Program of University of Southern California conducted an analysis of 1972-1999 census data and determined that there was no causal link between cancer and residential proximity to Quemetco. Although these studies have not shown significant health impacts due to proximity to a lead-acid battery recycler, increased levels of lead found in soils can potentially cause health problems if ingested.

REGULATORY HISTORY

Lead-acid battery recyclers have been subject to regulation for more than two decades. Below is a chronology of regulatory activity:

- In November 1970, CARB set the state ambient air quality standard for lead at 1.5 $\mu g/m^3$ averaged over 30 days.
- In October 1978, the U.S. EPA adopted the NAAQS for lead requiring attainment with a lead ambient concentration of 1.5 $\mu g/m^3$ averaged over a calendar quarter.
- In September 1992, the AQMD adopted Rule 1420 – Emissions Standard for Lead. The rule incorporated the state ambient air quality standard and required control devices on lead emission points, control efficiency requirements for lead control devices, housekeeping, and monitoring or modeling of ambient air quality.
- In October 1992, OEHHA classified lead as a carcinogenic toxic air contaminant and assigned to it a cancer potency factor and a cancer unit risk factor.
- In January 1993, CARB adopted the Airborne Toxic Control Measure for Emissions of Toxic Metals from Non-Ferrous Metal Melting. The state regulation required control devices for lead and other toxic metal emission points, control efficiency requirements for control devices, fugitive emission control, and recordkeeping.
- In June 1997, the U.S. EPA adopted the National Emissions Standards for Hazardous Air Pollutants (NESHAP) from Secondary Lead Smelting. The federal regulation required

[3] Environmental Protection Agency, "National Ambient Air Quality Standards for Lead; Final Rule," 40 CFR Parts 50, 51, 53, and 58, November 2008.

lead emission concentration limits of lead control devices, control of process fugitive emissions, monitoring, recordkeeping, and reporting.

- On October 15, 2008, the U.S. EPA signed into ~~legislation~~ regulation an amended NAAQS for lead of 0.15 µg/m^3.

The following provides additional background information about Rule 1420 and the 2008 NAAQS for lead.

Rule 1420

Rule 1420 was adopted in September 1992 and has not been amended since its adoption. Rule 1420 applies to facilities that process or use lead-containing materials which includes, but is not limited to, primary or secondary lead smelters, foundries, lead-acid battery manufacturers or recyclers, and lead-oxide, brass and bronze producers. Rule 1420 is based on the current state ambient air quality standard of 1.5 µg/m^3 averaged over a 30-day period. The rule includes requirements for point source controls, monitoring, sampling, recordkeeping, and reporting. Rule 1420 requires facilities that process more than two tons of lead per year to submit a Compliance Plan that provides information on how the facility will conduct monitoring, air dispersion modeling, and implement requirements to install and implement point source controls.

2008 NAAQS for Lead

Since U.S. EPA established the initial standard of 1.5 µg/m^3 in 1978, scientific evidence about lead and health has expanded dramatically. More than 6,000 new studies on lead health effects, environmental effects, and lead in the air have been published since 1990. Evidence from health studies shows that adverse effects occur at much lower levels of lead in the blood than previously thought. As a result, U.S. EPA amended the NAAQS for lead which now reduces the ambient air quality standard from 1.5 µg/m^3 to 0.15 µg/m^3. The 2008 lead NAAQS requires full attainment by each state no later than five years after final designations for attainment status are made. Demonstration of attainment is based on measurements using a rolling 3-month averaging form to be evaluated over a 3-year period. Measurements are to be determined by U.S. EPA-required monitoring networks within each state which consist of both source-oriented and non-source-oriented monitors. The AQMD has already established the required monitoring network for both source and non-source-oriented lead monitors.

ATTAINMENT STATUS WITH 2008 NAAQS

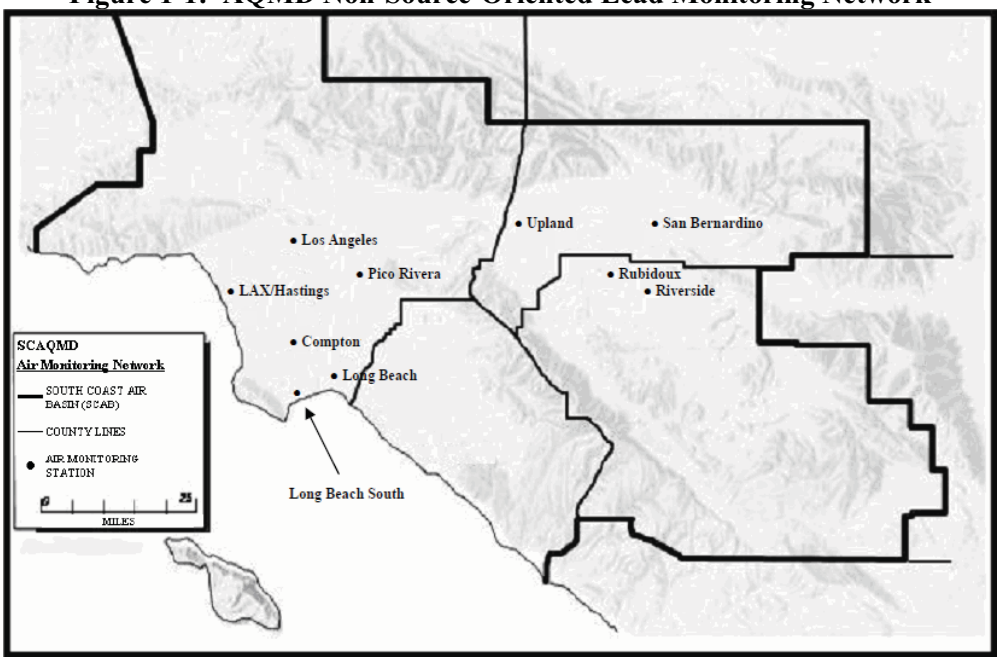
The 2008 NAAQS for lead requires that each state install and operate a network of ambient air lead monitors in order to determine attainment status with the standard. Two types of monitors are required; those that are population-based referred to as "non-source-oriented," and those that are facility-based referred to as "source-oriented." The lead attainment assessment conducted by the state of California was based on data from both sets of monitoring networks. CARB recommended to the U.S. EPA that the South Coast portion of Los Angeles County be designated as non-attainment for the 2008 federal lead standard based on data from the ATSF and Rehrig-Pacific Street monitors for Exide Technologies (Exide) as discussed in more detail below. Final designation of attainment status by the U.S. EPA is expected by October 15, 2010 and would require the Basin to be in attainment with the new NAAQS no later than five years thereafter. A State Implementation Plan (SIP), outlining the strategy to demonstrate attainment

with the lead NAAQS, must also be submitted by the AQMD within 18 months of the final designation date. Details pertaining to the monitors and data used for the assessment are explained below.

Non-Source-Oriented Monitors

The AQMD currently operates a non-source-oriented monitoring network of 10 locations throughout the Basin. The spatial distribution of these sites is shown below in Figure 1-1. The AQMD's current lead monitoring network meets the minimum requirements for the U.S. EPA non-source-oriented monitoring network as specified in the new lead NAAQS, therefore data from the existing monitors were used to provide an indication of lead attainment status on a regional scale. Data values from measurements made at non-source-oriented monitors in the Basin were reviewed for years 2007 through 2009 and showed concentrations well below the new lead NAAQS of 0.15 $\mu g/m^3$ and range from 0.01 $\mu g/m^3$ to 0.03 $\mu g/m^3$.

Figure 1-1: AQMD Non-Source-Oriented Lead Monitoring Network



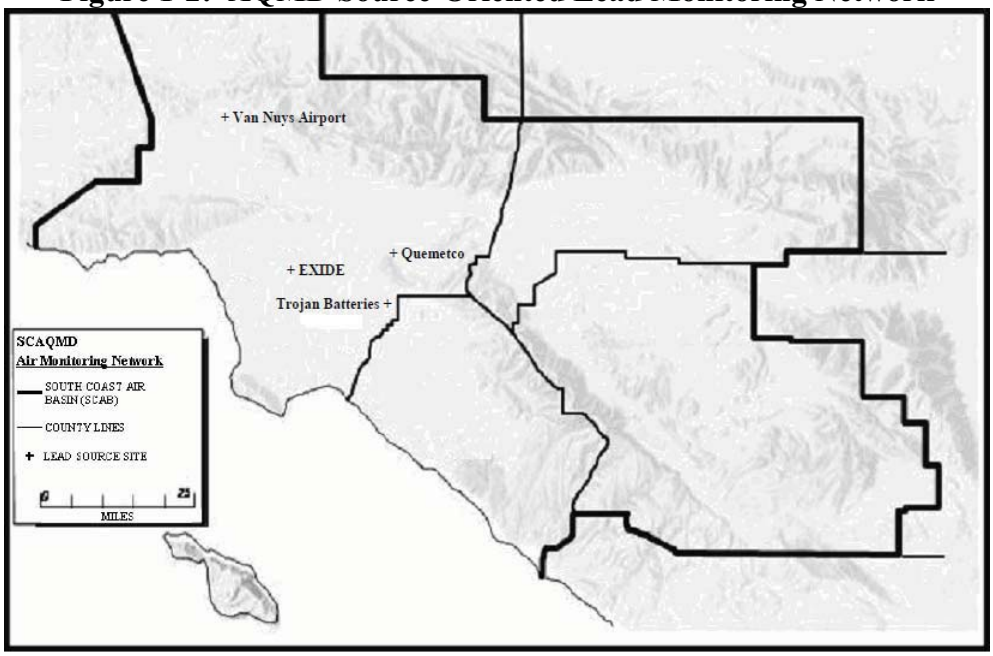
Source-Oriented Monitors

40 CFR Part 58, Appendix D, Paragraph 4.5 requires installation of source-oriented monitors at lead sources that are expected to or have been shown to contribute to violations of the lead NAAQS. The U.S. EPA requires agencies to have, at a minimum, one source-oriented State and Local Air Monitoring Station (SLAMS) site located at each lead source with lead emissions of 1.0 or more tons/year. The monitoring location is to be determined based on the modeled point of maximum impact, taking into consideration population exposure and logistical considerations.

The AQMD currently operates existing source-oriented monitoring networks at the following three facilities: Trojan Battery Company in Santa Fe Springs, Quemetco, Inc. in the City of Industry, and Exide Technologies in Vernon, and one additional network recently installed at Van Nuys Airport to meet the monitoring requirements of the new lead NAAQS. General aviation aircraft use leaded aviation fuel, and have been identified as a source of lead emissions.

Although required to conduct source-oriented monitoring of this source according to U.S. EPA regulations, the AQMD currently does not have jurisdiction for regulating the aviation gas formulation or the aircraft emissions since it is a mobile source. Figure 1-2 below shows the locations of AQMD's current source-oriented monitoring networks and their respective lead sources.

Figure 1-2: AQMD Source-Oriented Lead Monitoring Network



Based on data from AER reporting years 2005 through 2007, lead emissions at Trojan Battery, a battery manufacturer located in Santa Fe Springs, are reported as 0.0145 tons/yr and sampling is conducted at one site. The site operates on a 1-in-6 day sampling schedule and had its highest monthly average of 0.23 $\mu g/m^3$ in May 2007. Since September 2007, all monthly averages have been below the new lead NAAQS with an average concentration of 0.07 $\mu g/m^3$.

At Quemetco, Inc., a lead-acid battery recycling facility located in the City of Industry, lead emissions are reported as 0.32 tons/yr and sampling is currently conducted at one site based on AER data for reporting years 2005 through 2007. Monthly averages last exceeded the concentration of 0.15 $\mu g/m^3$ in 2005 at 0.38 $\mu g/m^3$. In 2006, monthly averages ranged between 0.02 and 0.10 $\mu g/m^3$. Sampling did not take place in 2007 and most of 2008 due to loss of access to the AQMD sampling location. Monitoring resumed in October 2008 with monthly measurements through January 2010 below 0.15 $\mu g/m^3$ and a monthly average of 0.07 $\mu g/m^3$.

Based on data from AQMD's AER program for lead emissions reported from years 2005 through 2007, Exide is the only non-aviation source currently emitting over 1.0 ton/yr with an annual average of 1.5 tons/yr. Sampling is conducted at two locations with monitors identified as "Rehrig" and "ATSF". All 3-month averages for ambient air lead concentrations from February 2008 through January 2010 from the monitor located at Rehrig exceeded the new lead NAAQS of 0.15 $\mu g/m^3$. Concentrations from the ATSF monitor exceeded the new lead NAAQS for all 3-

month averaging periods from February 2008 through May 2008, and September 2008 through November 2008.

RULE APPLICABILITY

PR 1420.1 will affect large lead-acid battery recycling facilities that process more than 50,000 tons of lead a year. The provisions of PR 1420.1 are in addition to Rule 1420 and the other lead sources in the district will be addressed through future rulemaking efforts. The decision to address large lead-acid battery recycling facilities was due in part to the AQMD's source-oriented monitors that have historically shown that this industry category has the potential to exceed the new lead ambient air quality standard and their annual mass emissions.

The AQMD staff analyzed multiple data sources, including AQMD's AER program for years 2005 through 2007, permitting data, and compliance data to initially identify the universe of lead-emitting sources. Approximately 600 lead sources were identified and analyzed. Almost all facilities located within the Basin emit less than 0.15 tons of lead per year, an amount far below U.S. EPA's 1.0 ton per year threshold warranting source-oriented monitoring at these facilities. Based on the AQMD's AER program between 2005 and 2007, the industry category with the largest stationary source lead emissions is lead-acid battery recycling.

AFFECTED INDUSTRY

PR 1420.1 applies to large lead-acid battery recycling facilities. There are currently two facilities within the AQMD that the proposed rule will apply to: Exide Technologies and Quemetco, Inc. Exide and Quemetco are the only large lead-acid battery recyclers in the state of California and in the western United States, with the next nearest large lead-acid battery recycling facility located in Texas. These facilities receive spent (used) lead-acid batteries and other lead-bearing materials and recycle them, recovering the lead. Approximately 98 percent of lead acid batteries in the United States are recycled and all components of the batteries are recycled, primarily lead, plastic, and acid. Through the recycling process, approximately 95 percent of the lead in the batteries is recovered. Lead is recycled because of its value and is primarily used to manufacture new batteries.

Exide is located in the city of Vernon on about 24 acres of land. Exide has the highest stationary source lead emissions in the District. Based on AER data for 2005 through 2007, Exide has an average of more than 1.5 tons of lead emission per year, with its highest annual emissions of 1.99 tons of lead per year in 2006-2007 AER reporting year. The facility has an average production of 100,000 to 120,000 tons of lead per year. This is equivalent to recycling approximately 11 million automotive batteries. The facility also recycles lead-bearing plant scrap and other lead-bearing materials.

Figure 1-3
Exide Technologies
Vernon, CA 90058

Quemetco is located in the City of Industry on approximately 14 acres of land. Based on AER data for 2005 through 2007, Quemetco has the second highest average lead emissions of 0.28 tons per year with a high of 0.32 tons per year for the 2006-2007 AER reporting year. Spent automotive batteries account for almost all of the lead processed by Quemetco. The facility processed more than 110,000 tons of lead in 2009. Quemetco processes approximately 10 million automotive batteries per year.

City of Industry, CA 91746

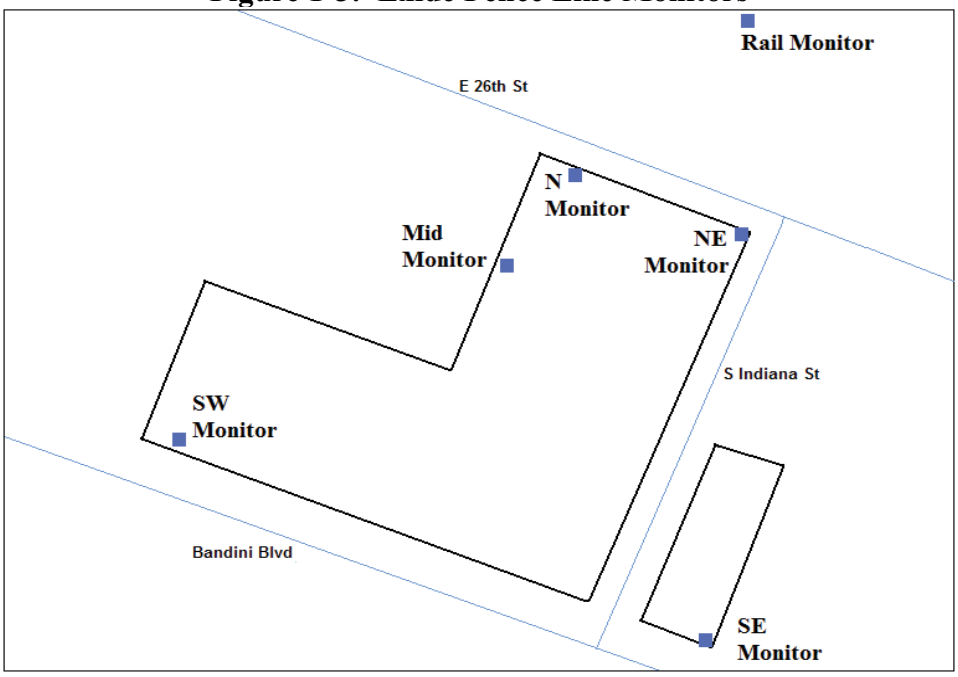
FENCE LINE MONITORS

Under Rule 1420, Exide and Quemetco are required to maintain and operate two fence line monitors to collect samples to demonstrate compliance with the Rule 1420 ambient lead standard of 1.5 µg/m^3. Each facility currently operates an ambient air monitoring and sampling network (fence line monitors) pursuant to requirements of Rule 1420. The fence line monitors are installed at locations that are based on the maximum expected ground-level concentrations of lead at or beyond the facility's property line.

Exide Fence Line Monitors

As shown in Figure 1-5 below, Exide currently maintains six fence line monitors. The AQMD maintains and operates two source-oriented monitors near Exide which are not shown in the figure. Exide conducts sampling at least once every three days at six monitors. The SW, SE, and Rail monitors have been in operation for over ten years. Due to exceedances of the ambient air quality standard of Rule 1420, the facility was required to modify its ambient air monitoring plan to add three additional monitors. The N and NE monitors were installed in the beginning of 2009 with the MID monitor installed at the end of 2009.

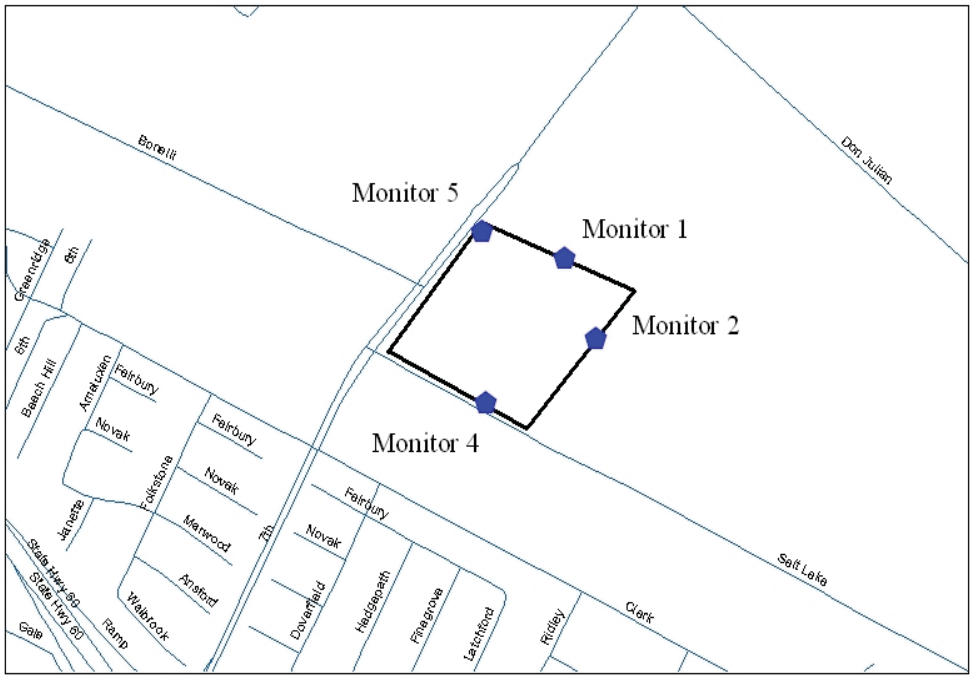
Figure 1-5: Exide Fence Line Monitors



Quemetco Fence Line Monitors

Quemetco collects daily samples at four monitors that have been in operation for over ten years. Monitor 3 was renamed Monitor 5 and moved to the northwest corner of the facility in late 2007 in response to complaints from residents requesting sampling at a location upwind from their neighborhood. Locations of fence line monitors at Quemetco are shown in Figure 1-6 below. The AQMD maintains and operates one source-oriented monitor near Quemetco which is not shown in the figure.

Figure 1-5: Quemetco Fence Line Monitors



COMPLIANCE HISTORY

The following briefly describes the compliance history for each facility with respect to the ambient air lead concentrations, complaints, and other toxic regulations.

Exide

Over the past five years, Exide has been required to increase their fence line monitors and implement changes within their facility to reduce lead emissions. In 2004, the AQMD began receiving complaints from neighbors and the surrounding community which prompted installation of additional monitors. In 2007, the AQMD installed an additional monitor at the Rehrig facility. During 2007-2008, lead concentrations from the Rehrig monitor exceeded the Rule 1420 lead standard of 1.5 µg/m^3. This led to extensive revisions to Exide's Rule 1420 Compliance Plan and issuance of an Order for Abatement in 2009. The AQMD staff continues to work with Exide to ensure all measures in the Compliance Plan and Order for Abatement are being implemented. A brief chronology is described below.

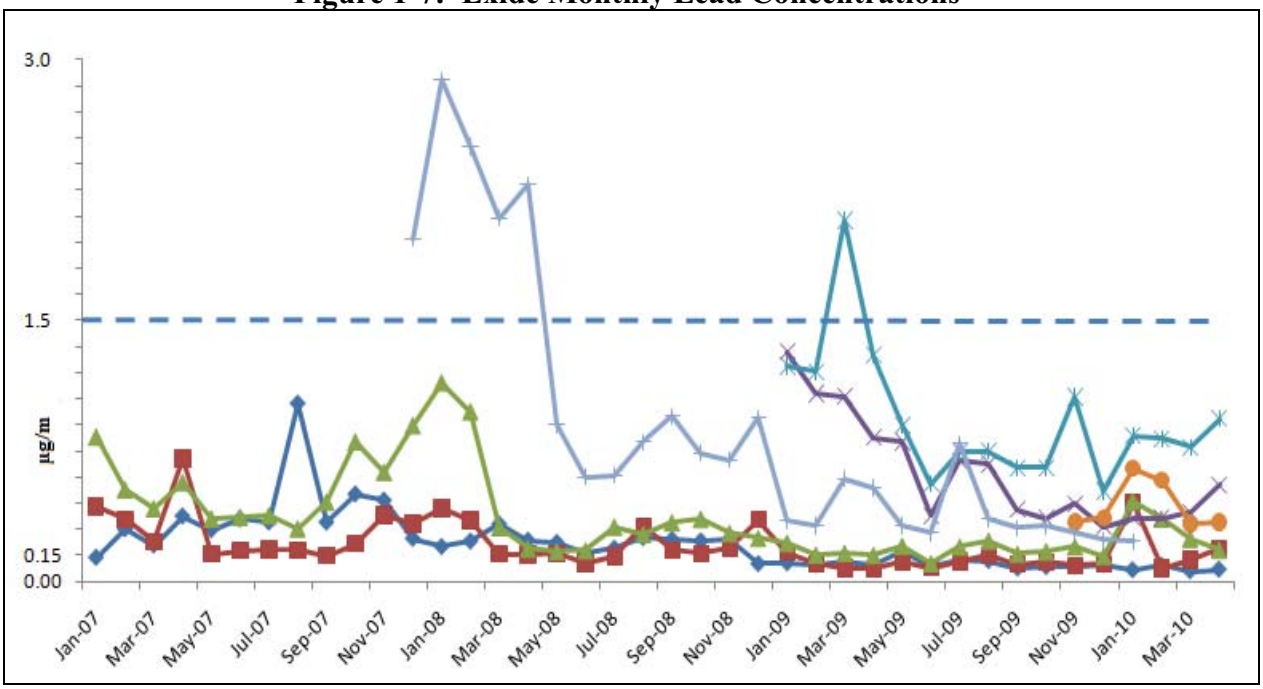
- November 2007: AQMD installs additional monitor at Rehrig facility next to Exide based on complaints alleging Exide as a source of dust, smoke, and odors.
- December 2007 – April 2008: Exide exceeded the ambient air lead concentration requirement of Rule 1420. Monthly averages during this time range from 2.0 to 2.9 µg/m^3.
- 2008: AQMD revised Exide's Compliance Plan to include upgrades to lead control devices, additional housekeeping, extensive housekeeping requirements including building roof tops and perimeter sidewalks and public roadways, and expanded ambient air monitoring.

- January 2009: AQMD staff required two more fence line monitors at Exide.
- December 2009: AQMD staff required one more fence line monitor at Exide.
- June 2009: AQMD issued an Order for Abatement which included further, more stringent requirements beyond those specified in Rule 1420 and existing permit and Compliance Plan conditions. Requirements included total enclosures of two lead processing areas, lead control device upgrades, process curtailments if ambient concentrations approached or exceeded the lead standard, and additional housekeeping and monitoring requirements.

Monthly Lead Concentrations at Exide

Average monthly lead concentrations for all fence line monitors at Exide from 2007 to the beginning of 2010 are 0.47 µg/m^3 with a high of 2.08 µg/m^3. Average monthly concentrations from source-oriented monitors for Exide to date are 0.99 µg/m^3 with a high of 2.88 µg/m^3. Exide received multiple violations for exceedances with the 1.5 µg/m^3 concentration standard of Rule 1420 between December 2007 and June 2008 at a source-oriented monitor, including a violation in March 2009 for an exceedance measured at a fence line monitor. Figure 1-7 below shows Exide monthly lead concentrations at each monitor from 2007 to the beginning of 2010.

Figure 1-7: Exide Monthly Lead Concentrations



Quemetco

From 2000 to 2001, Quemetco was issued violations by the AQMD for exceeding the Rule 1420 ambient air lead concentration standard of 1.5 µg/m^3. As a result, Quemetco was required to modify conditions of their Rule 1420 Compliance Plan and reduce charging limits on furnaces used in their lead smelting process.

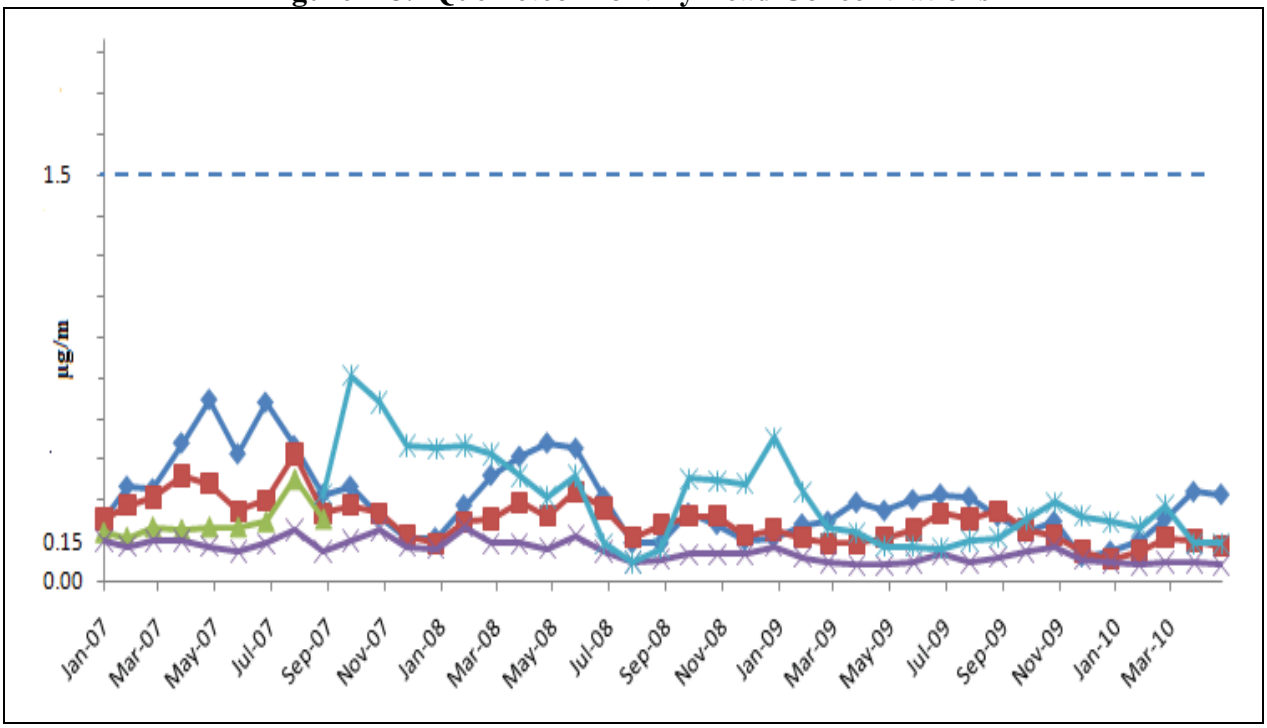
In 2000, Quemetco submitted a health risk assessment (HRA) approved by the District in 2005, showing that the maximum cancer risk for the facility was 22 in one million, primarily from

arsenic and 1,3-butadiene emissions, and that the cancer burden was 1.15. Under Rule 1402, the facility was required to perform public notice and hold a public meeting because the cancer risk exceeded 10 in one million, and was required to reduce risk because the cancer burden exceeded 0.5. In order to reduce the health risk, Quemetco installed a wet electrostatic precipitator (WESP) to control particulate and metal emissions and regenerative thermal oxidation (RTO) to control organic emissions. Following installation of controls and subsequent emissions testing, their approved HRA from February 2010 shows a maximum cancer risk of 4.4 in one million and a cancer burden of 0.023. Average monthly ambient air lead concentration readings at the facility fence line monitors have also been reduced by 40% after control upgrades were made at the facility.

Monthly Lead Concentrations at Quemetco

Average monthly lead concentrations for all fence line monitors at Quemetco from 2007 until the middle of 2008 were 0.29 µg/m^3 with a high of 0.76 µg/m^3. After installation of the WESP in the third quarter of 2008, average concentrations to date have dropped to an average of 0.18 µg/m^3. Although the facility is still above the ambient air lead concentration requirement of the proposed rule, it is expected that completion of the total enclosure for the battery breaking area and additional housekeeping measures to be implemented at the facility will decrease ambient concentrations levels of lead required for compliance. Figure 1-8 below shows fence line average monthly lead concentrations at each monitor for Quemetco between 2007 and 2010.

Figure 1-8: Quemetco Monthly Lead Concentrations



PROCESS DESCRIPTION AND LEAD EMISSION POINTS

Lead-acid battery recycling facilities are secondary lead smelting operations where spent lead-acid batteries, mostly automotive, and other lead-bearing materials are received from various

sources and processed to recover lead, plastics, and acids. The process mainly involves the sorting, melting, and refining of lead-acid batteries, which ultimately produces lead ingots that are then sold to other entities. Emission points consist of those from lead point sources and fugitive lead-dust emissions. Lead point source emissions are generally discharged as the main exhaust of the battery breaking process, smelting furnaces, and refining kettles and vented through ductwork or a stack. Fugitive lead-dust emissions are from facility roadways subject to wind, vehicular, or foot traffic, materials handling and storage areas, battery breaking areas, and smelting and refining areas. Below is a general description of the process including potential lead emission points:

I. **Phase I – Raw Materials Processing**: Lead-bearing materials recovered from lead-acid batteries are prepared and processed prior to being charged (loaded) to a smelting furnace. Lead point source emissions may result during the crushing process of lead-acid batteries. Fugitive lead-dust emissions may result from areas surrounding the crushing process and from the handling and transporting of lead-bearing materials.

   a. **Receiving and Storage:** Spent lead-acid batteries are usually received on pallets that are either stored or sent directly to conveyors for immediate crushing.

   b. **Battery Breaking/Crushing:** The spent lead-acid batteries are unloaded from conveyors and loaded into a hammer mill system where they are crushed whole. The crushed material is then placed into a series of tanks filled with water in order to clean materials of the acids. Through gravity separation, the crushed material sinks to the bottom of the tanks and goes through a series of screens to further isolate lead-bearing materials. The materials are then typically stored in open or partially covered piles if not required for immediate charge preparation.

   c. **Charge Preparation/Rotary Drying/Sweating**: Recovered lead-bearing materials are prepared by blending them with stored lead scrap and reagents prior to being charged to a furnace. The metallic scrap materials are placed in dryers to remove moisture prior to charging to a furnace in order to reduce furnace upsets (puffs and explosions). The materials are then sweated (subjected to temperatures above the melting temperature of lead, but below that of the other metals) to separate lead from other metals with higher melting points.

II. **Phase II – Smelting:** Smelting is the production of crude lead by melting and separating the lead from metallic and non-metallic contaminants and by reducing oxides to elemental lead. Smelting is carried out in blast, reverberatory, and rotary kiln furnaces. These furnaces emit high levels of lead point source emission from the lead fumes during the charging and tapping processes. Fugitive lead-dust may result during the handling of the charged materials and surrounding areas.

   a. **Blast furnaces**: Typically, "hard" lead, or antimonial lead (containing ~10% antimony) is produced in blast furnaces. Scrap metal, re-run slag, scrap iron, coke, recycled dross, flue dust, and limestone are used as charge materials to the

furnace. Process heat is produced by the reaction of the charged coke with blast air that is blown into the furnace.

b. **Reverberatory furnaces**: Semi-soft lead (containing ~3-4% antimony) is produced in reverberatory furnaces. Lead scrap, metallic battery parts, oxides, dross, and other residues are used as charge materials to the furnace. The charge materials are heated directly using natural gas, oil, or coal.

III. **Phase III – Refining and Casting:** Refining and casting the crude lead from the smelting process can consist of softening, alloying, and oxidation, depending on the degree of purity or alloy type desired. Crude lead produced during smelting operations is remelted and refined by the addition of reagents, such as sulfur and caustic soda. The purified lead is then cast into molds or ingots. Refining furnaces and kettles are typically gas or oil-fired and maintained at operating temperatures between 600-1300 degrees F. Both lead point source and fugitive lead-dust emissions result from lead fumes that may be emitted when molten lead is transferred to refining kettles and lead particulates may become airborne off refining kettle surfaces due to updrafts created by thermal rise.

a. **Alloying furnaces:** Alloying furnaces are kettle furnaces used to simply melt and mix ingots of lead and alloy materials, such as antimony, tin, arsenic, copper, and nickel.

b. **Refining furnaces**: Refining furnaces are used to either remove copper and antimony for soft lead production, or to remove arsenic, copper, and nickel for hard lead production. Sulfur may be added to the molten lead to remove copper. The resultant copper sulfide is skimmed off as dross and may be processed in a blast furnace to recover residual lead. Aluminum chloride is used to remove copper, antimony, and nickel.

c. **Oxidizing furnaces:** Either kettle or reverberatory units are used to oxidize lead and to entrain the product lead oxides in the combustion air stream for subsequent recovery in high-efficiency baghouses.

CONTROL STRATEGIES

Several types of controls for lead emissions are currently used at the lead-acid battery recycling facilities in the Basin. Lead emissions at lead-acid battery recycling facilities are generally categorized as point and fugitive lead emissions. Point source emissions are those emissions that are vented to a stack where the stack can be from a specific piece of equipment such as a furnace or building. Fugitive emissions are particulate matter that contain lead, is in contact with the ambient air, and can become airborne. Point source emissions that are vented through a control device, but not captured and contained can become fugitive emissions. The following discusses lead point source controls and fugitive source control strategies.

Lead Point Source Control Strategies

The following describes lead point source control strategies. As with any type of control device, maintenance and proper operation of the control device are important to ensure the control device can achieve its maximum control efficiency. The following provides a description of baghouses and filter controls, wet scrubbers, high efficiency particulate arrestors (HEPA), electrostatic precipitators and wet electrostatic precipitators. Use of multistage point source controls such as use of baghouse filters and HEPA filters can improve the capture efficiency and provide additional protection. Lead emissions from lead processes discussed in the previous section are vented to one or more lead control devices listed below:

Baghouses and Filters

Baghouses operate by collecting particles on a fabric filter. Typically, they consist of fabric bags of tubular or envelope shapes. As an air stream flows through the bags, small particles are initially captured and retained on the fabric filter by one or a combination of the following collection mechanisms: impaction, direct interception, diffusion, electrostatic attraction, and gravitational settling. Once dust has accumulated on the walls of the bags, the "dust mat" acts as a sleeve to further increase particulate matter capture. Bags of polytetrafluoroethylene membrane-type are currently considered to be the most effective for the control of lead emissions.

Arrays of filters are also used to collect particulate matter. They can be used after the bags in a baghouse to further reduce emissions or can be used alone as in a spray booth. Filters are often used in combination with a pre-filter which is "changed out" on a regular basis allowing the bank of filter cartridges to last longer. HEPA and cartridge-type filters are currently the most effective filters used in the lead-acid battery recycling industry.

Baghouses are commonly used in metal melting operations. They have one of the highest control efficiencies for particulate emissions, and the captured particulate can be recycled to recover metal. Operating parameters of melting operations, such as exhaust stream temperature, gas stream velocity, and particulate chemical properties must be taken into account when designing the baghouse.

Daily maintenance and monitoring of the baghouse is necessary to ensure that it continuously meets the required standard of efficiency. Gas volume, temperature, pressure drop, and dust load are monitored continuously or intermittently. Baghouse shaking and sending pulses of air backwards through the bags is done at specific intervals, or when the bags are overloaded, to remove the captured particulate matter from the bags and drop it into a hopper below the bags.

Baghouse and filter technology combined can achieve an overall particulate matter capture efficiency certifiable up to 99.97 percent. It is important that baghouses are designed and use parts, bags, and filters according to manufacturer's recommendations in order to achieve optimal performance and control of emissions. The well designed baghouse can control 99 percent of particulate emissions. The capture efficiency of lead particulates is anticipated to be slightly lower, since metals are found in greater amounts on smaller particles. The lead removal efficiency is at least 98 percent for a baghouse with 99 percent efficiency for particulates. Demonstrated removal efficiencies may be improved with the addition of secondary controls or several baghouses in series. Secondary controls also serve as a back-up or fail safe for the

control of lead emissions in the event that lead control devices upstream are not properly maintained or encounter breakdowns or malfunctions, resulting in leaks or complete failure to filters or bags.

All facilities subject to this rule would be able to use baghouses or filter systems to control particulate lead emissions from most all operations in the lead-acid battery recycling processes. Examples include lead emissions coming from the battery breaking areas and all smelting, refining, and casting operations.

Wet Scrubbers

Wet scrubbers remove both particulate matter and gases from industrial process gas streams. In lead-acid battery recycling operations, wet scrubbers are typically used to remove residual lead particulates and sulfur oxides from the exhaust of baghouses that control emissions from rotary dryers and smelting furnaces. There are a variety of scrubber designs. However, only a limited number can remove small particulates from an exhaust stream. Wet scrubbers are capable of 98 percent collection efficiencies for particles as small as 5 microns in size. Two scrubbers designed to remove small particulates are the ionizing wet scrubber and the venturi scrubber.

In an ionizing wet scrubber, the gas stream first enters a chamber where a high voltage is used to ionize the gas stream. The second chamber is a wet scrubbing chamber, where the ionized particles and gases are attracted to the surface of the chamber and the scrubbing liquid. Larger size particles are removed by water through inertial impaction.

Venturi scrubbers are used by some facilities in the District. In these scrubbers, the exhaust stream is passed through a constriction (the venturi) where the scrubbing liquid is sprayed in. The turbulence at and after the venturi promotes contact of particles with the scrubbing liquid droplets. High particulate matter removal efficiencies for small particles can be achieved with this type of scrubber.

High-Efficiency Particulate Arrestors (HEPA)

Used in conjunction with a pre-filter, high-efficiency particulate air filters can trap particles as small as 0.3 μm at an efficiency of 99.97 percent or greater. Like cartridge filters, HEPA filter elements are of pleated construction. HEPA filters are generally limited to ambient temperature (100^{o}F), though special applications for higher temperatures are available. Unlike bags or cartridge filters, HEPA filters are not automatically cleaned. When a HEPA filter element becomes loaded with particulate matter such as lead particles, the element is changed out and disposed of as hazardous waste. Filters can be combined or applied to controls such as baghouses to reduce lead emissions from lower temperature exhaust streams and fugitive lead-dust emissions collected within total enclosures. They can also be utilized in negative air equipment or vacuums used to conduct housekeeping activities throughout the facility.

Electrostatic Precipitators/Wet Electrostatic Precipitators

Electrostatic precipitators operate by charging the effluent particulate matter with a highly ionized gas stream and then attracting the charged particles to an oppositely charged metal wall. Typically, a cylindrical metal tube is used with an ionized wire running through it. As the ions move outward toward the oppositely charged cylinder, the particles are also ionized, and are deposited on the cylinder. The cylinder wall is periodically vibrated to collect particulate matter

into a hopper. This technology can achieve 99 percent efficiency for total particulate matter as small as 1 μm. Electrostatic precipitators in lead-acid battery recycling operations are typically used downstream from other lead controls such as baghouses, and treat exhaust streams with smaller lead particulates.

Fugitive Lead-Dust Control

Fugitive lead-dust at lead-acid battery recycling facilities can be a major source of lead emissions. Fugitive lead-dust accumulates in and around process areas, from lead point sources, on roof tops, in and around facility, and during maintenance operations to name a few. There are a variety of housekeeping and containment strategies that can be implemented to minimize fugitive lead dust. Housekeeping activities must be implemented frequently and properly to ensure they are effective. The concept behind many of these strategies is to either contain or remove lead dust so it cannot become airborne. Housekeeping practices specifying adequate frequencies and locations for all cleanings to be performed are also critical in the effectiveness to control fugitive lead-dust emissions. The following summarizes some potential fugitive lead dust control strategies:

- Pave roadways subject to vehicular and foot traffic;
- Clean paved areas through vacuuming, vacuum sweepers, and use of wet suppression;
- Wet wash or vacuum areas where lead particulate and accumulate such as roof tops, areas where lead-containing wastes are stored or disposed of;
- Clean areas where lead dust may accumulate due to accidents, process upsets or equipment malfunctions;
- Clean surface impoundments ponds before lead-containing sludge dries and can become a source of fugitive lead-dust;
- Use of enclosures or containment areas during maintenance activities or storage of lead-containing materials; and
- Use of total enclosures under negative air pressure vented to point lead point source controls to ensure that lead dust that accumulates in and around process areas does not become fugitive.

CHAPTER 2: SUMMARY OF PROPOSED RULE 1420.1

OVERVIEW

PR 1420.1 will address lead emissions produced by lead-acid battery recycling facilities. In addition to protecting public health, the major impetus for the rule is to establish requirements that will help ensure that the Basin meets attainment status with the 2008 NAAQS for lead. As a result, the rule proposes standards for total facility mass lead emission rates, maximum lead emission rates for lead control devices, secondary lead control devices on dryers, and concentrations for ambient air lead levels resulting from the facility. Fugitive lead emissions are addressed through housekeeping and maintenance activity requirements, and total enclosures of process areas used in the lead-acid battery recycling operation. Additionally, source testing, ambient air concentration monitoring, and recordkeeping requirements have been added to ensure continuous compliance.

OVERALL APPROACH

Rule Approach

During the rule development process, the AQMD staff considered the following three approaches for Proposed Rule 1420.1: (1) Compliance Plan; (2) Core Requirements with No Compliance Plan; and (3) Core Requirements with a "Contingency" Compliance Plan. The three approaches were evaluated with consideration of health effects of lead, past experience with affected facilities considering potential causes of past exceedances, complaints received, and AQMD staff experience. In addition, the AQMD staff considered whether or not each approach would afford the public an opportunity to participate and provide input. The following describes the three approaches and discusses why the third approach for PR 1420.1 was selected.

Compliance Plan Approach

The Compliance Plan approach is based on an approach similar to Rule 1420. The proposed rule facilities would be required to submit and implement a compliance plan and meet a lead ambient air quality standard of 0.15ug/m^3. Past experience with Rule 1420 shows that compliance plan approaches are not sufficient to demonstrate compliance with the lead ambient air quality standard. Moreover, with the more stringent lead standard, even greater assurances in the specificity of the control measures are needed. Strictly relying on an individual facility-specific compliance plan provides the facility with less regulatory certainty of the types of control measures that must be included. In addition, there are potential delays to develop, approve and implement a compliance plan. Compliance plans are generally developed between the affected facility and the AQMD staff with limited to no public process in the plan approval. As a result, the AQMD staff did not pursue this approach for the proposed rule.

Core Requirements with No Compliance Plan Approach

The Core Requirements with No Compliance Plan approach would establish core requirements that would be included in the proposed rule for point and fugitive sources, similar to PR 1420.1. Establishing core requirements in the proposed rule provides regulatory certainty for affected facilities of the key required controls for point sources and housekeeping requirements. This approach also allows public input during the development of core requirements. Under this approach, facilities would be required to implement the core requirements and meet an

established lead ambient air quality standard of 0.15 ug/m^3. If facilities exceeded the lead ambient air quality standard, legal remedies would be implemented. In the event that the standard is exceeded, there can be delays in requiring additional measures to ensure future compliance.

Core Requirements with a "Contingency" Compliance Plan Approach

The third approach is a hybrid approach between the first and second approaches. This approach is similar to the second approach but includes a "Contingency" Compliance Plan that would be submitted if the facility approaches the lead ambient air quality standard, and would only be implemented if the facility exceeded the ambient lead standard of 0.15 ug/m^3. The AQMD staff believes that the Compliance Plan element is needed to ensure that measures can be identified prior to exceeding the 0.15 ug/m^3 standard and are ready to begin implementation if the 0.15 ug/m^3 standard is exceeded. This approach provides greater assurance that the ambient lead standard will be achieved, and additional measures are in place if needed. The AQMD staff selected this approach as it is more proactive than the other two approaches, provides regulatory certainty for the affected facilities by establishing core requirements in the proposed rule, and is designed to minimize and/or eliminate potential delays to implement additional measures if the facility exceeds the ambient lead standard.

PROPOSED RULE 1420.1

As discussed in more detail below, PR 1420.1 provides a comprehensive approach to addressing lead emissions from large lead-acid battery recyclers with the additional safeguard of a "Contingency" Compliance Plan. The proposed rule establishes core requirements, many of which are currently used at the affected lead facilities and takes into account the value that this industry provides in recycling lead. Core requirements for lead point sources are based on a facility-wide emission rate for the facility's lead point sources and are more stringent than the efficiency requirement under Rule 1420. Core requirements for fugitive lead sources include a comprehensive list of housekeeping and maintenance activities. The efficacy of controlling fugitive emissions, however, are in part based on the operator, such as how well sweeping activities are conducted, how carefully maintenance activities are implemented to contain fugitive dust emissions, etc. In addition, the proposed rule includes more frequent source testing, expanded monitoring network, and increased sampling and monitoring requirements than Rule 1420. In addition, PR 1420.1 provides additional reporting requirements and public notification of key activities that occur at the facility.

Applicability

PR 1420.1 applies to lead-acid battery recycling facilities in the AQMD that processed more than 50,000 tons of lead a year. In the Basin, this industry currently processes an average of at least 300 tons of lead a day per facility. As discussed in Chapter 1, there are currently two facilities in the district that meet the applicability of the proposed rule. These facilities represent the largest stationary source of lead in emissions in the Basin. In addition, data from AQMD monitors in 2005 for Quemetco and as recent as 2009 for Exide have shown that monthly averages for these facilities have exceeded the new federal lead standard of 0.15 µg/m^3. In order to first target the largest lead sources, a minimum process limit of 50,000 tons of lead a year was set as the threshold for rule applicability. The amount was derived by assuming an operating

scenario of 5 days a week, 50 weeks a year, at 50 percent of the lowest current facility throughput limit for this industry in the Basin (~400 tons of lead/day) in order to account for years of decreased production. The language of "large" throughout the rule has been used solely to differentiate these facilities from those that are below the applicability threshold of the rule. Smaller lead-acid battery recycling facilities and other stationary lead sources are currently subject to Rule 1420. The AQMD staff will be amending Rule 1420 to address further reductions from these other lead sources.

Definitions

PR 1420.1 includes definitions of the following terms used in the proposed rule. Please refer to subdivision (c) of PR 1420.1 for the definitions:

- Agglomerating Furnace
- Ambient Air
- Battery Breaking Area
- Dryer
- Dryer Transition Piece
- Duct Section
- Emission Collection System
- Fugitive Lead-Dust
- Furnace and Refining/Casting Area
- Lead-acid Battery Recycling Facility
- Lead
- Lead Control Device

Requirements

Subdivision (d) of PR 1420.1 establishes key requirements. This subdivision includes requirements for the ambient air quality lead concentration, total enclosures, and lead point source controls.

Ambient Air Lead Concentration

Until January 1, 2012, large lead-acid battery recycling facilities will be required to meet an ambient air lead concentration standard of 1.5 $\mu g/m^3$ averaged over 30 days pursuant to Rule 1420. Beginning January 1, 2012, large lead-acid battery recycling facilities subject to PR 1420.1 will not be allowed to discharge into the atmosphere emissions which contribute to ambient air concentrations of lead that exceed 0.15 $\mu g/m^3$ averaged over any 30 consecutive days. Measurements recorded at any rule-required ambient air lead monitor, including those operated by the District that have been installed as source-oriented monitors for the facility, are subject to compliance with the standard. The averaging time for PR 1420.1 is shorter than that of the lead NAAQS with a more frequent sampling requirement of one sample in three days versus the NAAQS which requires one sample in six days.

Total Enclosures

Under PR 1420.1, no later than July 1, 2011, all areas used in the lead-acid battery recycling operation to process or store lead-containing material will be required to be located within a total enclosure vented to a lead control device. The areas may be enclosed individually or in groups. The intent of this requirement is to provide maximum containment and minimize fugitive lead-dust emissions generated in areas where processing, handling and storage of lead-containing materials occur. Areas for total enclosure will include:

- Battery breaking areas;
- Material storage and handling areas, excluding areas where unbroken lead-acid batteries and finished lead products are stored;
- Dryer and dryer areas including transition pieces, charging hoppers, chutes, and skip hoists conveying any lead-containing material;
- Smelting furnace and smelting furnace areas charging any lead-containing material;
- Agglomerating furnace and agglomerating furnace areas; and
- Refining and casting areas.

Facilities will be required to submit complete permit applications for all construction and necessary equipment for total enclosures within 30 days of the date of adoption for PR 1420.1. Construction is required to be completed within 180 days of receiving Permit to Construct approvals from the Executive Officer, or by July 1, 2011, whichever is earlier. In order to account for unexpected delays, facilities may be granted extensions to the compliance deadline date if they can demonstrate that all complete permit applications were timely filed, and that compliance deadlines cannot be met due to reasons beyond the facility's control. The request shall be submitted to the Executive Officer no less than 30 days before the compliance deadline date.

Areas with a total ground surface area of 10,000 square feet or more require a minimum of three digital differential pressure monitors: one at the leeward wall of the total enclosure, one at the windward wall, and one at an exterior wall that connects the leeward and windward wall at a location defined by the intersection of a perpendicular line between this wall and a straight line between the other two monitors in order to account for shifts in draft direction throughout the enclosure. Each total enclosure is required to be maintained at a negative pressure of at least 0.02 mm of Hg (0.011 inches H_2O) and an in-draft velocity of at least 300 feet per minute at any opening such as vents, windows, passages, doorways, bay doors, and roll-ups. For smaller enclosures, at least one differential pressure monitor, continuously measuring the negative pressure of the total enclosure, is required to be installed on the leeward wall.

Digital differential pressure monitors must be capable of measuring and displaying negative pressure in the range of 0.01 to 0.2 mm Hg (0.005 to 0.11 inches H_2O) with a minimum accuracy of plus or minus 0.001 mm Hg (0.0005 inches H_2O). Digital differential pressure monitoring systems will also need to be equipped with a continuous strip chart recorder or electronic recorder approved by the Executive Officer. If the facility elects to use an electronic recorder, the recorder will need to be capable of writing data on a medium that is secure and tamper-proof. The recorded data needs to be readily accessible upon request by the Executive Officer. A copy of any software that is not readily available to the Executive Officer and required to access the recorded data, including all subsequent revisions, must be provided to the Executive Officer at no cost. If a device is needed to retrieve and provide a copy of such recorded data, the device must be maintained and operated at the facility.

Additionally, to ensure availability of data that may be useful in determining reasons for changes in ambient air lead concentrations during power outages, installation of a backup, uninterruptible power supply will be required on all digital differential pressure monitors. The amount of backup power supplied must be capable of sufficiently powering the monitors until processes and equipment at the facility can be safely brought down if the power outage is for a substantial period.

Lead Point Source Emission Controls

Lead point sources are defined by the proposed rule as any location where lead is emitted into the atmosphere from processes or equipment used in the lead-acid battery recycling operation that pass through a stack or vent designed to direct or control its exhaust flow. All lead emissions from lead point sources are required to be vented to an emissions collection system that ducts the entire gas stream to a lead control device. Proposed requirements for lead point source emission controls will be effective beginning July 1, 2011 in order to give facilities ample time to apply for permits and construct all necessary lead control devices. Requirements for the submittal of complete permit applications, construction, compliance deadlines, and extensions for lead control devices are the same as those specified earlier for total enclosures.

The total facility mass lead emission rate for all lead point sources shall not exceed 0.045 pounds of lead per hour, with a maximum emission rate for any single lead point source not to exceed 0.010 pounds of lead per hour. The total facility and maximum emission rates shall be determined using the most recent source tests conducted by the facility or the District. The facility mass emission rate for all lead point sources requires a greater control efficiency than the 99 percent control efficiency required under Rule 1420. The total facility mass emission rate standard of 0.045 pounds of lead per hour was selected based on modeling emissions from the facilities' existing lead emission point sources. The air dispersion modeling performed was consistent with the modeling in the most recent HRAs for each facility, and used updated stack parameters, meteorological data, and source test results for each point source. Calculations do not include background lead concentrations.

In order to meet the 0.15 $\mu g/m^3$ standard, considering stack emissions only, modeling resulted in an emission rate threshold of 0.0009 g/s or 0.007 lbs/hr for each stack for Exide and 0.002 g/s or 0.016 lbs/hr for each stack for Quemetco. The modeled emission rates do not ensure that the

standard will be met, but provide a correlation between the stack emission rate and potential ambient lead concentration. Since overall facility emissions are a combination of lead point source emissions and fugitive emissions, to achieve the lead standard of 0.15 µg/m^3, the stack emissions must be sufficiently controlled to provide some margin for fugitive emissions. Using the most recent source tests from both facilities, the AQMD staff found that the emission rates from one of the affected facilities were not sufficiently controlled and through air dispersion modeling would exceed the 0.15 µg/m^3 lead standard.

Requiring a mass emission rate from all lead point sources of 0.045 pounds per hour ensures point sources are controlled to allow a 30 percent margin for fugitive emissions. It is difficult to determine if a 30 percent margin for fugitive emissions is sufficient because the fugitive emissions are based on how well the facility can implement housekeeping and containment provisions. Under PR 1420.1, if the facility approaches 0.12 µg/m^3 averaged over any 30 consecutive days, the facility is required to submit a Compliance Plan that will specify additional control strategies to further control lead point sources and fugitive emissions. If lead point sources are further controlled, this would provide a greater margin to work with for fugitive emissions. If additional housekeeping control strategies are added, this will further reduce fugitive emissions.

The maximum emission rate of 0.010 lb/hr for any individual lead control device was selected to adequately provide a protective limit for exposure to lead emissions and the ambient standard. Additionally, modeling of each individual stack for both facilities was conducted and results showed that a single stack emitting 0.01 lb/hr would not exceed 0.15 µg/m^3 standard at the fence line. Both the total facility and maximum individual stack emission rates, if exceeded, serve as a screening tool to indicate whether facilities need to reassess their lead control strategy to address other factors that affect the ambient air quality standard, such as controlling fugitive lead-dust emissions.

Facilities will also be required to install a secondary lead control device that is fitted with dry filter media and controls lead emissions from the exhaust of the primary lead control device used for a dryer. Staff has reviewed historical source test data, modeling results, breakdown reports, and maintenance records for the dryer at one facility and has determined that it requires a secondary lead control device due to its high emissions. If the secondary lead control device for the dryer is fitted with dry filter media, it shall only be used to vent the primary lead control device for the dryer to ensure that breakdowns or malfunctions resulting from events such as filters or bags catching fire are appropriately attributed to and isolated to the dryer, avoiding impacts to the performance or emissions of other control devices. This will also ensure that emissions from other control devices are not affected if the secondary lead control device fails due to the failure of the primary lead control device for the dryer. A facility may use an alternative secondary lead control method that is equally or more effective for the control of lead emissions if a complete permit application is submitted as part of the permit application required under paragraph (d)(3) and approved by the Executive Officer.

Furthermore, all filters and filter bags used in any lead control device are required to be rated by the manufacturer to achieve a minimum of 99.97% capture efficiency for 0.3 micron particles, or made of polytetrafluoroethylene membrane material. Any other material that is equally or more

effective for the control of lead emissions may be used so long as it is approved by the Executive Officer.

Staff reviewed source test results conducted for existing lead control devices at both facilities. Results indicate that existing lead control devices at one facility will meet both the proposed average and maximum emission rate limits. The other facility is anticipated to install a secondary lead control device on an existing baghouse controlling a dryer, and upgrade the filter media for a primary lead control device ventilating a total enclosure in order to comply with the proposed rule emission rate limits.

Compliance Plan

Compliance with PR 1420.1 is primarily based on an ambient concentration of lead at fence line monitors. The proposed rule is designed to control lead point source emissions and fugitive lead-dust emissions to achieve the ambient lead standard. Due to the uncertainties involved in controlling fugitive lead-dust, however, a Compliance Plan is proposed as a contingency if a facility approaches the ambient lead standard after all control strategies are implemented. The Compliance Plan is a "safety net" to ensure that the facility will achieve the 0.15 ug/m^3 lead standard. Beginning July 1, 2011, any facility that exceeds an ambient air lead concentration of 0.12 µg/m^3 averaged over any 30 consecutive days will be required to submit a Compliance Plan that identifies additional lead emission reduction measures to ensure that the ambient air quality concentration of 0.15 µg/m^3 is not exceeded. The purpose of this provision is to address those facilities that still may have difficulty demonstrating compliance with the ambient air lead concentration even after full implementation of PR 1420.1 requirements. The Compliance Plan will identify additional measures to be implemented if the 0.15 µg/m^3 concentration is exceeded. At a minimum, each Compliance Plan submittal shall include:

- A comprehensive list of additional short term and long term lead emission reduction measures to be implemented in the event that ambient concentrations of lead exceed 0.15 µg/m^3 averaged over any 30 consecutive days. Additional lead emission reduction measure must include, but are not limited to:
    - More stringent housekeeping measures, such as installation and maintenance of vehicle wet wash areas additional areas for cleaning, and increased cleaning frequencies;
    - Additional areas for total enclosures that may result in exceedances or are a significant source of lead emissions;
    - Modification to lead control devices,
    - Installation of multi-stage control devices;
    - Process changes including reduced throughput limits; and
    - Conditional curtailments including, at a minimum, information specifying the curtailed processes, process amounts, and length of curtailment;
- Locations within the facility and method(s) of implementation for each lead reduction measure; and
- An implementation schedule for each lead reduction measure if ambient air concentrations of lead exceed 0.15 µg/m^3 averaged over any 30 consecutive days, including a schedule for those that can be implemented immediately prior to plan approval.

Under the proposed rule, facilities are only required to submit a Compliance Plan if the ambient air concentration of lead is above 0.12 µg/m^3 averaged over any 30 consecutive days. Facilities will be required to notify the Executive Officer in writing within 72 hours of when the facility knew or should have known of exceeding an ambient air concentration of lead above 0.12 µg/m^3 averaged over any 30 consecutive days. Facilities will then be required to submit the Compliance Plan to the Executive Officer for review and approval within 30 calendar days of exceeding the ambient air lead concentration of 0.12 µg/m^3. The Executive Officer will notify the facility in writing whether the Compliance Plan is approved or disapproved. Determination of approval status will be based on, at a minimum, submittal of information that satisfies the criteria set forth in paragraph (g)(2) of the proposed rule.

If the Compliance Plan is disapproved, the owner or operator will be required to resubmit the Compliance Plan within 30 calendar days after notification of disapproval. The resubmitted Compliance Plan shall include any information necessary to address deficiencies identified in the disapproval letter. If the resubmitted Compliance Plan is denied, the operator or owner may appeal the denial by the Executive Officer to the Hearing Board under Rule 216 – Appeals and Rule 221 - Plans.

Lead reduction measures identified in the Compliance Plan will be implemented based on the schedule of the approved Compliance Plan. Implementation of measures will begin if ambient concentrations of lead exceed 0.15 µg/m^3 averaged over any 30 consecutive days. It should be noted that exceeding the 0.15 µg/m^3 standard will only trigger implementation of the Compliance Plan if it occurs before January 1, 2012. Thereafter, an exceedance of the standard will constitute a violation, as well as triggering implementation of the Compliance Plan.

Housekeeping Requirements

The following housekeeping requirements are proposed to minimize fugitive lead-dust emissions. All requirements will be effective within 30 days of rule adoption.

- Clean by wet wash or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles. This shall be done in a manner that does not generate fugitive lead-dust. The following areas shall be cleaned at the specified frequencies, unless located within a total enclosure vented to a lead control device:
    - Monthly cleanings of roof tops on structures ≤ 45 feet in height that house areas that are associated with the storage, handling or processing of lead-containing materials;
    - Quarterly cleanings of roof tops of structures > 45 feet in height that house areas associated with the storage, handling or processing of lead-containing materials;
    - Weekly cleanings of all areas where lead-containing wastes generated from housekeeping activities are stored, disposed of, recovered or recycled; and
    - Initiate immediate cleaning after any maintenance activity or event, including, but not limited to, process upsets or equipment malfunction that causes deposition of lead-containing materials onto any of the above areas.
- Monthly structural integrity inspections of any structures that house, contain, or control lead emission points or fugitive lead-dust emissions.

- Storage or processing of any lead-acid battery that is cracked or leaking upon receipt at the facility.
- Encapsulation (paving, asphalting, etc.) of all facility grounds for the purpose of providing a surface that accommodates ease of cleaning.
- Removal of weather caps on any stack that is a lead emissions source.
- Storage of all materials capable of generating any amount of fugitive lead-dust in sealed, leak-proof containers, unless located within a total enclosure. Examples of materials include slag, spent filters used in lead control devices, and lead-containing waste generated from housekeeping requirements.
- Transport of all materials capable of generating any amount of fugitive lead-dust emissions within closed conveyor systems or in sealed, leak-proof containers, unless conducted within a total enclosure.
- Surface impoundment pond cleanings.
- Facility grounds cleaning using onsite mobile vacuum sweepers.

Surface Impoundment Cleaning

The proposed rule requires cleanings of surface impoundment ponds or reservoirs. These ponds are typically exposed to the atmosphere and used to hold storm water and spent water used for washing down areas or objects that may contain fugitive-lead dust. These holding areas pose the potential for release of lead to the atmosphere when they are drained or when water evaporates. This provision will require facilities to initiate removal~~e~~ of any lead-containing material, including sludge, from the entire surface area of any surface impoundment pond or reservoir within 1~~2~~24 hour~~s~~ after the water level is equal to or less than one inch at any point above the bottom of the pond or reservoir. Removal of lead-containing material is required to be completed as soon as possible, and no later than six calendar days after the time initiation of the removal was required. Surfaces shall be washed down in a manner that does not generate fugitive lead-dust weekly thereafter until used again for holding water.

Onsite Mobile Vacuum Sweepers

Another proposed requirement intended to reduce fugitive lead-dust emissions is periodic facility sweepings using onsite mobile vacuum sweepers or vacuums equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles. Facilities will be required to vacuum sweep all facility areas subject to vehicle and foot traffic with a vacuum or an onsite mobile vacuum sweeper that is in compliance with District Rule 1186. Vacuum sweeping will be required three times each day, occurring at least once per operating shift with each event not less than four hours apart. Additionally, any accidents, mishaps and/or process upsets occurring in the aforementioned areas that result in the deposition of lead-containing material or dust shall be vacuum swept immediately, no later than one hour after occurrence. Further, sweeping will not be required on any day where the onsite measured rain amount is greater than 0.01 inches in any 24-hour calendar day. Facilities may use locally recorded and reported measured rain amounts.

Maintenance Activity

For purposes of the proposed rule, maintenance activity is defined as any of the following activities conducted outside of a total enclosure that generates fugitive lead-dust:

- Building construction, renovation, or demolition;
- Replacement or repair of refractory, filter bags, or any internal or external part of equipment used to process, handle, or control lead-containing materials;
- Replacement of any duct section used to convey lead-containing exhaust;
- Metal cutting or welding that penetrates the metal structure of any equipment used to process lead-containing material, and its associated components, such that lead dust within the internal structure or its components can become fugitive lead-dust; or
- Resurfacing, repair, or removal of ground, pavement, concrete, or asphalt.

Upon adoption of the rule, the owner or operator of a large lead-acid battery recycling facility will be required to conduct any maintenance activity that is not done in a total enclosure, inside a negative air containment enclosure that is vented to a permitted negative air machine equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles. The negative air containment shall enclose all affected areas where the potential for fugitive lead-dust generation exists. If the maintenance activity cannot be conducted in a negative air containment enclosure due to physical constraints, limited accessibility, or safety issues when constructing or operating the enclosure, the facility will be required to conduct the activity under the following conditions:

- In a partial enclosure, barring conditions posing physical constraints, limited accessibility, or safety issues;
- Using wet suppression or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles, at locations where the potential to generate fugitive lead-dust exists prior to conducting and upon completion of the maintenance activity. Wet suppression or vacuuming will also be required during the maintenance activity barring safety issues;
- While collecting 24-hour samples ~~In conjunction with sample collections at ambient air~~ at monitors for every day that maintenance activity is occurring notwithstanding paragraph (j)(2). For unplanned maintenance activity, if sampling is not being conducted on the day the incident occurs, sample collection shall begin at midnight at the end of the day on which the incident occurs; and
- Maintenance activity conducted outside a negative enclosure must cease immediately if instantaneous wind speeds are 25 miles per hour or greater. Maintenance work may be continued if it is necessary to prevent the release of lead emissions.

All lead-contaminated equipment and materials used for any maintenance activity requires immediate storage or cleaning after completion of work, by wet wash or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97% capture efficiency for 0.3 micron particles. Storage and cleaning must be done in a manner that does not generate fugitive lead-dust. Facilities will also be required to notify the public regarding specific types of maintenance activity (see below in *Notifications to the Public*).

Ambient Air Monitoring and Sampling Requirements

Under PR 1420.1, each facility will be required to collect and analyze ambient air lead samples to determine compliance with the ambient air quality lead concentration standard of PR 1420.1. Prior to January 1, 2011, facilities will be required to conduct ambient air monitoring and

sampling pursuant to Rule 1420. No later than January 1, 2011, facilities shall conduct ambient air monitoring and sampling as follows:

- Collect samples from a minimum of four sampling sites approved by the Executive Officer, at locations that are based on maximum expected ground level lead concentrations at or beyond the property line of the facility.
    - Locations are to be determined by air dispersion modeling calculations approved by the Executive Officer and emission estimates from all lead point sources and fugitive lead-dust sources. Other factors to be considered when determining sampling locations include, but are not limited to, population exposure and seasonal meteorology.
    - Sampling sites at the property line may be located just inside the fence line on facility property if logistical constraints preclude placement outside the fence line at the point of maximum expected ground level lead concentrations.
    - One or more of the four sampling sites may be required by the Executive Officer to be at locations that are not based on maximum impact, and that are instead at locations at or beyond the property line that is representative of upwind or background concentrations. A minimum of one of the four sampling sites, however, will be required to be based on maximum impact.
- Collect 24-hour, midnight-to-midnight, samples at all sites for 30 consecutive days from the date of initial sampling, followed by one 24-hour, midnight-to-midnight, sample collected at least once every three calendar days, on a schedule and frequency approved by the Executive Officer;
- Submit collected samples to a laboratory approved under the SCAQMD Laboratory Approval Program for analysis within three calendar days of collection and provide duplicate samples to the District upon request by the Executive Officer; and
- Calculate 30-day average ambient lead concentrations for individual 24 hour samples within 15 calendar days of the end of the calendar month.

Facilities will also be required to continuously monitor wind speed and direction for the ambient air quality monitoring system at all times to supplement data analysis of samples collected. Only personnel approved by the Executive Officer will be allowed to conduct ambient air quality monitoring, and sampling equipment shall be operated and maintained in accordance with U.S. EPA-referenced methods.

Cleaning activities, such as wet washing and misting, that result in damage or biases to samples collected, will not be allowed within 10 meters of any sampling site required by the rule. Additionally, all ambient air quality monitoring systems will be required to be equipped with a backup, uninterruptible power supply for use during a power outage. The backup power supplied must be sufficient to power the monitors until processes and equipment at the facility can be safely brought down.

Facilities will be required to collect samples at least once every three days. Current Rule 1420 requires at least one sample to be collected every six days, however, approvals of Rule 1420 ambient air monitoring plans over the past years have required facilities to sample at frequencies proposed in PR 1420.1. Staff believes that sampling every three days provides sufficient

information to accurately reflect the ambient air concentrations at the facility during normal operations. The AQMD staff agrees that if the facility does see a spike, that more frequent sampling should be implemented as discussed below. Community members commented that sampling once every three days does not account for fluctuations in throughput and feel that a daily sampling would provide for a more comprehensive look regarding ambient air lead concentrations. Based on historical monitoring data, in most cases exceedances have been due to housekeeping or maintenance activities and were not related to throughput fluctuations. As discussed under "Housekeeping Requirements," PR 1420.1 includes a number of requirements to address these potential emissions spikes.

On and after January 1, 2012, facilities that exceed an ambient air lead concentration of 0.15 $\mu g/m^3$ averaged over any 30 consecutive days, measured at any fence line monitor required by the rule, will be required to increase ambient air monitoring and sampling to a daily frequency. Daily ambient air monitoring and sampling will be required to begin no later than three calendar days of the time the facility knew or should have known of the exceedance. Daily monitoring and sampling will be required to be conducted for a period of sixty consecutive days at each sampling site that measured an exceedance. Any subsequent exceedance at a monitor that measured an exceedance shall require restarting the 60 consecutive-day period.

Any existing ambient air monitoring network currently in use for Rule 1420 may be used for compliance with PR 1420.1 so long as all rule requirements have been met.

Source Tests

The proposed rule will require annual source tests for all lead control devices in order to demonstrate compliance with the facility total lead mass emission rate standard of 0.045 lb/hr, and the maximum individual stack lead emission rate standard of 0.01 lb/hr. Initial source tests for new and modified lead control devices with an initial start-up date on or after the adoption date of the proposed rule will be required within 60 days of initial start-up. Existing lead control devices in operation before the adoption date of the rule will require a source test no later than six months after adoption of the rule. An existing source test, for existing lead control devices, conducted on or after January 1, 2009 may be used as the initial source test as long as the test:

- Is the most recent conducted since January 1, 2009;
- Demonstrated compliance with the applicable control standard;
- Is representative of the method to control emissions currently in use; and
- Was conducted using applicable and approved test methods.

The rule lists the following applicable test methods:

- SCAQMD Method 12.1;
- CARB Methods 12 and 436; and
- EPA Method 12.

Use of an alternative or equivalent test method will be allowed as long as it is approved in writing by the Executive Officer, CARB, and the U.S. EPA. Facilities will be required to submit a pre-test protocol to the Executive Officer at least 60 calendar days prior to conducting the source test. Notification to the Executive Officer in writing shall also be required one week prior to conducting the source test.

The proposed rule provides an incentive for lead control devices that demonstrate exemplary lead emission rate source test results. If the results of the most recent source test for a single lead point source control device indicate emissions of 0.0025 pounds of lead per hour or less, the next test for that lead control device may be performed within 24 months after the date of the most recent test. The rate of 0.0025 pounds of lead per or hour represents 50% of the average rate required for an individual stack, based on modeling of the PR 1420.1 affected facilities, to meet the 0.045 pounds of lead per hour rate for all facility lead point sources.

New Facilities

Under PR 1420.1, any new facility that begins construction or operations on or after rule adoption shall not be located in an area that is zoned for residential or mixed use. In addition, any new facility shall not be located within 1,000 feet from the property line of a sensitive receptor, a school under construction, park, or any area that is zoned for residential or mixed use. A siting provision for new facilities is proposed to avoid the possibility of high lead exposure for nearby residences and sensitive receptors from any new lead-acid battery recycling facility. This provision was included in PR 1420.1 due to the persistent nature of lead and the potential for lead particle accumulation over time. Individual events of small amounts of lead emitted by the facility may not trigger non-attainment status with the new lead NAAQS, however, chronic, cumulative lead exposure is a concern.

Recordkeeping

PR 1420.1 will require records indicating amounts of lead-containing material processed at the facilities to be maintained by the facility. Examples of records include purchase records, usage records, results of lead content analysis, or other AQMD-approved verification to indicate processing amounts. Records for all rule-required housekeeping, maintenance activity, ambient air lead monitoring, lead control device inspection and maintenance, and unplanned shutdowns of any smelting furnaces must also be maintained. All records shall be maintained for five years and maintained onsite for at least two years.

Reporting

Ambient Air Monitoring

Under the proposed rule, facilities will be required to submit reports for monthly ambient air monitoring results for lead and wind data measured at each sampling location on a monthly basis. Reports must be submitted starting no later than January 1, 2011 and must include the results of individual 24-hour samples and 30-day averages for each day within the reporting period. In addition, any exceedance of the ambient air quality concentration shall be reported to the Executive Officer (1-800-CUT-SMOG) within 24 hours of receipt of completed sample analysis, followed by a written report to the Executive Officer no later than three ~~calendar~~ business days after the notification.

Shutdown and Turnarounds

PR 1420.1 requires notifications to the Executive Officer and the public of planned and unplanned shutdowns. Planned shutdown of any smelting furnace, battery breaker, or lead control device that results in lead emissions shall be reported to the Executive Officer by calling 1-800-CUT-SMOG at least ten days prior to shutdown. Unplanned shutdown of any lead control device shall be notified to the Executive Officer by calling 1-800-CUT-SMOG within 1 hour of

shutdown. The notification shall include the associated processes or equipment vented by the shutdown lead control device. For both shutdowns above, a written notification shall also be made to the Executive Officer no later than three calendar days after the shutdown has occurred. Provisions for public notifications are described below.

Maintenance Activity

Under PR 1420.1 facilities will be required to notify the Executive Officer at least ten days prior to the beginning of any maintenance activity that is conducted routinely on a monthly or less frequent basis. Notification information shall include a description of the activity including dates, times, name of person(s) conducting the activity, and specific locations at the facility where activities will be conducted. A description of lead abatement procedures that will be used to minimize lead emissions is also required. For the purpose of the proposed rule, maintenance activity means any maintenance activity defined in paragraph (c)(15) that is conducted outside a total enclosure and generates fugitive-lead dust as recognized by the Executive Officer. Below is a list of specific types of activities that require a notification if the potential for fugitive-lead dust generation exists:

- Building construction, renovation, or demolition;
- Replacement or repair of refractory, filter bags, or any internal or external part of equipment used to process or handle lead containing materials;
- Replacement of any duct section used to convey lead-containing exhaust;
- Metal cutting or welding that penetrates the metal structure of any equipment used to process lead-containing material; or
- Resurfacing, repair, or removal of ground, pavement, concrete, or asphalt.

Provisions for public notifications of these activities are described below.

Notifications to the Public

Through comments received at working group meetings for this rule, residents in close proximity to PR 1420.1 facilities have expressed their concern for the lack of awareness of various activities conducted at the plant that have the potential to result in increased ambient lead concentrations. Community members have requested that information be made available to them so that they can safely plan outdoor activities.

In response to these concerns, PR 1420.1 requires facilities to provide notifications to the public through a facility contact or pre-recorded notification center that is accessible 24 hours a day, 7 days a week, or by another method approved by the Executive Officer that informs the public when the facility will be conducting the specific activities. The facility will be required to install a sign displaying the phone number for the contact or the pre-recorded notification center that is visible to the public. In addition, the facility is required to send notifications via electronic mail. The AQMD staff will provide a list of people who would receive the electronic mail. Facility representatives have asked if information can be placed on their website. This approach would be acceptable provided the sign includes the website information.

The timing of the notifications is similar to notification requirements that are required for the Executive Officer. PR 1420.1 also specifies the type of information that must be included in the

notification such as the date, time, location, and description of the activity. PR 1420.1 requires that notification to the public be provided for the following activities:

- Roof washings;
- Resurfacing, repair, or removal of ground, pavement, concrete, or asphalt that are located outside of a total enclosure and generate fugitive lead-dust;
- Building construction, renovation, or demolition conducted outside of a total enclosure and generates fugitive lead-dust;
- Planned shutdowns or turnarounds of any smelting furnace, battery breaker, or lead control device that will result in lead emissions; or
- Unplanned shutdowns of any lead control device.

Initial Facility Status Report

Under PR 1420.1, no later than January 1, 2011, existing facilities will be required to submit an Initial Facility Status Report. Minimum information required in the report is specified in Appendix 1 of the proposed rule. Below is a summary of required information:

- General facility information (name, address, contact number);
- Worker and sensitive receptor locations with respect to the facility;
- Facility building parameters;
- Description of the lead processes at the facility;
- For all three calendar years dating back from the adoption of the rule:
  - ✓ Annual amounts of all lead-containing materials processed;
  - ✓ Maximum and average daily and monthly operating schedules;
  - ✓ Maximum and average daily and monthly lead-processing rates for all equipment and processes;
  - ✓ Maximum and average daily and annual lead emissions;
- Engineering drawings, calculations, or other methodology to demonstrate compliance with emission standards; total enclosures; ambient air lead monitoring and concentrations; and source tests;
- Intended source test dates for all lead control devices; and
- The name, title, and signature of the responsible official certifying the report.

Ongoing Facility Status Report

Facilities will be required to update the Executive Officer of facility status and changes through submittal of an Ongoing Facility Status Report under PR 1420.1. Reports will be due every year on or before February 1st and shall include information covering the preceding calendar year. Minimum information required in the report is specified in Appendix 2 of the proposed rule. Below is a summary of required information:

- ✓ General facility information (name, address, contact number);
- ✓ Quantities of lead-containing materials processed;
- ✓ Maximum and average daily and monthly lead-processing rates from all equipment and processes;
- ✓ Maximum and average daily and annual emissions of lead from all emission points and fugitive lead-dust sources;
- ✓ Description of changes in worker and sensitive receptor locations and distances since the previous reporting period;

- ✓ Description of changes in monitoring, processes, or controls since the previous reporting period; and
- ✓ The name, title, and signature of the responsible official certifying the report.

CHAPTER 3: IMPACT ASSESSMENT

INTRODUCTION

Various potential sources of lead emissions within the Basin were evaluated in order to plan strategies for attainment with the 2008 NAAQS. Staff has conducted an analysis of lead-emitting sources that may contribute to non-attainment status with the new lead NAAQS. Measurements taken at AQMD's monitoring network for ambient air lead concentrations were also reviewed for years 2007 through 2010, along with an analysis of lead emissions using multiple data sources including AQMD's AER program, permitting data, and compliance data for years 2005 through 2007. Additional information from AQMD's AB2588 air toxics program, including results of historical and current source test reports, were also included in the evaluation. Based on the analysis, the lead-acid battery recycling industry was identified as the largest source of lead emissions in the AQMD and is the industry affected by PR 1420.1.

Historical AQMD compliance data indicates that some exceedances of ambient air quality concentrations for lead have been related to fugitive lead-dust emissions from partially controlled emission points, process upsets, and minimal housekeeping practices at large lead-acid battery recycling facilities. PR 1420.1 requirements for total enclosures of all major lead recovery and storage processes along with enhanced housekeeping practices are expected to achieve reductions in fugitive lead-dust emissions and consequently reduce ambient air lead concentrations resulting from large lead-acid battery recycling facilities.

IMPACT ASSESSMENT FOR PROPOSED RULE 1420.1

A technical analysis of the impacts of requirements for facilities subject to PR 1420.1 was conducted to evaluate potential economic and environmental impacts of PR 1420.1. The impact analysis was based on compliance with requirements proposed to achieve attainment with the 2008 NAAQS for lead.

Implementation of PR 1420.1 will reduce lead point source and fugitive emissions from lead-acid battery recycling facilities. PR 1420.1 will result in a reduction in lead point source emissions through requirements for lead point source emission rates, installation of secondary controls on dryers, and use of specific filters/bags in lead control devices. Based on emission rates from the most recent source tests, implementation of PR 1420.1 will reduce overall facility lead emissions from point sources at Exide. PR 1420.1 is not expected to result in additional reductions to lead point source emissions at Quemetco since the most recent source tests for its lead control devices show they are well below the facility lead emission rate of 0.045 lbs/hour. However, proposed emission rates of the rule will require maintenance at these levels. Reductions of fugitive lead emission are expected at both facilities through PR 1420.1 housekeeping requirements and total enclosures, however, they are difficult to quantify due to the nature of these types of emissions, the types of control strategies that are used, and the manner and frequencies in which housekeeping is conducted. Ultimately facilities will be required to meet a new ambient air quality standard of 0.15 $\mu g/m^3$, which is tenfold lower than the previous standard.

Implementation of PR 1420.1 would result in a net environmental benefit due to the further reduction of lead exposure and associated health benefits. However, potential cost and environmental impacts may occur in association with the installation of air pollution control devices and implementation of other measures to control lead emissions.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

Pursuant to California Environmental Quality Act (CEQA) Guidelines §15252 and AQMD Rule 110, the AQMD has prepared an Environmental Assessment (EA) for PR 1420.1. The Draft EA was released for a 30-day public review and comment period beginning April 27, 2010 and ending May 26, 2010. No comments were received.

Subsequent to the public circulation of the Draft EA for proposed project, PR 1420.1 was modified as follows:

- Removal of 99 percent control efficiency compliance option for lead control devices
- Addition of total facility lead emission rate and maximum individual lead control device emission rate (pounds per hour)
- Addition to use specific filters/bags in lead control devices
- Addition of secondary lead controls on the dryer
- Removal of vehicle wet wash area requirement
- Public notifications for:
    - Unplanned and planned shutdowns/turnarounds of specific equipment
    - Specific types of maintenance activity

The modifications were analyzed and AQMD staff concluded that recirculation was not necessary per CEQA Guidelines §15073.5, because the modifications were determined not to be a substantial revision (i.e., a new, avoidable significant effect that requires mitigation measure or project revisions to reduce the effect to insignificance or that project effects cannot be reduced to insignificant and new measures or project revisions are required). Recirculation is not required, because mitigation is not required; the modifications were not a response to written or verbal comments on the proposed effects identified in the Draft EA; modifications were not required by CEQA, and do not create new significant environmental effects, and it is not necessary to mitigate an avoidable significant effect; and new information added to the proposed project makes insignificant modifications to the Draft EA.

SOCIOECONOMIC ASSESSMENT

PR 1420.1 will incorporate the latest amendments to the federal NAAQS for Lead, as adopted by the U.S. EPA on October 15, 2008. PR 1420.1 would also propose additional provisions beyond the NAAQS which include total enclosures, detailed housekeeping requirements, increased monitoring, and periodic emissions testing of add-on air pollution control devices. The total annual cost for both facilities to comply with PR 1420.1 is estimated at $0.41 million for the first year, and $0.32 million annually thereafter. The socioeconomic assessment ~~will be~~was made available to the public at least 30 days prior to the Public Hearing and will be included as part of the Public Hearing package.

DRAFT FINDINGS UNDER CALIFORNIA HEALTH AND SAFETY CODE SECTION 40727

Requirements to Make Findings

California Health and Safety Code Section 40727 requires that prior to adopting, amending or repealing a rule or regulation, the AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the public hearing and in the staff report.

Necessity

A need exists to adopt Proposed Rule 1420.1 in order to 1) implement the more stringent National Ambient Air Quality Standard for lead set by the U.S. EPA adopted October 15, 2008, 2) impose requirements intended to reduce lead emissions from the source category that has caused non-attainment designation of the Los Angeles County portions of the Basin, and 3) to protect public health by reducing cancer risk and other health effects from exposure to lead emissions pursuant to California Health and Safety Code Sections 39669.5 and 44390 through 44394.

Authority

The AQMD Governing Board has authority to adopt Proposed Rule 1420.1 pursuant to the California Health and Safety Code Sections 39002, 39650 et. seq., 39669.5, 40000, 40001, 40440, 40441, 40702, 40725 through 40728, 41508, 41700, 41706, 44365, and 44390 through 44394.

Clarity

PR 1420.1 is written or displayed so that its meaning can be easily understood by the persons directly affected by it.

Consistency

PR 1420.1 is in harmony with and not in conflict with or contradictory to, existing statutes, court decisions or state or federal regulations.

Non-Duplication

PR 1420.1 will not impose the same requirements as any existing state or federal regulations, other than implementing the NAAQS for lead. The requirements of PR 1420.1 are in addition to Rule 1420. The proposed rule is necessary and proper to execute the powers and duties granted to, and imposed upon, the AQMD.

Reference

By adopting PR 1420.1, the AQMD Governing Board will be implementing, interpreting or making specific the provisions of the California Health and Safety Code Sections 40001 (rules to achieve and maintain ambient air quality standards), 41700 (nuisance), 41706(b) (emission standards for lead compounds from non-vehicular sources), Federal Clean Air Act Section 112 (Hazardous Air Pollutants), and the 2008 National Ambient Air Quality Standards for Lead.

Problem

Prior to adoption of a rule or regulation that reduces criteria pollutants, H&S Code 40001(c) requires districts to determine that there is a problem that the proposed rule or regulation will alleviate and that the rule or regulation will promote the attainment or maintenance of state or federal ambient air quality standards. It has been determined that ~~lead-acid battery recycling facilities~~the District will have a problem meeting the 2008 NAAQS for lead if further strategies are not implemented to control lead emissions from ~~their~~lead-acid battery recycling facilities. PR 1420.1 will help alleviate this problem and help ensure compliance with the 2008 NAAQS for lead.

Rule Adoption Relative to Cost-effectiveness

Health and Safety Code Section 40922 requires that a cost-effectiveness ranking of available and proposed control measures is to be assessed for plans prepared pursuant to and Health and Safety Code, Part 3, Chapter 10. PR 1420.1 is not a control measure in the 2007 Air Quality Management Plan (AQMP) and thus, was not ranked by cost-effectiveness relative to other AQMP control measures in the 2007 AQMP. Furthermore, pursuant to Health and Safety Code Section 40910, cost-effectiveness in terms of dollars per ton of pollutant reduced is only applicable to rules regulating ozone, carbon monoxide, sulfur dioxide, and nitrogen dioxide and does not apply to toxic air contaminants.

Incremental Cost-effectiveness

Health and Safety Code Section 40920.6 requires an incremental cost effectiveness analysis for Best Available Retrofit Control Technology (BARCT) rules or emission reduction strategies when there is more than one control option which would achieve the emission reduction objective of the proposed amendments, relative to ozone, CO, SOx, NOx, and their precursors. Since the proposed rule applies to lead, the incremental cost effectiveness analysis requirement does not apply. Furthermore, PR 1420.1 is not a BARCT rule for the listed pollutants, but rather is intended to bring the AQMD into compliance with the federal NAAQS.

AQMP and Legal Mandates

PR 1420.1 is not a measure in the AQMP. PR 1420.1 is a~~n air toxic~~ rule that would implement the requirements of the U.S. EPA's NAAQS for lead and would also reduce cancer and other risk.

COMPARATIVE ANALYSIS

Health and Safety Code section 40727.2 requires a comparative analysis of the proposed rule with any rules and regulations applicable to the same source. This comparative analysis does not include the state ambient air quality standard because it is still at 1.5 $\mu g/m^3$.

Table 3-1: Comparison of PR 1420.1 with District Rule 1420, the 2008 Lead NAAQS, and the NESHAP for Secondary Lead Smelters

Rule Element	PR 1420.1	District Rule 1420	2008 Lead NAAQS	NESHAP from Secondary Lead Smelting
Applicability	Lead-acid battery recycling facilities that have ~~ever~~ processed more than 50,000 lead-tons/year in the past 5 years or in any future year	Facilities that use or process lead-containing materials	All States	Secondary lead smelters
Ambient Air Quality Standard	On and after January 1, 2012, meet 0.15 µg/m^3 averaged over 30 consecutive days	1.5 µg/m^3 averaged over 30 days	0.15 µg/m^3: - 3-month average - Demonstrated over a 3-year period.	None
Total Enclosures	Total enclosures for main areas where processing, handling and storage of lead-containing materials occur	None[1]	None[2]	Total or partial enclosures for: - Smelting furnace and dryer charging hoppers, chutes, and skip hoists; - Smelting furnace lead taps, and molds during tapping; - Refining kettles; - Dryer transition pieces; and - Agglomerating furnace product taps
Emission Standard and Requirements for Lead Control	- Total facility mass emission rate of 0.045 lbs/hr of lead from all lead	99% control efficiency for particulate matter; 98% control efficiency	None	Concentration of 2.0 mg/dscm

[1] Total enclosures have been required through Compliance Plans and legal actions.

[2] Effective date for the NAAQS is five years after final attainment designation.

Rule Element	PR 1420.1	District Rule 1420	2008 Lead NAAQS	NESHAP from Secondary Lead Smelting
Devices	point sources; maximum emission rate of 0.010 lb/hr of lead for any individual lead point source - Use of filters or bags that are rated by the manufacturer to achieve 99.97 percent control efficiency on 0.3 micron particles or made of PTFE membrane material - Secondary lead controls on dryer	for lead		
Compliance Plan	Only required if a facility exceeds 0.12 µg/m^3; 30 consecutive day avg.; Identifies additional lead control measures beyond the rule; Begin implementation if facility exceeds 0.15 µg/m^3; 30 consecutive day avg.	Specifies general facility information[3]	None	None
Ambient Air Monitoring Requirements	- Minimum of four monitors at facility locations approved by the	- Minimum of two monitors at facility locations approved by the	For states, a minimum of: - One source-oriented monitor at all	None

[3] Additional facility requirements have been added through revised Compliance Plans.

Rule Element	PR 1420.1	District Rule 1420	2008 Lead NAAQS	NESHAP from Secondary Lead Smelting
	Executive Officer - Samples collected at least once every three days - Results reported monthly - Daily sampling if 0.15 µg/m^3 is exceeded after January 1, 2012	Executive Officer - Samples collected every six days - Results reported quarterly	facilities emitting 1.0 tons of lead/year; and - One non-source-oriented monitor in urban areas with a population of at least 500,000 people - Samples collected every six days	
Housekeeping Requirements	Prescribed requirements for cleaning frequencies of specific areas; maintenance activity; building integrity inspections; storage and transport of lead-containing materials; onsite mobile sweeping; and surface impoundment cleanings	Requirements for storage of dust-forming material; weekly cleaning of surfaces subject to vehicular or foot traffic; and storage, disposal, recovery, and recycling of lead or lead-containing wastes generated from housekeeping activities[4]	None	Periodic wash down of plant roadways (lower frequency than PR 1420.1); wet suppression of battery breaking area storage piles; vehicle wet washing of vehicles exiting the materials handling and storage areas
Reporting Requirements	- Ambient air lead and wind monitoring; - Shutdown, turnaround, and maintenance activity reports; - Public notifications for	Ambient air lead and wind monitoring for any lead-processing facility that is required or elects to do ambient air monitoring	For states: - State Implementation Plan submittal; - Periodic emissions reports from stationary source	- Lead control alarm/failure reports including fugitive dust control measures performed during failures

[4] Additional housekeeping measures have been required through revised Compliance Plans and legal actions.

Rule Element	PR 1420.1	District Rule 1420	2008 Lead NAAQS	NESHAP from Secondary Lead Smelting
	specific shutdown and maintenance activity; - Initial Facility Status Reports - Ongoing Facility Status Reports		monitors; - Ambient air quality data and associated assurance data

APPENDIX A: COMMENTS AND RESPONSES

Comments from the Public Workshop held April 14, 2010 and those received in writing are addressed below.

APPLICABILITY

1. Comment: Requirements under PR 1420.1 should only apply to large lead-acid battery recycling facilities if they discharge emissions that cause ambient concentrations of lead to exceed 0.15 $\mu g/m^3$ at or beyond the facility property line.

Response: The federal standard was reduced tenfold from a concentration of 1.5 $\mu g/m^3$ to 0.15 $\mu g/m^3$. Achieving the new standard will be challenging. Based on experience with the Rule 1420 compliance plan approach, the AQMD staff decided that it is more health protective to establish base requirements in PR 1420.1. PR 1420.1 takes a more proactive approach to establish key requirements in the proposed rule that address point source and fugitive emissions. Many of these requirements are currently being implemented at one or both of the affected facilities. The approach that the commenter is suggesting may result in delays in implementing additional measures at the facility as these would likely be developed individually with the facility through a compliance plan that would need to be developed by the facility and reviewed and approved by the AQMD staff. In addition, the approach under PR 1420.1 provides certainty to the affected facilities of the requirements since they are specified upfront as opposed to later through a compliance plan.

2. Comment: Why was the processing of 50,000 tons of lead per year chosen as the applicability criteria for PR 1420.1? The staff report indicates that the threshold was selected because 50,000 tons per year is approximately 50 percent of the lowest "current facility" throughput limit; however, there is no rationale for why this constitutes a "large" recycling facility.

Response: Lead-acid battery recycling facilities with large throughputs are the largest lead emission sources in the Basin. The facilities currently process an average of at least 300 tons of lead a day each. Ambient air concentrations of lead from these facilities were, in large part, the reason CARB recommended a non-attainment designation for Los Angeles County with the 2008 NAAQS for lead. The description of these facilities as "large" is solely to differentiate them from smaller facilities that are below the applicability threshold of the rule and are not expected to exceed the new NAAQS standard. This rationale is further explained on page 2-2.

3. Comment: The applicability threshold limit should be lowered to include medium-sized facilities.

Response: Other lead sources will be addressed in a future amendment to Rule 1420 – Emissions Standard for Lead. The AQMD staff started with large lead-acid battery recyclers because they represent the largest stationary lead emission sources in the district. A number of the requirements under Proposed Rule 1420.1 are specific to lead-acid battery recycling. There are requirements, however, that will be applicable to other lead sources that will likely be included in amendments to Rule 1420.

4. Comment: The applicability is worded awkwardly and suggests that a facility is only subject to the rule if it has processed more than 50,000 tons of lead a year in any of the five calendar years prior to the date of adoption, AND annually thereafter. Such wording would exempt any new facility coming on line after the date of adoption since it would not satisfy both of the conditions linked by the "and."

Response: Staff agrees with the commenter and rule language has been revised to say "or" rather than "and."

5. Comment: Once a facility becomes subject to the rule, is it always subject?

Response: The intent of the rule is to include all large lead-acid battery recycling facilities that, in the past five years, have ~~ever~~ processed or will ever process 50,000 tons of lead-containing material per year, to always be subject to the rule. Rule language has been revised to clearly convey this. The AQMD staff believes that this important to ensure that a facility does not circumvent the rule based on the applicability.

6. Comment: Is the term "annually thereafter" to be assessed on a calendar year basis?

Response: The rule states that "calendar years" are to be used when reviewing years prior to the adoption date for determining applicability. For consistency, calendar years will also be used to determine applicability after the adoption date of the rule.

7. Comment: Rather than the prescriptive approach proposed, the approach for PR 1420.1 should simply specify reasonable compliance schedules for achieving the new lead NAAQS, require submittal of compliance plans by companies, and specify monitoring requirements.

Response: This approach would be similar to Rule 1420. Past experience with Rule 1420 shows that a Compliance Plan approach is not sufficient to demonstrate compliance with the lead ambient air quality standard. Reliance of a Compliance Plan to establish lead control measures will result in delays for implementation of lead control measures due to the time taken for development and District approvals. Moreover, with the

new lead standard being tenfold lower than previous, even greater assurances in the specificity of the control measures is needed. Please refer to the response to Comment #1.

8. Comment: The prescriptive approach of PR 1420.1 would undertake management of our facility as well as design our facility's air pollution control systems which is legally impermissible.

Response: For both affected facilities, many of the provisions under PR1420.1, including those for total enclosures and lead point source emission controls, are being implemented through an updated compliance plan, settlement agreement, compliance with Rule 1402, or an order for abatement. As previously discussed in Response to Comment #1 and #7, the affected facilities have demonstrated the need for a rule that includes core requirements.

PR 1420.1 will not undertake management of either facility. The AQMD staff agrees that the best compliance test for the lead air quality standard is the ambient monitors. To achieve the lead standard, lead point sources and fugitive sources must be well controlled. The AQMD staff has studied the lead point sources at each of the affected facilities and their emission rates. Based on source tested data and air dispersion modeling, it is clear that a minimum emission rate standard is needed for lead point sources. Affected facilities have a variety of options of which stacks to control and which control technologies to implement, if needed.

Based on source test data and air dispersion modeling, it is clear that the dryer has the greatest potential to impact fence line emissions. Thus, a requirement has been added to PR 1420.1 to install a secondary lead control device for dryer. Staff has added rule language to paragraph (f)(4) that requires the facility to include additional information in the permit application for equipment required under subdivision (f) – Lead Point Source Emission Controls, regarding an alternative secondary lead control method to compliance if requested by the facility.

The AQMD staff understands that there are physical alterations a facility can make to their stack parameters to change the dispersion of lead emissions from the point sources. Increasing the stack height or buoyancy may dilute the concentration at a fence line monitor, however, the same lead emissions are being dispersed in the atmosphere. Simply changing the air dispersion of emissions without overtly reducing emissions is not in the best interest for air quality and public health. In addition, the Clean Air Act, Section 123, prohibits use of stack height or other "dispersion" techniques~~t~~ in lieu of emission controls.

AMBIENT AIR QUALITY CONCENTRATION AND MONITORING

9~~7~~. Comment: Paragraph (d)(2) gives the Executive Officer sole authority to judge the evidence that might be provided by a facility to demonstrate that measured ambient air quality concentrations are not the result of that facility's emissions. The last line of the proposed language should be reworded by striking the phrase, "as approved by the Executive Officer."

Response: The rule language has been modified and now reads "The ambient air concentrations of lead shall be determined by monitors pursuant to subdivision (j) or at any District-installed monitor." Subdivision (j) contains all monitoring and sampling requirements and the referenced provision has been removed.

10~~8~~.Comment: The deadline to achieve the ambient concentration of 0.15 $\mu g/m^3$ by January 1, 2012 is not consistent with SCAQMD's stated intent to achieve attainment with the federal standard based on U.S. EPA timeframes. The deadline for final designations for initial non-attainment areas for areas with existing monitoring networks is no later than October 2010 with an effective date of January 1, 2011. The earliest final attainment date would then be five years later, or January 1, 2016. We suggest the compliance date for the ambient air concentration standard of the rule should be "no less than two years after the effective date of any final designation of non-attainment area." Such a compliance date would allow the collection of three years of compliant data necessary for attainment demonstration as required by U.S. EPA.

Response: We agree with the commenter's assessment for determining deadlines and timeframes regarding attainment with the NAAQS. However, staff believes that allotting only three years to collect compliant data does not allow any margin for additional attempts to demonstrate attainment in the event of an exceedance of the standard. In addition, staff believes that action to protect public health should be taken as soon as practicable, and that the requirements of the proposed rule to reduce exposure to lead emissions can be implemented by January 1, 2012.

11~~9~~.Comment: The requirement for ambient air monitoring to begin by January 1, 2011 does not consider how long it might take to arrive at a selection of sampling sites "approved by the Executive Officer" based on "Executive Officer-approved air dispersion modeling." Instead, the proposed rule should allow 120 days after approval of the sampling site(s), with more time allowed if property access issues arise.

Response: Both facilities currently operate an approved ambient air monitoring network required by Rule 1420 with at least four monitors. Both facilities currently meet the air monitoring network requirements under PR 1420.1.

No changes to the current networks are anticipated. Therefore, additional time is not needed.

12~~0~~.Comment: Determining compliance with the ambient air concentration standard based on concentrations "at or beyond the property line" is inappropriate. The placement of monitors "at or beyond the property line of the facility" given the proposed definition of "property line" could include locations as much as 25 feet inside the facility's property boundary. Such locations inside the facility do not constitute "ambient air" monitoring according to 40 CFR 58 Appendix E.

and

The definition of AMBIENT AIR as outdoor air is vague and ambiguous. The definition should be considered to be outside air unaffected by the local environment either upwind of an area in question, or a significantly diluted mixed environment downwind of an area in question.

Response: The definition of PROPERTY LINE has been removed from the rule and a definition of AMBIENT AIR has been added. For the purposes of this rule, ambient air will refer to any outdoor air which is similar to the California Air Resources Board definition rather than the federal definition. It should also be noted that the proposed rule and the 2008 NAAQS for lead requires compliance with ambient air lead standards based on facility emissions that *contribute* to exceedances, with facility emissions not having to be the sole cause.

13~~1~~.Comment: The SCAQMD does not have the authority to impose the proposed definition of AMBIENT AIR which is counter to that established by U.S. EPA in 40 CFR 50.1(e). We do not see where this overly expansive revised definition of ambient air would come into play.

Response: The concern is that ambient air monitors located at or beyond the facility property line used to measure maximum ground level concentrations have historically been placed slightly within the facility property line at the facility's request due to issues such as vandalism, theft, or property rights. In the past, the AQMD staff has approved the alternative siting requests. As a result, the subject monitors do not technically qualify as measuring "ambient air" under the federal definition, as they do not measure air that is accessed by the public. For these reasons, staff has chosen the broader definition of "ambient air" as defined by CARB which accommodates these "fence line" monitors that are located slightly within the property line.

14~~2~~.Comment: The sampling frequency associated with the federal standard is every sixth day, and not every three days as proposed in subdivision (j). There is no

rationale for selecting this sampling frequency in the preliminary draft staff report. U.S. EPA thoroughly considered a variety of sampling frequencies in the promulgation of the federal standard and consciously selected every sixth day sampling.

Response: In 1970, CARB set the California Ambient Air Quality Standard for lead at 1.5 µg/m^3 for a 30-day average. Subsequently in 1978, U.S. EPA established the National Ambient Air Quality Standard at 1.5 µg/m^3 averaged over a calendar quarter, with collection of samples once every six days. Although Rule 1420 only required facilities to sample once every six days, they are currently sampling once every three days and in some cases more frequently. PR 1420.1 maintains the same averaging period as Rule 1420, but proposes to increase the sampling requirement to once every three days. Based on more recent sampling at affected facilities, the AQMD staff believes that sample collections once every three days provides a good representation of lead emissions.

153.Comment: Paragraph (j)(5) is ambiguous and vague in terms of how many wind speed and direction monitors would be required at a given facility. This section should be revised to clarify the meaning of the word "system" such that it is clear that a single meteorological data system to record wind speed is required rather than one at each ambient monitor.

Response: Staff agrees and has modified the rule language to reflect the commenter's suggestion. Please refer to the proposed rule.

164.Comment: We request that a provision be added to the ambient air monitoring section to explicitly provide a mechanism for the consideration and exclusion of ambient monitoring data influenced by an "exceptional event" so that additional measures and/or enforcement are not unnecessarily triggered. The provision should be modeled after the procedures set forth in 40 CFR 50.14 with the incorporation of the definition of "exceptional event" as presented in 50 CFR 50(j).

Response: "Exceptional event" as referenced in 50 CFR 50(j) applies to data submitted to U.S. EPA to demonstrate attainment with any NAAQS. The purpose is to exclude emissions caused by uncontrollable events not expected to recur at a given location, such as fires, explosions, or accidents so that an area's attainment status is not affected. Therefore, no change has been made to the proposed rule.

175.Comment: There is no justification provided for using an averaging form of 30 consecutive days for compliance with the ambient air concentration standard. The federal standard is based on a three-month averaging form. Accordingly, given AQMD's stated purpose in promulgating PR 1420.1,

compliance with an ambient air concentration standard must be established based on the same averaging form.

Response: The Health and Safety Code allows local governments, such as AQMD, to require more stringent standards than those set forth federally or by the state if deemed necessary. Staff believes a more stringent averaging form provides for earlier detection of high ambient air lead concentrations and ample time that is necessary to implement measures that would reduce lead concentrations before a three-month average exceeding the new standard results.

18. Comment: Compliance with the proposed rule should not be based on data from air samples collected from on-site monitors. Revise subparagraph (j)(1)(C) to read "The Executive Officer may require one or more of the four sampling sites to be at locations that are not based on maximum ground level lead concentrations *that are not located within the fence line,* and that are instead at locations representative of upwind or background concentrations."

Response: The intent of monitors under this subparagraph is not to be located well into the facility where the lead recycling process occurs, but to be as close to the fence line as feasible. The AQMD staff does not anticipate that existing monitors located at either of the affected facilities would need to be moved. However, staff understands the commenter's concern and rule language has been modified to read "The Executive Officer may require one or more of the four sampling sites to be at locations that are not based on maximum ground level lead concentrations and that are instead at locations at or beyond the property line that are representative of upwind or background concentrations." It should be noted that Rule 1420 had similar language requiring that monitors be located "at or beyond the property line of the facility where maximum ground level lead concentrations are…"

TOTAL ENCLOSURES

19~~6~~.Comment: The definition of TOTAL ENCLOSURE is from the federal hazardous waste containment building regulations. It requires containment buildings to maintain the primary barrier free of significant cracks, gaps, corrosion or other deterioration that could cause hazardous waste to be released from the primary barrier. Since the total enclosures required in PR 1420.1 are utilized for areas that do not store hazardous waste (such as a battery wrecker or refinery area or a furnace), this definition places an unnecessary requirement on a smelter.

and

References to 40 CFR 264.1101 should be added to the TOTAL ENCLOSURE definition to ensure that these requirements apply to the permitted hazardous waste facilities that are considered large lead acid battery recycling facilities.

Response: The originally proposed definition of TOTAL ENCLOSURE has been changed to limit it to only those requirements that affect air quality and the applicable requirements are spelled out in the definition. In addition, the definition no longer contains references to the Code of Federal Regulations in order to avoid confusion.

20~~17~~. Comment: Consider exempting enclosures that are existing or under construction at the time of rule adoption from the strict definition of TOTAL ENCLOSURE for facilities meeting the fenceline standard at some early date.

Response: The AQMD staff believes that total enclosure of the specified areas is necessary to ensure that fugitive lead dust from such operations is properly contained and well controlled. Exempting existing enclosures or those that are under construction would relieve these structures from meeting the requirements for total enclosures. The proposed rule provides sufficient time for affected facilities to build new or upgrade existing enclosures to ensure they meet the total enclosure requirements.

21~~18~~. Comment: The requirement for total enclosures of any operation deemed necessary by the Executive Officer extends too much authority without any requirement to demonstrate the necessity for the enclosure.

Response: This language has been omitted from the rule. However, it should be noted that Compliance Plan requirements may contain additional measures for total enclosures of additional areas if they are determined to be a significant source of lead emissions or the cause of an exceedance of the ambient lead standard.

22~~19~~. Comment: The requirement for specified areas to be enclosed within total enclosures by January 1, 2011 does not account for the possibility that factors beyond the facility's control including, but not limited to, delays in processing of Permits to Construct applications by the AQMD staff in a timely manner, could prevent a facility from meeting the enclosure deadline despite its best efforts.

and

The requirement for total enclosure installations to be completed within 180 days of receiving Permits to Construct or by July 1, 2011, whichever is EARLIER should be reworded to LATER. Otherwise facilities might

not be given adequate construction time in the event Permits to Construct are issued too close to the July 1, 2011 deadline. Facilities have a reasonable expectation of reciprocal response, acknowledgement, and approval times. It is expected that if the District requests a response within a given timeframe, the facility has the expectation that the District shall similarly respond within the same timeframe.

and

Approvals for extensions should be based on reasonableness rather than discretionary.

Response: The timing for this requirement, along with the timing for lead control devices, has been changed in response to comments received. The previous deadline of January 1, 2011 has been extended by six months and now says that enclosures are to be installed and in operation no later than July 1, 2011. In order to account for potential delays for permit approvals, building department permits, and construction, an extension of the compliance date may be approved by the Executive Officer if the facility can demonstrate that it is unable to meet the deadline due to reasons beyond the facility's control. The request must be made prior to the compliance deadline and all complete permit applications must have been submitted in a timely manner according to due dates specified in the rule.

The dates specified under paragraph (d)(3) are based on estimates of how long that it will take to permit, build, and begin operation of equipment to comply with the provisions. It is the AQMD staff's understanding that both facilities have already begun the process to install total enclosures and have primary controls on all of point sources. If the facility is required to install secondary controls as required under subdivision (f), it is the AQMD staff's understanding that this would be the only additional requirement. The AQMD staff believes that the dates and times for compliance provide sufficient time for affected facilities to comply.

2~~0~~3.Comment: In subparagraph (d)(3)(B), for total enclosures, can construction begin prior to receipt of a Permit to Construct if that is what's necessary to meet the July 1, 2011 deadline?

Response: Construction can begin on anything that does not require a Permit to Construct consistent with the AQMD's interim rule interpretation for Rule 201, however, if a permit is required, the construction cannot begin until the permit is approved. Subparagraph (d)(3)(C) provides for an extension of the deadline if the facility can demonstrate that complete applications were filed within 30 days of the date of adoption of PR 1420.1 and that it cannot meet the deadline due to reasons beyond its control.

241.Comment: The rule specifies that each total enclosure be "vented to an emission collection system that ducts the entire gas stream to a lead control device..." The term "entire" is unnecessarily absolute and subject to potential misinterpretation. A more appropriate word would be "collected."

and

The word "collected" is not necessary because total enclosures are required to be maintained under negative air pressure and are free from leaks or cracks.

Response: Staff agrees that the word collected is not necessary and the language reads, "ducts the entire gas stream."

252.Comment: A requirement for both a negative pressure and an in-draft velocity to be measured at each total enclosure is redundant. Compliance with either criterion would ensure capture of potential fugitive emissions.

Response: The in-draft velocity requirement helps ensure that sufficient negative pressure is maintained at openings that do not have an associated differential pressure monitor. The requirement that periodic in-draft velocity measurements and recordkeeping have has been removed, however, maintaining the in-draft velocity at a minimum of 300 feet per minute is required and may be checked at any time to determine compliance.

263.Comment: No rationale or justification is provided for the selection of an in-draft velocity of at least 300 feet per minute.

Response: The in-draft velocity requirement of 300 feet per minute was derived from hood face velocity requirements for process fugitive emissions set forth in the NESHAP for Secondary Lead Smelters (40 CFR Part 63.544 (b)(1)). This requirement is currently being met at one of the PR 1420.1 affected facilities, as it was established as a condition for the facility through an order for abatement.

274.Comment: The "monitoring system" is required to be maintained at a negative pressure of at least 0.02 mm of Hg, when it is actually the "enclosure" that must be maintained at this negative pressure.

Response: Language has been changed as suggested by the commenter.

285.Comment: No justification is given as to why the accuracy of the pressure drop monitor must be to the nearest 0.001 mm Hg.

Response: The proposed rule requires that pressure differential monitors are digital. Readings to the nearest 0.001 mm Hg allows more accurate readings so that compliance with the 0.02 mm Hg standard can be determined.

296.Comment: The manufacturer's calibration requirement for differential pressure typically specifies calibration on an annual basis, not every six months.

Response: The language has been changed to require calibration every 12 months or more often if recommended by the manufacturer.

3027. Comment: Fitting each differential pressure monitoring system with a continuous chart recorder is unnecessary, redundant, wastes paper, and generates a recordkeeping hardship. Once established via periodic logging of pressure monitor data that the enclosure is fitted with ventilation sufficient to maintain negative pressure, the ongoing imposition of that negative pressure is assured as long as the ventilation fans keep running.

and

The requirement for continuous differential pressure monitoring is duplicative, beyond the normal checks and balances theory of regulation. Differential pressure should be a weekly or monthly performance criteria rather than continuous monitoring. Differential building pressure can be inferred from the operation of baghouse flowrate or by in-draft velocity measurements.

Response: An ongoing imposition of a fixed negative pressure based solely on ventilation fans running or baghouse flowrates being maintained as normal does not account for changes in negative pressure due to in-draft changes resulting from opening of doors or windows which can be demonstrated by the chart recorder and recordkeeping. The proposed rule also allows for the use of an electronic recorder as an alternative to the chart recorder eliminating the concern for generating paper waste.

3128. Comment: The District requests copies, provided at the expense of the facility, of any software necessary to review the output of the digital differential pressure monitoring system rather than requesting the output data file in a standard ASCII data format. This may be an issue of ethics and conflict of interest.

Response: The intent of the provision is to only provide software needed to access the recorded data that is not readily available to the Executive Officer. Rule language has been modified to reflect this.

329.Comment: Requiring backup power for differential pressure monitors is an unnecessary measure that will generate no meaningful additional information. If the facility loses electrical power, the fans imposing the

negative pressure on the total enclosure will not operate and the differential pressure will drop to zero requiring no further verification via monitoring.

Response: Staff agrees with the commenter if the assumption was that all power disruptions to a differential pressure monitor were a result of a complete facility power outage. However, backup power on the differential pressure monitor also accounts for instances where continuous power or connectivity problems affect only the differential pressure monitor. During these instances, it is necessary for monitoring to continue so that the negative pressure is measured and recorded.

33~~0~~.Comment: The proposed definition of WINDWARD WALL is ambiguous and unclear as to what data would inform selection of a "most prevailing" wind direction. The definition also does not sufficiently describe how to select the referenced "most impacted" wall.

Response: The definition of WINDWARD WALL has been changed to mean the "exterior wall of a total enclosure which is most impacted by the wind in its most prevailing direction determined by a wind rose using data required under paragraph (j)(5) of this rule, or other data approved by the Executive Officer."

34~~1~~.Comment: There is no justification given for the need to have three separate pressure drop monitors on buildings that are greater than 10,000 square feet in surface area, nor for the 10,000 square feet criteria. When determining the number of differential pressure monitoring systems for total enclosures, does the 10,000 square feet refer to the floor area of the building, or the entire surface area of the structure itself.

Response: The 10,000 square feet refers to the floor area of the building and rule language has been modified for clarification. The requirement for three monitors is intended to provide assurance that the negative air pressure requirements for total enclosures are being met. This requirement is currently being met at one of the PR 1420.1 affected facilities, as it was established as a condition for the facility through an order for abatement. The requirement allows smaller total enclosures to install only one monitor rather than three.

35~~2~~.Comment: Flexibility should be provided to allow pressure drop monitoring to be conducted in units of inches of water in lieu of mm Hg on an equivalency basis.

Response: Language has been added to provide both alternative measurements as suggested by the commenter.

LEAD POINT SOURCE EMISSIONS

363.Comment: Control efficiencies for lead control devices venting a total enclosure should be determined by a manufacturer's guarantee of particulate reduction. Demonstrating 99% or higher efficiency through inlet/outlet testing will be very difficult because of the small amount of particulate on either side of the control device and because the test methods are not consistently accurate enough to achieve a plus or minus 1% result. A better approach would be to establish an emission rate or standard similar to the NESHAP for Secondary Lead Smelting.

and

The requirement for lead control devices to meet a control efficiency of 99 percent or more for either lead or particulate matter is inappropriate in general because control device efficiency is an improper standard to select for the fabric filter control technologies typically employed at these facilities. Further, there is no justification for departing from the 98 percent control efficiency for lead as required in Rule 1420 without any discussion or supporting rationale.

Response: The control efficiency requirement for lead control devices has been replaced with a mass emission requirement which better characterizes the emissions from the stacks. The total lead emission rate from all lead point source control devices source tested pursuant to subdivision (k) may not exceed 0.045 pounds of lead per hour and no single device shall exceed 0.010 pounds of lead per hour. To address efficacy of controls, lead point source control devices using dry filter media are required to be fitted with filters rated by the manufacturer to meet 99.97 percent control for 0.3 micron particles and lead control devices using bags are required to use bags made of polytetrafluoroethylene membrane material or any other material that is equally or more effective and approved by the Executive Officer.

374. Comment: Our facility test results for lead emissions from three baghouses controlling process fugitive and fugitive dust emissions range between 0.00339 to 0.00499 lb/hr, and also have difficulty in achieving 99 percent control efficiency under testing. The outlet concentrations for baghouses are all substantially lower than the federal MACT standard level of 2 mg/dscm. For PR 1420.1 to imply that they are not, unless they can achieve some contrived target of 99 percent control efficiency is absurd.

and

U.S. EPA gave direct consideration to a mass emission rate form of that standard when promulgating the NESHAP for Secondary Lead and

specifically rejected it [59 FR 110, June 9, 1994, pg. 29766 and 29767). An outlet concentration form of the standard is the appropriate form.

and

We support the addition of a provision that allows reduced source testing frequency of lead control devices for exemplary performance. However, we disagree fundamentally with the mass emission rate form of the emission standards of the rule. The alternative compliance form should be a concentration level of 1 mg/dscm (one half the federal NESHAP level). Accordingly, reduced testing frequency should be afforded to any source with exhaust lead concentrations less than 0.5 mg/dscm.

Response: As stated above, the 99 percent control efficiency requirement has been removed from the rule. U.S. EPA explicitly stated in the rule summary document [pg. 2-13] that the goal of the NESHAP for Secondary Lead Smelting was not to achieve compliance with the lead NAAQS. Rather, the intent of the standards was to reduce HAP emissions from secondary lead smelters to the maximum degree achievable through the application of maximum achievable control technology (MACT). U.S. EPA rejected the emission standard format for process sources because they believed it could not account for differences in actual emission rates between different size smelting when trying to determine a MACT level [59 FR 110, June 9, 1994, pg. 29766 and 29767].

The intent of PR 1420.1 is to achieve attainment with the revised NAAQS for lead and not to determine a MACT level for the industry. An emission rate in lbs/hr is appropriate for PR 1420.1 because the total point source emissions and fugitive emissions from the facility affect the fence line concentration and, as evidenced by historical fenceline monitoring data, must be reduced significantly to meet the 2008 NAAQS. Reduced source testing frequency is allowed under subdivision (k) if the results of the most recent source test for a lead point source are 0.0025 pounds per hour or less in keeping with the pounds per hour standards.

3~~5~~8.Comment: It is unclear what AQMD means by having the mass rate emission standard apply to "one lead point source, or more than one lead point source if combined." Does this mean, for example, that a facility could test two or more lead point sources and combine those test results for comparison with the 0.0020 lb/hr limit, even if those lead point source exhausts are not physically combined into a common stack?

Response: All lead point sources that vent to the atmosphere must comply with the hourly maximum limit, whether they are venting a single process or multiple processes with emissions manifolded together. The 0.0020 lb/hr

emission standard has been changed as discussed in the response to Comment #363.

396.Comment: The requirement for installation of lead control devices by January 1, 2011 does not account for the possibility that factors beyond the facility's control including, but not limited to, delays in processing of applications for Permits to Construct by SCAQMD in a timely manner, could prevent a facility from meeting the compliance date despite its best efforts.

Response: The timing for this requirement, along with the timing for total enclosures, has been changed in response to comments received. The deadline has been extended by six months and now says that lead control devices are to be installed and in operation no later than July 1, 2011. In order to account for delays for permit approvals, building department permits, and construction, an extension of the compliance date may be approved by the Executive Officer if the facility can demonstrate that it is unable to meet the deadline due to reasons beyond the facility's control. The request must be made prior to the compliance deadline and all complete permit applications must have been submitted in a timely manner according to due dates specified in the rule.

4037. Comment: We would like to see an additional requirement capping annual facility-wide point source lead emissions at 25 pounds per year based on the most recent approved source tests and maximum permitted production.

Response: The AQMD staff does not object if a facility elects to self impose an emission cap on their point sources of 25 pounds per year. The AQMD staff is concerned that imposing an emissions cap at 25 pounds per year on all lead-acid battery recyclers may require installation of pollution controls beyond what is needed to achieve the PR 1420.1 lead standard of 0.15 µg/m^3. The measurement for the 25 pounds per year would be based on an annual or possibly biennial source test that is a "snap shot" of point source emissions. The AQMD staff believes that a better and more appropriate use of the source test data is to ensure the control equipment is properly operating and is achieving emission rates sufficient to achieve the ambient air quality standard. The AQMD staff believes that sampling the ambient air more than 120 times per year is a more appropriate test to ensure that facility-wide emissions of point and fugitive emissions do not exceed the PR 1420.1 lead standard of 0.15 µg/m^3.

4138. Comment: It is unclear how the maximum lead emission rate limit of 0.010 lb/hr for any lead point source was derived.

Response: Staff conducted air dispersion modeling of each individual stack for both facilities and results showed that out of approximately twenty lead point sources modeled, a stack emitting more than 0.013 lb/hr would exceed the

federal 0.15 μg/m^3 standard at the fence line for a given lead point source at one facility. Consequently, a maximum emission rate of 0.010 lb/hr for any individual lead point source was selected to adequately provide a protective limit for exposure to lead emissions and the ambient standard.

42~~39~~. Comment: The AQMD is specifying filter media and bags beyond the usual Best Available Control Technology (BACT). This could be a possible ethics and conflict of interest issue.

Response: The AQMD is not precluded from requiring available controls that are more effective than what is considered as BACT. Further, existing facilities are currently utilizing both forms of filtering media in some or most of their existing lead control devices.

43. Comment: We have determined that issues of ambient air lead concentrations have predominantly been due to fugitive emissions and stacks that are being affected by downwash. The solution is through a redesign of the geometry of the stacks rather than wasting resources on essentially unachievable emission limitations.

and

Neither the federal Clean Air Act nor relevant California or District rules would in any way prohibit the use of stack height increases to resolve adverse building downwash influences.

Response: Changing stack parameters may lower ground level lead concentrations, however, the emission rate does not change. Lead is a persistent toxic compound and establishing the proposed emission rates will reduce the amount of lead that is deposited by lead point sources. Additionally, the proposed emission limitations are currently being achieved by one PR 1420.1 affected facility.

44. Comment: Insufficient and faulty data was used to derive the emission rates. The back-calculated method did not take into account alternative emission stack heights, used Lynwood rather than Central Los Angeles as an incorrect meteorological station, and used different coordinate locations for modeling maximum impact than that of the facility's Rule 1420 monitoring plan.

Response: The AQMD staff used source test data and stack heights and other stack parameters provided to the AQMD staff from the affected facility to derive emission rates. In addition, the AQMD staff followed the same air dispersion modeling methodologies used to estimate health risk under the AB2588 Hot Spots program. The AQMD staff agrees that both the Lynwood site and Central Los Angeles sites are close to Exide. However,

the Central Los Angeles site consists of two years of meteorological data for modeling, whereas the Lynwood site has three years of data (see http://www.aqmd.gov/smog/metdata/AERMOD_Table1.html). Both sites are relatively close to Exide; the Lynwood site was chosen because there was one more year of meteorological data to establish the facility emission limit.

45. Comment: A facility-wide point source emission limit of 0.045 pounds of lead per hour, which equates to 394.2 pounds of lead per year, is not reflective of Best Available Control Technology (BACT) or Best Available Control Technology for Toxics (T-BACT) and is not health protective as achievable. A facility-wide point source emission limit of 0.003 to 0.004 pounds of lead per hour reflects achieved in practice BACT and T-BACT as demonstrated through District-approved source tests. Since lead is subject to a national air quality standard and is a toxic air contaminant, sources of lead emissions are subject to BACT and T-BACT. A facility–wide point source emission limit of 0.045 lbs/hr is not reflective of BACT or T-BACT. A facility-wide point source emission limit of 0.003 to 0.004 lbs/hr reflects achieved in practice BACT and T-BACT, as demonstrated through District-approved source tests.

Response: The AQMD staff agrees that the level of control your facility has achieved is likely to be the basis of BACT and T-BACT. For clarification, BACT applies to individual equipment and is not facility wide. As you are aware, Regulation XIII – New Source Review and Rule 1401 – Toxics New Source review are the rules that establish requirement for new and modified sources for criteria pollutants and toxic air contaminants, respectively. PR 1420.1, however, is not a new source review rule. ~~Proposed Rule 1420.1 is a Best Available Retrofit Control Technology (BARCT) rule for lead. Health and Safety Code Section 40406 defines Best Available Control Technology as "an emission limitation that is based on the maximum degree of reduction achievable, taking into account environmental, energy, and economic impacts by each class or category of source."~~ The AQMD staff has evaluated source test data, conducted air dispersion modeling, and monitoring data. If PR1420.1 is implemented as required, the AQMD staff believes that the other facility can achieve the new lead standard of 0.15 $\mu g/m^3$. Achieving the lead standard is in large part based on the ability of the facility to control fugitive emissions and properly implement all housekeeping and maintenance provisions of the proposed rule. If, however, that facility approaches or exceeds this new lead standard, they will be required to submit a contingency compliance plan that will identify additional point source controls as well as measures to reduce fugitive emissions. If they exceed the new lead standard that compliance plan would need to be implemented. In addition, if through implementation of AB25888 and Rule 1402 – Control of Toxic Air Contaminants from Existing Sources,

additional controls are needed the facility may be required to install additional controls.

46. Comment: The requirement for the total facility lead emission rate of 0.045 lbs/hr from all lead point sources does not allow for the addition of point source controls such as a total enclosure used to reduce fugitive lead-dust emissions.

Response: The total facility lead emission rate of 0.045 lb/hour from all lead point sources does not prohibit use of a total enclosure to further reduce fugitive lead dust emission. The emission rate for all lead sources is the minimum standard that should be achieved. The proposed rule does not prohibit the ~~the~~ facility from implementing additional point source controls or measures to contain or reduce fugitive emissions. If the facility exceeds 0.12 µg/m^3, the facility will be required to submit a compliance plan. If the facility exceeds 0.15 µg/m^3, the facility will be required to implement the compliance plan. The AQMD staff encourages the affected facilities to continue to identify further point and fugitive controls that can be implemented in event the compliance plan is triggered.

47. Comment: It is entirely possible that our facility could emit lead from stationary sources at a greater emission rate than those proposed and still demonstrate compliance with 0.15 µg/m^3.

Response: Staff's review of facility emission rates and monitored ambient air lead concentration data indicate that current emission rates at your facility are higher than those proposed in the rule, and have led to concentrations higher than both the previous and current ambient standard of 1.5 and 0.15 µg/m^3, respectively. Based on point source modeling and monitored data, the AQMD staff believes that is unlikely that your facility can achieve compliance with the 0.15 µg/m^3 standard with an emission rate greater than 0.045 lb/hr.

48. Comment: A facility's emissions are equal to the contribution from stationary sources and fugitive sources. If the emission rate from fugitive sources is less than the rate assumed by the AQMD, then the 0.045 lbs/hr lead emission rate from all lead point sources would be overly restrictive, more so than would be required if a concentration limit determined compliance.

Response: Staff did not assume an emission rate for fugitives and rather provided a margin for fugitive emissions based on point source modeling. U.S. EPA literature and past monitoring data suggests that fugitive emissions play a large role in violations of ambient air standards. Strict adherence to the housekeeping provisions of the proposed rule will determine whether the facility is able to control fugitive emission to a level that is below the margin.

49. Comment: The requirement for a secondary filtration device on the facility's feed dryer is an arbitrary design edict that may not have any meaningful benefit to ambient air quality. The feed dryer at our facility is greatly affected by building downwash so further filtration may well not be the best overall improvement measure from an ambient air perspective. Further, a common approach for secondarily filtering baghouse-controlled sources is a HEPA filter system. The feed dryer drives off a great deal of moisture and HEPA filters do not work well with heavily moisture-laden emission due to potential plugging.

Response: Staff has reviewed historical source test data, modeling results, breakdown reports, and maintenance records for the dryer at your facility and has determined that it requires a secondary lead control device due to its high emissions. Modeled ambient air lead concentrations resulting from reduced lead emissions from the feed dryer at your facility also showed a benefit in that ambient air lead concentrations were decreased at locations of maximum ground lead level impacts. Historical maintenance records and breakdown reports also show that the primary control device for the facility's feed dryer is susceptible to failures and bag leaks due to hot embers of the process and maintenance issues. The addition of a secondary lead control device would provide for backup control of uncontrolled emissions that result during failures of the primary control. It should be noted that the rule does not solely specify the use of a HEPA filter system as the secondary control.

50. Comment: Paragraph (f)(4) states that HEPA and/or cartridge-type filter media used in lead control devices shall be rated by the manufacturer to achieve a minimum of 99.97% capture efficiency for 0.3 micron particles. The standard is based solely on HEPA filter performance. There is no reason to apply that standard to all cartridge filters. Unlike HEPA filters, cartridge-type fabric filter collects do not rely simply on the filtering media itself, and also receives additional filtration on the built-up filter cake. It is not appropriate, therefore, to lump cartridge-type filter media in with HEPA filters in a common performance requirement.

Response: The intent of this provision is to require the use of the highest efficiency filter media currently available for a lead control device. Although not the same as HEPA filters, cartridge-type filters that are rated by the manufacturer of achieving 99.97% capture efficiency for 0.3 micron particles are available for use. In order to more accurately reflect staff's intent for this provision, rule language has been modified to read "For any lead control device that uses filter media other than a filter bag(s), the filter(s) used shall be rated by the manufacturer to achieve a minimum of 99.97% capture efficiency for 0.3 micron particles."

51. Comment: Exide supports a longer test schedule for individual sources that meet an incentive. However, we believe the incentive emission threshold should be 50% of a concentration-based emission limit established in the proposed rule in order to be consistent with the concept under the federal NESHAP for this industry.

Response: The concept of an incentive that allows less frequent testing if a lead control device demonstrates source test results lower than a proposed emission standard can be applied regardless of the format selected. Staff believes that a mass emission rate standard is the more appropriate format for lead point source emission standards of the proposed rule. See response to Comment #37.

52. Comment: Paragraph (k)(6) requires that source tests shall be conducted while operating at a minimum of 80% of equipment maximum capacity. Equipment may have a permit condition that limits its operating capacity at a level below its maximum rated capacity. The section should be revised to have source tests conducted at a minimum of 80% of permitted maximum capacity.

Response: Language as suggested does not account for situations where an equipment maximum capacity may be lower based on historical operating data, economic situations, or other factors. The source tests are typically run at maximum capacity for the plant's current capability based on those factors. This value may be lower than both what is stated on the permit or by the manufacturer, and the suggested rule language would restrict determination of what the reasonable maximum capacity should be. Maximum capacity, permitted capacity, and capacity based on the plants current capability will be taken into consideration by AQMD staff during review and approval of a pre-test protocol submitted by the facility pursuant to paragraph (k)(3). The current language allows flexibility for both staff and the facility to choose the capacity which is appropriate at the time of testing.

53. Comment: Revise subparagraph (k)(5) to read "The owner or operator…shall notify the Executive Officer within *3 business days*" rather than 72 hours. Source test results are dependent upon the notification of the results from a third party, and if the facility were informed of the results late in the day on Friday, they would not have sufficient time to review the report to confirm whether the results did in fact exceed an emission rate standard or were in error.

Response: Staff has modified rule language to reflect the commenter's suggestion.

COMPLIANCE PLAN

5440. Comment: There is no justification for the selection of the 0.12 µg/m^3 trigger for a Compliance Plan.

and

Use of a 0.12 µg/m^3 trigger will likely cause submittal of a Compliance Plan in situations where an exceedance of the 0.15 µg/m^3 standard will never occur.

Response: Proposed Rule 1420.1 takes a proactive approach because of the toxicity and persistent nature of lead. The trigger of 0.12 µg/m^3 represents 80% of the 0.15 µg/m^3 standard. The AQMD staff selected 80% of the standard as a trigger to submit the compliance plan because it close enough to the standard to warrant concern that the 0.15 µg/m^3 lead concentration standard may be exceeded. This approach provides more assurance that if there is an exceedance, measures will be identified and implementation can begin immediately. It should be noted, that implementation of the Compliance Plan is required only if the facility exceeds the 0.15 µg/m^3 lead concentration standard.

5541. Comment: The imposition of the Compliance Plan trigger level on the basis of concentrations "at or beyond the property line" is inappropriate given the proposed definition of PROPERTY LINE, as concentrations measured within 25 feet of a facility's boundary is not "ambient."

Response: The definition of PROPERTY LINE has been removed and a definition of AMBIENT AIR has been added as discussed in the response to Comment #120.

5642. Comment: Since the requirement for a Compliance Plan is triggered by emissions from the lead-acid battery recycler, the concentration from the upwind monitor for the facility should be deducted from the downwind monitor(s) when determining whether the 0.12 µg/m^3 threshold is exceeded.

Response: The ambient air lead concentration of the rule is based on facility emissions that contribute to exceedances, with facility emissions not having to be the sole cause. See response to Comment #120.

5743. Comment: Use of the term "exceedance" for a monthly average between 0.12 µg/m^3 and 0.15 µg/m^3 is misleading.

Response: The language has been clarified to state that "...emissions which contribute to ambient air concentrations of lead that exceed 0.12 µg/m^3 averaged over any 30 consecutive days..." is only a trigger to submit the Compliance Plan. If the facility exceeds 0.15 µg/m^3 after July 1, 2011 or before January 1, 2012, it is not a violation of the proposed rule, however,

the facility would at that time be required to begin implementation of the approved Compliance Plan. If the facility exceeds the 0.15 µg/m^3 lead concentration standard on or after January 1, 2012, that would constitute a violation of the ambient lead standard and the facility would be required to begin implementation of the approved Compliance Plan.

5844. Comment: A Compliance Plan should not be required where an exceedance of the 0.15 µg/m^3 standard has not occurred. If an exceedance occurs, the facility needs to obtain a variance from the District's Hearing Board which will require Increments of Progress, or in other words, a Compliance Plan.

Response: Although submittal of a Compliance Plan will be required when the facility exceeds a concentration of 0.12 µg/m^3, the implementation of the plan will only be required if the facility actually exceeds the 0.15 µg/m^3 concentration. Staff believes that it is necessary to have a plan prepared in advance so that immediate implementation can occur.

5945. Comment: There is no justification provided for using a 30-day averaging form for multiple elements of the Compliance Plan (i.e., trigger for submittal, implementation of additional lead reduction measures). The federal standard is based on a three-month averaging form. Accordingly, given AQMD's stated purpose in promulgating PR 1420.1, targets for triggering a Compliance Plan must be established based on the same averaging form.

Response: Using the 30-day averaging form is consistent with the ambient lead concentration averaging form of Rule 1420. The response to Comment #175 provides the rationale behind use of the 30-day form.

6046. Comment: The Compliance Plan fee structure in subparagraph (d)(3)(C) potentially exposes a facility to repetitive payment solely at the discretion of the Executive Officer who may continually disapprove a submitted plan, resulting in the collection of additional fees each time.

and

Paragraph (g)(3) seems to imply that a denial of the originally submitted plan cannot be appealed. Please clarify that this is not the case.

Response: The language in the proposed rule has been changed so that disapproval occurs only once. At the disapproval stage, appeal is not necessary or appropriate because the AQMD staff is still working with the applicant. If the resubmitted plan does not adequately address the deficiencies identified in the disapproval, the plan will be denied. The denial may be appealed through the Hearing Board under Rule 216 – Appeals. The

Compliance Plan fees are consistent with fees in set forth in District Rule 306 – Plan Fees.

6147. Comment: The revised language has reduced the deadline for Compliance Plan submittal from 30 days to 10 days. This is totally inappropriate and unworkable as a timeframe for the production and submittal of a meaningful and thoughtful plan. AQMD is mandating (Expedited Review Processing) a fee (tax) schedule above that normally associated, which have not been subject public review or approvals. Fees assessed per schedule in Rule 306, where expedited review scheduling is mandated by timing requirement should be waived.

Response: ~~Staff agrees with the commenter and t~~The submittal time has been changed back to the original language of 30 days. This provides sufficient time for preparation of the plan without the need for expedited processing fees.

HOUSEKEEPING REQUIREMENTS

6248. Comment: The definition of FUGITIVE LEAD-DUST needs to include something describing particle size, de minimis level of lead content, or its capability to become airborne. The current definition could be misconstrued to mean any solid particle regardless of its capability to become airborne is FUGITIVE LEAD DUST;

and

The definition of FUGITIVE LEAD-DUST is vague, misleading, and not consistent with the Federal definition of "any particulate matter, containing lead, which becomes airborne and mixes with ambient air in quantifiable detectable quantities."

Response: Staff agrees with the commenter and rule language has been revised to clarify that the particle size is capable of becoming airborne. Staff has not, however, included the phrasing that the particulate matter containing lead have to become airborne and mix with ambient air. Defining it as such would allow particulate matter containing lead that has not yet become airborne to not constitute as fugitive lead-dust, and not trigger requirements of the proposed rule to address its prevention and clean-up. Additionally, any size lead particle that has the capability of becoming airborne, regardless of the level of lead content of the particle, should be contained as it would still impact ambient air lead concentrations.

6349. Comment: Rather than effective immediately, facilities should be given time to establish and implement procedures to comply with housekeeping requirements, such as maintenance of a vehicle wet washing area,

following a reasonable period of time, such as 60 days, after the date of rule adoption.

Response: Staff agrees with the commenter and has added that the housekeeping activities become effective no later than 30 days following rule adoption. The requirement to maintain a vehicle wet washing area has been removed.

64~~50~~. Comment: The building height differentiation that sets roof washing frequencies should be 45 feet instead of 65 feet. Access to roofs greater than 45 feet requires specialized equipment and techniques.

Response: Staff agrees and the proposed rule language has been modified to reflect the commenter's suggestion.

65~~51~~. Comment: There is no discussion in the preliminary draft staff report providing the rationale behind a weekly roof washing frequency, and the effectiveness of weekly versus monthly or semi-annual frequency.

and

We recommend that the frequency of roof washing for building heights above 45 feet be conducted on a semi-annual basis rather than a quarterly basis, and should not be required in months having measurable precipitation. Quarterly washing of these elevated surfaces is a hardship providing limited additional benefit beyond a semi-annual that has not been shown to be insufficient.

Response: For roofs that are greater than 45 feet in height, one facility is conducting washes semi-annually while the other conducts them at least monthly. Staff has reviewed 2010 monitoring data for both facilities and has observed that roofs semi-annually cleaning may result in lead concentration spikes at ambient air lead monitors due to an accumulation of lead dust. Therefore, staff believes that a quarterly washing frequency for the higher roofs is necessary to minimize the amount of lead particles that may be accumulated before it is cleaned up. Both facilities are currently conducting roof washings for roofs that are less than 45 feet in height at least monthly and, based on the historical monitoring data, staff believes monthly washings are appropriate. In addition, the rule allows for days of measurable precipitation to count as a washing for compliance.

66~~52~~. Comment: The proposed definition of MEASURABLE PRECIPITATION may require reprogramming of existing CEMS/DAHS systems to include precipitation data handling. The definition should be modified to included locally recorded & reported measured rain amounts (producing surface run-off) in any 24-hour calendar day.

Response: The definition of MEASURABLE PRECIPITATION has only been proposed to provide facilities the option to use days of rain to count as a cleaning/washing. There is no requirement that the facility demonstrate measurable precipitation readings in order to meet this cleaning/washing exemption. Chapter 2 of this report clarifies that MEASURABLE PRECIPITATION can be demonstrated by using locally recorded and reported measured rain amounts.

6753. Comment: Does the housekeeping requirement in subparagraph (h)(1)(C) for cleaning storage areas apply to outdoor storage only?

Response: Pursuant to paragraph (h)(1), cleanings are required in storage areas that are not located within a total enclosure vented to a lead control device.

6854. Comment: The timeframe of "immediate cleaning (within one hour)" of surfaces following maintenance activities or process upsets that cause lead deposition on the subject surfaces is completely unworkable, especially for the elevated surfaces greater than 45 feet in elevation. Such cleanup process would require more than one hour to initiate and complete as it is not possible to marshal the necessary lift equipment or resources within one hour. Also, no consideration is given to the fact that such an upset might occur at night. Access to elevated roofs for cleaning is only safe during daylight hours. Realistic timing is about 72 hours or 3 business days.

Response: Staff agrees and the proposed rule language has been modified to reflect the commenter's suggestion.

6955. Comment: The inspection, process, handling and storage of incoming batteries are regulated by DTSC. This section is redundant and should be deleted.

Response: Although a similar regulation exists, the purpose for inspection by DTSC relates more to minimizing the release of lead-acid as it hazardous waste. For the purposes of air quality, the provisions are necessary to prevent the generation and release of fugitive lead-dust into the air from damaged lead-acid batteries. Despite this differentiation, rule language has been modified to require action to prevent the generation and release of fugitive lead-dust upon discovery of a cracked or leaking lead-acid battery rather than a general requirement for inspection.

7056. Comment: Does the requirement for inspecting batteries in paragraph (h)(3) require every single battery to be inspected? This is really not practical and incredibly difficult to document. Batteries are not really a source of fugitive emission because they are wet with acid and stored inside a battery casing. The U.S. Department of Transportation regulates the

transport of batteries and is actively inspecting loads of batteries going into secondary lead smelters throughout the country.

Response: The intent of this provision was to prevent fugitive lead dust emissions by inspecting loads of batteries upon arrival and, if cracked or leaking, send the battery to be processed immediately or properly store it in a sealed container or inside a total enclosure. The language has been clarified to state that "upon receipt, any battery that is cracked or leaking shall be immediately sent to the . . ." See response to Comment #6955.

7157. Comment: Is paving required for all facility grounds, including areas where trees and plants are located?

Response: The intent of this requirement is to provide surfaces throughout the facility that facilitate the ease of cleaning or vacuum sweeping, and to avoid the chance for fugitive lead-dust to be entrained in large plots of soils, dirt, or other areas difficult to thoroughly clean. The proposed rule has been modified to allow that "…Facility grounds used for plant life that are less than a total surface area of 100 square feet shall not be subject to encapsulation."

7258. Comment: The final phrase of the requirement to encapsulate facility grounds that reads "as approved by the Executive Officer," should be struck from this condition as it is redundant and understood. Additionally, it should be made clear that facilities may be allowed to breach pavement or land cover as needed to accomplish maintenance or construction activities.

Response: The language has been clarify that "facility grounds requiring removal of existing pavement, concrete, asphalt or other forms of encapsulation, necessary for maintenance purposes shall not require encapsulation while undergoing work, and shall be re-encapsulated immediately after all required work is completed," and the phrase "as approved by the Executive Officer" has been removed.

7359. Comment: The requirement for surface impoundment ponds could be subject to misinterpretation and should be reworded to read "…after the water level falls below 1 inch above the pond…"

Response: Staff agrees with the commenter and language has been revised to read "…after the water level is ≤ 1 inch at any point above the bottom of the pond or reservoir."

7460. Comment: The retention pond is permitted and operated under the regulatory authority of DTSC. Our facility initiates removales of any sludge or sediment that accumulates in the storm water retention pond within 24 hours of accumulation or in as timely a manner as possible following

accumulation. There is no precedent for weekly wash downs once the pond has been drained and cleaned.

Response: The purpose of the DTSC regulation for the retention pond is different than the requirements of the proposed rule. The retention pond holds water that contains lead through storm water runoff and other washdown activities at the facility and the DTSC monitors the concentrations of lead and other hazardous compounds in the water in order to determine if the retention pond is in compliance with regulations for hazardous waste containment. The AQMD's purpose for the sludge cleanup is to prevent the generation of fugitive lead-dust resulting from the evaporation of the lead-laden water of the pond. The weekly washdowns are necessary as the pond's bottom surface is large and subject to deposition of lead dust similar to the paved areas.

75. Comment: Removal of lead-containing material from our storm water pond is a complex process that cannot be performed within a 24-hour period consistent with sound environmental practice. The provision should be revised to require initiation of lead-containing material removal within 24 hours and that cleanup should be completed as soon as possible.

Response: Staff has modified the rule language to reflect the comment. Based on historical time periods taken by the facility to conduct cleaning of the surface impoundment, the provision has been modified to "Initiate removal of any lead-containing material… within 1 hour after the water level is < 1 inch at any point above the bottom of the pond or reservoir. Removal of lead-containing material shall be completed as soon as possible, and no later than 6 calendar days after the time initiation of the removal was required."

76~~61~~. Comment: The DTSC supports the housekeeping requirement for the surface impoundment ponds.

Response: Staff thanks DTSC for the comment and appreciates their input during working group meetings in order to make sure that the requirements for surface impoundments are consistent with those set forth by DTSC.

77~~62~~. Comment: Vehicle wet washing should be limited to those vehicles exiting the facility which have traversed the facility areas associated with lead-acid battery recycling. Onsite mobile sweepers and other plant vehicles are washed at wash areas located within containment buildings. Also, the requirement to keep records of all vehicle wet washing is a complete waste of time and effort.

Response: This requirement has been removed from the proposed rule. However, if a facility triggers the requirement for a Compliance Plan, implementation of

a vehicle wet wash area may be required as an additional lead reduction measure if deemed necessary.

7863. Comment: In the 2009 Order for Abatement for Exide, the AQMD insisted on installation and use of a vehicle wet washing area without providing supporting justification for its necessity, control strategy, or effectiveness.

Response: Vehicle wet washing is an effective measure to reduce track out and is required to be used at Exide based on the Order for Abatement. Vehicle wet washing is used at a variety of facilities to minimize track out. Use of vehicle wet washing at Exide will ensure that potential fugitive emissions that settle on the pavement that are not swept~~,~~ will not be tracked out of the facility. In addition, if a facility triggers the requirement for a Compliance Plan, implementation of a vehicle wet wash area may be required as an additional lead reduction measure if deemed necessary.

7964. Comment: The requirement for sweepings around monitors not to occur on days when sampling is conducted does not take into consideration monitor locations that collect daily samples. The section should also be specific to cleaning and maintenance activities conducted surrounding a monitoring location.

Response: After review, staff determined that the proposed rule language would prevent the cleaning/sweeping of several areas throughout the facility, which was not the intent. The intent was to prevent samples and monitors from being damaged or altered. Therefore, the language has been removed.

MAINTENANCE ACTIVITY

8065. Comment: The proposed definition of TURNAROUND/MAINTENANCE is unnecessarily broad and encompassing, extending far beyond the scope of activities reasonably associated with major maintenance typically involved in plant turnarounds. Additionally, it should only apply to building, construction, renovation, resurfacing, ground removal activities, etc. which are associated with lead processing.

Response: Staff agrees that the definition originally proposed was overly encompassing as it did not provide a causal link to lead emissions. Therefore, the definition of MAINTENANCE ACTIVITY has been revised to include only specific activities that generate fugitive lead-dust and that are conducted outside of a total enclosure.

8166. Comment: The definition of TURNAROUND/MAINTENANCE requirements are tied to requirements for activities to be conducted in a negative air containment enclosure and notification requirements of four week notice

prior to commencement of work. Neither of these requirements is reasonable or feasible given the proposed definition.

and

Proposed notification requirements for turnaround/maintenance activities would place a facility in a state of constantly submitting four-week advance notifications, essentially every day, to cover the unnecessarily broad and encompassing number of activities that would constitute a "turnaround/maintenance activity." The combination of this notification requirement with the other requirements for turnaround/maintenance activity is infeasible and unworkable.

Response: In response to comments received, these requirements have been revised. The definition of TURNAROUND/MAINTENANCE has been replaced with a definition for MAINTENANCE ACTIVITY which has a narrower scope. The requirement to perform maintenance activities in a total enclosure has been expanded to include other options if total enclosure is not possible due to physical constraints, limited accessibility, or safety concerns. The noticing requirements have been changed to notification by telephone at least ten days prior to planned maintenance activities followed by a written notification.

8267. Comment: Architectural coating is defined as a turnaround/maintenance activity. Does this mean that painting the building would need to be performed in a negative air environment?

and

In the definition of renovations, could the word "alter" be construed to mean painting?

Response: Architectural coating has been removed from the definition and the definition of renovation has been clarified to say that it pertains to activities that generate fugitive lead dust.

8368. Comment: The rule requires complete replacement of certain ductwork sections after a maximum of two "corrosions leaks" or "patch repairs" for which no minimum size or definition is provided. There is no rationale provided for this requirement, and no consideration of the relative environmental benefit to undergoing the process disruption necessary to replace a large ductwork section which may, after patching or repairing a third time, not leak or release emissions to the atmosphere at all.

Response: Staff agrees with the commenter and this requirement has been omitted from the proposed rule and replaced with a requirement to conduct

periodic inspections of ducting to ensure structural integrity. In addition, duct replacement is now specified in the definition as one of the maintenance activities which requires notification and must be done in a negative air environment, or of the other options provided in subdivision (i) if that is not feasible, to reduce the potential for fugitive lead dust emissions.

8469. Comment: Does the requirement in subparagraph (i)(1)(B) for wet suppression include wet suppression during lifting activities, for example when a crane is lifting ductwork or a tank during rebuild? This is both impractical and unsafe. Please consider a safety exemption or specify that lifting is not subject to wet suppression.

Response: Staff agrees and has added a safety provision for wet suppression or vacuuming *during* maintenance activities. However, the requirement remains the same for *prior to* and *upon completion* of the maintenance activity.

85. Comment: In instances where maintenance is in response to upsets or equipment failures, it may well be the best for the environment to proceed with the maintenance (stopping releases) as expeditiously as possible without waiting for either erection of temporary enclosures or mobilization of vacuum equipment, etc.

Response: PR 1420.1 already provides flexibility in how a facility can implement lead abatement procedures during maintenance activity that results in fugitive lead-dust emissions. A hierarchy of what is to be implemented ranging from a full negative-air containment to wet suppression is based on physical constraints, limited accessibility, or safety issues.

8670. Comment: The requirement for specified maintenance activities to occur only on days when instantaneous wind speeds are < 25 mph is arbitrary and impractical. Large maintenance activities must be scheduled and orchestrated well in advance, and to predict ten days in advance what the maximum wind speed will be on a given day is not possible. Additionally, if work has commenced and an instantaneous wind speed spike > 25 mph occurs, the facility would be subject to a violation of PR 1420.1 for an unforeseeable meteorological event.

and

Stopping maintenance activities "immediately when instantaneous wind speeds are > 25 mph" is impractical and may not well be the best prescription for the environment. It may well be that maintenance to an enclosure, for example, is itself necessary because of a high wind storm situation damaging siding. Proceeding with the necessary maintenance,

even in the face of high wind, would be the best action for the environment, provided it can be done safely.

Response: Staff agrees with the commenter and the requirement has been modified to require maintenance activity conducted outside a negative containment enclosure to cease if an instantaneous wind speed spike of > 25 mph occurs. This requirement is necessary to prevent fugitive lead-dust from becoming airborne when maintenance activities are being conducted outside of a total enclosure. Staff has also modified the provision to allow maintenance work to continue during instantaneous wind speed spikes, if the maintenance work is necessary to prevent the release of lead emissions.

87. Comment: It is not possible to conduct a 24-hour ambient air lead sample in conjunction for any maintenance activity that is conducted in response to an unforeseen event.

Response: For unplanned maintenance activity, if sampling is not being conducted on the day the incident occurs, sample collection shall begin at midnight at the end of the day on which the incident occurs.

88. Comment: Equipment used for maintenance activity that is contaminated with lead should not require cleaning immediately upon completion of work if it is located within a partial or total enclosure.

Response: Staff agrees with the commenter and has modified rule language to read "Store or clean…all lead-contaminated equipment and materials immediately after completion of work in a manner that does not generate fugitive lead-dust."

89~~71~~. Comment: The entire reporting provisions are in need of a significant rewrite. This section will likely result in multiple notifications each day for things like feed augers getting stuck, the battery breaker jamming, the burner going off in the furnace, conveyor belts breaking, etc. This is completely impractical and will result in notifications for things that are really routine for mechanical operations. The facilities, public, and the AQMD will be so overwhelmed with notifications that the effect of the notifications for more significant breakdowns will be nullified.

Response: The notification requirements are intended to apply only to those activities that result in lead emissions. The language has been clarified in paragraph (n)(2) to clarify that only unplanned shutdowns of lead control devices are required, notifications to the Executive Officer are only required if the listed activities "result in lead emissions" and notifications to the public for planned construction; renovation; demolition; and resurfacing, repair, or removal of pavement, concrete, or asphalt are only required if the

activities take place outside a total enclosure and generate fugitive-lead dust.

9072. Comment: Section (n)(2) adds requirements for public notification approved by the Executive Officer and places the burden of the public notification on the facility in spite of the fact that: 1) AQMD is requiring the facility to notify AQMD through the 1-800-CUT-SMOG hotline; 2) Public notifications must be approved by the Executive Officer; 3) SCAQMD maintains an internet site where public notifications can be posted, and 4) SCAQMD has access to the Reverse 911 telephone notification.

and

While the facility contact is available 24/7, notifying the public via a prerecorded message AND e-mail notification may not be achievable within the time period proposed. In addition, the rule does not state what content of the prerecorded notice and the outgoing e-mail should require.

Response: In all AQMD rules, public notification requirements are the responsibility of the facility. The facility can satisfy the public notification requirements through a pre-recorded phone message OR a facility contact that the public can call or call into. In addition, the proposed rule allows the facility to suggest other alternative public notification approaches provided they are approved by the Executive Officer. The timeframe for the public notification is the same given for notification to the Executive Officer. Staff has modified rule language to provide what content is required in the notifications required by (n)(2)(A), (n)(2)(B), and (n)(2)(C).

91. Comment: Section (n)(2)(A) appears to be duplicative with the existing notification requirements under Rule 430. It is not clear what additional notification needs are being fulfilled by this proposed subsection. If this section is retained, we suggest that the language include the caveat that notification is based on an unplanned shutdown of a lead control device that results in excess emissions and revised for consistency with Rule 430.

Response: Subparagraph (n)(2)(A) is not a duplication of Rule 430, and is intended to be more inclusive than requirements of Rule 430 as it includes unplanned shutdowns of lead control devices that do not result in excess emissions. It should be noted that subparagraph (n)(2)(A) states that "If the unplanned shutdown involves a breakdown pursuant to Rule 430, the breakdown notification report required by Rule 430 shall serve in lieu of this notification to the Executive Officer."

92. Comment: Facilities often make verbal reports to the SCAQMD to err on the side of caution. Follow-up written reports can then be made to the SCAQMD to

provide additional detail about the incident. These notifications to the public could unnecessarily alarm the public and PR 1420.1 does not provide a mechanism for any follow-up written report.

Response: The proposed rule is clear that public notifications are only for those events that result in the generation of fugitive-lead dust or excess lead emissions. Community members have expressed their concern and interest in knowing of these types of incidents at PR 1420.1 facilities so they can plan their lifestyle to minimize lead exposure to themselves or other members in their care. The facility can implement their own protocol to improve communication to their neighbors and community. This would likely prove to be information to the community and your facility to establish an open dialogue.

OTHER COMMENTS

9373. Comment: The proposed definition of PERSON should be consistent, such that a PERSON refers to any individual that is differentiated from an ENTITY.

Response: A definition for PERSON has not been included in PR 1420.1 because PERSON is defined in Rule 102 – Definition of Terms.

9474. Comment: What is the purpose of maintaining records indicating quantities and lead content of each lead-containing material processed? We already know that these facilities handle and produce a lot of lead. We believe that this recordkeeping requirement has no value.

Response: Rule language regarding this matter has been changed to require "daily records indicating amounts of lead-containing material processed, including, but not limited to, purchase records, usage records, results of analysis, or other District-approved verification to indicate processing amounts." Records of lead-containing material processed are necessary to help verify compliance with furnace charging limits for existing facility permit conditions, and for determining compliance during incidents such as equipment breakdowns and ambient air lead concentration exceedance investigations.

9575. Comment: Consider the combination of the facilities funding three monitoring stations, maintained and operated by the AQMD, to be used for compliance, with a requirement to develop a compliance plan supported by proposed projects and modeling (based on the District's monitors) demonstrating how facilities would comply with and maintain the 0.15 µ~~#~~g/m^3 standard.

Response: The AQMD staff believes the compliance plan requirements in the proposed rule provide a necessary safety net. It is necessary to have measures identified that can be implemented immediately in the event of an exceedance of the ambient lead standard. If no exceedance occurs, the facility would not be required to implement measures in the plan. The offer to fund three monitoring stations for determining compliance with PR 1420.1 is generous, however, the AQMD ~~would not be able to locate the monitors at the fence line of the facility which could result in a location which is not at the point of maximum impact of lead emissions from the facility~~staff believes that the existing monitoring network for both affected facilities is sufficient. There are currently four facility-operated monitors and one AQMD-operated monitor at Quemetco, and six facility-operated monitors and two AQMD-operated monitors at Exide. If new information shows a need, additional monitors can be installed.

96~~76~~. Comment: How long does the uninterruptible power supply (UPS) need to be capable of supporting operations? Typically UPS can last a couple of hours which would be enough time to bring the plant down safely in the event of a power interruption. However, an earthquake or similar event that causes power to be out for extended periods of time cannot be covered entirely by UPS.

Response: The rule language has been changed to clarify that the uninterruptible power supply is to be used for power outages, and the staff report reflects that it needs to be operational long enough so that equipment and processes can be safely shutdown.

97~~77~~. Comment: Will previously performed and approved source tests and previously approved protocols comply with paragraphs (k)(2) and (k)(3)? Would source tests from 2009 be acceptable for equipment that is next scheduled to be tested in the first half of 2011?

Response: Yes, previously approved protocols are acceptable and paragraph (k)(11) has been revised to allow the 2009 source tests so long as they are the most recent conducted since January 1, 2009, demonstrate compliance with the lead control device standards, are representative of the control methods currently in use, and the test was conducted using approved methods in the proposed rule.

98~~78~~. Comment: Please clarify that the provision for new facilities applies to 100% new facilities and not changes/expansions/modifications of existing facilities.

Response: The provision applies to any facility beginning construction or beginning operations on or after the date of adoption of PR 1420.1. Therefore, in addition to totally new facilities, if an existing facility begins new lead battery recycling operations, this provision would apply.

99~~79~~. Comment: We are concerned that the AQMD is acting arbitrarily since there are significant proposed revisions to the rule language for the set hearing package since its original release at the March 18, 2010 public workshop. The AQMD is requesting comments to be received for the revisions to rule language within one week. This is an unreasonably short timeframe to provide comments especially due to the fact that the Draft Staff Report explaining the changes and rationale has not yet been provided. We suggest that the commenting period be extended until September 10, 2010 in order for our facility to provide comments and suggestions to revise the proposed rule so that it achieves compliance with the federal rule in a cost effective and technologically feasible and reliable manner.

Response: The request for comments to be received from the working group within one week was set in order to allow time for staff to include and address

any comments and suggestions that could be included in the set hearing package. The close of comments date established for the set hearing package does not preclude stakeholders and the public from providing comments for the overall rule development. Comments received will be addressed up until the public hearing date for this rule proposal. Additionally, the public will be given the opportunity to make comments at the public hearing. The set hearing package for this rule will be released on August 31, 2010 and will include the draft staff report.

100.Comment: ~~Two~~Several letters were received from employees of a company near one of the PR 1420.1 facilities expressing concerns about lead exposure and lack of notification of violations. The letters expressed support of the proposed rule lowering the ambient air lead concentration standard to 0.15 µg/m3.

Response: Staff thanks the commenters and appreciates their support. Staff would like to note that PR 1420.1 includes requirements for public notifications of shutdowns, turnarounds, and maintenance activities

101.Comment: Communities are concerned that lead monitoring once every three days allows facilities to tailor their production around the monitoring schedule. The rule needs to be rewritten to ensure that the facilities do not stop or reduce their production during sampling days and/or increase production when samples are not taken.

Response: A provision was added to the proposed rule to address the need for additional monitoring if the facility exceeds the new lead standard of 0.15 $\mu g/m^3$. Paragraph (j)(9) requires sampling to be conducted on a daily basis for sixty consecutive days if the facility exceeds the ambient air lead concentration standard of 0.15 $\mu g/m^3$ averaged over any 30 consecutive days. Normally, PR 1420.1 requires sampling one day in every three days. Historic sampling results indicate that spikes or excursions are typically not related to process emissions, but rather, to fugitive emissions from housekeeping or maintenance activities. Based on recent sampling at affected facilities, the AQMD staff believes that sample collections once every three days provides a good representation of lead emissions.

102.Comment: The original draft of the rule stated that enclosure may be required of "Any other area used in the lead-acid battery recycling operation to process or store lead-containing materials deemed necessary by the Executive Officer." We request this provision be reinstated as a valuable tool that can be utilized to further reduce lead emissions.

Response: Based on discussions at the PR 1420.1 Working Group meetings, additional enclosures are now required to be considered in the compliance plan requirements in subparagraph (g)(2)(A) as one of the additional lead

emissions reduction measures which can be implemented by the facility in the event of an exceedance of the 0.15 µg/m^3 ambient lead standard averaged over any 30 days. This provision was moved to the compliance plan because enclosures are already required in paragraph (e)(1) for areas of likely lead emissions such as: battery breaking areas; material storage and handling areas excluding areas where unbroken lead-acid batteries and finished lead products are stored; dryer and dryer areas including transition pieces; smelting furnaces and smelting furnace areas charging any lead containing material; agglomerating furnaces and agglomerating furnace areas charging any lead-containing materials; and refining and casting areas. Staff believes these enclosures should be sufficient.

103.Comment: The original draft of the rule stated that "Sweeping activities shall not be performed within 10 meters of any ambient air monitor location specified in subdivision (g) that is undergoing sample collection." We would like the wording to be restored along with additional language that specifies no fogging, misting, spraying of water or other liquids shall occur within 20 meters of any ambient air monitoring during sample collection. We understand that this has been a problem in the past.

Response: This provision has been changed from the original draft in response to similar comments made at the Working Group meetings. It has been moved to paragraph (j)(8) and now reads "Cleaning activities including, but not limited to, wet washing and misting, that result in damage or biases to samples collected shall not be conducted within 10 meters of any sampling site required under this subdivision."

104.Comment: In light of the many times hazardous waste levels of lead have been detected in the soils surrounding Quemetco, we would like the rule to require that the monitoring be conducted in such a way as to detect lead that is kicked up by wind or train or truck traffic. Quemetco released 7121 pounds of lead from their stacks and fugitive dust emissions between 1995 and 1999. Testing done by Quemetco and DTSC in 2004 revealed gross lead contamination surrounding the facility and that the contamination is more widespread and greater than originally expected. How does the AQMD plan on monitoring the air levels at the precise times when trucks and trains are kicking up dust that contains high lead levels.

Response: The AQMD maintains a U.S.-EPA approved network of source and non-source oriented monitors. Source-oriented monitors are located near lead-emitting facilities and non-source oriented monitors are located at 10 sites throughout the AQMD. Monitoring at the sites is required to be conducted as a 24 hour sample on a midnight to midnight basis. This means that all hours of the day are accounted for, including winds and traffic considerations. Quemetco's total lead emissions from point sources are currently less than 0.003 pounds per hour, considerably less than

several years ago. This reduction is due to additional controls Quemetco added to reduce air toxic emissions required by the AB 2588 Toxics "Hot Spots" program. Current air monitoring data from Quemetco's monitors shows that they are close to the new NAAQS and, with completion of their total enclosure for the battery breaking area and adherence to all PR 1420.1 requirements, the facility is expected to be in compliance with the new standard.

105.Comment: The rule requires facilities to pave over or encapsulate contaminated soil in areas other than locations less than 100 square feet used for planters. By not coordinating with the Department of Toxic Substances Control (DTSC), U.S.-EPA, and the Los Angeles Regional Water Quality Board to mandate clean up of the contamination that potentially threatens ground water; this requirement effectively facilitates a cover up and inhibits the implementation of responsible corrective action.

Response: This provision states that the facility shall "Pave, concrete, asphalt, or otherwise encapsulate all facility grounds as approved by the Executive Officer." The intent of the encapsulation requirement of PR 1420.1 is to prevent fugitive dust from being kicked up, facilitate cleaning of the areas, and minimize track out from the facility. Essentially all areas at both facilities are already in compliance with this requirement. The AQMD staff currently works closely with other regulatory agencies and agrees that the AQMD should cooperate and coordinate with DTSC, U.S.-EPA, and water boards. A DTSC representative participated as a member of the PR 1420.1 Working Group and worked closely with staff throughout the process of developing PR 1420.1 to ensure that requirements would not overlap or conflict with any of their requirements and ongoing efforts to address soil contamination. DTSC also sent a letter of support for the housekeeping requirements for surface impoundment ponds (see comment 76).

106.Comment: The manner in which the current rule is written with the compliance plan and timetable offers no immediate remedy to the community. We request that a provision be added that would require facilities to reduce their throughput and decrease the quantity of material processed when they exceed the 0.15 $\mu g/m^3$ limit. This would bring them into compliance in a timely manner while they implemented their Compliance Plan and is a similar provision to one included in Quemetco's previous Title V permit.

Response: If a facility exceeds the 0.15 $\mu g/m^3$ standard, the facility must begin implementing their compliance plan. The compliance plan includes measures for process changes including reduced throughput limits and conditional curtailments under clauses (g)(2)(A)(v) and (vi).

107.Comment: A proposal to change the facility total point source mass emission rate from 0.045 pounds per hour to 0.003 pounds per hour would constitute a major change to PR 1420.1. Any action by the Governing Board on this proposal at the October 1, 2010 meeting would violate the procedural rulemaking requirements of the California Health & Safety Code by not allowing time for performing additional environmental and socio-economic impact assessment. At a minimum, Health & Safety Code Section 40726 would require additional opportunity for public comment, and revisions to the District staff report and supporting assessments addressing such a major change.

and

The Staff Report, Environmental Assessment and Socioeconomic Impact Assessment do not contain the evaluations necessary to support the 0.003 lbs/hr emission rate. No workshops were held and no opportunity for public comment was allowed on this issue.

Response: Staff's proposal is a total facility lead mass emission rate limit for all lead point sources of 0.045 lb/hr and not the 0.003 lb/hr lead emission rate. If directed by the Board at the November 5, 2010 hearing to consider 0.003 lbs/hr as the emission rate for the proposed rule, AQMD staff will conduct the appropriate analyses and return to the Board at a later date.

108.Comment: Exide is unsure if the WESP control technology installed at the Quemetco facility is technically feasible and compatible with Exide's process. The Exide facility uses a fundamentally different furnace technology than Quemetco to process reverberatory furnace slag, and Exide has no basis to assume this difference is amenable to the WESP control technology. Neither Exide nor the SCAQMD has had sufficient time to review the technical feasibility and economic aspects of meeting a facility emission rate limit of 0.003 lb/hr from all point sources. Whether emissions from our facility would be below this limit with implementation of the WESP is unknown.

Response: Staff understands that the WESP control technology installed at Exide may result in different emission rates than those achieved at Quemetco. AQMD staff agrees that additional time is needed to further evaluate the technical feasibility, potential environmental impacts and economic impacts of such a proposal. Staff's proposal is to retain the total facility lead emission rate of 0.045 lb/hr.

109.Comment: It has been reported that Quemetco spent $18 million on installation of its emission control system, inclusive of the WESP. Exide's best cost estimate to achieve 0.003 lb/hr would be on the same order on the basis of no site or process-specific analysis. A cost of this magnitude will threaten

the economic viability of the Exide facility. Exide would have to consider the alternative of expanding operations at its other recycling facilities outside of California. Such would result in previously unconsidered significant adverse socioeconomic and environmental consequences including loss of jobs, loss of Basin lead-acid battery recycling capacity, and related air emission increases.

Response: Proposed Rule 1420.1 requires as a core requirement that affected facilities achieve a total stack emission rate of 0.045 lbs/hr. AQMD staff agrees that additional time is needed further evaluate the technical feasibility, potential environmental impacts and economic impacts of lowering the stack emission rate to 0.003 pounds per hour. Staff's proposal is to retain the total facility lead emission rate of 0.045 lbs/hr.

110.Comment: Exide has previously stated that an emission rate is not the proper control methodology for this rule and is not needed to ensure compliance with the ambient standard. If a facility mass emission rate limit is to be considered at all, Exide proposes that the rule require the emission rates if compliance with 0.15 $\mu g/m^3$ limit cannot be achieved by January 1, 2012. Both the total facility and individual point source emission rate limits would go into effect as components of the Contingency Compliance Plan.

Response: Based on air dispersion modeling using the most recent source tests results and stack parameters, the stack emissions of one affected facility would exceed the 0.15 ambient lead standard. As a result, Proposed Rule 1420.1 establishes a point source emission rate of 0.045 lbs/hour as a core requirement which modeling shows that at the point of maximum impact the ambient concentration about 30 percent below the 0.15 ambient lead standard in Proposed Rule 1420.1. The 30 percent "buffer" is necessary so the facility has an emissions budget for the fugitive emissions. Staff believes that if the emission standards are not required as a core requirement, at least one of the facilities would most likely exceed the standard and requirements for implementation of controls would be delayed if required under the Contingency Compliance Plan. Thus, staff's proposal of the emission rate limits as a core requirement stands.

111.Comment: Health and Safety Code Section 40001(d)(1) through (3) sets forth the appropriate balance between NAAQS compliance and allowing a facility to design the method by which it will comply. As stated in the statue: "A district shall allow the implementation of alternative methods of emission reduction, emission monitoring, or recordkeeping if a facility demonstrates to the satisfaction of the district that those alternative methods will provide equivalent performance." If the District specifies an "emission limit, " the District shall allow the facility to include operational and effectiveness measurement elements "that can be included as permit conditions by the District to ensure compliance with, and enforcement of,

the equivalent performance requirements…" The District's mandated facility mass emissions rate limit here functions both as an emission limit and control method. Though Exide opposes any mass emissions rate limit, at the very least PR 1420.1 must provide for, and allow, Exide an alternative compliance method in accordance with Health and Safety Code Section 40001(d). Though Exide opposes the inclusion of any facility stack mass emissions rate limit as a core rule requirement, at a minimum, Exide requests that language be added in subsection (f)(3) to allow for *"an alternative method that is equally or more effective to satisfy the ambient air concentration requirement."*

Response: PR 1420.1 does not specify the method or control approach that a facility must use to meet either the total facility lead emission rate of 0.045 lb/hr or individual point source lead emission rate of 0.010 lb/hr. Furthermore, Health and Safety Code Section 40001(d)(3) states that "if a district rule specifies an emission limit for a facility or system, the district shall not set operational or effectiveness requirements for any specific control equipment operating on a facility or system under that limit." PR 1420.1 simply requires achieving an emission rate limit and does not set any operational or effectiveness requirements for any specific emission control equipment operating on a facility or system under the proposed emission rate limit.

112.Comment: Proposed Rule 1420.1 attempts to impose an ATCM emissions limit on stack emissions to achieve the NAAQS lead standard. The District cites Health and Safety Code Section 39666 as legal authority for PR 1420.1. If the District relies on Section 39666, then it must satisfy its requirements to allow sources to submit to the District an alternative method or methods that will achieve an equal or greater amount of reduction in emission of that air toxic contaminant and its associated risk. The District shall approve the alternative method if it is demonstrated.

Response: The commenter's reference to the Health & Safety Code Section 39666(f) states, "Where an airborne toxic control measure requires the use of a specified method or methods to reduce, avoid, or eliminate the emissions of a toxic air contaminant, a source may submit to the district an alternative method or methods that will achieve an equal or greater amount of reduction in emissions of, and risk associated with, that toxic air contaminant…" PR 1420.1 does not implement an ATCM. As a result, the reference to Health and Safety Code Section 39666(d) is removed.

113.Comment: The District has stated in a staff response that PR 1420.1 is a BARCT rule for lead. BARCT is defined as "an emissions limitation that is based on the maximum degree of reduction achievable, taking into account environmental, energy, and economic impacts by each class or category of

source." Exide contends that the District's rulemaking record is presently inadequate to even allow for Governing Board consideration as to whether the 0.045 lb/hr facility mass emissions rate limit is BARCT under Health and Safety Code Section 40920.6. The District must provide a BARCT analysis considering facility-specific economic and environmental impacts.

Response: The staff response has been revised in Response to Comment #45 reflecting that PR 1420.1 is not a BACT rule. The response no longer states that PR 1420.1 is a BARCT rule.

114.Comment: The District's socioeconomic analysis is insufficient because it does not properly and adequately consider the availability and cost-effectiveness of alternatives to the mass emissions rate limit as required by Health and Safety Code 40440.8, 40703, and 40922. The District avoids a relative cost-effectiveness analysis and does not cite to section 40922, presumably because the District takes the position that section 40922 only applies to rules meant to control ozone, CO, NOx and SOx. While the District generally considered certain compliance costs to reach its $0.41/$0.32 million per year estimate, it did not adequately consider the economic impact to Exide, particularly as to the newly-proposed alternative of a 0.003 lbs/hr facility mass emissions rate limit, and the District did not properly consider cost-effective alternatives that would still result in NAAQS compliance.

Response: Regarding requirements for availability and cost-effectiveness analyses required by the Health and Safety Code Sections referenced by the commenter, the District continues to take the position that section 40922 does not pertain to lead. Although Health and Safety Code Sections 40440.8 and 40703 require these analyses, both require the analyses pursuant to section 40922 which again only pertains to ozone, CO, SOx, and NOx. It should also be noted that staff's proposal remains at the 0.045 lb/hr and 0.010 lb/hr lead emission rate for total facility and individual point sources, respectively. See response to Comment #108.

115.Comment: The District rejected Exide's proposal to increase stack heights, stating that "the Clean Air Act prohibits using stack heights in lieu of emissions control" (Staff Response to Comment #8). The District is incorrect. Under the federal CAA, a facility can take full credit for improved dispersion provided by any stack height up to 65 meters without any justification required as dictated by good engineering practices. Good engineering practice means "the height necessary to ensure that emissions from the stack do not result in excessive downwash." "In no event may the Administrator prohibit any increase in any stack height or restrict in any manner the stack height of any source." Exide is significantly impacted by downwash at its stacks, which are barely taller than the

facility buildings. Increasing the stack height is a legally viable alternative to satisfy the NAAQS.

Response: Increasing the stack height or buoyancy would just be a dilution of fence line monitor concentrations, and that the same amount of lead emissions are being dispersed in the atmosphere. Lead is a persistent contaminant and would continue to accumulate on the ground in areas of dispersion. Simply changing the air dispersion of emissions without overtly reducing emissions is not in the best interest for air quality and public health.

116.Comment: The proposed 0.003 lbs/hr facility mass emissions rate limit alternative threatens the economic viability of Exide to remain operating in Southern California, resulting in significant adverse economic and environmental impacts not previously considered that require subsequent of supplemental socioeconomic and environmental impact assessments. Exide's closure as a result of "substantial changes" to the rule will result in significant adverse economic impacts and direct and indirect significant adverse environmental impacts necessitating the District to prepare subsequent or supplemental socioeconomic environmental impact assessments (14 CCR § 15162).

Response: Staff's proposal is a total facility mass emission rate limit of 0.045 lb/hr and not the 0.003 lb/hr rate. See response to Comment #108.

117.Comment: The statement in response to comment #45 that the 0.003 lbs/hr standard is "likely to be the basis of BACT and T-BACT" is unsupported. Staff should state that this response cannot be considered or acted upon in this rulemaking.

Response: Staff does not define BACT or T-BACT in this rulemaking. There is a specific process for determining if a given technology or emission limit is BACT and only new, modified, or relocated equipment or processes are subject to BACT and T-BACT. PR 1420.1 addresses existing sources of lead emissions. As such, BACT and T-BACT are not addressed under this rulemaking. See response to comment #37 regarding the intent of this rulemaking.

EXECUTIVE SUMMARY

A socioeconomic analysis was conducted to assess the impacts of Proposed Rule 1420.1– *Emissions Standard for Lead from Large Lead-Acid Battery Recycling Facilities*. A summary of the analysis and findings is presented below.

Elements of Proposed Rule	Proposed Rule (PR) 1420.1–*Emissions Standard for Lead from Large Lead-Acid Battery Recycling Facilities*–reduces exposure to and emissions of lead from large lead-acid battery recycling facilities. This rule would apply to any owner or operator of a lead-acid battery recycling facility that processes more than 50,000 tons of lead a year. An affected facility is required to control emissions such that ambient concentrations of lead do not exceed a 30-day average of 0.15 µg/m³. The proposed rule will require that point and fugitive lead emissions are controlled.
Affected Facilities and Industries	Proposed Rule 1420.1 affects two facilities that process greater than 50,000 tons of lead annually. These two facilities belong to the industry of secondary lead smelting, refining, and alloying of nonferrous metal.
Assumptions of Analysis	Currently, Exide Technologies has entered into a settlement agreement with the South Coast Air Quality Management District (AQMD) that includes many of the requirements in the proposed rule. Because these similar requirements are already independently required, they are excluded from the cost analysis. Quemetco is meeting many of the PR 1420.1 requirements through compliance with Rule 1420 and AB2588. In addition, both facilities are subject to the National Emissions Standards for Hazardous Air Pollutants (NESHAPS) from Secondary Lead Smelting, which has some overlapping testing requirements in Proposed Rule 1420.1. The analysis focuses solely on the cost impact of the additional rule requirements for the two facilities. Information on costs were obtained from the two affected facilities, equipment vendors, and published sources.
Costs of Proposed Rule	The expected additional cost from the proposed rule is $0.32 million annually. The total cost is slightly higher in 2011 ($0.41 million) because of the public notification requirement (setup of one-time signs), hazardous waste disposal from construction of a secondary lead control device, potential compliance plan development, and the AQMD compliance plan review.

Employment and other Socioeconomic Impacts	PR 1420.1 is expected to result in an annual average of 11 jobs forgone in the four-county area from 2011 to 2025. This represents less than 0.0002 percent of the total employment in the four-county region and is within the noise of the model. The sector of primary metal manufacturing, where the two affected facilities belong, would have no jobs forgone, on average, between 2011 and 2025. The average annual jobs forgone in each of the other sectors are no more than one job between 2011 and 2025. Proposed Rule 1420.1 will have few impacts on the relative cost of production and delivered prices.

INTRODUCTION

Proposed Rule (PR) 1420.1–*Emissions Standard for Lead from Large Lead-Acid Battery Recycling Facilities*–reduces exposure to and emissions of lead from large lead-acid battery recycling facilities to protect public health and help attain the national ambient air quality standard for lead. This rule would apply to any owner or operator of a lead-acid battery recycling facility that processes more than 50,000 tons of lead a year. PR 1420.1 requires that affected lead acid battery recycling (secondary lead smelting) facilities install and maintain emissions control equipment, conduct ambient air monitoring, and perform regular housekeeping activities to control fugitive lead dust. An affected facility is required to control emissions such that ambient concentrations of lead do not exceed a 30-day average of 0.15 $\mu g/m^3$ at or beyond the property line of the facility.

LEGISLATIVE MANDATES

The socioeconomic assessments at the AQMD have evolved over time to reflect the benefits and costs of regulations. The legal mandates directly related to the assessment of the proposed amendments include the AQMD Governing Board resolutions and various sections of the California Health & Safety Code (H&SC).

AQMD Governing Board Resolutions

On March 17, 1989 the AQMD Governing Board adopted a resolution that calls for preparing an economic analysis of each proposed rule for the following elements:

- Affected Industries
- Range of Control Costs
- Cost Effectiveness
- Public Health Benefits

On October 14, 1994, the Board passed a resolution which directed staff to address whether the rules or amendments brought to the Board for adoption are in the order of cost effectiveness as defined in the AQMP. The intent was to bring forth those rules that are cost effective first.

Health & Safety Code Requirements

The state legislature adopted legislation that reinforces and expands the Governing Board resolutions for socioeconomic assessments. H&SC Sections 40440.8(a) and (b), which became effective on January 1, 1991, require that a socioeconomic analysis be prepared for any proposed rule or rule amendment that "will significantly affect air quality or emissions limitations." Specifically, the scope of the analysis should include:

- Type of Affected Industries
- Impact on Employment and the Economy of the District
- Range of Probable Costs, Including Those to Industries
- Emission Reduction Potential

- Necessity of Adopting, Amending or Repealing the Rule in Order to Attain State and Federal Ambient Air Quality Standards
- Availability and Cost Effectiveness of Alternatives to the Rule

For the emission reduction potential necessity of rule adoption and cost effectiveness of alternatives to the rule, please refer to the Staff Report for PR 1420.1, which is incorporated by reference. Additionally, the AQMD is required to actively consider the socioeconomic impacts of regulations and make a good faith effort to minimize adverse socioeconomic impacts. H&SC Section 40728.5, which became effective on January 1, 1992, requires the AQMD to:

- Examine the type of industries affected, including small businesses; and
- Consider Socioeconomic Impacts in Rule Adoption

H&SC Section 40920.6, which became effective on January 1, 1996, requires that incremental cost effectiveness be performed for a proposed rule or amendment relating to ozone, carbon monoxide (CO), oxides of sulfur (SOx), oxides of nitrogen (NOx), and their precursors. Incremental cost effectiveness is defined as the difference in costs divided by the difference in emission reductions between one level of control and the next more stringent control. PR 1420.1 regulates lead and is thus not subject to H&SC Section 40920.6.

AFFECTED INDUSTRIES

AQMD staff, using Annual Emissions Reporting program data for years 2004 through 2007, permitting data, and compliance data, identified two lead-acid battery recycling facilities that process more than 50,000 tons of lead-acid batteries per year. Exide Technologies is located in the City of Vernon. Quemetco is located in the City of Industry. These two facilities belong to the industry of secondary lead smelting, refining, and alloying of nonferrous metal [North American Industrial Classification System (NAICS) 331492] where spent lead-acid batteries, mostly automotive, and other lead-bearing materials are received from various sources and processed to recover lead, plastics, and acids. The process mainly involves the sorting, melting, and refining of lead-acid batteries, which ultimately produces lead ingots that are then sold to other entities.

Small Businesses

The AQMD defines a "small business" in Rule 102 as one which employs 10 or fewer persons and which earns less than $500,000 in gross annual receipts. In addition to the AQMD's definition of a small business, the federal Small Business Administration (SBA), the federal Clean Air Act Amendments (CAAA) of 1990, and the California Department of Health Services (DHS) also provide definitions of a small business.

The SBA's definition of a small business uses the criteria of gross annual receipts (ranging from $0.5 million to $25 million), number of employees (ranging from 100 to 1,500), megawatt hours generated (4 million), or assets ($150 million), depending on industry type. The SBA definitions of small businesses vary by 6-digit NAICS code. The size standard for a small business in the industry of secondary lead smelting, refining, and alloying of nonferrous metal, NAICS 331942, where the two affected facilities belong is 750 employees.

The CAAA classifies a facility as a "small business stationary source" if it: (1) employs 100 or fewer employees, (2) does not emit more than 10 tons per year of either VOC or NOx, and (3) is a small business as defined by SBA.

Exide Technologies has operations in 80 countries with fiscal year 2009 net sales of approximately $3.3 billion.[1] Quemetco, based in Indianapolis, Indiana, has operations in a few states. It has over 150 employees at the location in the City of Industry, CA. Neither facility is a small business based on the Rule 102 criteria. Corporate employment information is not available for either of the two facilities. Therefore, it is unknown whether they are small businesses under the U.S. SBA definition. Neither facility is a small business under the CAAA definition because both emit more than 10 tons of VOC or NOx annually.

COMPLIANCE COST IMPACT

The proposed rule would go into effect on various dates. Housekeeping requirements would go into effect 30 days after rule adoption. Total enclosure and lead control device requirements would go into effect on July 1, 2011, or 180 days after permits are approved by the AQMD, whichever is earlier. Until January 1, 2012, the owner or operator must meet the current lead ambient air quality standard of 1.5 µg/m³. On or after January 1, 2012, the owner or operator must meet the new lead ambient air quality standard of 0.15 µg/m³. The ambient air lead concentration requirement would go into effect on January 1, 2012. Therefore, it is expected that many of the equipment purchases, planning, and permitting activities will be completed in 2011. Beginning in 2012 and beyond, the major costs associated with this proposed rule will be operational expenses and equipment replacement.

Currently, Exide Technologies has entered into a settlement agreement with the AQMD that includes many of the requirements in the proposed rule. These similar requirements are excluded from the cost analysis. Quemetco is meeting many of the PR 1420.1 requirements through compliance with Rule 1420 and AB2588. ~~One alternative proposal that has been suggested is that the proposed rule require a total lead point source emission rate of 0.003 lbs/hr. In a letter from Quemetco, Inc. to the SCAQMD staff on September 22, 2010, the estimated cost to upgrade their facility to install state-of-the-art emission controls to reduce lead emissions from its facility to these low levels was approximately $18 million. Since Exide's throughput limits are comparable to Quemetco and the level of control to achieve 0.003 lbs/hr would be similar, the SCAQMD staff estimates the additional cost of control would be between $15 and $20 million.~~ Specifically, costs associated with the total enclosure of the areas used for processing and storage of lead-containing materials as well as ambient air quality monitoring are not included in the analysis. Total enclosures have been, or are currently being, constructed because of legal mandates prior to this rulemaking. The analysis focuses solely on the cost impact of the additional rule requirements for the two facilities.

The affected facilities are required to install digital differential pressure monitors to monitor the air pressure for the venting of the total enclosures. The purchase and installation cost for one facility is $2,000 per monitor and $30,000 for another. The cost differential was due to the lower

[1] Home Community. Exide Technologies. 2009-2010. http://www.exide.com/. Accessed 5/21/2010.

cost representing an upgrade of existing monitors to comply with the proposed rule and the higher cost representing the purchase and installation of necessary infrastructure to operate new monitors to comply with the proposed rule. A total of 11 monitors are assumed to be upgraded or purchased. It was assumed that five monitors will be upgraded at a cost of $2,000 per monitor, and six new monitors will be purchased and installed at a cost of $30,000 per monitor. The total annualized cost to the two facilities is $68,470 at the four percent interest rate and an assumed lifespan of three years, based on each individual facility's estimates of monitor prices.

The proposed rule would require the installation of a secondary lead control device, such as a HEPA filter, to reduce lead emissions from the exhaust of the primary lead control device used for a dryer. The cost of the device, including installation, is $200,000. The one-time cost for hazardous waste disposal resulting from construction of a HEPA filter will be $66,000. A filter to the device is to be replaced annually at a cost of $2,400. Information on the HEPA filter was obtained from an air pollution control vendor. The cost for the waste disposal was obtained from an affected facility. It is estimated that only one HEPA filter would be installed as a result of the proposed rule. The total annualized cost of the one-time expenditure at four percent interest rate and 10-year equipment life, and the annual filter replacement cost, is estimated to be $35,100.

The proposed rule requires more stringent housekeeping, recordkeeping, and maintenance practices to minimize fugitive lead dust emissions. This requirement will include the purchase of one mobile sweeper, at a cost of $100,000, according to a vendor. The mobile sweeper, with a 10 year lifespan at a four percent interest rate, is expected to have an annualized cost of $12,300. Staffing for sweeping, washing, annual inspections, secondary lead control HEPA filter maintenance, and recordkeeping is expected to cost approximately $130,000 annually for both facilities. The public notification requirement is estimated to add a one-time cost of $300 for creation of a sign at each facility. Costs on staffing were obtained from one of the affected facilities. For the other facility, information on prevailing wages for metal-refining furnace operators and tenders and office assistants were obtained from the California Employment Development Department, and was combined with industry estimated hours to determine the annual labor cost. The cost estimate for the sign was obtained from a vendor.

It is assumed that roof washing will be contracted out at a total cost of approximately $12,000 annually, based on data from an affected facility. Additional water usage for sweeping and roof washing is expected to cost $3,000 annually, given the current water rate and usage data. Water usage data was obtained from an affected facility and was combined with the water rate from a water utility company to provide estimated water usage costs.

Although it is not known if the facilities will trigger the requirement to submit a compliance plan, it was assumed in the analysis that both facilities would complete a compliance plan. For the two facilities combined, there is a one-time cost of $20,000 for the compliance plan development, and up to $85,000 in combined costs for the AQMD to review compliance plans. Facility compliance plan development costs were obtained from the two facilities and their consultants.

Currently under the NESHAPS, affected facilities are required to conduct source testing annually, or every other year if stack emissions are below 1 mg/DSCM of lead. One facility is currently below the NESHAPS threshold and therefore PR1420.1 will not require the facility to conduct additional source testing. The other facility's stack emissions from three of the nine

stacks are below the NESHAPS standard, so no additional source testing is required for these three stacks. Under PR 1420.1, six of the remaining stacks at that facility will be required to conduct source testing of emissions stacks annually at a cost of $45,000. Costs for source testing were obtained directly from the affected facility.

There is an additional cost for batteries used as backup power for air monitoring equipment that are expected to cost $4,000 per unit for four units. With a three year expected lifespan, at a four percent interest rate, the batteries are estimated to add $5,760 to the annualized cost. The cost and lifespan information was obtained from a vendor.

Based on the assumptions above, the annual total cost to comply with the proposed rule is estimated to be $0.32 million, on average, from 2011 to 2025. The total cost is slightly higher in 2011 ($0.41 million) because of the public notification requirement, hazardous waste disposal from construction of a secondary lead control device, compliance plan development, and the subsequent AQMD compliance plan review.

TOTAL IMPACTS

The REMI model (PI+ v1.1.6) is used to assess the total socioeconomic impacts of a policy change (i.e., the proposed rule). The model links the economic activities in the counties of Los Angeles, Orange, Riverside, and San Bernardino. The REMI model for each county is comprised of a five block structure that includes (1) output and demand, (2) labor and capital, (3) population and labor force, (4) wages, prices and costs, and (5) market shares. These five blocks are interrelated. Within each county, producers are made up of 66 private non-farm industries, three government sectors, and a farm sector. Trade flows are captured between sectors as well as across the four counties and the rest of U.S. Market shares of industries are dependent upon their product prices, access to production inputs, and local infrastructure. The demographic/migration component has 160 ages/gender/race/ethnicity cohorts and captures population changes in births, deaths, and migration.

The assessment herein is performed relative to a baseline where PR 1420.1 would not be implemented. Direct effects of the policy change (proposed rule) have to be estimated and used as inputs to the REMI model in order for the model to assess secondary and induced impacts for all the actors in the four-county economy on an annual basis and across a user-defined horizon (2011 to 2025). Direct effects of the proposed rule include additional costs to the affected entities and additional sales, by local vendors, of equipment, devices, or services that would meet the proposed requirements.

The utility sector (NAICS 22) will benefit from the sales of additional water. Purchases of digital differential pressure monitors, a secondary lead control device, and the mobile sweeper will increase the sales of the wholesale trade sector (NAICS 423). Purchases of batteries will increase sales in the electrical equipment, appliance, and component manufacturing sector (NAICS 335). The administrative support and waste management and remediation services sector (NAICS 56) will benefit from the utilization of roof cleaning contractors and hazardous waste disposal. The public notification requirement (setup of one-time signs) will increase demand for the product of the printing and related support sector (NAICS 323). The additional demand for services of compliance plan development and source testing will result in an increase

in sales of the professional and technical services sector (NAICS 541). Additional AQMD staff time will be needed to review compliance plans, but the proposed rule is expected to reduce compliance issues with the affected facilities. The additional staffing for the housekeeping requirements will slightly lower labor productivity in the sector of primary metal manufacturing (NAICS 331) where the two facilities belong. All the expenditures that are incurred by the two facilities will increase their cost of doing business.

PR 1420.1 is expected to result in an annual average of 11 jobs forgone in the four-county area from 2011 to 2025. This represents less than 0.0002 percent of the total employment in the four-county region and is within the noise of the model. The sector of primary metal manufacturing, where the two affected facilities belong, would have no jobs forgone, on average, between 2011 and 2025. The average annual jobs forgone in each of the other sectors are no more than one job between 2011 and 2025.

Proposed Rule 1420.1 will have few impacts on the relative cost of production and delivered prices.

RULE ADOPTION RELATIVE TO THE COST EFFECTIVENESS SCHEDULE

On October 14, 1994, the Governing Board adopted a resolution that requires staff to address whether rules being proposed for adoption are considered in the order of cost-effectiveness. The 2007 Air Quality Management Plan (AQMP) ranked, in the order of cost-effectiveness, all of the control measures for which costs were quantified. It is generally recommended that the most cost-effective actions be taken first. PR 1420.1 is not a control measure in the 2007 Air Quality Management Plan (AQMP) and thus, was not ranked by cost-effectiveness relative to other AQMP control measures in the 2007 AQMP.

PREFACE

This document constitutes the Final Environmental Assessment (EA) for Proposed Rule (PR) 1420.1 – Emissions Standard for Lead from Large Lead-Acid Battery Recycling Facilities. The Draft EA was released for a 30-day public review and comment period from April 27, 2010 to May 26, 2010. No comment letters were received on the Draft EA during the public comment period. Two comment letters were received after the public comment period and are included with response to comments in Appendix C.

Changes to PR 1420.1

Subsequent to the release of the Draft EA for public review, PR 1420.1 several requirements were added, deleted or modified. The following briefly summarizes proposed modifications to PR 1420.1. A more detailed description of the proposed modifications to PR 1420.1 can be found in Chapter 1 of this Final EA.

- Addition of total facility lead point source emission rate limitation and maximum individual lead point source emission rate (pound per hour)
- Removal of 99 percent control efficiency compliance option for lead control devices
- Addition of a requirement to use of specific filters/bags in lead control devices
- Addition of a requirement to add secondary lead controls on dryers
- Removal of vehicle wet wash area requirement
- Change in schedule of roof cleaning requirement with the new compliance option of vacuuming surfaces or wet washing
- Public notifications for:
    - Unplanned and planned shutdowns/turnarounds of specific equipment
    - Specific types of maintenance activity

The proposed modifications were analyzed and SCAQMD staff concluded that recirculation was not necessary per CEQA Guidelines §15073.5, because the modifications were determined not to be a substantial revision (i.e., a new, avoidable significant effect that requires mitigation measures or project revisions to reduce the effect to insignificance or that project effects cannot be reduced to insignificant and new measures or project revisions are required). Recirculation is not required, because mitigation is not required; the modifications were not a response to written or verbal comments on the proposed effects identified in the Draft EA; modifications were not required by CEQA, and do not create new significant environmental effects, and it is not necessary to mitigate an avoidable significant effect; and new information added to the proposed project makes insignificant modifications to the Draft EA.

To facilitate identification, modifications to the document are included as <u>underlined text</u> and text removed from the document is indicated by ~~strikethrough~~. This document constitutes the Final EA for PR 1420.1 – Emissions Standard for Lead from Large Lead-Acid Battery Recycling Facilities.

INTRODUCTION

The South Coast Air Quality Management District (AQMD) is responsible for developing and enforcing air pollution control rules and regulations in the South Coast Air Basin (Basin). By state law, the SCAQMD is required to adopt an Air Quality Management Plan (AQMP) demonstrating compliance with all federal regulations and standards such as National Ambient Air Quality Standards (NAAQS) for the Basin [H&S Code Section 40460 (a)]. On October 15, 2008, the U.S. Environmental Protection Agency (EPA) amended both the primary and secondary NAAQS for lead from a level of 1.5 micrograms per cubic meter to 0.15 micrograms per cubic meter averaged over a rolling three-month period, along with changes to monitoring and reporting requirements.

The purpose of Proposed Rule 1420.1 (PR 1420.1) is to propose a new rule for large lead-acid battery recycling facilities which are the highest stationary source emitters of lead in the Basin. In addition, PR 1420.1 is designed to address the amended NAAQS for lead to ensure the Basin can achieve the revised standard. Other lead-emitting sources will be addressed in a future amendment to District Rule 1420 – Emission Standards for Lead.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

PR 1420.1 is a discretionary action, which has the potential for resulting in direct or indirect change to the environment and, therefore, is considered a "project" as defined by the California Environmental Quality Act (CEQA). SCAQMD is the lead agency for the proposed project and has prepared this Final Environmental Assessment (EA) with no significant adverse impacts pursuant to its Certified Regulatory Program. California Public Resources Code §21080.5 allows public agencies with regulatory programs to prepare a plan or other written document in lieu of an environmental impact report or negative declaration once the Secretary of the Resources Agency has certified the regulatory program. SCAQMD's regulatory program was certified by the Secretary of the Resources Agency on March 1, 1989, and is codified as SCAQMD Rule 110. Pursuant to Rule 110, SCAQMD has prepared this Draft EA.

CEQA and Rule 110 require that potential adverse environmental impacts of proposed projects be evaluated and that feasible methods to reduce or avoid significant adverse environmental impacts of these projects be identified. To fulfill the purpose and intent of CEQA, the SCAQMD has prepared this Draft EA to address the potential adverse environmental impacts associated with the proposed project. The Draft EA is a public disclosure document intended to: (a) provide the lead agency, responsible agencies, decision makers and the general public with information on the environmental effects of the proposed project; and, (b) be used as a tool by decision makers to facilitate decision making on the proposed project.

SCAQMD's review of the proposed project shows that the proposed project would not have a significant adverse effect on the environment. The analysis in Chapter 2 supports the conclusion of no significant adverse environmental impacts. Therefore, pursuant to CEQA Guidelines §15252, no alternatives or mitigation measures are required to be included in this Draft EA. ~~Comments received on the Draft EA during the 30-day public review period will be addressed and included in the Final EA.~~ The Draft EA was released for a 30-day public review and comment period from April 27, 2010 to May 26, 2010. No comment letters were received on the Draft EA during the comment period. Two comment letters were received after the public comment period and are included with response to comments in Appendix C.

PROJECT LOCATION

PR 1420.1 would affect two large lead-acid battery recycling facilities located in the SCAQMD's jurisdiction. The SCAQMD has jurisdiction over an area of approximately 10,743 square miles, consisting of the four-county South Coast Air Basin (Basin) (Orange County and the non-desert portions of Los Angeles, Riverside and San Bernardino counties), and the Riverside County portions of the Salton Sea Air Basin (SSAB) and Mojave Desert Air Basin (MDAB). The Basin, which is a subarea of the SCAQMD's jurisdiction, is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto mountains to the north and east. It includes all of Orange County and the nondesert portions of Los Angeles, Riverside, and San Bernardino counties. The Riverside County portion of the SSAB is bounded by the San Jacinto Mountains in the west and spans eastward up to the Palo Verde Valley. The federal nonattainment area (known as the Coachella Valley Planning Area) is a subregion of the Riverside County and the SSAB that is bounded by the San Jacinto Mountains to the west and the eastern boundary of the Coachella Valley to the east (Figure 1-1).

Figure 1-1
Boundaries of the South Coast Air Quality Management District

PROJECT OBJECTIVE

PR 1420.1 would protect public health by reducing lead emissions produced by large lead-acid battery recycling facilities. Requirements under PR 1420.1 are designed to ensure the Basin can achieve the 2008 NAAQS for lead. PR 1420.1 would accomplish this by requiring total enclosures for any process associated with the preparation, recovery, refining and storage of lead-containing material and requiring pollution control devices on the enclosures and lead emission point sources. PR 1420.1 also includes housekeeping requirements, monitoring, reporting and recordkeeping.

PROJECT BACKGROUND

PR 1420.1 addresses exposure to lead emissions from lead-acid battery recycling facilities. The purpose of the proposed rule is to protect public health and ensure attainment with the amended lead NAAQS. As required by the federal Clean Air Act, the U.S. EPA periodically reviews the standard to determine if changes are warranted. Based on review of health studies, the U.S. EPA has determined that the standard of 1.5 micrograms per cubic meter set in 1978 was not sufficient to protect public health and welfare with an adequate margin of safety. The standard has been lowered to 0.15 micrograms per cubic meter based on studies that demonstrate health effects at much lower levels of lead than previously believed. Selection of the new standard provides increased protection for children and other at-risk populations against an array of health effects, most notably including neurological effects in children, including neurocognitive and neurobehavioral effects.

Large lead-acid battery recycling facilities have been determined by SCAQMD staff to be the highest stationary source emitters of lead in the Basin. Staff's analysis has also shown lead-acid battery recycling facilities to be the only known source category that currently demonstrates ambient air lead concentration measurements that would cause non-attainment with the new lead NAAQS. PR 1420.1 is in addition to Rule 1420 – Emission Standards for Lead which addresses lead emissions from any stationary source that uses or processes lead-containing material. Although Rule 1420 also applies to lead-acid battery recycling facilities, it does not contain specific control measures for this source category to minimize lead emission exposure such that ambient air lead concentrations will comply with the new lead NAAQS. Other lead-emitting sources in the Basin will be further analyzed and addressed in a future amendment to Rule 1420.

Health Effects of Lead

Human exposure to lead occurs in a variety of ways with common routes being that of inhalation and ingestion. Ingestion of lead-containing paint chips and soil with deposited atmospheric lead is a source of concern for exposure for children. The most widely used indicator of lead exposure in many studies is the amount of lead measured in whole blood because of the direct relationship with blood lead (PbB) levels and health effects. Clinical effects resulting from high-level lead exposure include nervous and reproductive system disorders, neurological and physical developmental effects, cognitive and behavioral changes, and hypertension. Young children are especially susceptible to the effects of environmental lead because they appear to be more vulnerable to certain biological effects of lead including learning disabilities, deficits in IQ, and behavioral problems.[1] Health & Safety Code Section 39669.5, "Special Provisions for Infants and Children," required the California Air Resources Board (CARB) to identify up to five TACs that may cause infants and children to be especially susceptible to illness. The "Prioritization of Toxic Air Contaminants under the Children's Environmental Health Protection Act" document released in 2001 by the Office of Environmental Health Hazard Assessment (OEHHA) lists lead as one of the original five toxic air contaminants.

Lead is classified as a probable human carcinogen by both the International Agency for Research on Cancer and the U.S. EPA. OEHHA classified lead as a carcinogenic toxic air contaminant (TAC) and it was added to the SCAQMD Rule 1401 list of TACs in 1992. SCAQMD's "Risk Assessment Procedures for Rules 1401 and 212" Tier 1 screening value for lead indicates that a lifetime exposure (70 years for residential receptors, 40 years for worker receptors) to 0.628

[1] Environmental Protection Agency, "Lead in Air," (*http://www.epa.gov/air/lead/health.html*), June 12, 2009.

pounds of lead a year at 25 meters could potentially cause one additional case of cancer out of a million cases.

Under the federal Clean Air Act, lead is classified as a "criteria pollutant." Lead has observed health effects at ambient concentrations. The EPA has thoroughly reviewed the lead exposure and health effects research, and has prepared substantial documentation in the form of a Criteria Document to support the selection of the 2008 NAAQS for lead. The Criteria Document used for the development of the 2008 NAAQS for lead states that studies and evidence strongly substantiate that PbB concentrations in the range of 5-10 micrograms per deciliter of blood, or possibly lower, could likely result in neurocognitive effects in children. The report further states that "there is no level of lead exposure that can yet be identified with confidence, as clearly not being associated with some risk of deleterious health effects."[2]

Based on studies conducted by the Clean Air Scientific Advisory Committee (CASAC), it was concluded that a "population loss of one to two intelligence quotient (IQ) points" resulting from exposure to ambient air lead concentrations "is highly significant from a public health perspective." EPA has determined that a primary and secondary standard of 0.15 microgram per cubic meter is requisite to provide an adequate margin of safety that would ensure the protection of public health and the environment regarding the aforementioned population IQ loss.[3]

Regulatory History

Lead-acid battery recyclers have been subject to regulation for more than two decades. Below is a chronology of regulatory activity:

- In November 1970, CARB set the state ambient air quality standard for lead at 1.5 microgram per cubic meter averaged over 30 days.
- In October 1978, the U.S. EPA adopted the NAAQS for lead requiring attainment with a lead ambient concentration of 1.5 microgram per cubic meter averaged over a calendar quarter.
- In September 1992, the SCAQMD adopted Rule 1420 – Emissions Standard for Lead. The rule incorporated the state ambient air quality standard and required control devices on lead emission points, control efficiency requirements for lead control devices, housekeeping, and monitoring or modeling of ambient air quality.
- In October 1992, OEHHA classified lead as a carcinogenic toxic air contaminant and assigned to it a cancer potency factor and a cancer unit risk factor.
- In June 1997, the EPA adopted the National Emissions Standards for Hazardous Air Pollutants (NESHAPS) from Secondary Lead Smelting. The federal regulation required lead emission concentration limits for lead control devices, control of process fugitive emissions, monitoring, recordkeeping, and reporting.
- On October 15, 2008, the EPA signed into regulation an amended NAAQS for lead of 0.15 microgram per cubic meter[3].

The new lead NAAQS requires full attainment by each state no later than five years after final designations for attainment status are made. Demonstration of attainment is to be based on measurements using a rolling 3-month averaging form to be evaluated over a three-year period. Measurements are to be determined by EPA-required monitoring networks within each state

[2] Environmental Protection Agency, Office of Research and Development, "Air Quality Criteria Document for Lead, Volumes I-II," October 2006.

[3] Environmental Protection Agency, "National Ambient Air Quality Standards for Lead; Final Rule," 40 CFR Parts 50, 51, 53, and 58, November 2008.

which consist of both source-oriented and non-source-oriented monitors. The SCAQMD has already established the required monitoring network for both source and non-source-oriented lead monitors.

Affected Industries

The SCAQMD staff analyzed multiple data sources, including SCAQMD's Annual Emissions Reporting program for years ~~2004~~ 2005 through 2007, permitting data, and compliance data to initially identify the universe of lead-emitting sources. Approximately 600 lead sources were identified and analyzed. Almost all facilities located within the Basin emit less than 0.15 ton of lead per year, an amount far below the 1.0 ton per year threshold warranting source-oriented monitoring at these facilities. Lead-acid battery recycling facilities have the highest lead emissions of all permitted stationary sources. The two lead acid-battery recycling facilities are Exide, Inc. in Vernon and Quemetco in the City of Industry. Exide has an average of more than 1.5 tons of lead emissions per year, with its highest annual emissions at 1.99 tons. Quemetco has the second highest average lead emissions of 0.28 ton per year with a high of 0.32 ton per year. This data was cross referenced with ambient air lead concentration data obtained from the SCAQMD's ambient air monitoring network. Analysis indicated that lead-acid battery recycling facilities are the only industry category that demonstrated consistent readings exceeding the new lead NAAQS.

The lead attainment assessment conducted by the state of California led to the same determination, and in October 2009, CARB submitted recommendations to the EPA of non-attainment status for the portions of Los Angeles County that are located within the Basin. Final designation of attainment status by the EPA may be made as early as 2010, which would require the Basin to be in attainment with the new NAAQS no later than five years later, or 2015. A State Implementation Plan (SIP), outlining the strategy to demonstrate attainment with the lead NAAQS, must also be submitted by the SCAQMD within 18 months of the final designation date.

Process Description and Lead Emission Points

Lead-acid battery recycling facilities are secondary lead smelting operations where spent lead-acid batteries, mostly automotive, and other lead-bearing materials are received from various sources and processed to recover lead, plastics, and acids. The process mainly involves the sorting, melting, and refining of lead from lead-acid batteries, which ultimately produces lead ingots that are then sold to other entities. Below is a general description of the process including potential lead emission points:

I. **Phase I – Raw Materials Processing**: Lead-bearing materials recovered from lead-acid batteries are prepared and processed prior to being charged (loaded) to a smelting furnace. Lead dust emissions may result during the crushing of lead-acid batteries and from the handling and transporting of lead-bearing materials.

   a. **Receiving and Storage:** Spent lead-acid batteries are usually received on pallets that are either stored or sent directly to conveyors for immediate crushing.

   b. **Battery Breaking/Crushing:** The spent lead-acid batteries are unloaded from conveyors and loaded into a hammer mill system where they are crushed whole. The crushed material is then placed into a series of tanks filled with water in order to clean materials of the acids. Through gravity separation, the crushed material sinks to the

bottom of the tanks and goes through a series of screens to further isolate lead-bearing materials. The materials are then typically stored in open or partially covered piles if not required for immediate charge preparation.

c. **Charge Preparation/Rotary Kiln Drying/Sweating**: Recovered lead-bearing materials are prepared by blending them with stored lead scrap and reagents prior to being charged to a furnace. The metallic scrap materials are placed in rotary kiln dryers to remove moisture prior to charging to a furnace in order to reduce furnace upsets (puffs and explosions). The materials are then sweated (subjected to temperatures above the melting temperature of lead, but below that of the other metals) to separate lead from other metals with higher melting points.

II. **Phase II – Smelting:** Smelting is the production of crude lead by melting and separating the lead from metallic and non-metallic contaminants and by reducing oxides to elemental lead. Smelting is carried out in blast, reverberatory, and furnaces. These furnaces emit high levels of lead fumes during the charging and tapping processes.

a. **Blast furnaces**: Typically, "hard" lead, or antimonial lead (containing approximately ten percent antimony) is produced in blast furnaces. Scrap metal, re-run slag, scrap iron, coke, recycled dross, flue dust, and limestone are used as charge materials to the furnace. Process heat is produced by the reaction of the charged coke with blast air that is blown into the furnace.

b. **Reverberatory furnaces**: Semi-soft lead (containing approximately three to four percent antimony) is produced in reverberatory furnaces. Lead scrap, metallic battery parts, oxides, dross, and other residues are used as charge materials to the furnace. The charge materials are heated directly using natural gas, oil, or coal.

III. **Phase III – Refining and Casting:** Refining and casting the crude lead from the smelting process can consist of softening, alloying, and oxidation, depending on the degree of purity or alloy type desired. Crude lead produced during smelting operations is remelted and refined by the addition of reagents, such as sulfur and caustic soda. The purified lead is then cast into molds or ingots. Refining furnaces and kettles are typically gas or oil-fired and maintained at operating temperatures between 600-1300º Fahrenheit. Lead fumes may be emitted when molten lead is transferred to refining kettles and lead particulates may become airborne off refining kettle surfaces due to updrafts created by thermal rise.

a. **Alloying furnaces:** Alloying furnaces are kettle furnaces used to simply melt and mix ingots of lead and alloy materials, such as antimony, tin, arsenic, copper, and nickel.

b. **Refining furnaces**: Refining furnaces are used to either remove copper and antimony for soft lead production, or to remove arsenic, copper, and nickel for hard lead production. Sulfur may be added to the molten lead to remove copper. The resultant copper sulfide is skimmed off as dross and may be processed in a blast furnace to recover residual lead. Aluminum chloride is used to remove copper, antimony, and nickel.

c. **Oxidizing furnaces:** Either kettle or reverberatory units are used to oxidize lead and to entrain the product lead oxides in the combustion air stream for subsequent recovery in high-efficiency baghouses.

PROJECT DESCRIPTION

The following is a summary of the proposed Rule 1420.1. A copy of PR 1420.1 can be found in Appendix A.

Purpose (Subdivision (a))

The purpose of the proposed rule is to protect public health by reducing exposure and emissions of lead from large lead-acid battery recycling facilities, and to help ensure the attainment of the National Ambient Air Quality Standard for Lead.

Applicability (Subdivision (b))

The proposed rule applies to all persons who own or operate a large lead-acid battery recycling facility that processes more than 50,000 tons of lead a year. Annual process amounts would be based on the greatest amount processed in any one of the five calendar years prior to the date of rule adoption, ~~and~~ or annually thereafter. Applicability would be based on facility lead processing records required under Subdivision (m ~~i~~) Recordkeeping of this proposed rule and Rule 1420 – Emissions Standards for Lead. Compliance with the proposed rule would be required in addition to other applicable rules such as Rule 1420.

Definitions (Subdivision (c))

Definitions for agglomerating furnace, ambient air, battery breaking area, ~~demand response program,~~ dryer, dryer transition piece, duct section, emission collection system, fugitive lead-dust, furnace and refining/casting area, ~~interruptible service contract,~~ ~~large~~ lead-acid battery recycling facility, lead, lead control device, lead point source, leeward wall, maintenance activity, materials storage and handling area, measurable precipitation, partial enclosure, ~~person,~~ process, ~~property line~~ renovation, sensitive receptor, slag, smelting, smelting furnace, total enclosure, and windward wall ~~turnaround/maintenance activity~~ are included in PR 1420.1.

General Requirements (Subdivision (d))

The owner or operator of a large lead-acid battery recycling facility would be subject to the following requirements:

- Prior to January 1, 2012, PR 1420.1 would prohibit the discharge of emissions into the atmosphere, which contribute to ambient air concentrations of lead that exceed 1.5 micrograms per cubic meter ($\mu g/m^3$) pursuant to SCAQMD Rule 1420.
- On and after January 1, 2012, PR 1420.1 would prohibit the discharge of emissions into the atmosphere, which contribute to ambient air concentrations of lead that exceed 0.15 $\mu g/m^3$ averaged over any 30 consecutive days. The ambient air concentrations of lead would be required to be determined by monitors pursuant to the Ambient Air Monitoring and Sampling Requirements Subdivision (j) or at any SCAQMD-installed monitor.

- No later than July 1, 2011, owner/operators would be required to install, maintain, and operate total enclosures pursuant to the Total Enclosures Subdivision (e) and lead point source emission control devices pursuant to the Lead Point Source Emissions Controls Subdivision (f). The owner or operator of a large lead-acid battery recycling facility would be required to comply with the following:
    - Submit complete permit applications for all construction and necessary equipment within 30 days of the date of adoption of the proposed rule.
    - Complete all construction within 180 days of receiving Permit to Construct approvals from the Executive Officer, or by July 1, 2011, whichever is earlier.
    - The Executive Officer may approve a request for an extension of the compliance deadline date if the facility can demonstrate that it timely filed all complete permit applications and is unable to meet the deadline due to reasons beyond the facility's control. The request would be required to be submitted to the Executive Officer no less than 30 days before the compliance deadline date.
- On and after July 1, 2011 submit a Compliance Plan pursuant to the Compliance Plan Subdivision (g) if emissions are discharged into the atmosphere which contribute to ambient air concentrations of lead that exceed 0.12 micrograms per cubic meters averaged over any 30 consecutive days determined by monitors pursuant to the Ambient Air Monitoring and Sampling Requirements Subdivision (j) or at any SCAQMD-installed monitor.

Total Enclosures (Subdivison (e))

Enclosure Areas

~~By January 1, 2011, the~~ The owner or operator of a large lead-acid battery recycling facility would be required to totally enclose the following areas in groups or individually: battery breaking areas~~;~~, material storage and handling areas, excluding areas where unbroken lead-acid batteries and finished lead products are stored~~;~~, dryer and dryer areas including transition pieces, charging hoppers, chutes, and skip hoists conveying any lead-containing material~~;~~, smelting furnaces and smelting furnace areas charging any lead-containing material~~;~~, agglomerating furnaces and agglomerating furnaces areas charging any lead-containing material~~;~~, refining and casting areas.

The owner or operator of a large lead-acid battery recycling facility would be required to vent each ~~Each~~ total enclosure ~~would be required to vent~~ to an emission collection system that ducts the entire gas stream to a lead control device pursuant to Subdivision (f) Lead Point Source Emissions Controls ~~that meets a lead or particulate reduction of 99 percent or more. Control efficiencies would be determined by a source test conducted in accordance with the test methods provided in Subdivision (h) Source Tests. Lead or particulate emission reduction would be calculated as prescribed in the proposed rule~~.

~~Each emission collection system and lead control device would be required, at minimum, to be maintained and operated in accordance with the manufacturer's specifications.~~

Total Enclosure Ventilation

Each total enclosure would be required to be maintained at a negative pressure of at least 0.02 millimeters of mercury (0.011 inches of water) and an in-draft velocity of at least 300 feet per minute at any opening such as vents, windows, passages, doorways, bay doors, and roll-ups.

Digital Differential Pressure Monitoring Systems

~~Depending on the size of the area that is to be enclosed, at least one~~ The owner operator of a large lead-acid battery recycling facility would be required to install, operate, and maintain a differential pressure monitoring system ~~continuously measuring the negative pressure of the~~ for each total enclosure ~~would be required to be installed on the leeward wall~~. Areas with a total surface area of 10,000 square feet or more require a minimum of one building digital differential pressure monitoring system installed and maintained at each of the following walls: ~~at the wall of the total enclosure opposite~~ the leeward wall, the windward wall and at an exterior wall that connects the leeward and windward wall at a location defined by the intersection of a perpendicular line between a point on the connecting ~~this~~ wall and a point on its furthest opposite exterior wall, and intersecting within plus or minus ten meters of the midpoint of a straight line between the other two monitors ~~in order to account for shifts in draft direction throughout the enclosure~~. The midpoint monitor would be prohibited from being on the same wall as either of the other two monitors in the room.

A minimum of one building digital differential pressure monitoring system would be required to be installed and maintained at the leeward wall inside of each total enclosure that has a total ground surface area of less than 10,000 feet.

Requirements for operating and maintaining differential pressure monitor are prescribed in the proposed rule.

In-draft Velocities

The in-draft velocity of the total enclosure would be required to be maintained equal or greater than 300 feet per minute at any opening including, but not limited to, vents, windows, passages, doorways, bay doors and roll-ups. In-draft velocities for each total enclosure would be required to be determined by placing an anemometer, or an equivalent device approved by the Executive Officer, at the center of the plane of any opening of the total enclosure ~~that does not have an associated differential pressure monitor. The owner or operator of the facility shall conduct a minimum of three measurements a day, occurring at least once per operating shift, at an opening of each exterior wall of the total enclosure~~.

Lead Point Source Emissions Controls (Subdivision (f))

~~By January 1, 2011, the~~ The owner or operator of a large lead-acid battery recycling facility ~~shall~~ would be required to vent emissions from each ~~all~~ lead point source ~~emissions~~ to ~~an emission collection system that ducts the entire gas stream to~~ a lead control device ~~that meets a lead or particulate reduction of 99 percent or more. Control efficiencies shall be determined by a source test conducted in accordance with the test methods provided in Subdivision (h) Source Test.~~ The total facility mass lead emissions from all lead point sources would be required not to exceed 0.045 pound of lead per hour. The maximum emissions rate for any single lead point source would be required not to exceed 0.010 pound of lead per hour. The total facility and maximum emission rates would be based on the most recent source tests conducted pursuant to Source Test Subdivison (k).

The owner or operator of a large lead-acid battery recycling facility would be required to install a secondary lead control device that controls lead emissions from the exhaust of the primary lead control device used for a dryer. The secondary lead control device would be required to be fitted with dry filter media, and the secondary lead control device would be required to be used to vent only the primary lead control device used for the dryer. An alternative secondary lead control

method that is equally or more effective for the control of lead emissions may be used if a complete application is submitted as part of the permit application required under total enclosure and lead point source emissions control device requirements of Subdivision (d) General Requirements and approved by the Executive Officer.

For any lead control device that, filter media other than filter bag(s), including, but not limited to, HEPA and cartridge-type filters, the filter(s) used would be required to be rated by the manufacturer to achieve a minimum of 99.97 percent capture efficiency for 0.3 micron particles.

For any lead control device that uses a filter bag(s), the filter bag(s) used would be required to be polytetrafluoroethylene membrane-type, or any other material that is equally or more effective for the control of lead emissions, and approved for use by the Executive Officer.

~~Lead or particulate emissions reduction would be calculated as prescribed in the proposed rule.~~ Each emission collection system and lead control device would be, at minimum, inspected, maintained and operated in accordance with the manufacturer's specifications.

Compliance Plan (Subdivision (g))

~~On or after July 1, 2011, any facility that exceeds an early detection~~ The owner or operator of a large lead-acid battery recycling facility that discharges into the atmosphere emissions which contribute to ambient air lead concentrations that exceed ~~of~~ 0.12 microgram per cubic meter averaged over any 30 consecutive days measured ~~by facility~~ at any monitor~~s set up~~ pursuant to Subdivision (j ~~g~~) Ambient Air Monitoring and Sampling Requirements or at any SCAQMD-installed monitor would be required to: ~~located within 1,000 feet of the facility would be required to submit a Compliance Plan that identifies additional measures to ensure that the ambient air quality concentration of 0.15 microgram per cubic meter is not exceeded.~~

~~Each compliance plan submittal would be required to include:~~

- Notify the Executive Officer in writing within 72 hours of when the facility knew or should have known of exceeding an ambient air lead concentration of 0.12 microgram per cubic meter averaged over any 30 consecutive days. Notification would only be required for the first time the ambient air lead concentration of 0.12 microgram per cubic meter is exceeded;
- Submit, within 30 calendar days of exceeding an ambient air lead concentration of 0.12 microgram per cubic meter averaged over any 30 consecutive days, a complete Compliance Plan to the Executive Officer for review and approval, subject to plan fees as specified in Rule 306. The Compliance Plan, at a minimum, would be required to include the following:
  - ~~All data that led to the finding of the exceedance of the early detection concentration;~~
  - ~~A determination of all probable activities or operations that may have contributed to exceedance of 0.12 microgram per cubic meter;~~
  - A ~~comprehensive list~~ description of additional lead emission reduction measures including but not limited to ~~(~~housekeeping and maintenance activities; additional total enclosures; modifications to lead control devices; installation of multi-stage lead control devices; process changes including reducing throughput limits; and conditional curtailments including, at a minimum, information specifying the curtailed processes, process amounts, and length of curtailment measures~~ that can be implemented immediately if lead emissions discharged from the facility contribute to, process modifications, lead control devices, etc.) to be implemented to ensure ambient concentrations of lead do not exceed 0.15 microgram per cubic meter averaged over any 30 consecutive day;~~

- Locations within the facility and method(s) of implementation for each additional lead reduction measure; and
- An implementation schedule for each lead reduction measure to be implemented if lead emissions discharged from the facility contribute to ~~ensure~~ ambient concentrations of lead ~~do not~~ that exceed 0.15 microgram per cubic meter averaged over any 30 consecutive days at any monitor pursuant to Subdivision (j) Ambient Air Monitoring and Sampling Requirements or at any SCAQMD-installed monitor. The scheduled would be required to include a list of the lead emission reduction measures that can be implemented immediately prior to plan approval.

Requirements for submittal, approval, disapproval and resubmittal of the Compliance Plan are detailed in the proposed rule.

~~All lead reduction measures identified to ensure ambient concentrations of lead do not exceed 0.15 microgram per cubic meter averaged over any 30 consecutive days, shall be implemented based on the schedule of the approved Compliance Plan.~~ The owner or operator would be required to implement measures based on the schedule in the approved Compliance Plan if lead emissions discharged from the facility contribute to ambient concentrations of lead that exceed 0.15 microgram per cubic meter averaged over any 30 consecutive days at any monitor pursuant to Subdivision (j) Ambient Air Monitoring and Sampling Requirements or at any SCAQMD-installed monitor. The owner or operator may make a request to the Executive Officer to modify or update the Compliance Plan.

~~Ambient Air Quality Concentration~~ (moved to Subdivision (d))

~~Beginning January 1, 2012, large lead-acid battery recycling facilities subject to PR 1420.1 would not be allowed to discharge into the atmosphere, at or beyond the property line of the facility, emissions which cause ambient concentrations of lead to exceed 0.15 microgram per cubic meter averaged over any 30 consecutive days. The ambient concentrations of lead shall be measured pursuant to Subdivision (g) Ambient Air Monitoring and Sampling Requirements. Exceedances measured at any rule-required ambient air lead monitor, including those operated by the District located within 1,000 feet of the facility property line, are subject to compliance with the standard.~~

~~Any exceedance of the 0.15 microgram per cubic meter concentration measured at any facility monitor set up pursuant to Subdivision (g) Ambient Air Monitoring and Sampling Requirements, or at any SCAQMD-installed monitor located within 1,000 feet of the facility property line, would be recognized as resulting from emissions discharged into the atmosphere by the facility unless evidence is provided by the facility demonstrating otherwise and as approved by the Executive Officer.~~

~~New Facilities (Subdivision (e))~~ (moved to Subdivision (l))

~~Any new facility that begins construction or operations on or after rule adoption would be required not to be located in an area that is zoned for residential or mixed use. In addition, any new facility shall not be located within 1,000 feet from the boundary of a sensitive receptor, a school under construction, or any area that is zoned for residential or mixed use.~~

Housekeeping Requirements (Subdivision (h~~-f~~))

~~Housekeeping requirements are proposed to minimize fugitive lead dust emissions. All requirements will be effective upon rule adoption.~~ No later than 30 days after the date of

adoption of the proposed rule, the owner or operator of a large lead-acid battery recycling facility would be required to control fugitive lead-dust by conducting all of the following housekeeping practices:

- ~~Wash down, at least once a week, unless located within a total enclosure vented to a lead control device~~ Clean by wet wash or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97 percent capture efficiency for 0.3 micron particles in a manner that does not generate fugitive lead-dust, the following areas at the specified frequencies, unless located within a total enclosure vented to a lead control device. Days of measurable precipitation in the following areas occurring within the timeframe of a required cleaning frequency may be counted as a cleaning:
  - ~~Roof tops of structures that house areas that are associated with the storage, handling or processing of lead-containing materials~~ Monthly cleanings of roof tops on structures less than 45 feet in height that house areas associated with the storage, handling or processing of lead-containing materials; and
  - Quarterly cleanings, no more than three calendar months apart, of roof tops on structures greater than 45 feet in height that house areas associated with the storage, handling or processing of lead-containing materials; and
  - ~~Any~~ Weekly cleanings of all areas where lead-containing wastes generated from housekeeping activities are stored, disposed of, recovered or recycled, and
  - Initiate immediate cleaning, no later than one hour, after any maintenance activity or event including, but not limited to, accidents, process upsets, or equipment malfunction, that causes deposition of fugitive lead-dust onto areas specified above (roof tops and areas where wastes from housekeeping activities are stored, disposed of, recovered or recycled). Immediate cleanings of roof tops would be required to be completed within 72 hours if the facility can demonstrate that delays were due to safety or timing issues.
- Inspect all total enclosures and facility structures that house, contain or control any lead point source or fugitive lead-dust emissions at least once a month. Any gaps, breaks, separations, leak points or other possible routes for emissions of lead or fugitive lead-dust to ambient air would be required to be permanently repaired within 72 hours of discovery. The Executive Officer may approve a request for an extension beyond the 72-hour limit if the request is submitted before the limit is exceeded.
- Any lead-acid battery that is cracked or leaking upon receipt would be required to be sent to the battery breaking area for processing or stored pursuant to the proposed rule.
- ~~Negative air containment enclosures vented to negative air machine equipped with filters certified for 99.97 percent efficiency on 0.3 micron particles enclosing all affected areas where dust generation potential exists during turnaround/maintenance activities unless located within a total enclosure approved by the Executive Officer.~~
- ~~Replacement of any heavy gauge steel hot acid exhaust duct sections which have developed more than two corrosion leaks or required patch repairs.~~
- ~~Monthly structural integrity inspections of any structures that house, contain, or control lead emission points or fugitive lead-dust emissions. Any gaps, breaks, separations, leak points or other possible routes for emissions of lead or fugitive lead-dust to outside ambient air would be required to be permanently repaired within three calendar days of discovery. The Executive Officer may approve a request for an extension of the three-calendar-day limit if made before the limit is exceeded.~~
- ~~Encapsulation (paving, asphalting, etc.) of all facility grounds as approved by the Executive Officer.~~ Pave, concrete, asphalt, or otherwise encapsulate all facility grounds as approved by the Executive Officer. Facility grounds used for plant life that are less than a total surface

area of 100 square feet would not be subject to encapsulation. Facility grounds requiring removal of existing pavement, concrete, asphalt or other forms of encapsulation, necessary for maintenance purposes would not require encapsulation while undergoing work, and would be required to be re-encapsulated immediately after all required work is completed. All work would be required to be conducted in accordance with maintenance activity requirements in Subdivision (i).

- Prohibition of weather caps on any stack that is a lead emissions source.
- ~~Storage of~~ Store all materials capable of generating any amount of fugitive lead-dust, including, but not limited to, slag and any other lead-containing waste generated from housekeeping requirements of this Subdivison and maintenance activities of Maintenance Activity Subdivision (i), in sealed, leak-proof containers unless located within a total enclosure.
- Transport of all materials capable of generating any amount of fugitive lead-dust emissions including, but not limited to, slag and any other waste generated from housekeeping requirements of this subdivision within closed conveyor systems or in sealed, leak-proof containers, unless located within a total enclosure.
- ~~Remove~~ Initiate removal of any lead-containing material, including sludge, from the entire surface area of any surface impoundment pond or reservoir holding storm water runoff or spent water from housekeeping activities within ~~24~~ one hour~~s~~ after the water level is one inch at any point above the bottom of the pond or reservoir. ~~Surfaces~~ Removal of lead-containing material would be required to be completed as soon as possible, and no later than six calendar days after the time initiation of the removal was required. Thereafter, surfaces are required to be washed down weekly ~~thereafter~~ in a manner that does not generate fugitive lead-dust until the pond or reservoir is used again for holding water.
- ~~Facility owner/operator would be required to sweep paved, concreted or asphalted facility areas subject to vehicle and foot traffic and vehicle wet wash down areas with an onsite mobile sweeper that is in compliance with SCAQMD Rule 1186. Sweeping would be required three times each day, occurring at least once per operating shift with each event not less than four hours apart. Additionally, any accidents, mishaps and/or process upsets occurring in the aforementioned areas that result in the deposition of lead-containing material or dust shall be swept immediately using an onsite mobile sweeper. Sweeping would not be required within ten meters of any ambient air monitor location when conducting sample collection in order to avoid interference. Further, sweeping would not be required during days of measurable precipitation.~~ The owner or operator of a large lead-acid battery recycling facility would be required to maintain an onsite mobile vacuum sweeper that is in compliance with SCAQMD Rule 1186, or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97 percent capture efficiency for 0.3 micron particles to conduct the following sweeping activities:
  - Vacuum sweep all paved, concreted or asphalted facility areas subject to vehicular or foot traffic three times per day and occurring at least once per operating shift with each event not less than four hours apart, unless located within a total enclosure vented to a lead control device.
  - Immediately vacuum sweep any area specified to be swept above, no later than one hour after any maintenance activity or event including accidents, process upsets, or equipment malfunction that results in the deposition of fugitive lead-dust.
  - Vacuum sweeping activities specified in sweeping requirements above would not be required during days of measurable precipitation.
- ~~A vehicle wet washing area would be required to maintain a vehicle wet washing area using a wet washing method approved by the Executive Officer. The system would be required to be~~

~~capable of removing dust and other accumulated material from the wheels, body, and vehicle underside to prevent the inadvertent transfer of lead contaminated material to public roadways. All vehicles traversing facility areas associated with the lead-acid battery recycling process prior to exiting the facility and onsite mobile sweepers after operation, would need to be sufficiently washed such as visual inspections of all vehicle surfaces, wheel, or tires does not indicate any accumulation of dust, particles or mud contamination. Each vehicle would need to be inspected after washing to verify compliance with washing requirements. Vehicles that do not pass would be prohibited from exiting the facility. Ground surfaces where vehicles are washed would be required to be wet washed prior to the vehicle wet washed areas becoming dry to prevent any fugitive lead-dust or residue from becoming airborne. Practices that minimize the potential for further releases of lead emission when collecting and disposing of lead contaminated water accumulated during washing processes would be required. Practices would include the minimization of the amount of water which is allowed to dry exposed to the atmosphere prior to collection for treatment.~~

Maintenance Activity (Subdivision (i))

- Beginning date of adoption, the owner or operator of a large lead-acid battery recycling facility would be required to conduct any maintenance activity in a negative air containment enclosure, vented to a permitted negative air machine equipped with a filter(s) rated by the manufacturer to achieve a 99.97 percent capture efficiency for 0.3 micron particles, that encloses all affected areas where fugitive lead-dust generation potential exists, unless located within a total enclosure or approved by the Executive Officer. Any maintenance activity that cannot be conducted in a negative air containment enclosure due to physical constraints, limited accessibility, or safety issues when constructing or operating the enclosure would be required to be conducted:
  - In a partial enclosure, barring conditions posing physical constraints, limited accessibility, or safety issues;
  - Using wet suppression or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97 percent capture efficiency for 0.3 micron particles, at locations where the potential to generate fugitive lead-dust exists prior to conducting, during, and upon completion of the maintenance activity. Wet suppression or vacuuming would be required to be conducted during the maintenance activity barring safety issues;
  - While collecting 24-hour samples at monitors for every day that maintenance activity is occurring and notwithstanding Ambient Air Monitoring and Sampling Requirements Subdivison (j);
  - Would be required to be stopped immediately when instantaneous wind speeds are greater than 25 miles per hour. Maintenance work may be continued if it is necessary to prevent the release of lead emissions.
- Store or clean by wet wash or a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97 percent capture efficiency for 0.3 micron particles, all lead-contaminated equipment and materials used for any maintenance activity immediately after completion of work in a manner that does not generate fugitive lead-dust.

Ambient Air Monitoring and Sampling Requirements (Subdivision (k ~~g~~))

~~Each facility would be required to collect and analyze ambient air lead samples to determine compliance with the ambient air quality lead concentration standard of PR 1420.1.~~ Prior to January 1, 2011, ambient air monitory and sampling would be conducted pursuant to SCAQMD Rule 1420. No later than January 1, 2011, the owner or operator of a large lead-acid battery recycling facility would be required to conduct ambient air monitoring and sampling as follows:

- Collect samples from a minimum of ~~three~~ four sampling sites approved by the Executive Officer~~, located at or beyond the property line of the facility~~;
  - Locations for sampling sites would be required to be based on maximum expected ground level lead concentrations, at or beyond the property line, as determined by Executive Officer-approved air dispersion modeling calculations and emission estimates from all lead point sources and fugitive lead-dust sources, and other factors including, but not limited to, population exposure and seasonal meteorology.
  - The Executive Officer may require one or more of the four sampling sites to be at locations that are not based on maximum ground level lead concentrations, and that are instead at locations at or beyond the property line that are representative of upwind or background concentrations.
  - Sampling sites at the property line may be located just inside the fence line on facility property if logistical constraints preclude placement outside the fence line at the point of maximum expected ground level lead concentrations.
- ~~Collect samples from a minimum of one Executive Officer-approved sampling site to determine background ambient lead concentration;~~
- Collect 24-hour, midnight-to-midnight, samples at all sites for 30 consecutive days from the date of initial sampling, followed by one 24-hour, midnight-to-midnight, sample collected at least once every three calendar days, on a schedule approved by the Executive Officer;
- Submit collected samples to ~~an Executive Officer approved~~ laboratory approved under the SCAQMD Laboratory Approval Program for analysis within three calendar days of collection and calculate ambient lead concentrations for individual 24 hour samples within 15 calendar days of the end of the calendar month in which the samples were collected. ~~provide duplicate~~ Duplicate samples would be required to be made available to the ~~District~~ SCAQMD upon request by the Executive Officer; and
- ~~Calculate ambient lead concentrations for individual 24 hour samples within 15 calendar days of the end of the calendar month.~~
- Sample collection would be required to be conducted using Title 40, CFR 50 Appendix B - *Reference Method for the Determination of Suspended Particulate Matter in the Atmosphere (High Volume Method)*, or U.S. EPA-approved equivalent methods, and sample analysis ~~shall~~ would be required to be conducted using Title 40, CFR 50 Appendix G - *Reference Method for the Determination of Lead in Suspended Particulate Matter Collected from Ambient Air*, or U.S. EPA-approved equivalent methods.
- ~~Facilities would also have to continuously monitor wind speed and direction for the ambient air quality monitoring systems at all times to supplement data analysis of samples collected.~~ Continuously record wind speed and direction data at all times using equipment approved by the Executive Officer at a minimum of one location and placement approved by the Executive Officer.
- ~~Only personnel approved by the Executive Officer would be allowed to conduct ambient air quality monitoring, and sampling equipment shall be operated and maintained in accordance with U.S. EPA-referenced methods.~~ Ambient air quality monitoring would be required to be conducted by persons approved by the Executive Officer and sampling equipment be required to be operated and maintained in accordance with U.S. EPA-referenced methods.
- Cleaning activities, including, but not limited to, wet washing and misting, that result in damage or biases to samples collected would be required not to be conducted within 10 meters of any sampling site required by this subdivision.

- All ambient air quality monitoring systems ~~would be~~ required by this subdivision would be required to be equipped with a backup, uninterruptible power supply ~~if the facility is enrolled into a Demand Response Program~~.
- On and after January 1, 2012, if the owner or operator of a large lead-acid battery recycling facility exceeds an ambient air lead concentration 0.15 microgram per cubic meter measured pursuant to General Requirements Subdivision (d), the owner or operator would be required to:
    - Begin daily ambient air monitoring and sampling no later than three calendar days after the time the facility knew or should have known of the exceedance. Conduct daily ambient air monitoring and sampling for 60 consecutive days at each sampling site that measured an exceedance according to General Requirements Subdivision (d).
    - The 60 consecutive-day period would be restarted for any subsequent exceedance.

Source Tests (Subdivision (k ~~h~~))

- ~~Annual source tests would be required for all lead control devices in order to demonstrate compliance with the 99 percent control efficiency standard.~~ The owner or operator of a large lead-acid battery recycling facility would be required to conduct a source test of all lead control devices at least annually to demonstrate compliance with the control standards specified in the Lead Point Source Emissions Controls Subdivison (f). If the results of the most recent source test for a lead control device demonstrating compliance with the lead emission standards of Lead Point Source Emissions Controls Subdivison (f) demonstrate emissions of 0.0025 pounds of lead per hour or less, the next test for that lead control device would be required to be performed no later than 24 months after the date of the most recent test.
- The owner or operator of a large lead-acid battery recycling facility with an ~~Existing~~ existing lead control devices in operation before the adoption date of the rule would ~~require a~~ would be required to conduct a source test no later than January 1, 2011. Initial source tests for new and modified lead control devices with an initial start-up date on or after the adoption date of the rule would be required within 60 days of initial start-up.
- The Executive Officer would be required to be notified in writing one week prior to conducting any source test required by PR 1420.1.
- Prior to conducting a source test for PR 1420.1 the owner/operator of a large lead-acid battery recycling facility would be required to ~~obtain~~ submit a~~n approved~~ pre-test protocol~~,~~ ~~submitted~~ to the Executive Officer for approval at least 60 calendar days prior to conducting the source test. The pre-test protocol would need to include the source test criteria of the end user and all assumptions, required data, and calculated targets for testing the following: target lead control efficiency; preliminary lead analytical data; planned sampling parameters; and information on equipment, logistics, personnel, and other resources necessary for an efficient and coordinated test.
- The owner or operator of a large lead-acid battery recycling facility would be required to notify the Executive Officer within three business days, including Mondays, of when the facility knew or should have known of any source test result that exceeds any of the emission standards specified in Lead Point Source Emissions Controls Subdivison (f). Notifications would be made to 1-800-CUT-SMOG.
- ~~The proposed rule lists the following applicable test methods~~ Source tests would be required to be conducted while operating at a minimum of 80 percent of equipment maximum capacity and in accordance with any of the following applicable test methods:
    - ~~SCAQMD Methods 5.1, 5.2, and 12.1;~~

~~o CARB Methods 12 and 436; and~~
~~o EPA Methods 9 and 12.~~
- o SCAQMD Method 12.1 - Determination of Inorganic Lead Emissions from Stationary Sources Using a Wet Impingement Train
- o ARB Method 12 – Determination of Inorganic Lead Emissions from Stationary Sources
- o EPA Method 12 – Determination of Inorganic Lead Emissions from Stationary Sources
- o ARB Method 436 – Determination of Multiple Metal Emissions from Stationary Sources

- The average of triplicate samples according to approved test methods would be required to be used to determine compliance.
- ~~Use of~~ The operator may use an alternative or equivalent test method defined in U.S. EPA 40 CFR 60.2,~~would be allowed as long as it is~~ approved in writing by the Executive Officer, CARB, and the U.S. EPA. ~~Source tests would be required to be completed by a test laboratory approved under the SCAQMD Laboratory Approval Program.~~
- The operator would be required to use a test laboratory approved under the SCAQMD Laboratory Approval Program for the source test methods cited in this subdivision. If there is no approved laboratory, then approval of the testing procedures used by the laboratory would be granted by the Executive Officer on a case-by-case basis based on SCAQMD protocols and procedures.
- When more than one source test method or set of source test methods are specified for any testing, the application of these source test methods to a specific set of test conditions is subject to approval by the Executive Officer. In addition, a violation established by any one of the specified source test methods or set of source test methods ~~shall~~ would be constitute a violation of the rule.
- An existing source test, for existing lead control devices, conducted on or after January 1, 2010 may be used as the initial source test specified in this subdivison ~~as long as the test~~ to demonstrate compliance with the control standard of Lead Point Source Emissions Controls Subdivison (f) upon Executive Officer approval. The source test would be required to meet, at a minimum, the following criteria:
  - o The test is the most recent conducted since January 1, 2009;
  - o The test demonstrated compliance with the applicable control standard of Lead Point Source Emissions Controls Subdivison (f) ~~99 percent control efficiency;~~
  - o ~~Is~~ The test is representative of the method to control emissions currently in use; and
  - o ~~Was~~ The test was conducted using applicable and approved test methods in this subdivison.

New Facilities (Subdivision (l))

The owner or operator of a large lead-acid battery recycling facility beginning construction or operations on or after the date of adoption of the rule would be required to:

- Demonstrate to the satisfaction of the Executive Officer that the facility is not located in an area that is zoned for residential or mixed use; and
- Demonstrate to the satisfaction of the Executive Officer that the facility is not located within 1,000 feet from the property line of a sensitive receptor, a school under construction, park or any area that is zoned for residential or mixed use. The distance would be measured from the property line of the new facility to the property line of the sensitive receptor.
- Submit complete permit applications for all equipment required by this rule prior to beginning construction or operations.

Recordkeeping (Subdivision (m ~~i~~))

The owner or operator of a large lead-acid battery recycling facility would be required to keep records of the following:

- ~~Records~~ Daily records indicating ~~quantities and lead content of each~~ amounts of lead-containing material processed, including, but not limited to, purchase records, usage records, results of analysis, or other SCAQMD-approved verification ~~at a facility~~ to indicate processing amounts; ~~lead content and lead would be required to be maintained by the facility.~~
- Results of all ambient air lead monitoring, meteorological monitoring, and other data specified by the Ambient Air Monitoring and Sampling Requirements Subdivision (j)
- Recordkeeping for all housekeeping activities in Subdivision (h), maintenance of Subdivision (i), and lead control device inspection and maintenance requirements of Lead Point Source Emissions Controls Subdivision (f), including the name of the person performing the activity, and the dates and times on which specific activities were completed ~~ambient air lead monitoring, meteorological monitoring, vehicle wet washing and vehicle inspection required by the rule would be required to be maintained~~.
- Records of unplanned shutdowns of any smelting furnace including the date and time of the shutdown, description of the corrective measures taken, and the re-start date and time.
- All records would be required to be maintained for five years and maintained onsite for at least two years.

Reporting (Subdivision (n ~~j~~))

Ambient Air Monitoring Reports

- ~~Facilities would be required to submit reports for monthly ambient air monitoring results for lead and wind data measured at each sampling location on a monthly or more frequent basis if determined by the EO. Results of individual 24-hour samples would be required to be reported and averaged each calendar month.~~ Beginning no later than January 1, 2011, the owner or operator of a large lead-acid battery recycling facility would be required to report by the 15th of each month to the Executive Officer, the results of all ambient air lead and wind monitoring for each preceding month, or more frequently if determined necessary by the Executive Officer. The report would be required to include the results of individual 24-hour samples and 30-day averages for each day within the reporting period.
- Any exceedance of the ambient air quality concentration specified in the General Requirements (d) ~~shall~~ would be required to be reported with a notification made to the 1-800-CUT-SMOG ~~to the Executive Officer~~ within 24 hours of receipt of completed sample analysis required by Ambient Air Monitoring and Sampling Requirements Subdivsion (j), followed by a written report to the Executive Officer no later than three calendar days after the notification. The written report would be required to include the causes of the exceedance and the specific corrective actions implemented.

Shutdown,Turnaround~~/~~, and ~~–~~Maintenance Activity Notification ~~and Unplanned Shutdown Reporting~~

The owner or operator of a large lead-acid battery recycling facility would be required to:

- Notify the Executive Officer within one hour after an unplanned shutdown of any lead control device has occurred. The notification would be required to include the associated processes or equipment vented by the shutdown lead control device. If the unplanned shutdown involves a breakdown pursuant to Rule 430, the breakdown notification report required by Rule 430 would serve in lieu of this notification to the Executive Officer.

- Notify the Executive Officer at least ten calendar days prior to a planned turnaround or shutdown of any smelting furnace, battery breaker, or lead control device that result in lead emissions. The notification would be required to specify the subject equipment and the start and end date of the turnaround or shutdown period.
- Notify the Executive Officer at least ten calendar days prior to the beginning of maintenance activity, as defined in Definitions Subdivision I, that is conducted routinely on a monthly or less frequent basis. The notification and report would be required to include, at a minimum, the following:
  - Dates, times, and locations of activities to be conducted;
  - Description of activities;
  - Name of person(s)/company conducting the activities;
  - Lead abatement procedures, including those specified in Maintenance Activity Subdivision (i), to be used to minimize fugitive lead-dust emissions; and
  - Date of expected re-startup of equipment.
- Notify the public at least ten calendar days prior to the beginning of building construction, renovation, or demolition, and resurfacing, repair, or removal of ground pavement, concrete or asphalt if such activities are conducted outside of a total enclosure and generate fugitive lead-dust. The notification would include, at a minimum, the following:
  - Dates, times, and locations of activities to be conducted;
  - Description of activities;
  - Date of expected re-start of equipment.
- Notification in this subdivision would be required to be made to 1-800-CUT-SMOG followed by a written notification report to the Executive Officer no later than three business days, including Mondays, after the unplanned shutdown occurred.
- Provide notification to the public required under this subdivision through a facility contact or pre-recorded notification center that is accessible 24 hours a day, seven days a week, and through electronic mail using a list of recipients provided by the Executive Officer. Another method of notification to the public may be used provided it is approved by the Executive Officer.
- Install a sign indicating the phone number for the facility contact or pre-recorded notification center that meets the following requirements, unless otherwise approved in writing by the Executive Officer:
  - Installed within 50 feet of the main entrance of the facility and in a location that is visible to the public;
  - Measures at least 48 inches wide by 48 inches tall;
  - Displays lettering at least four inches tall with text contrasting with the sign background; and
  - Located between six and eight feet above grade from the bottom of the sign.

~~A Turnaround/Maintenance Lead Abatement Notification would be required to be submitted at least four weeks prior to the beginning of any turnaround/maintenance activity no later than January 1, 2011. Notification information would need to include a description of the activity including dates, times, persons conducting the activity, and specific locations at the facility where activities will be conducted. Lead abatement procedures that would be used to minimize lead emissions would also be required.~~

~~Unplanned shutdown of any equipment that processes lead-containing material shall be reported to the Executive Officer by calling 1-800-CUT-SMOG within one hour of shutdown. A written notification would also be required to be made to the Executive Officer no later than three calendar days after the unplanned shutdown occurred.~~

Initial Facility Status Report

No later than January 1, 2011, existing large lead-acid battery recycling facility owners/operators would be required to submit an initial facility status report. Large lead-acid battery recycling facilities beginning construction or initial operations after the date of rule adoption would be required to submit the initial compliance report upon start-up. Minimum information required in the report is specified in Appendix 1 of the rule. Below is a summary of required information:

- General facility information (name, SCAQMD Facility ID Number, address, contact number);
- The distance from the property line of the facility to the property line of the nearest commercial/industrial facility and sensitive receptor.
- Sensitive receptor and worker locations with respect to the facility if they are within one-quarter mile from the center of the facility;
- Facility building parameters;
- Description of the types of lead processes at the facility;
- For ~~all three~~ each of the last five calendar years dating back from the adoption of the rule:
  - Annual amounts and lead content of all lead-containing materials processed;
  - Maximum and average daily and monthly operating schedules;
  - Maximum and average daily and monthly lead-processing rates for all equipment and processes;
  - Maximum and average daily and annual lead emissions from all emission points and fugitive lead sources;
- Approximate date of intended source tests for all lead control devices, as required by source test requirements.
- Engineering drawings, calculations, or other methodology to demonstrate compliance with enclosure areas ~~emission standards~~; total enclosures; total enclosure ventilation~~; ambient air lead monitoring and concentrations~~; and source tests;
- Air dispersion modeling calculations using procedures approved by the Executive Officer to determine the location of sampling sites as required by ambient air monitoring and sampling requirements.
- All information necessary to demonstrate means of compliance with ambient air monitoring and sampling requirements.
- ~~Intended source test dates for all lead control devices; and~~
- The name, title, and signature of the responsible official certifying the report.
- Date of the report.

Ongoing Facility Status Report

Facilities would be required to submit a summary report to ~~update~~ the Executive Officer ~~of~~ to document the ongoing facility status ~~and changes through submittal of an Ongoing Facility Status Report~~. Ongoing Facility Status Reports would be due every year on or before February 1st for all sources and would require information covering the preceding calendar year. Minimum information required in the report is specified in Appendix 2 of the rule. Below is a summary of required information:

- General facility information (name, SCAQMD Facility ID Number, address, contact number);
- Beginning and ending dates of the calendar year for the reporting period.

- The following information would be required to be provided for each of the last 12 calendar months of the reporting period:
    - ~~Quantities~~Annual amounts of lead-containing material processed;
    - ~~Lead content of lead-containing materials processed;~~
    - Maximum and average daily and monthly lead-processing rates from all equipment and processes;
    - Maximum and average daily and annual emissions of lead from all emission points and fugitive lead-dust sources;
- ~~Description of changes in sensitive receptor locations and distances since the previous reporting period;~~ Worker and sensitive receptor distances, if they are located within one-quarter mile from the center of the facility and facility maximum operating schedule, if changed since submittal of the initial compliance status report or prior year's ongoing compliance status and emission reports.
- Description of changes in monitoring, processes, or controls since the previous reporting period; and
- The name, title, and signature of the responsible official certifying accuracy of the report.
- Date of the report.

Adjustments to the Timeline for Submittal and Format of Reports

The Executive Officer may adjust the timeline for submittal of periodic reports, allow consolidation of multiple reports into a single report, establish a common schedule for submittal of reports, or accept reports prepared to comply with other state or local requirements. Adjustments ~~shall~~ would be required to provide the same information and ~~shall~~ not to alter the overall frequency of reporting.

CONTROL STRATEGIES

Several types of controls for lead emissions are currently used at the lead-acid battery recycling facilities in the Basin. Lead emissions at lead-acid battery recycling facilities are generally categorized as point and fugitive lead emissions. Point source emissions are those emissions that are vented to a stack where the stack can be from a specific piece of equipment such as a furnace or building. Fugitive emissions are particulate matter that contain lead, is in contact with the ambient air, and can become airborne. Point source emissions that are vented through a control device, but not captured and contained can become fugitive emissions. The following discusses lead point source controls and fugitive source control strategies: ~~from lead processes discussed in the previous section are vented to one or more lead control devices listed below:~~

Lead Point Source Control Strategies

The following describes lead point source control strategies. As with any type of control device, maintenance and proper operation of the control device are important to ensure the control device can achieve its maximum control efficiency. The following provides a description of baghouses and filter controls, wet scrubbers, high efficiency particulate arrestors (HEPA), electrostatic precipitators and wet electrostatic precipitators. Use of multistage point source controls such as use of baghouse filters and HEPA filters can improve the capture efficiency and provide additional protection. Lead emissions from lead processes discussed in the previous section are vented to one or more lead control devices listed below:

Baghouses and Filters

Baghouses operate by collecting particles on a fabric or membrane filter. Typically, they consist of fabric or membrane bags of tubular or envelope shapes. As an air stream flows through the

bags, small particles are initially captured and retained on the fabric or membrane filter by one or a combination of the following collection mechanisms: impaction, direct interception, diffusion, electrostatic attraction, and gravitational settling. Once dust has accumulated on the walls of the bags, the "dust mat" acts as a sleeve to further increase particulate matter capture.

Arrays of filters are also used to collect particulate matter. They can be used after the bags in a baghouse to further reduce emissions or can be used alone as in a spray booth. Filters are often used in combination with a prefilter which is "changed out" on a regular basis allowing the bank of filter cartridges to last longer.

Baghouses are commonly used in metal melting operations. They have one of the highest control efficiencies for particulate emissions, and the captured particulate can be recycled to recover metal. Operating parameters of melting operations, such as exhaust stream temperature, gas stream velocity, and particulate chemical properties must be taken into account when designing the baghouse.

Daily maintenance and monitoring of the baghouse is necessary to ensure that it continuously meets the required standard of efficiency. Gas volume, temperature, pressure drop, and dust load are monitored continuously or intermittently. Baghouse shaking and sending pulses of air backwards through the bags is done at specific intervals, or when the bags are overloaded, to remove the captured particulate matter from the bags and drop it into a hopper below the bags.

Baghouse and filter technology combined can achieve an overall particulate matter capture efficiency certifiable up to 99.97 percent. The well designed baghouse can control 99 percent of particulate emissions. The control efficiency of lead particulates is anticipated to be slightly higher, since analytical test methods for metals are more accurate and precise than test methods for total particulates, regardless of particle size distribution. Historical test data performed for compliance with Rule 1420 has demonstrated this to be true. The lead removal efficiency is at least 98 percent for a baghouse with 99 percent efficiency for particulates.

All facilities subject to this rule would be able to use baghouses or filter systems to control particulate lead emissions from most all operations in the lead-acid battery recycling processes. Examples include lead emissions coming from the battery breaking areas and all smelting, refining, and casting operations.

Baghouses and filters are expected to be used to control lead particulate emissions at both affected facilities.

Wet Scrubbers

Wet scrubbers remove both particulate matter and gases from industrial process gas streams. In lead-acid battery recycling operations, wet scrubbers are typically used to remove residual lead particulates and sulfur oxides from the exhaust of baghouses that control emissions from rotary dryers and smelting furnaces. There are a variety of scrubber designs. However, only a limited number can remove small particulates from an exhaust stream. Wet scrubbers are capable of 98 percent collection efficiencies for particles as small as five microns in size. Two scrubbers designed to remove small particulates are the ionizing wet scrubber and the venturi scrubber.

In an ionizing wet scrubber, the gas stream first enters a chamber where a high voltage is used to ionize the gas stream. The second chamber is a wet scrubbing chamber, where the ionized

particles and gases are attracted to the surface of the chamber and the scrubbing liquid. Larger size particles are removed by water through inertial impaction.

Venturi scrubbers are used by some facilities in the district ~~District~~. In these scrubbers, the exhaust stream is passed through a constriction (the venturi) where the scrubbing liquid is sprayed in. The turbulence at and after the venturi promotes contact of particles with the scrubbing liquid droplets. High particulate matter removal efficiencies for small particles can be achieved with this type of scrubber.

One facility ~~would modify~~ has modified an existing scrubber by increasing the blower size and adding a HEPA filter to comply with PR 1420.1.

High-Efficiency Particulate Arrestors (HEPA)

Used in conjunction with a prefilter, high-efficiency particulate air filters can trap particles as small as 0.3 micrometers at an efficiency of 99.97 percent or greater. Like cartridge filters, HEPA filter elements are of pleated construction. HEPA filters are generally limited to ambient temperature (100° Fahrenheit), though special applications for higher temperatures are available. Unlike bags or cartridge filters, HEPA filters are not automatically cleaned. When a HEPA filter element becomes loaded with particulate matter, the element is changed out and disposed of as hazardous waste. Filters can be applied to controls such as baghouses to reduce lead emissions from lower temperature exhaust streams and fugitive lead-dust emissions collected within total enclosures. They can also be utilized in negative air equipment or vacuums used to conduct housekeeping activities throughout the facility.

HEPA filters ~~mist eliminators~~ are expected to be installed in a modified baghouse ~~scrubber~~ at one of the affected facilities.

Electrostatic Precipitators/Wet Electrostatic Precipitators

Electrostatic precipitators operate by charging the effluent particulate matter with a highly ionized gas stream and then attracting the charged particles to an oppositely charged metal wall. Typically, a cylindrical metal tube is used with an ionized wire running through it. As the ions move outward toward the oppositely charged cylinder, the particles are also ionized, and are deposited on the cylinder. The cylinder wall is periodically vibrated to collect particulate matter into a hopper. This technology can achieve 99 percent efficiency for total particulate matter as small as one µm. Electrostatic precipitators in lead-acid battery recycling operations are typically used downstream other lead controls such as baghouses, and treat exhaust streams with smaller lead particulates.

Based on conversations with facility owners/operators, neither type of electrostatic precipitators are expected to be used to comply with PR1420.1.

Fugitive Lead-Dust Control

Fugitive lead-dust at lead-acid battery recycling facilities can be a major source of lead emissions. Fugitive lead-dust accumulates in and around process areas, from lead point sources, on roof tops, in and around facility, and during maintenance operations to name a few. There are a variety of housekeeping and containment strategies that can be implemented to minimize fugitive lead dust. Housekeeping activities must be implemented frequently and properly to ensure they are effective. The concept behind many of these strategies is to either contain or remove lead dust so it cannot become airborne. Housekeeping practices specifying adequate

frequencies and locations for all cleanings to be performed are also critical in the effectiveness to control fugitive lead-dust emissions. The following summarizes some potential fugitive lead dust control strategies:

- Pave roadways subject to vehicular and foot traffic;
- Clean paved areas through vacuuming, vacuum sweepers, and use of wet suppression;
- Wet wash or vacuum areas where lead particulate and accumulate such as roof tops, areas where lead-containing wastes are stored or disposed of;
- Clean areas where lead dust may accumulate due to accidents, process upsets or equipment malfunctions;
- Clean surface impoundments ponds before lead-containing sludge dries and can become a source of fugitive lead-dust;
- Use of enclosures or containment areas during maintenance activities or storage of lead-containing materials; and
- Use of total enclosures under negative air pressure vented to point lead point source controls to ensure that lead dust that accumulates in and around process areas does not become fugitive.

BASELINE CONSIDERATIONS

The two affected facilities already comply with some of the requirements of PR 1420.1 under orders of abatement, best available control technology (BACT) requirements, or existing housekeeping practices. Tables 1-1 and 1-2 present control and housekeeping requirements at each of the two affected facilities. The tables show whether the facility complies with PR 1420.1 requirements (done), would need to comply with PR 1420.1 requirements (PR 1420.1) or the PR 1420.1 does not apply to the affected facility (N/A). One of the affected facilities has permits to construct enclosures and control equipment that comply with PR 1420.1 requirements. The other facility has applied for permits to construct, but has not received them. Adverse environmental impacts in Chapter 2 were evaluated for requirements that had not been implemented at time of the environmental analysis commenced.

Table 1-1
Control Technology Requirements

Control Technology Requirement	Facility 1	Facility 2	PR 1420.1 Reference
Enclosure Raw Material	PR 1420.1	PR 1420.1	~~(d)(1)(i)~~ (e)(1)(A) and (B)
Enclosure Dryer	PR 1420.1	N/A	~~(d)(1)(iii)~~ (e)(1)(C)
Enclosure Smelting Operations	PR 1420.1	PR 1420.1	~~(iv)~~ (e)(1)(D)
Other Enclosures	Done	Done	~~(d)(1)(ii), (v) to (vii)~~ (e)(1)(B)
Ventilation	PR 1420.1	PR 1420.1	~~(d)(1)(B) to (H) and (d)(2)~~ (e)(3) and (e)(5)
Baghouses	PR 1420.1 for new enclosures	Done	~~(d)(1)(B) to (H) and (d)(2)~~ (f)(1) to (5)
Dryer – Secondary Control	PR 1420.1	N/A	(f)(1)(3)
Modification to Scrubber	PR 1420.1	N/A	~~(d)(1)(B) to (H) and (d)(2)~~ (f)(1) and (2)

Done – Facility operators already comply with proposed rule.
PR 1420.1 – Facility operators would need to comply with requirement under PR 1420.1
N/A – Not applicable to facility – facility does not have dryer, scrubber or pond/reservoir

Table 1-2
Housekeeping Requirements

Housekeeping Requirements	Facility 1	Facility 2	PR 1420.1 Reference
Wash/Vacuum Roof Tops	PR 1420.1 ~~would increase from~~ monthly washing (~~semi-annual~~ quarterly for tall buildings) ~~to weekly washing~~	Done	~~(f)(1)(A)~~ (h)(1)(A) and (B)
Wash/Vacuum of Any Area Where Lead Is Stored, Disposed, Recovered or Recycled	Done	Done	~~(f)(1)(B)~~ (h)(1)(C)
Wash/Vacuum Areas After Maintenance or Event (Accidents, Process Upsets, Equipment Malfunction, etc., that causes deposition of Fugitive Dust)	PR 1420.1	PR 1420.1	(h)(1)(D) and (i)(2)
Turnaround/Maintenance in Enclosure with Negative Air Machine with Filters	PR 1420.1	PR 1420.1	~~(f)(2)~~ (i)(1)
~~Replace any Heavy Gauge Steel Hot Acid Gas Exhaust Duct Sections~~	~~PR 1420.1~~	~~PR 1420.1~~	~~(f)(3)~~
Inspect All Facility Structures That House Point or Fugitive Source of Lead Emissions	PR 1420.1	PR 1420.1	~~(f)(4)~~ (h)(2)
Send cracked or leaking batteries immediately to battery breaking area for processing or storage	PR 1420.1	PR 1420.1	(h)(3)
Pave, Concrete, Asphalt or Otherwise Enclosure All Facility Grounds	Done	Done	~~(f)(5)~~ (h)(4)
Remove All Weather Caps	Done	Done	~~(f)(6)~~ (h)(5)
Store Lead Containing Materials Leak-Proof Containers or Enclosure	PR 1420.1	PR 1420.1	~~(f)(7)~~ (h)(6)
Transport Lead Containing Materials Leak-Proof Containers or Enclosure	PR 1420.1	PR 1420.1	~~(f)(8)~~ (h)(7)
Pond or Reservoir	Seasonal washing done; weekly washings required by PR 1420.1	N/A	~~(f)(9)~~ (h)(8)

Done – Facility operators already comply with proposed rule.
PR 1420.1 – Facility operators would need to comply with requirement under PR 1420.1
N/A – Not applicable to facility – facility does not have dryer, scrubber or pond/reservoir

Table 1-2
Housekeeping Requirements (Concluded)

Housekeeping Requirements	Facility 1	Facility 2	PR 1420.1 Reference
On-site Mobile Sweeper	Done	PR 1420.1 would require sweeping twice more per day	~~(f)(10)~~ (h)(9)
~~Vehicle Wet Washing~~	~~PR 1420.1~~	~~PR 1420.1~~	~~(f)(11)~~

Done – Facility operators already comply with proposed rule.
PR 1420.1 – Facility operators would need to comply with requirement under PR 1420.1
N/A – Not applicable to facility – facility does not have dryer, scrubber or pond/reservoir

CHAPTER 2 - ENVIRONMENTAL CHECKLIST

Introduction

General Information

Environmental Factors Potentially Affected

Determination

Environmental Checklist and Discussion

INTRODUCTION

The environmental checklist provides a standard evaluation tool to identify a project's adverse environmental impacts. This checklist identifies and evaluates potential adverse environmental impacts that may be created by the proposed project.

GENERAL INFORMATION

Project Title:	Proposed Rule 1420.1 ─ Emissions Standard For Lead From Large Lead-Acid Battery Recycling Facilities
Lead Agency Name:	South Coast Air Quality Management District
Lead Agency Address:	21865 Copley Drive, Diamond Bar, CA 91765
CEQA Contact Person:	James Koizumi, (909) 396-3234
PR 1420.1 Contact Person:	Eugene Kang, (909) 396-3524
Project Sponsor's Name:	South Coast Air Quality Management District
Project Sponsor's Address:	21865 Copley Drive, Diamond Bar, CA 91765
General Plan Designation:	Not applicable
Zoning:	Not applicable
Description of Project:	PR 1420.1 would protect public health by reducing lead emissions produced by large lead-acid battery recycling facilities. PR 1420.1 would accomplish this by requiring enclosures for lead processes, pollution control equipment for lead point sources and additional housekeeping. Owner/operators of affected facilities would be required to meet a standard for lead of 0.15 micrograms per cubic meter averaged over any 30 consecutive days. Additionally, the proposed rule includes source testing, air monitoring, and recordkeeping requirements.
Surrounding Land Uses and Setting:	Primarily industrial and commercial facilities
Other Public Agencies Whose Approval is Required	Not applicable

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The following environmental impact issues have been assessed to determine their potential to be affected by the proposed project. As indicated by the checklist on the following pages, environmental topics marked with an "✓" may be adversely affected by the proposed project. An explanation relative to the determination of impacts can be found following the checklist for each area.

☐	Aesthetics	☐	Geology and Soils	☐	Population and Housing
☐	Agricultural Resources	☑	Hazards and Hazardous Materials	☐	Public Services
☑	Air Quality	☑	Hydrology and Water Quality	☐	Recreation
☐	Biological Resources	☑	Land Use and Planning	☑	Solid/Hazardous Waste
☐	Cultural Resources	☐	Mineral Resources	☐	Transportation./Traffic
☑	Energy	☐	Noise	☑	Mandatory Findings

DETERMINATION

On the basis of this initial evaluation:

☑ I find the proposed project, in accordance with those findings made pursuant to CEQA Guideline §15252, COULD NOT have a significant effect on the environment, and that an ENVIRONMENTAL ASSESSMENT with no significant impacts has been prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will NOT be significant effects in this case because revisions in the project have been made by or agreed to by the project proponent. An ENVIRONMENTAL ASSESSMENT with no significant impacts will be prepared.

☐ I find that the proposed project MAY have a significant effect(s) on the environment, and an ENVIRONMENTAL ASSESSMENT will be prepared.

☐ I find that the proposed project MAY have a "potentially significant impact" on the environment, but at least one effect 1)has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL ASSESSMENT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier ENVIRONMENTAL ASSESSMENT pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL ASSESSMENT, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Date: April 23, 2010 Signature: Susan Nakamura

Susan Nakamura
Planning and Rules Manager

CHANGES TO PR 1420.1 SINCE THE DRAFT EA

Subsequent to the release of the Draft EA for public review, PR 1420.1 several requirements were added, deleted or modified. The following briefly summarizes proposed modifications to PR 1420.1. A more detailed description of the proposed modifications to PR 1420.1 can be found in Chapter 1 of this Final EA.

- Addition of total facility lead point source emission rate limitation and maximum individual lead point source emission rate (pound per hour)
- Removal of 99 percent control efficiency compliance option for lead control devices
- Addition to require use of specific filters/bags in lead control devices
- Addition of requirement to added secondary lead controls on dryers
- Removal of vehicle wet wash area requirement
- Change in schedule of roof cleaning requirement with the new compliance option of vacuuming surfaces or wet washing
- Public notifications for:
    - Unplanned and planned shutdowns/turnarounds of specific equipment
    - Specific types of maintenance activity

Secondary Lead Controls on Dryers

The addition of secondary lead controls on dryers would require one of the two affected facilities to install a new baghouse. The new baghouse would require demolition of a 52 foot by 52 foot concrete area and removal of any contaminated soil, which is expected to be contaminated with lead. Since lead does not typically migrate any appreciable distance, SCAQMD staff estimates that soil would need to be removed to a depth of two feet at most. Based on discussion with facility operators, the lead contaminated concrete and soil would be hauled to the US Ecology Beatty Facility, Beatty Nevada.

After demolition, a new concrete pad would be poured to support the new control equipment. A new baghouse would then be installed and the dryer would be ducted to the new baghouse. Analysis of demolition and paving were added to the aesthetic, agriculture and forest resources, air quality, biological resources, cultural resources, energy, geology and soils, noise and solid/hazardous waste environmental topics.

Control Efficiency, Emission Rates and Specification of Filters and Bags

The lead control device efficiency in the version of PR 1420.1 that was circulated with the Draft EA has been replaced with emission rate limits for both the control devices and total facility. Specifications have been added for filters and bags. These changes were made to provide easier verification of compliance and to clarify the characteristics of the control devices expected to be used to comply with PR 1420.1. The purpose of the control efficiency or emission rate limits and filter and bag specifications would be to reduce emissions into the atmosphere, which contribute to ambient air concentrations of lead that exceed 0.15 micrograms per cubic meter averaged over any 30 consecutive days. No change in construction or operation that was analyzed in the Draft EA would be expected by the changes.

Removal of Vehicle Wet Wash Area Requirement

SCAQMD staff determined that the vehicle wet washing area requirement would be required as an additional lead reduction measure of the Compliance Plan if deemed necessary. Therefore, this proposed requirement was removed from PR 1420.1. Construction and water use from the

vehicle wet wash area were analyzed in the Draft EA circulated for public comment. Impacts from wet washing were removed from the analysis in the Final EA.

Change to Schedule in Roof Washing Requirements

The roof washing requirement in the version of PR 1420.1 circulated with the Draft EA for public comment required weekly washing of roof top structures.

The current proposal allows either wet washing or cleaning with a vacuum equipped with a filter rated by the manufacture to achieve a 99.97 percent capture efficiency for 0.3 micro particles. The current proposal requires immediate cleaning (no later than one hour) after any maintenance activity or event including, but not limited to accidents, process upsets or equipment malfunction that causes the deposition of fugitive lead dust onto roof tops or areas where lead-containing waste are generated from housekeeping areas are stored, disposed of, recovered or recycled. The weekly routine cleaning of areas where lead-containing waste are generated from housekeeping areas are stored, disposed of, recovered or recycled is the same as the version of PR 1420.1 circulated with the Draft EA for public comment. Immediate cleanings of roof tops would be required to be completed within 72 hours if the facility owners/operators can demonstrate that delays were due to safety or timing issues. Monthly cleaning of roof tops of structures equal or less than 45 feet in high that house areas associated with the storage, handling or processing of lead-containing materials would be required. Quarterly cleaning, no more than three calendar months apart, of roof tops of structures greater 45 feet in high that house areas associated with the storage, handling or processing of lead-containing materials would be required.

SCAQMD staff expects that wet washing and vacuuming as specified would result in similar fugitive lead-dust emission reductions. SCAQMD staff also expects that the requirement to immediately clean roofs and areas where lead-containing waste are generated from housekeeping areas are stored, disposed of, recovered or recycled after any maintenance activity or event with the monthly and quarterly routine roof top cleanings would result in less lead-dust emissions than the weekly routine cleaning presented in the version of PR 1420.1 circulated with the Draft EA for public comment since both routine and unscheduled events would be addressed.

The modifications to the requirements would reduce the amount of water used and disposed, since less roof top washings are likely to be required and vacuuming could be substituted for washing. Since both facilities currently wash roofs it is unlikely that vacuuming would replace roof top washing. However, vacuuming may replace wet washing of areas where lead-containing wastes are generated from housekeeping areas are stored, disposed of, recovered or recycled. Pressure washers and vacuums are expected to use similar amount of electricity so no change to energy is expected. Analysis of vacuuming has been added to the solid/hazardous waste environmental topics.

Notification and Recordkeeping

Reporting and recordkeeping changes are not expected to impact any environmental topic.

Weekly Washings of Ponds or Reservoir

Only one of the affected facilities has a surface impoundment pond. The analysis in the Draft EA assumed that the facility operators at the affected facility already comply with the pond/reservoir housekeeping requirements in PR 1420.1. While facility operators does comply with the requirements to remove lead-containing material and sludge within 24 hours after the

water level is less than one inch at any point above the bottom of the surface impoundment pond. Under PR 1420.1, facility operators would need to wash down the empty surface impoundment pond weekly until the pond/reservoir is used to store water again. Water use from weekly washings has been added to the hydrology/water quality section of PR 1420.1.

Changes to the Environmental Checklist

At the time the Draft EA was circulated, the environmental checklist did not include impacts to forest lands as a topic to be evaluated as part of a CEQA document. SCAQMD staff revised the Environmental Checklist to reflect amendments to the CEQA Guidelines adopted by the Natural Resources Agency which became effective on March 18, 2010. These amendments contained revisions, which included the consideration of impacts to forestry lands and greenhouse gases (GHGs) in the environmental analysis. The topic of "Agriculture Resources" in the checklist was revised and renamed as "Agriculture and Forest Resources" and questions were added to address the consideration of impacts to forest resources. The topic of "Air Quality" in the checklist was revised and renamed as "Air Quality and Greenhouse Gases, and questions were added to address the consideration of impacts to GHG resources.

Although the Draft EA did not include a preliminary analysis of forest resources, to make the analysis of environmental impacts consistent with the recent changes to the environmental checklist, a discussion of indirect impacts from the proposed project that could conflict with, or cause rezoning of forest land has been included in this section of the Final EA. No significant impacts on forest resources were identified.

The Draft EA already evaluated impacts from GHGs on the environment. No significant impacts from GHGs were identified in the Draft EA. The existing analysis was renumbered to correspond to the GHG questions in the checklist.

Conclusion

The modifications were analyzed and SCAQMD staff concluded that recirculation was not necessary per CEQA Guidelines §15073.5, because the modifications were determined not to be a substantial revision (i.e., a new, avoidable significant effect that requires mitigation measure or project revisions to reduce the effect to insignificance or that project effects cannot be reduced to insignificant and new measures or project revisions are required). Recirculation is not required, because mitigation is not required (because PR 1420.1 would have less than significant impacts for all environmental topics); the modifications were not a response to written or verbal comments on the proposed effects identified in the Draft EA (since no comments were received on the Draft EA); modifications were not required by CEQA (no modifications were made because of CEQA requirements), and do not create new significant environmental effects (because PR 1420.1 would have less than significant impacts for all environmental topics), and it is not necessary to mitigate an avoidable significant effect (because PR 1420.1 would have less than significant impacts for all environmental topics); and new information added to the proposed project makes insignificant modifications to the Draft EA (because PR 1420.1 would have less than significant impacts for all environmental topics).

ENVIRONMENTAL CHECKLIST AND DISCUSSION

		Potentially Significant Impact	Less Than Significant Impact	No Impact
I.	**AESTHETICS.** Would the project:			
a)	Have a substantial adverse effect on a scenic vista?	☐	☐	☑
b)	Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☑
c)	Substantially degrade the existing visual character or quality of the site and its surroundings?	☐	☐	☑
d)	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☑

Significance Criteria

The proposed project impacts on aesthetics will be considered significant if:

- The project will block views from a scenic highway or corridor.
- The project will adversely affect the visual continuity of the surrounding area.
- The impacts on light and glare will be considered significant if the project adds lighting which would add glare to residential areas or sensitive receptors.

Discussion

I. a), b), c), & d) PR 1420.1 would require the construction of enclosures, control technology, ~~vehicle washing stations~~ and paving of dirt areas at two existing large lead-acid battery recycling facilities in the district. All construction activities would occur on-site at these existing facilities and are not expected to require substantial earthmoving. Changes to operations would include additional housekeeping activities to reduce lead emissions. All changes to operation would also occur on-site, with the exception of off-site monitors. Most of the processes at the two affected facilities are enclosed. Construction would consist of enclosing existing raw material processing operations, dryers and smelting operations and venting the enclosures to air pollution control devices; installing, ~~and vehicle washing stations~~ and paving any remaining dirt areas.

The enclosure of the remaining open processing operations and paving of any remaining dirt areas on-site would be consistent with the industrial area where these facilities are located. The other processes (refining and casting) are already vented to air pollution control systems. The air pollution control systems used for the enclosures and secondary lead controls on dryers are expected to be similar to existing systems, and therefore, similar to the existing aesthetics of the facility. ~~Vehicle washing stations are not expected to be visible from outside of the affected facilities.~~ Any portions that are visible are expected to appear as partial enclosures or piping that is similar to other structures and equipment on site.

Both affected facilities are twenty-four hour operations. Therefore, additional lighting may be required on the outside of new structures. However, any new lighting is expected to be similar to

existing lighting; therefore, similar in character to existing lighting. The facilities are also located in industrial areas that are zoned for continuous operation.

Off-site monitors may be place around the affected facilities. Off-site monitors would be placed manually without heavy construction. The off-site monitors typically consist of a two foot by eight foot platform, two meters above the ground. The monitors are place one meter above the platform. The monitors are expected appear similar to the industrial area surrounding the existing affected facilities.

Because PR 1420.1 affects operations on-site at existing facilities in industrial areas, any new construction at these affected facilities is expected to be similar to existing buildings or other structures, and off-site air monitors are expected to appear similar to the surrounding industrial area, PR 1420.1 is not expected to obstruct scenic resources or degrade the existing visual character of a site, including but not limited to, trees, rock outcroppings, or historic buildings. Further, additional light or glare is expected to be similar to existing lighting. Therefore, PR 1420.1 is not expected to adversely affect day or nighttime views in the area.

Based upon these considerations, significant adverse aesthetics impacts are not anticipated and will not be further analyzed in this ~~Draft~~ Final EA. Since no significant aesthetics impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that aesthetic impacts from the overall project are less than significant.

		Potentially Significant Impact	Less Than Significant Impact	No Impact
II.	**AGRICULTURE ~~RESOURCES~~ AND FOREST RESOURCES.** Would the project:			
a)	Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☑
b)	Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☑

		Potentially Significant Impact	Less Than Significant Impact	No Impact
c)	~~Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?~~ Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code §12220(g)), timberland (as defined by Public Resources Code §4526), or timberland zoned Timberland Production (as defined by Government Code §51104 (g))?	☐	☐	☑
d)	Result in the loss of forest land or conversion of forest land to non-forest land	☐	☐	☑

Significance Criteria

Project-related impacts on agricultural resources will be considered significant if any of the following conditions are met:

- The proposed project conflicts with existing zoning or agricultural use or Williamson Act contracts.
- The proposed project will convert prime farmland, unique farmland or farmland of statewide importance as shown on the maps prepared pursuant to the farmland mapping and monitoring program of the California Resources Agency, to non-agricultural use.
- The proposed project conflicts with existing zoning for, or causes rezoning of, forest land (as defined in Public Resources Code §12220(g)), timberland (as defined in Public Resources Code §4526), or timberland zoned Timberland Production (as defined by Government Code § 51104 (g)).
- The proposed project would involve changes in the existing environment, which due to their location or nature, could result in conversion of farmland to non-agricultural uses or forest to non-forest use.

Discussion

II. a), b), c) & ~~e~~d) PR 1420.1 would require the construction of enclosures, control technology~~,~~ ~~vehicle washing stations~~ and air monitors at two existing large lead-acid battery recycling facilities in the district. All construction activities would occur on-site at these existing facilities and are not expected to require substantial earthmoving. A 52 foot by 52 foot section of concrete would be removed along with soil to a depth of two feet so a concrete pad could be poured to support the secondary control of a dryer. Since the affected facilities are located in industrial areas that have been previously disturbed the removal of the concrete and soil is not expected to adversely impact agricultural or forest resources. Changes to operations would include additional housekeeping activities to reduce lead emissions. All changes to operation would also occur on-site.

Air monitors may be place off-site of the facility in the surrounding industrial area. Air monitors are expected to be placed at industrial sites on paved surfaces that have also already been greatly disturbed.

Therefore, the proposed project would not result in any construction of new buildings or other structures that would require converting farmland to non-agricultural use, or conflict with zoning for agricultural use or a Williamson Act contract, conflict with zoning for or cause reszoning of forest land, timber land or loss of forest land, or conversion of forest land to non-forest ues. Since the proposed project would not substantially change the facility or process at the facility, there are no provisions in PR 1420.1 that would affect land use plans, policies, or regulations. Land use and other planning considerations are determined by local governments and no land use or planning requirements relative to agricultural or forest resources would be altered by the proposed project.

Based upon these considerations, significant agricultural or forest resource impacts are not anticipated and will not be further analyzed in this ~~Draft~~ Final EA. Since no significant agriculture or forest resources impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that agricultural and forest resource impacts from the overall project are less than significant.

	Potentially Significant Impact	**Less Than Significant Impact**	**No Impact**
III. AIR QUALITY AND GREENHOUSE GAS EMISSIONS. Would the project:			
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☑
b) Violate any air quality standard or contribute to an existing or projected air quality violation?	☐	☑	☐
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)?	☐	☑	☐
d) Expose sensitive receptors to substantial pollutant concentrations?	☐	☑	☐
e) Create objectionable odors affecting a substantial number of people?	☐	☐	☑
f) Diminish an existing air quality rule or future compliance requirement resulting in a significant increase in air pollutant(s)?	☐	☐	☑

	Potentially Significant Impact	Less Than Significant Impact	No Impact
g) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☑
h) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☑

Significance Criteria
Potential significant adverse air quality impacts will be evaluated and compared to the significance criteria in Tables 2-1a and 2-1b. If impacts equal or exceed any of the following criteria, they will be considered significant.

Discussion
PR 1420.1 would require the construction of enclosures, control technology~~, vehicle washing stations~~ and paving of dirt areas at two existing large lead-acid battery recycling facilities in the district. All construction activities would occur on-site at these existing facilities. Air monitors would not require construction and would be placed at industrial sites around the affected facility. ~~Based on discussions with the facility operators construction would occur on existing paved surfaces and are not expected to require earthmoving.~~ A 52 foot by 52 foot section of concrete would be removed along with soil to a depth of two feet so a concrete pad could be poured to support the secondary control of a dryer.

Changes to operations would include additional housekeeping activities to reduce lead emissions. All changes to operation would also occur on-site. Most of the processes at the two affected facilities are enclosed. Construction would consist of enclosing existing raw material processing operations at both affected facilities, and smelting and drying operations at one of the facilities; venting the enclosure to air pollution control devices at both facilities; installing additional baghouses at one facility~~; installing vehicle washing stations at both facilities~~; and paving any remaining dirt areas at both facilities.

III. a) The SCAQMD is required by law to prepare a comprehensive districtwide AQMP which includes strategies (e.g., control measures) to reduce emission levels to achieve and maintain state and federal ambient air quality standards, and to ensure that new sources of emissions are planned and operated to be consistent with the SCAQMD's air quality goals. The AQMP's air pollution reduction strategies include control measures which target stationary, mobile and indirect sources. These control measures are based on feasible methods of attaining ambient air quality standards. Pursuant to the provisions of both the state and federal CAAs, the SCAQMD is required to attain the state and federal ambient air quality standards for all criteria pollutants, including lead. PR 1420.1 will not obstruct or conflict with the implementation of the AQMP because, overall, PR 1420.1 achieves net lead emission reductions. Further, the SCAQMD approved an air toxics planning document in March 2000 called "Final Draft Air Toxics Control

Plan (ATCP) for the Next Ten Years." PR 1420.1 would reduce lead emissions and therefore, be consistent with the goals of both the AQMP and ATCP. Therefore, implementing PR 1420.1 would not conflict or obstruct implementation of the AQMP or ATCP.

III. b), c) d) & f) For a discussion of these items, refer to the following analysis:

Construction Air Quality Impacts

New Affected Facilities

SCAQMD staff is not aware of any new large lead recycling facilities planned to be constructed in the future. Construction related to PR 1420.1 at new facilities would be similar to construction of structures to support the new large lead recycling processes. The same construction equipment used to build the facility is expected to build enclosures and control equipment at new facilities. However, construction of new large lead recycling facilities is considered speculative according to CEQA Guidelines §15145 at this time and will not be evaluated further in this analysis.

Existing Affected Facilities

One of the two existing facilities affected by PR 1420.1 has been issued air quality permits to construct enclosures and to install an air pollution control system (exhaust system with two baghouses) from the battery breaking area. These permit applications were submitted to comply with existing agreements with SCAQMD and other agencies. ~~Although no permit applications have been submitted for the vehicle washing system at this facility, it was assumed to be included in the construction for this analysis. A permit application for a vehicle washing system would be expected to be filed, if PR 1420.1 is adopted.~~

The other existing facility affected by PR 1420.1 has submitted air quality permit applications for enclosures and air pollution control systems for the raw material preparation system, smelting and refining building system and rotary dryers. The air pollution control systems would consist of exhaust systems, a spark arrestor, high efficiency particulate absorbing (HEPA) filter mist eliminator for an existing scrubber~~, vehicle wash system~~ and sweeper. These permit applications were submitted to comply with existing agreements with SCAQMD and other agencies. A permit application for a secondary lead-control device for the rotary dryers would be expected to be filed, if PAR 1420.1 is adopted.

PR 1420.1 was modified subsequent to the circulation of the Draft EA for public comment. The modifications include a requirement to add secondary lead control device to the exhaust of primary lead controlled devices used for dryers. The addition of a secondary control device at one of the affected large lead-acid battery recycling facilities would require demolition of a 52 foot by 52 foot area of concrete. The soil under the concrete area may be contaminated with lead. Since lead dose not typically migrate over any appreciable distance through soil, SCAQMD staff assumed that two feet of soil at most would be required to be removed. Based on the dimensions of the area demolished and a depth of two feet, approximately 200 cubic yards of lead-contaminated debris would need to be removed. The concrete and soil would be considered hazardous waste and the facility owner/operators have stated that the debris would be sent to US Ecology Beatty Facility, Beatty Nevada. Based on a capacity of 30 cubic yards per haul truck, seven haul truck trips would be required to haul the concrete and soil debris. The distance traveled by haul trucks within SCAQMD jurisdiction (distance from the affected facility to Castaic) is approximately 68 miles one-way. The distance traveled by haul trucks within MDAQMD jurisdiction (distance from the Castaic to Nevada) is approximately 191 miles one-way. Emissions calculations for vehicle trips were based on two-way trips.

Even though enclosures~~,~~ and air pollution control systems ~~and vehicle wash system~~ at the affected facilities construction would be done to fulfill obligations other than PR 1420.1, construction emissions were estimated since these structures, control technology and housekeeping activities would be required by PR 1420.1. Based on discussions with owner/operators at the affected large lead-acid battery recycling facilities, construction at the two facilities is not expected to overlap. In addition, demolition, concrete paving and structure construction phase are not expected to overlap.

PR 1420.1 includes requirements for air monitors. Air monitors are placed on two meter height platforms that are two feet wide by eight feet long. Other than placing the monitors on the platforms, air monitors do not require construction. Therefore, no construction emissions are associated with the air monitors. The delivery of the air monitors would be less than the peak day emissions associated with construction of the enclosures, ducting and control systems.

PR 1420.1 includes a requirement to enclose turnaround and maintenance activities in negative air containment enclosures vented to a permitted negative air machine. These enclosures are expected to be tarps or plastic sheeting supported by frames. No construction emissions are expected to be generated by the assembly of the tarps or plastic sheeting for turnaround and maintenance activities.

Construction emissions related to PR 1420.1 are presented in Appendix B and summarized in Tables 2-2a and 2-2b. Construction emissions were estimated from construction equipment, delivery vehicles and worker vehicles. Construction equipment, delivery vehicles and worker vehicle types and numbers were estimated based on the enclosure sizes (3.1 acres for both sites) and information from sample construction scenarios posted on the SCAQMD webpage (http://www.aqmd.gov/ceqa/handbook/LST/LST.html). Demolition, concrete paving and structure construction would occur within SCAQMD's jurisdiction, these activities (including vehicle travel within SCAQMD's jurisdiction) are compared to SCAQMD significance thresholds. Since haul trucks containing demolition debris would travel through MDAQMD's jurisdiction, emissions from haul truck travel through MDAQMD's jurisdiction are compared to MDAQMD significance thresholds. All construction criteria emissions are below the significance thresholds presented in Tables 2-1a and 2-1b; therefore, PR 1420.1 is not expected to be significant for construction emissions.

Table 2-2a
Criteria Emissions from Construction in SCAQMD

Description	CO, lb/day	NOx lb/day	VOC lb/day	SOx lb/day	PM10 lb/day	PM2.5 lb/day

Exceed Significance?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**

Operational Air Quality Impacts

PR 1420.1 requires enclosing and controlling emissions from lead recycling operations and additional housekeeping operations (encapsulation of all facility grounds, washing roof tops, paved surfaces and vehicles; replacing steel hot acid gas exhaust duct sections, pond or reservoir lead material management, and sweeping). PR 1420.1 also includes provisions for ambient air monitoring, sampling and source testing. Compliance plans would be required if any facility is found to exceed an early detection ambient air lead concentration of 0.12 microgram per cubic meter averaged over any 30 consecutive days measured by facility monitors set up pursuant to PR 1420.1.

Table 2-2b
Criteria Emissions from Construction in MDAQMD

Description	CO, lb/day	NOx lb/day	VOC lb/day	SOx lb/day	PM10 lb/day	PM2.5 lb/day
Demolition Phase	30.5	97.5	7.8	0.1	4.7	4.1
MDAQMD Significance Threshold	*548*	*137*	*137*	*137*	*82*	*82*
Exceed Significance?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**

Enclosing and Controlling Emissions
Most operating processes at the two affected facilities are enclosed and already controlled. One facility would add one new enclosure and two new baghouses. The other facility would add new enclosures that would vent to existing control systems. The additional enclosures and lead emission control equipment would reduce lead emissions and is not expected to directly increase any other emissions (i.e., criteria, toxic or GHG emissions).

Secondary emissions ~~form~~ from vehicles may be generated by the transport of new and spent filters; however, filters are expected to be purchased and disposed with existing filters used at the facility and other hazardous wastes generated at the facility. Therefore, no new trips are expected.

Therefore, no new emissions are expected from operation of enclosures and lead control technology requirements.

Housekeeping Operations
The affected facilities already perform many of the housekeeping requirements of the proposed rule. Almost all unpaved areas are encapsulated, operators already wash down paved operating areas, lead material is managed in pond and reservoir areas, and operators already sweep affected facilities. PR 1420.1 would increase the frequency of housekeeping operations, increase roof top washing, and process area sweeping ~~and add vehicle wet washing~~. None of the housekeeping operations are expected to directly increase criteria, toxic or greenhouse gas emissions. Secondary criteria emissions may increase from the additional sweeping and aerial lifts used for roof washing. One affected facility operator sweeps three times a day with LNG sweepers, which complies with PR 1420.1, but washes low roofs monthly and high roofs semi-annually. The other affected facility operator sweeps once a day with a diesel sweeper, so sweeping would have to increase to three times a day to be compliant with PR 1420.1. This facility uses sprinklers to wash roofs every day so no new secondary emissions would be generated. Emissions were estimated for the two extra sweeping events required at the affected facility that currently only sweeps once per day and from increasing the use of aerial lifts to weekly at the other affected facility. Emissions from sweepers were estimated by assuming that sweepers would be nine feet wide, sweep over the entire outside area around the production site (i.e., not around administrative buildings) two additional times a day with two feet of overlap on the return path as the sweepers travel back and forth. Emissions from aerial lifts assumed that lifts were operated six hours per day for two days, fifty times more a year (52 weeks minus the existing two weeks, since roofs are washed semi annually).

Based on a 10 mile per gallon fuel consumption, 65 additional gallons of diesel would be required annually for the two additional sweepings at the facility that is swept only once per day. The additional consumption of 65 gallons of diesel per year is not expected to require an additional fueling trip, so no increase in emissions are expected from diesel delivery trips. No additional LNG fueling trips are expected because the facility operators currently comply with the PR 1420.1 requirement to sweep three times per day.

Roof washing is contracted out so aerial lifts are delivered to the affected facility. A single heavy-duty diesel truck round trip of 40 miles per day is expected to be required on a peak day.

Minor emissions from welding may be generated by increased replacement of steel hot acid gas exhaust duct sections; and the replacement of sections is expected to be infrequent. Welding equipment is expected to be electric, so emissions would be generated only from the welding process itself. Emissions from welding by increased replacement of steel hot acid gas exhaust duct sections are expected to be infrequent and less than significant.

Air monitors would be visited every other day. One affected facility is located 30 miles from the district; the other is located 10 miles from the district. Therefore, a total of 80 miles may be traveled round trip to visit the air monitors.

Criteria emissions are presented in Table 2-3 and detailed in Appendix B. These emissions are less than the significance thresholds in Table 2-1; therefore, are expected to be less than significant.

Compliance Plans

SCAQMD staff expects that the enclosure, control technology and housekeeping requirements detailed in proposed project would reduce lead emission concentrations at the affected facilities to below 0.15 microgram per cubic meter concentration averaged over any 30 consecutive days measured by facility monitors compliant with PR 1420.1. Under PR 1420.1 compliance plans are required if the facility exceeds 0.12 microgram per cubic meter concentration averaged over any 30 days. Implementation of the approved compliance plans would occur if the facility exceeds the 0.15 microgram per cubic meter concentration averaged over any 30 consecutive days. It is unknown what types of measures the facility operators would include in the compliance plans, if this requirement is triggered. It is possible that compliance plans would consist of more frequent housekeeping activities, which as can be seen from the above analysis, are not expected to generate direct criteria emissions and generate secondary criteria emissions far below the significance thresholds.

Any compliance options that would require additional control equipment would need air quality permits. All permitted equipment is evaluated under CEQA.

Since enclosure, control and housekeeping requirements are expected to reduce lead emission concentrations at facilities to below 0.15 microgram per cubic meter averaged over any 30 consecutive days measured by facility monitors and compliance plans would address specific emission sources that are not known at this time; adverse impacts from compliance plans are considered speculative according to CEQA Guidelines §15145 and will not be evaluated further in this analysis.

Table 2-3
Secondary Criteria Emissions from Housekeeping Operation

Description	CO, lb/day	NOx, lb/day	VOC, lb/day	SOX, lb/day	PM10, lb/day	PM2.5, lb/day
Heavy-Duty Sweeper	0.39	0.43	0.05	0.001	0.02	0.01
Aerial Lift	1.26	2.2	0.40	0.002	0.15	0.14
Aerial Lift Delivery	0.96	3.06	0.24	0.003	0.15	0.13

Total	3.3	5.7	0.77	0.007	0.32	0.28
Significant Thresholds	550	55	55	150	150	55
Significant?	No	No	No	No	No	No

Toxic Air Contaminants (TACs)
PR 1420.1 is designed to reduce lead emissions from lead-acid battery recycling facilities. PR 1420.1 is expected to reduce lead emission concentrations to below 0.15 microgram per cubic meter averaged over any 30 consecutive days.

Construction TACs
Since facilities currently sweep and would be required to sweep three times per day, and construction is expected to occur on existing paved surfaces; construction is not expected to generate lead dust emission from lead entrained in soils and on paved surfaces.

Secondary diesel exhaust particulate emissions are expected from construction equipment to build enclosures, ventilation for the enclosures and control equipment. Based on existing permit applications for the enclosures, ventilation for the enclosures and control equipment, construction should be completed within nine months at one affected facility and two months at the other affected facility. Since diesel exhaust particulates are carcinogenic TACs that are evaluated over 40 year exposure durations for off-site workers and 70-year exposure durations for sensitive receptors, construction projects lasting less than a year are not expected to be significant for toxic air contaminant emissions.

Operation TACs
PR 1420.1 is not expected to generate direct emissions from operations. The enclosures and control equipment are not expected to generate TAC emissions. Housekeeping is not expected to generate direct TAC emissions, and compliance plan requirements are considered to be speculative.

No additional quantifiable health risk is expected by one additional gasoline vehicle trip to each facility to visit air monitors every other day.

Secondary diesel exhaust particulate emissions are expected to be generated by sweeping requirements. One facility is currently swept three times a day with LNG sweepers, which complies with PR 1420.1. The other facility is swept once a day with diesel sweepers. Emissions were estimated for the two extra times sweeping would be required at the affected facility that currently only sweeps once per day.

Since the additional sweeping is only expected to require 65 gallons more fuel per year, no additional diesel fuel delivery is expected, so there would be no new health risk from diesel fuel delivery.

Secondary diesel exhaust particulate emissions are also expected to be generated by aerial lifts used to wash roofs. One facility uses sprinklers to wash roofs, so no additional health risk would be generated from this facility. The other facility uses aerial lifts to wash the tallest buildings twice a year. It takes two days to wash the tallest buildings with six hours of aerial lift use. PR 1420.1 would increase washing to every week. So, PR 1420.1 would increase building washing by 100 days per year (two days per washing, 50 weeks per year (52 weeks minus the two weeks when washing is currently done)).

Since health risk is localized, it must be evaluated at each of the affected facilities:

Health Risk from Facility A

Health risk was estimated based on diesel exhaust particulate emissions from increased roof washing at the other affected facility. Facility operators at this facility already sweep three times per day required by PR 1420.1, so no increased health risk would be caused by sweeping at this facility. Using SCAQMD Tier II health risk methodology, sensitive/residential receptor carcinogenic health risk would increase by 0.2 in one million. Off-site worker carcinogenic health risk would increase by 2.2 in one million according to air dispersion modeling using ISCST3. Both off-site worker and sensitive/residential receptor carcinogenic health risk are less than the significance threshold of 10 in one million; therefore, PR 1420.1 is not expected to cause a significant adverse health risk impact to receptors near this facility.

Health Risk from Facility B

Health risk was estimated based on diesel exhaust particulate emissions from sweeping two more times at the facility that currently only sweeps once a day. This facility uses sprinklers to wash roof tops, so no increased health risk would be caused by roof washing. Using SCAQMD Tier II health risk methodology, off-site worker receptor carcinogenic health risk would increase by 0.5 in one million and sensitive/residential receptor carcinogenic health risk would increase by 0.1 in one million. Both off-site worker and sensitive/residential receptor carcinogenic health risk are less than the significance threshold of 10 in one million; therefore, PR 1420.1 is not expected to cause a significant adverse health risk impact to receptors near this facility.

III. g) & h) Global Warming and Greenhouse Gases

In addition to criteria pollutant emissions, combustion processes generate GHG emissions that have the potential to affect global climate. Reducing the lead emission from lead-acid battery recycling facilities does not directly produce GHGs. However, sweepers used for housekeeping during the operational phase are expected to generate GHG emissions in combustion exhaust. The following GHG analysis focuses primarily on CO2 emissions because CO2 is the primary GHG pollutant emitted during the combustion process and is the GHG pollutant for which emission factors are most readily available. ARB EMFAC2007 emission factors for on-road mobile sources were used to determine carbon dioxide (CO2) and methane (CH4) emission factors. ARB OFFROAD2007 emission factors for off-road mobile sources were used to determine carbon dioxide (CO2) and methane (CH4) emission factors. EMFAC2007 and OFFROAD2007 does not include nitrous oxide (N2O) emission factors for the vehicles and

equipment assumed for this project, so NO2 emission factors were developed from the ratio of CH4 and NO2 emissions factors presented in ARB's Regulation for the Mandatory Reporting of Greenhouse Gas Emissions for on-road mobile sources.

The analysis of GHGs is a much different analysis than the analysis of criteria pollutants for the following reasons. For criteria pollutants, significance thresholds are based on daily emissions because attainment or non-attainment is based on daily exceedances of applicable ambient air quality standards. Further, several ambient air quality standards are based on relatively short-term exposure effects on human health, e.g., one-hour and eight-hour. Since the half-life of CO2 is approximately 100 years, the effects of GHGs are longer-term, affecting global climate over a relatively long time frame. As a result, GHG emission impacts are considered to be cumulative impacts rather than project-specific impacts.

Detailed calculations are presented in Appendix B. PR 1420.1 is expected to result in an incremental increase of 30 metric tons of CO2eq emissions per year from construction, which is 927 metric tons from construction amortized over a 30 year period as proscribed in the Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans[4] adopted by the SCAQMD Governing Board in December 2008. Operational CO2eq emissions are expected to be 54 metric tons per year (20 metric tons from sweeping, 11 metric tons from aerial lifts for roof washing, 15 tons from delivery of aerial lifts and 7.3 metric tons from ~~district~~ SCAQMD staff visiting air monitors). An incremental increase of 84 tons (30 metric tons from construction and 54 metric tons from operations) per year of CO2 emissions is less than the significance threshold of 10,000 metric tons of CO2 per year. PR 1420.1 would reduce lead emissions, which along with other control measures in the 2007 AQMP, are a comprehensive ongoing regulatory program that would reduce overall GHGs emissions. GHG emissions are summarized in Table 2-4. Based on the above analysis, PR 1420.1 would not generate GHG emissions either directly or indirectly, that may have a significant impact on the environment or conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions. Therefore, PR 1420.1 is not considered significant for adverse GHG impacts.

III. e) As previously noted, implementing PR 1420.1 is not expected to directly require construction to install control equipment or construction of new structures other than a secondary lead control device for a dryer ~~an additional vehicle washer~~, since permit applications for required structures and control equipment have been submitted to address other existing obligations. However, since PR 1420.1 also includes requirements for these structures and control equipment, odors related to construction and operation of these structures and control equipment are addressed here. Construction is expected to occur on-site ~~and is not expected to require the use of large earthmoving equipment~~. Also, the affected facilities are located in industrial facilities where heavy duty diesel trucks already operate. Therefore, the addition of several pieces of construction equipment is not expected to generate diesel exhaust odor greater than what is already present.

[4] Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans, http://www.aqmd.gov/hb/2008/December/081231a.htm.

Table 2-4
Secondary GHG Emissions from the Proposed Project ~~Housekeeping~~ Operation

Description	CO2, Mton/year	CH4, Mton/year	N2O, Mton/year	CO2eq, Mton/year
Demolition	0.26	0.000012	0.000005	0.26
Concrete Paving	0.056	0.000007	0.000006	0.056
Structure Construction	30	0.0025	0.0021	30
Total Construction*	30	0.0025	0.0021	30
Sweepers	20	0.0009	0.00008	20
Aerial Lifts	11	0.0004	0.001	11
Aerial Lift Delivery	15	0.0005	0.00004	15
Air Monitor	7.3	0.0005	0.0007	7.3
Total Operation	54	0.0024	0.0015	54
Project Total	**84**	**0.005**	**0.004**	**84**

Construction emissions were estimated for construction equipment at both affected facilities. Construction emissions are spread evenly over 30 years per Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans, http://www.aqmd.gov/hb/2008/December/081231a.htm .
Operational emissions were estimated for sweepers and air monitoring station visits.

PR 1420.1 would require additional sweeping and roof washing at the facilities. Heavy-duty diesel trucks are used to deliver used batteries and to ship recycled lead product. Additional exhaust from more frequent sweeping and roof washing activities is not expected to generate diesel exhaust odor greater than what is already present.

Therefore, no significant adverse odor impacts are expected from implementing PR 1420.1.

Based upon these considerations, the air quality impacts associated with increased emissions of criteria pollutants, toxic air contaminants and GHG emissions are not expected to be significant. Therefore, based on the analysis above, PR 1420.1 is not expected to generate significant air quality impacts and will not be evaluated further in this ~~Draft~~ Final EA. Since no significant adverse air resources impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that air quality and greenhouse gas emissions impacts from the overall project are less than significant.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
IV. BIOLOGICAL RESOURCES. Would the project:			
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☑
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☑
c) Have a substantial adverse effect on federally protected wetlands as defined by §404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☑
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☑
e) Conflicting with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☑
f) Conflict with the provisions of an adopted Habitat Conservation plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☑

Significance Criteria

Impacts on biological resources will be considered significant if any of the following criteria apply:

- The project results in a loss of plant communities or animal habitat considered to be rare, threatened or endangered by federal, state or local agencies.
- The project interferes substantially with the movement of any resident or migratory wildlife species.
- The project adversely affects aquatic communities through construction or operation of the project.

Discussion

IV. a), b), c), & d) PR 1420.1 would require the construction of enclosures, control technology~~,~~ ~~vehicle washing stations~~ and monitors at two existing large lead-acid battery recycling facilities in the district. All construction activities would occur on-site at these existing facilities and are not expected to require substantial earthmoving. A 52 foot by 52 foot section of concrete would be removed along with soil to a depth of two feet so a concrete pad could be poured to support the secondary control of a dryer. Since the affected facilities are located in industrial areas that have been previously disturbed the removal of the concrete and soil is not expected to adversely impact biological resources. Changes to operations would include additional housekeeping activities to reduce lead emissions. All changes to operation would also occur on-site. The existing large lead-acid battery recycling facilities are located in areas zoned as industrial, which have already been greatly disturbed.

Air monitors may be place off-site of the facility in the surrounding industrial area. Air monitors are expected to be place at industrial sites on paved surfaces that have also already been greatly disturbed.

In general, the affected facilities and surrounding industrial areas currently do not support riparian habitat, federally protected wetlands, or migratory corridors. Additionally, special status plants, animals, or natural communities identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service are not expected to be found in close proximity to the affected facilities. Therefore, the proposed project would have no direct or indirect impacts that could adversely affect plant or animal species or the habitats on which they rely in the SCAQMD's jurisdiction.

Compliance with PR 1420.1 is expected to reduce lead emissions from operations at the affected facilities, which would improve not worsen present conditions of plant and animal life. PR 1420.1 does not require acquisition of additional land or further conversions of riparian habitats or sensitive natural communities where endangered or sensitive species may be found.

IV. e) & f) The proposed project is not envisioned to conflict with local policies or ordinances protecting biological resources or local, regional, or state conservation plans because it will only affect two existing large lead-acid battery recycling located in industrial areas. PR 1420.1 is designed to reduce lead adverse impacts outside the boundaries of affected facilities. Land use and other planning considerations are determined by local governments and no land use or planning requirements would be altered by the proposed project. Additionally, the proposed project would not conflict with any adopted Habitat Conservation Plan, Natural Community Conservation Plan, or any other relevant habitat conservation plan, and would not create divisions in any existing communities because all activities associated with complying with PR 1420.1 would occur at existing industrial facilities.

The SCAQMD, as the Lead Agency for the proposed project, has found that, when considering the record as a whole, there is no evidence that the proposed project will have potential for any new adverse effects on wildlife resources or the habitat upon which wildlife depends. Accordingly, based upon the preceding information, the SCAQMD has, on the basis of substantial evidence, rebutted the presumption of adverse effect contained in §753.5 (d), Title 14 of the California Code of Regulations. Further, in accordance with this conclusion, the

SCAQMD believes that this proposed project qualifies for the no effect determination pursuant to Fish and Game Code §711.4 (c).

Based upon these considerations, significant adverse biological resources impacts are not anticipated and will not be further analyzed in this ~~Draft~~ Final EA. Since no significant adverse biological resources impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that biological resource impacts from the overall project are less than significant.

		Potentially Significant Impact	Less Than Significant Impact	No Impact
V.	**CULTURAL RESOURCES.** Would the project:			
a)	Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	☐	☐	☑
b)	Cause a substantial adverse change in the significance of an archaeological resource as defined in §15064.5?	☐	☐	☑
c)	Directly or indirectly destroy a unique paleontological resource, site, or feature?	☐	☐	☑
d)	Disturb any human remains, including those interred outside a formal cemeteries?	☐	☐	☑

Significance Criteria

Impacts to cultural resources will be considered significant if:

- The project results in the disturbance of a significant prehistoric or historic archaeological site or a property of historic or cultural significance to a community or ethnic or social group.
- Unique paleontological resources are present that could be disturbed by construction of the proposed project.
- The project would disturb human remains.

Discussion

V. a), b), c), & d) PR 1420.1 would require the construction of enclosures, control technology~~, vehicle washing stations~~ and paving of dirt areas at two existing large lead-acid battery recycling facilities in the district. All construction activities would occur on-site at these existing facilities and are not expected to require substantial earthmoving. A 52 foot by 52 foot section of concrete would be removed along with soil to a depth of two feet so a concrete pad could be poured to support the secondary control of a dryer. Since the affected facilities are located in industrial areas that have been previously disturbed the removal of the concrete and soil is not expected to adversely impact cultural resources. Changes to operations would include additional

housekeeping activities to reduce lead emissions. All changes to operation would also occur on-site.

Air monitors may be place off-site of the facility in the surrounding industrial area. Air monitors are expected to be place at industrial sites on paved surfaces.

The existing large lead-acid battery recycling facilities are located in areas zoned as industrial, which have already been greatly disturbed. Areas used for air monitors are also expected to be zoned industrial and previously disturbed. Therefore, PR 1420.1 is not expected to require physical changes to the environment that could disturb paleontological or archaeological resources. Therefore, the proposed project has no potential to cause a substantial adverse change to a historical or archaeological resource, directly or indirectly destroy a unique paleontological resource or site or unique geologic feature, or disturb any human remains, including those interred outside a formal cemeteries. Finally, because the proposed project would involve construction activities in previously disturbed areas on-site at industrial facilities and are not expected to require substantial earthmoving, it is unlikely that the county coroner or that the Native American Heritage Commission would need to be contacted. The proposed project is, therefore, not anticipated to result in any activities or promote any programs that could have a significant adverse impact on cultural resources in the district.

Based upon these considerations, significant adverse cultural resources impacts are not expected from implementing PR 1420.1 and will not be further assessed in this ~~Draft~~ Final EA. Since no significant cultural resources impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that cultural resources impacts from the overall project are less than significant.

		Potentially Significant Impact	Less Than Significant Impact	No Impact
VI.	**ENERGY.** Would the project:			
a)	Conflict with adopted energy conservation plans?	☐	☐	☑
b)	Result in the need for new or substantially altered power or natural gas utility systems?	☐	☑	☐
c)	Create any significant effects on local or regional energy supplies and on requirements for additional energy?	☐	☑	☐
d)	Create any significant effects on peak and base period demands for electricity and other forms of energy?	☐	☑	☐
e)	Comply with existing energy standards?	☐	☐	☑

Significance Criteria
Impacts to energy and mineral resources will be considered significant if any of the following criteria are met:
- The project conflicts with adopted energy conservation plans or standards.
- The project results in substantial depletion of existing energy resource supplies.
- An increase in demand for utilities impacts the current capacities of the electric and natural gas utilities.
- The project uses non-renewable resources in a wasteful and/or inefficient manner.

Discussion
VI. a) & e) PR 1420.1 does not require any action which would result in any conflict with an adopted energy conservation plan or violation of any energy conservation standard. PR 1420.1 is not expected to conflict with adopted energy conservation plans because existing facilities would be expected to continue implementing any existing energy conservation plans.

PR 1420.1 is not expected to cause new development. The local jurisdiction or energy utility sets standards (including energy conservation) and zoning guidelines regarding new development and will approve or deny applications for building new facilities. During the local land use permit process, the project proponent may be required by the local jurisdiction or energy utility to undertake a site-specific CEQA analysis to determine the impacts, if any, associated with the siting and construction of new development.

As a result, PR 1420.1 would not conflict with energy conservation plans, use non-renewable resources in a wasteful manner, or result in the need for new or substantially altered power or natural gas systems. Accordingly these impact issues will not be further analyzed in the ~~Draft~~ Final EA.

VI. b), c) & d. PR 1420.1 would increase electric use from additional blowers associated with controlling new enclosures. Diesel fuel would be consumed from construction and additional sweeping.

Electricity Impacts
The owner/operators at the two affected facilities are currently enclosing their raw material/battery breaking, smelting and rotary dryer areas. Based on permit applications the enclosures are expected to require two 100-horsepower blowers at one facility serviced by Southern California Edison (Edison), and two 100-horsepower blowers and two 150-horsepower blowers at the other facility serviced by the Los Angeles Department of Water and Power (LADWP).

Air monitors are expected to be powered by electricity service near where the air monitors are placed (i.e., may not be powered from the affected lead-acid battery recycling facilities). The air monitors typically require 16 amps of service (six amps for the monitor and 10 amps for vacuum pumps), which would be approximately two kilowatts (16 amps x 110 voltage). The addition of two kilowatts is not expected to be significant.

California Energy Commission staff reports that the southern California area (Edison Planning Area) consumed 105,054 gigawatts ~~megawatts~~ in 2008 with a peak consumption of 23,272

~~gigawatts~~ megawatts per hour that year.[5] The 142 kilowatts per hour required to run blowers at the affected facilities would be 1.3E-7 percent of the 2008 consumption and 0.001 percent of the peak area consumption that was available in 2008 (Table 2-5). The CEC staff reports that LADWP consumed 25,921 gigawatts in 2008 with a peak consumption of 5,717 megawatts per hour in 2008. The 319 kilowatts per hour required to run the blowers at the affect facility would be 319 kilowatts-hour, which is 1.2E-6 percent of the 2008 consumption and 0.006 percent of the peak consumption. Therefore, SCAQMD staff concludes that the amount of electricity required to meet the incremental energy demand associated with PR 1420.1 would be sufficient and would not result in a significant adverse electricity energy impact.

Table 2-5
Electricity Use

Area	Combined Blower Rating, HP	Electricity Use, kW/hr	Area Consumption, GW	Percent of Area Consumption	Area Peak Consumption MW/hr	Percent of Area Peak Consumption
Edison	200	142	105,054	1.3E-07	23,727	0.001
LADWP	450	319	25,921	1.2E-06	5,717	0.006

Diesel Impacts

Construction Diesel Use

Approximately 317 gallons of diesel fuel per day would be expected to be consumed by construction equipment and delivery trucks on a peak day. Since construction is phased, the additional diesel consumption from the demolition and construction of new baghouse for secondary control of a dryer is within the 317 gallons of diesel expected on a peak construction day, which would occur during the construction of enclosures. According to the 2007 AQMP, 10 million gallons of diesel is consumed every day. Since 317 gallons of diesel per day is far less than one percent (0.003 percent) of the diesel available, the proposed project is not considered to have a significant adverse diesel fuel use impact from construction.

Operational Diesel Use

Sweeper Diesel Use

One facility is currently swept three times a day with LNG sweepers, which complies with PR 1420.1. The other facility is swept once a day with diesel sweepers. Diesel use was estimated for the two extra sweeping events that would be required at the affected facility that currently only swept once per day. Diesel use was estimated assuming that sweepers would be nine feet wide, sweep over the entire outside area around the production site (i.e., not around administrative buildings) two times a day with two feet of overlap on the return path as the sweepers travel back and forth. Assuming a ten mile per gallon of diesel fuel efficiency approximately 2.1 gallons of diesel would be consumed on a peak day.

[5] Supply from California Energy Commission's Energy Almanac at http://energyalmanac.ca.gov/naturalgas/natural_gas_receipts.html.

Since the additional sweeping is only expected to require 65 gallons more fuel per year, no additional diesel fuel delivery is expected, so there would be no additional diesel fuel use from diesel fuel delivery.

Aerial Lift Diesel Use
One facility uses sprinklers to wash roofs, so no fuel is required. The other facility uses aerial lifts to wash tall roof tops. The aerial lifts are used six hours per day. Diesel fuel use was estimated using a 1.4 gallon per hour fuel consumption from OFFROAD2007. The diesel fuel use from aerial lifts would be 8.4 gallons per day.

Roof washing is contracted out so aerial lifts are delivered. A single heavy-duty diesel truck round trip of 40 miles per day is expected to be required on a peak day. Assuming a ten mile per gallon of diesel fuel efficiency approximately eight gallons of diesel would be consumed on a peak day.

According to the 2007 AQMP, 10 million gallons of diesel is consumed every day in California. Since 18.5 gallons of diesel fuel per day (2.1 gallons from sweepers, 8.4 from aerial lifts and eight gallons from aerial lift delivery) is less than one percent (0.0002 percent) of the diesel available, the proposed project is not considered to have a significant adverse operational impact for diesel fuel use.

Gasoline Usage

Construction Gasoline Use
Nine construction worker trips are expected on a peak day. Based on a 20 mile round trip, and a 16 mile per gallon fuel efficiency, approximately 10 gallons of gasoline would be used on a peak day. The 2007 AQMP states that 44 million gallons of gasoline are consumed per day in California. An additional 10 gallons of gasoline consumed on a peak day (0.00002 percent of the daily consumption) is not expected to have an adverse impact on gasoline supplies.

Operational Gasoline Use
One trip to each facility to visit air monitors, based on 80 miles round trip (30 miles to one facility and 10 miles to the other from the district), and a 16 mile per gallon fuel efficiency, would consume approximately five gallons of gasoline on a peak day. An additional five gallons of gasoline consumed on a peak day (0.00001 percent of the daily consumption) is not expected to have an adverse impact on gasoline supplies.

Based upon the above considerations, the proposed project is not expected to use energy in a wasteful manner, would not substantially deplete energy resources.

Based upon the preceding analysis, it is not expected that PR 1420.1 would create any significant effects on peak and base period demands for electricity and other forms of energy, create any significant effects on local or regional energy supplies or requirements for additional energy, or result in the need for new or substantially altered power or natural gas utility systems since only insignificant use of electricity and diesel fuel are expected.

Based upon these considerations, significant adverse impacts to energy are not expected from implementation of PR 1420.1 and will not be evaluated further in this ~~Draft~~ Final EA. Since no

significant energy impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that energy impacts from the overall project are less than significant.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
VII. GEOLOGY AND SOILS. Would the project:			
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:			
• Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?	☐	☐	☑
• Strong seismic ground shaking?	☐	☐	☑
• Seismic–related ground failure, including liquefaction?	☐	☐	☑
• Landslides?	☐	☐	☑
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☑
c) Be located on a geologic unit or soil that is unstable or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☑
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	☐	☐	☑
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☑

Significance Criteria

Impacts on the geological environment will be considered significant if any of the following criteria apply:

- Topographic alterations would result in significant changes, disruptions, displacement, excavation, compaction or over covering of large amounts of soil.

- Unique geological resources (paleontological resources or unique outcrops) are present that could be disturbed by the construction of the proposed project.
- Exposure of people or structures to major geologic hazards such as earthquake surface rupture, ground shaking, liquefaction or landslides.
- Secondary seismic effects could occur which could damage facility structures, e.g., liquefaction.
- Other geological hazards exist which could adversely affect the facility, e.g., landslides, mudslides.

Discussion

VII. a) PR 1420.1 would require the construction of enclosures, control technology~~, vehicle washing stations~~ and encapsulation of facility grounds at two existing large lead-acid battery recycling facilities in the district. All construction activities would occur on-site at these existing facilities and are not expected to require substantial earthmoving. A 52 foot by 52 foot section of concrete would be removed along with soil to a depth of two feet so a concrete pad could be poured to support the secondary control of a dryer. Since the affected facilities are located in industrial areas that have been previously disturbed and must be construction according to Uniform Building Code, the removal of the concrete and soil is not expected to cause risk of loss, injury or death involving rupture of an earthquake fault, seismic ground shaking or landslides.

Changes to operations would include additional housekeeping activities to reduce lead emissions. All changes to operation would also occur on-site.

Air monitors may be placed off-site. Air monitors are expected to be placed on existing paved surfaces; and therefore are not expect to affect soil or geology.

Because Southern California is an area of known seismic activity, existing facilities are expected to conform with the Uniform Building Code and all other applicable state and local building codes. As part of the issuance of building permits, local jurisdictions are responsible for assuring that the Uniform Building Code is adhered to and can conduct inspections to ensure compliance. The Uniform Building Code is considered to be a standard safeguard against major structural failures and loss of life. The basic formulas used for the Uniform Building Code seismic design require determination of the seismic zone and site coefficient, which represents the foundation condition at the site. The Uniform Building Code requirements also consider liquefaction potential and establish stringent requirements for building foundations in areas potentially subject to liquefaction.

Since all structures and control technology would be built according to the Uniform Building Code, the proposed project would not expose people or structures to risks of loss, injury, or death involving: rupture of an earthquake fault, seismic ground shaking, ground failure or landslides. Since the affect facilities already exist, PR 1420.1 is not expected to increase exposure to existing earthquake risk.

VII. b) Based on discussion with affected facility operators, construction related to PR 1420.1 is expected to occur on existing paved surfaces and is not expected to require ~~any~~ substantial earthmoving. A 52 foot by 52 foot section of concrete would be removed along with soil to a depth of two feet so a concrete pad could be poured to support the secondary control of a dryer.

A new concrete pad would be constructed in accordance with the Uniform Building Code, which would prevent soil erosion. PR 1420.1 also requires the encapsulation of all facility grounds to prevent lead contamination. Therefore, no soil erosion or loss of topsoil, unstable earth conditions or changes in geologic substructures are expected to occur at the affected facilities as a result of implementing the proposed project.

VII. c) Since the proposed project would affect existing facilities and all demolition and construction is expected to follow the Universal Building Code, it is expected that the soil types present at the affected facilities would not be further susceptible to expansion or liquefaction. Furthermore, subsidence is not anticipated to be a problem since no substantial excavation, grading, or filling activities are expected occur at affected facilities. Additionally, the affected areas are not envisioned to be prone to landslides or have unique geologic features since the affected facilities are existing facilities that are located in industrial areas.

VII. d) & e) Since PR 1420.1 would affect existing facilities located in industrial zones and all demolition and construction is expected to follow the Universal Building Code, it is expected that people or property would not be exposed to expansive soils or soils incapable of supporting water disposal. Though each affected facility has an existing wastewater treatment systems that would continue to be used, these systems have the capacity to support this proposed project. Sewer systems are available to handle wastewater produced and treated by each affected facility. PR 1420.1 would not require the installation of septic tanks or alternative wastewater disposal systems at each existing facility affected by the proposed project. As a result, PR 1420.1 would not require operators to utilize septic systems or alternative wastewater disposal systems. Thus, the proposed project would not adversely affect soils associated with a septic system or alternative wastewater disposal system.

Based upon these considerations, significant geology and soils impacts are not expected from the implementation of PR 1420.1 and would not be further analyzed in this ~~Draft~~ Final EA. Since no significant geology and soils impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that geology and soils impacts from the overall project are less than significant.

		Potentially Significant Impact	Less Than Significant Impact	No Impact
VIII.	**HAZARDS AND HAZARDOUS MATERIALS.** Would the project:			
a)	Create a significant hazard to the public or the environment through the routine transport, use, and disposal of hazardous materials?	☐	☑	☐
b)	Create a significant hazard to the public or the environment through reasonably foreseeable upset conditions involving the release of hazardous materials into the environment?	☐	☐	☑
c)	Emit hazardous emissions, or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☑
d)	Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code §65962.5 and, as a result, would create a significant hazard to the public or the environment?	☐	☐	☑
e)	For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?			
f)	For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☑
g)	Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☑
h)	Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	☐	☐	☑
i)	Significantly increased fire hazard in areas with flammable materials?	☐	☐	☑

Significance Criteria

Impacts associated with hazards will be considered significant if any of the following occur:

- Non-compliance with any applicable design code or regulation.
- Non-conformance to National Fire Protection Association standards.

- Non-conformance to regulations or generally accepted industry practices related to operating policy and procedures concerning the design, construction, security, leak detection, spill containment or fire protection.
- Exposure to hazardous chemicals in concentrations equal to or greater than the Emergency Response Planning Guideline (ERPG) 2 levels.

Discussion

VIII. a) PR 1420.1 would require the construction of enclosures, control technology~~, vehicle washing stations~~ and paving of dirt areas at two existing large lead-acid battery recycling facilities in the district. Changes to operations would include additional housekeeping activities to reduce lead emissions. All changes to operation would also occur on-site. Since the goal of PR 1420.1 would be to reduce direct and indirect sources of lead, the proposed project would reduce the emissions of hazardous emissions

PR 1420.1 would not affect the amount of lead recycled, so it is not expected to directly affect operations. Indirectly, PR 1420.1 would reduce the amount of fugitive lead that is emitted by enclosing all lead recycling operations, additional air pollution control systems and through additional housekeeping requirements.

PR 1420.1 may increase the amount of lead disposed of by capturing additional fugitive emissions through enclosures, control technology, and housekeeping activities (see Section XVI. Solid/Hazardous Waste), but the increase amount of lead captured would be the lead that currently is emitted as fugitive emission. The capture of these fugitive emissions would reduce lead exposure to the public and environment.

Therefore, PR 1420.1 is not expected to create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous material.

VIII. b) PR 1420.1 requirements (enclosure, control, housekeeping and monitoring) would not increase the frequency or magnitude of lead emissions through reasonably foreseeable upset and accident conditions. The enclosure, control, housekeeping and monitoring would reduce existing potential adverse impacts from upset and accident conditions, since additional monitoring would alert owner/operators earlier to upsets and accidents, additional operations would be enclosed and controlled, and additional housekeeping requirements would assist in capturing fugitive lead emissions.

VIII. c) No schools are located within a quarter mile of either affected facility. Therefore, PR 1420.1 would not result in hazardous emissions, handling of hazardous or acutely hazardous materials, substances or wastes within one-quarter mile of an existing or proposed school.

VIII. d) Government Code §65962.5 refers to hazardous waste handling practices at facilities subject to the Resources Conservation and Recovery Act (RCRA). Though some of the affected facilities subject to PR 1420.1 may be included on the list of the hazardous materials sites compiled pursuant to Government Code §65962.5, compliance with the proposed project is expected to enhance current hazardous waste handling practices by requiring enclosures or use of closed containers to store or transport lead containing material. Hazardous wastes from the existing facilities are required to be managed in accordance with applicable federal, state, and local rules and regulations.

PR 1420.1 would further reduce fugitive emissions from lead-acid battery existing recycling facilities. Lead emissions from point sources are already controlled at these facilities. Lead emissions collected from air pollution control systems connected to enclosures and housekeeping activities required by PR 1420.1 would be placed in the lead recycling process to be formed into lead product (see Tables 1-2 and 1-2 for list of existing and PR 1420.1 fugitive emission control and housekeeping activities). Accordingly, significant hazards impacts from the disposal/recycling of hazardous materials are not expected from the implementation of PR 1420.1.

VIII. e) & f) One affected facility is not near any airports or private airstrips. The other facility is within six miles of the El Monte Airport. PR1420.1 is not expected to affect any airport or private airstrip since the proposed project is not expected to cause the construction of any object that would exceed the height of existing buildings or equipment. PR 1420.1 would result in the reduction of lead emissions. Secondary TAC emissions from sweeping were addressed in the Air Quality section of this EA and found to be less than significant. Therefore, no new hazards are expected to be introduced at affected facilities that could create safety hazards at local airports or private airstrips. Therefore, PR 1420.1 is not expected to result in a safety hazard for people residing or working in the project area even within the vicinity of an airport.

VIII. g) Emergency response plans are typically prepared in coordination with the local city or county emergency plans to ensure the safety of not only the public (surrounding local communities), but the facility employees as well. The proposed project would not impair implementation of, or physically interfere with any adopted emergency response plan or emergency evacuation plan. The two existing affected facilities already have emergency response plans in place. Thus, PR 1420.1 is not expected to impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

VIII. h) & i) The Uniform Fire Code and Uniform Building Code set standards intended to minimize risks from flammable or otherwise hazardous materials. Local jurisdictions are required to adopt the uniform codes or comparable regulations. Local fire agencies require permits for the use or storage of hazardous materials and permit modifications for proposed increases in their use. Permit conditions depend on the type and quantity of the hazardous materials at the facility. Permit conditions may include, but are not limited to, specifications for sprinkler systems, electrical systems, ventilation, and containment. The fire departments make annual business inspections to ensure compliance with permit conditions and other appropriate regulations. Further, businesses are required to report increases in the storage or use of flammable and otherwise hazardous materials to local fire departments. Local fire departments ensure that adequate permit conditions are in place to protect against potential risk of upset.

The air pollution control systems for the new enclosures would not involve increase fire risk because it would not involve flammable materials. The enclosure for the smelter area would be vented to a scrubber. The water in the existing wet scrubber reduces the risk of fire from smelting emissions. The air pollution control system for the rotary driers includes a spark arrestor which would reduce the risk of fire on-site.

The proposed project would not increase the existing risk of fire hazards in areas with flammable brush, grass, or trees. No substantial or native vegetation typically exists on or near the affected

facilities (specifically because such areas could allow the accumulation of fugitive lead dust), the proposed project requires the encapsulating (paving or asphalting) of all facility grounds. So the proposed project is not expected to expose people or structures to wild fires. Therefore, no significant increase in fire hazards is expected at any of the affected facilities associated with the proposed project.

Based upon these considerations, significant hazards and hazardous materials impacts are not expected from the implementation of PR 1420.1 and will not be further analyzed in this ~~Draft~~ Final EA. Since no significant hazards and hazardous materials impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that hazards and hazardous materials impacts from the overall project are less than significant.

		Potentially Significant Impact	Less Than Significant Impact	No Impact
IX.	**HYDROLOGY AND WATER QUALITY.** Would the project:			
a)	Violate any water quality standards or waste discharge requirements?	☐	☑	☐
b)	Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g. the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	☐	☐	☑
c)	Substantially alter the existing drainage pattern of the site or area, including through alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?	☐	☐	☑
d)	Substantially alter the existing drainage pattern of the site or area, including through alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site?	☐	☐	☑

		Potentially Significant Impact	Less Than Significant Impact	No Impact
e)	Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	☐	☑	☐
f)	Otherwise substantially degrade water quality?	☐	☑	☐
g)	Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	☐	☐	☑
h)	Place within a 100-year flood hazard area structures which would impede or redirect flood flaws?	☐	☐	☑
i)	Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	☐	☐	☑
j)	Inundation by seiche, tsunami, or mudflow?	☐	☐	☑
k)	Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	☐	☑	☐
l)	Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☐	☐	☑
m)	Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☐	☑	☐
n)	Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	☐	☐	☑
o)	Require in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☑

Significance Criteria
Potential impacts on water resources will be considered significant if any of the following criteria apply:

Water Quality:
- The project will cause degradation or depletion of ground water resources substantially affecting current or future uses.
- The project will cause the degradation of surface water substantially affecting current or future uses.
- The project will result in a violation of National Pollutant Discharge Elimination System (NPDES) permit requirements.
- The capacities of existing or proposed wastewater treatment facilities and the sanitary sewer system are not sufficient to meet the needs of the project.
- The project results in substantial increases in the area of impervious surfaces, such that interference with groundwater recharge efforts occurs.
- The project results in alterations to the course or flow of floodwaters.

Water Demand:
- The existing water supply does not have the capacity to meet the increased demands of the project, or the project would use a substantial amount of potable water.
- The project increases demand for water by more than five million gallons per day.

Discussion
The following discussion addresses weekly roof washing and wheel washing. PR 1420.1 was modified after the Draft EA was circulated for public review to remove the wheel washing requirement and the roof top washing requirement was modified. Roof washing was reduced to monthly cleanings of roof tops on structures less than 45 feet in height that house areas associated with the storage, handling or processing of lead-containing materials; and quarterly cleanings, no more than three calendar months apart, of roof tops on structures greater than 45 feet in height that house areas associated with the storage, handling or processing of lead-containing materials. Owner/operators would be required to initiate immediate cleaning, no later than one hour, after any maintenance activity or event including, but not limited to, accidents, process upsets, or equipment malfunction, that causes deposition of fugitive lead-dust onto areas specified above (roof tops and areas where wastes from housekeeping activities are stored, disposed of, recovered or recycled). Immediate cleanings of roof tops would be completed within 72 hours if the facility can demonstrate that delays were due to safety or timing issues. The hydrology and water quality analysis has been revised to reflect these changes.

IX. a), f), & k) The two existing affected facilities already have wastewater treatment operations on-site. The wastewater treatment systems are comprised of settling and equalization tanks. Lead collected in the wastewater treatment systems is placed into the lead recycling operation to be recycled. Water from the wastewater treatment systems is discharged to publicly owned treatment works (POTWs). The water discharge complies with existing lead water quality standards. Based on conversations with facility operators, the existing wastewater systems would be able to treat additional wastewater generated by the proposed project from the ~~vehicle washers and~~ housekeeping requirements. Therefore, PR 1420.1 is not expected to have significant adverse affects on water quality standards or waste discharge requirements, otherwise

degrade water quality or exceed wastewater treatment requirements of the Regional Water Quality Control Board.

IX. b), l), n) &o)

Surface Impoundment Pond

Only one of the affected facilities has a surface impoundment pond. PR 1420.1 includes a requirement that would prevent the surface impoundment pond from drying while holding lead-containing materials. PR 1420.1 would also require that the pond be washed until used again for holding water. ~~Facility operators comply with surface impoundment pond requirements in PR 1420.1. Therefore, water use associated with the surface impoundment pond is considered part of the existing setting and would not increase the amount of water used.~~ The analysis in the Draft EA assumed that the facility operators at the affected facility already comply with the pond/reservoir housekeeping requirements in PR 1420.1. While facility operators does comply with the requirements to remove lead-containing material and sludge within 24 hours after the water level is less than one inch at any point above the bottom of the surface impoundment pond. Under PR 1420.1, facility operators would need to wash down the empty surface impoundment pond weekly until the pond/reservoir is used to store water again. It was assumed that the affected facility operator would wash the entire surface area of the surface impoundment pond in a day with $1/16^{th}$ inch of water. Based on the surface impoundment pond area of one acre that would be washed, approximately 1,697gallons of water would be used to wash the impoundment pond area.

Facility Process Area Washing

Based on discussions with existing affected facility operators PR 1420.1 ~~1120.1~~ would not increase water used in existing wet scrubber and wet ESP. It was assumed that the facilities wash the entire surface area of each affected site minus non-process buildings and areas on the same day with $1/16^{th}$ inch of water. Based on a combined area of 170,000 square feet that would be washed, approximately 6,623 gallons of water would be used to wash facility surfaces on a worst-case day.

The facility process area washing analysis in the Draft EA included roof washing. One affected facility operator currently washes roofs daily; therefore, already meets the roof washing requirement of PR 1420.1 The other facility operator washes roofs of structures less than 45 feet in height monthly, which meets the requirements of PR 1420.1. Roofs that are greater than 45 feet are washed semi-annually, so two more washings of these roofs per year would be required to comply with quarterly roof washing requirement in PR 1420.1. Therefore, the modified amendments to Rule 1420.1 would result in greater roof washings for roofs greater than 45 feet than are currently done at one of the affected facilities, but fewer roof top washings than the weekly washings previously proposed in the Draft EA that was circulated for public comment.

In addition owner operators are offered the choice whether to wet wash roofs and storage areas or to use a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97 percent capture efficiency for 0.3 micron particles. If facilities use vacuums to clean roofs, then cleaning the roofs would not involve water use.

The "worst-case" under the modification would the same as that analyzed in the Draft EA, i.e., when all surfaces (roofs, ground, etc.) are washed in a single day. Therefore, the "worst-case"

water usage would remain approximately 6,623 gallons of water would be used to wash facility surfaces on a worst-case day.

Wheel Washing

The wheel washing requirement was removed from PR 1420.1; therefore, adverse impacts from the requirement were removed from this analysis. ~~Approximately 100 trucks per day may be washed between both facilities. Based on the assumption that a truck is 15 feet tall by 75 feet long by nine feet wide and washed with 1/16th inch of water, approximately 15,078 gallons of water per day would be used.~~

The total water use of ~~21,701~~ 8,320 gallons per day is less than the significance threshold of five million gallons per day. Even though the total potential increase in water use of the proposed project is below the SCAQMD's five million gallons per day significance threshold, it may be helpful to consider other criteria for evaluating what would be considered a substantial use of potable water, especially since California is in a State of Emergency for Drought. For example, CEQA Guidelines §15155 – City or County Consultation with Water Agencies, defines a "water-demand" project in several ways. While the criteria for defining water demand are not significance thresholds per se, the criteria can provide some insight as to how city or county lead agencies evaluate water-demand impacts. Most of the criteria in this part of the CEQA Guidelines do not have a bright line or direct way to correlate the criteria in terms of gallons per day for a direct comparison to SCAQMD's significance criteria for potable water use. However, CEQA Guidelines §15155 (a)(1)(C) defines a water-demand project as: "A commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space." To estimate what this means in terms of water demand per person relative to the square footage (sf) of the floor area of the plant, commercial water usage rates[6] and average employment levels[7] (i.e. the number of employees per square foot) can be applied as follows:

$$\frac{\text{(123 GAL WATER)}}{\text{(YEAR) (SF OF BUILDING)}} \times \frac{\text{(1,000 SF OF BUILDING)}}{\text{(1.8 EMPLOYEES)}} \times \frac{\text{(1 YEAR)}}{\text{(260 DAYS)}} \times \text{(1,000 EMPLOYEES)} = \text{262,820 GAL/DAY}$$

This water demand estimate can then be applied to industrial sources because CEQA Guidelines §15155 (a)(1)(E) uses the same 1,000 employee level to defines a water-demand project as: "An industrial, manufacturing, or processing plant or industrial park planned to house more than 1,000 persons, occupying more than 40 acre of land, or having more than 650,000 square feet of floor area."

The total water use of ~~21,701~~ 8,320 gallons per day is also below 262,820 gallons of potable per day. Therefore, PR 1420.1 would not significantly deplete groundwater supplies or interfere substantially with groundwater recharge, and sufficient water supplies are available to serve existing entitlements and resources. With water use less than significance threshold of five million gallons per day and 262,820 gallons of potable water per day, PR 1420.1 would not

[6] California Commercial End-Use Survey, Consultant Report, Table 8-1, p 150. Prepared For: California Energy Commission, Prepared by: Itron, Inc. March 2006. http://www.energy.ca.gov/2006publications/CEC-400-2006-005/CEC-400-2006-005.pdf

[7] Urban Land Use Institute Data, Wausau West Industrial Park Expansion, Development Impact Analysis, Average Employment Levels, p.4, Prepared by Vierbicher Associates, January 5, 2001.

require or result in construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. Further, because water use is less than the significance threshold of five million gallons per day and 262,820 gallons of potable water per day the proposed project is not expected to require a determination by the wastewater treatment provider which serves or may serve the project's projected demand in addition to the provider's existing commitments.

IX. c), d), g), h), i), and j) PR 1420.1 would affect operations at two existing lead-acid battery recycling facilities. These facilities are mostly paved. PR 1420.1 would enclose all operations related to lead-acid battery recycling and require the encapsulation of all facility grounds by paving or asphalting. Since the affected facilities already exist and are essentially fully paved, and the areas the facilities are located in are zoned industrial, PR 1420.1 is not expected to alter the existing draining pattern of the site or area, including through alteration of the course of a stream or river that would result substantial erosion or siltation on- or off-site; place housing within a 100-year flood hazard area; place structures within a 100-year flood hazard area which would impede or redirect flood flaws; exposure people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or a dam; or inundation by seiche, tsunami or mudflow.

IX. e) & m) ~~PR 1420.1 includes a requirement for vehicle wet washing areas.~~ PR 1420.1 requires that all water used for the washing process be collected, handled and treated such that further releases of lead emissions are avoided. Other housekeeping requirements involving washing roofs and areas where lead-containing wastes associated with storage, handling or processing of lead materials, and lead material management at ponds and reservoirs are already occurring to comply with orders for abatement. Since new washing requirements under PR 1420.1 require that all water used for the washing process be collected, handled and treated, the proposed project is not expected to create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems; provide substantial additional sources of polluted runoff; or require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which would cause significant effects.

Based upon these considerations, significant hydrology and water quality impacts are not expected from the implementation of PR 1420.1 and would not be further analyzed in this ~~Draft~~ Final EA. Since no significant hydrology and water quality impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that hazards and hydrology and water quality impacts from the overall project are less than significant.

X. LAND USE AND PLANNING. Would the project:	Potentially Significant Impact	Less Than Significant Impact	No Impact
a) Physically divide an established community?	☐	☐	☑
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☑	☐
c) Conflict with any applicable habitat conservation or natural community conservation plan?	☐	☐	☑

Significance Criteria

Land use and planning impacts will be considered significant if the project conflicts with the land use and zoning designations established by local jurisdictions.

Discussion

X. a) PR 1420.1 would require the construction of enclosures, and control technology~~, and vehicle washing stations~~ at two existing large lead-acid battery recycling facilities in the district. All construction activities would occur on-site at these existing facilities and are not expected to require substantial earthmoving. Changes to operations would include additional housekeeping activities to reduce lead emissions. All changes to operations would also occur on-site. Therefore, the proposed project would not create divisions in any existing communities.

X. b) Land use and other planning considerations are determined by local governments. PR 1420.1 would restrict the construction or operation of large lead recycling facilities in areas that are zoned for residential or mix use. In addition, any new facility would be required to be located further than 1,000 feet from the boundary of a sensitive receptor, school under construction or any area that is zoned for residential or mixed use. The new facility requirements are not designed to impede or conflict with existing land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect, but to assist in avoiding or mitigating lead impacts from large lead recycling facilities. Operations at affected facilities would still be expected to comply, and not interfere, with any applicable land use plans, zoning ordinances.

X. c) Large lead recycling facilities are expected to be restricted to industrial zoned areas. Since zoning is established in general plans, which undergo CEQA analysis, no industrial zoned areas are expected to conflict with an applicable habitat conservation or natural community conservation plan. Therefore, PR 1420.1 affects existing and new large lead recycling facilities which exist or would be build in industrial areas no significant adverse impacts to applicable habitat conservation or natural community conservation plan are expected.

Based upon these considerations, significant land use and planning impacts are not expected from the implementation of PR 1420.1 and would not be further analyzed in this ~~Draft~~ Final EA. Since no significant land use and planning impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that land use and planning impacts from the overall project are less than significant.

		Potentially Significant Impact	Less Than Significant Impact	No Impact
XI.	**MINERAL RESOURCES.** Would the project:			
a)	Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☑
b)	Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☑

Significance Criteria

Project-related impacts on mineral resources will be considered significant if any of the following conditions are met:

- The project would result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.
- The proposed project results in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

Discussion

XI. a) & b) There are no provisions in PR 1420.1 that would result in the loss of availability of a known mineral resource of value to the region and the residents of the state such as aggregate, coal, clay, shale, et cetera, or of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

Based upon these considerations, significant mineral resources impacts are not expected from the implementation of PR 1420.1 and will not be further analyzed in this ~~Draft~~ Final EA. Since no significant mineral resources impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that mineral resources impacts from the overall project are less than significant.

		Potentially Significant Impact	Less Than Significant Impact	No Impact
XII.	**NOISE.** Would the project result in:			
a)	Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☑
b)	Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☑
c)	A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☑	☐
d)	A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☑	☐
e)	For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☑	☐
f)	For a project within the vicinity of a private airship, would the project expose people residing or working in the project area to excessive noise levels?	☐	☑	☐

Significance Criteria

Impacts on noise will be considered significant if:

- Construction noise levels exceed the local noise ordinances or, if the noise threshold is currently exceeded, project noise sources increase ambient noise levels by more than three decibels (dBA) at the site boundary. Construction noise levels will be considered significant if they exceed federal Occupational Safety and Health Administration (OSHA) noise standards for workers.
- The proposed project operational noise levels exceed any of the local noise ordinances at the site boundary or, if the noise threshold is currently exceeded, project noise sources increase ambient noise levels by more than three dBA at the site boundary.

Discussion

XI. a) & f) Noise is usually defined as sound that is undesirable because it interferes with speech communication and hearing, is intense enough to damage hearing, or is otherwise annoying (unwanted noise). Sound levels are measured on a logarithmic scale in decibels (dB). The universal measure for environmental sound is the "A" weighted sound level, dBA, which is the sound pressure level in decibels as measured on a sound level meter using the A-weighted

filter network. "A" scale weighting is a set of mathematical factors applied by the measuring instrument to shape the frequency content of the sound in a manner similar to the way the human ear responds to sounds.

Federal, state and local agencies regulate environmental and occupational, as well as, other aspects of noise. Federal and state agencies generally set noise standards for mobile sources, while regulation of stationary sources is left to local agencies. Local regulation of noise involves implementation of General Plan policies and Noise Ordinance standards, which are general principles, intended to guide and influence development plans. Noise Ordinances set forth specific standards and procedures for addressing particular noise sources and activities. The Occupational Safety and Health Administration (OSHA) sets and enforces noise standards for worker safety.

One example of local jurisdiction requirements might be the City of Los Angeles. Existing operational noise generated from lead acid battery recycling in Los Angeles would be subject to the City of Los Angeles Noise Element of the General Plan and/or the City of Los Angeles Municipal Code. Table 2-6 summarizes these requirements. Other local jurisdictions typically have similar requirements.

Table 2-6
City of Los Angeles Noise Requirements

Requirement	Construction Limit (dBA)	Operational Limit (exterior dBA except where noted)
Noise Element of the General Plan of the City of Los Angeles	65 dBA CNEL or less - considered "conditionally acceptable" for residential use. 70-75 dBA CNEL - considered "conditionally acceptable for industrial use".	65 dBA CNEL or less - considered "conditionally acceptable" for residential use. 70-75 dBA CNEL - considered "conditionally acceptable" for industrial use.
City of Los Angeles Municipal Code Chapter XI, Article 2, §112.05	Requires that noise levels generated by construction equipment within a residential zone not exceed 75 dBA.	Not applicable.
City of Los Angeles Municipal Code Chapter IV, Article 1, §41.40	Construction activities prohibited without a special permit between the hours of 10:00 p.m. and 7:00 a.m.	Not applicable.

The proposed project affects existing facilities and would not generate excessive noise levels outside the boundaries of the affected facilities, or expose people residing or working in the project area to excessive noise levels. The proposed project requires no additional equipment to the existing facilities which would cause noise level to exceed ambient levels.

Construction-Related Noise

One of the two existing facilities affected by PR 1420.1 has been issued air quality permits to construct for enclosing and air pollution control system (exhaust system with two baghouses) from the battery breaking area. These permit applications were submitted to comply with existing agreements with SCAQMD and other agencies. ~~No permit applications have been submitted for the vehicle washing system at this time.~~

The other existing facility affected by PR 1420.1 has submitted air quality permit applications for enclosures and air pollution control systems for the raw material preparation system, smelting and refining building system and rotary dryers. The air pollution control systems would consist of exhaust systems, a spark arrestor, high efficiency particulate absorbing (HEPA) filter mist eliminator for an existing scrubber~~, vehicle wash system~~ and sweeper. These permit applications were submitted to comply with existing agreements with SCAQMD and other agencies. A permit for a secondary lead control device for the dryers is expected to be filed, if PR 1420.1 is adopted.

Existing sites are paved and most of the construction is expected to occur on these existing paved surfaces~~; therefore, large potentially noise intensive construction equipment would not be needed to prepare the site, build enclosures and install control equipment.~~ A 52 foot by 52 foot section of concrete would be removed along with soil to a depth of two feet at most and a new concrete pad could be poured to support the secondary control of a dryer. Table 2-6 presents construction noise levels from typical construction equipment. The affected facility operations currently include diesel truck traffic to deliver recycled batteries and ship recycled lead product. Based on Table 2-6, truck noise levels are around 82 dBA at 50 feet. Construction would increase the noise levels to around 85 dBA at 50 feet from the center of construction activity. The closest resident to either facility is about 850 feet. Using an estimated six dBA reduction for every doubling in distance, the noise levels at the closest resident would be indistinguishable from background. In general, given ambient noise levels near affected facilities, noise attenuation (the lowering of noise levels over distances), and compliance with local noise ordinances, potential construction noise impacts are not expected to be significant.

Table 2-7~~-6~~
Construction Noise Sources

Equipment	Typical Range (decibel)	Analysis Value (decibel)
Cranes	75-89	85
Tractors/Loaders/Backhoes	73-98	85
Pavers	85-88	75
Generator Sets	71-83	85
Truck	82-92	82

Typical ranges are from the City of Los Angeles, 1998. Levels are in dBA at 50-foot reference distance.
Analysis values are intended to reflect noise levels from equipment in good condition, which appropriate mufflers, air intake silencers, etc. In addition, these values assume averaging of sound level over all directions from the listed piece of equipment.

Operational Noise

Noise is a by-product of lead-acid battery recycling operations. Employees and equipment at existing affected facilities currently perform activities which create noise, such as, raw material processing (battery breaking/crushing, charger preparation, rotary drying, sweating), smelting (furnaces), refining and casting, and truck loading/unloading. Noise ordinances and noise general plan requirements typically govern activities at existing facilities. Contributors to ambient noise levels at typical facilities include onsite equipment and mobile sources. PR 1420.1 does not require the installation of any equipment which could be defined as a major contributor to ambient noise levels. Enclosing existing open processes, such as, raw material handling and rotary dryers would reduce noise produced during these processes. The affected facilities already comply with the types of housekeeping requirements in PR 1420.1 due to other requirements and obligations; therefore, the types of housekeeping activities that are done are expected to remain unchanged, the frequency of housekeeping activities is expected to increase ~~and vehicle wet washers would be added~~. Since housekeeping activities are already done~~, with the exception of vehicle wet washing,~~ only the duration of the noise from these activities is expected to increase, since PR 1420.1 would increase the frequency which housekeeping activities are done. ~~Wet washing of vehicles is not expected to generate substantial noise.~~ Therefore, PR 1420.1 is not expected to cause an increase in noise above current existing ambient noise levels.

Also, local noise levels are usually governed by noise elements within a local jurisdiction's General Plan, and/or local noise ordinances. Because of the attenuation rate of noise based on distance from the source, it is unlikely that noise levels exceeding local noise ordinances would occur beyond a facility's boundaries.

Based upon these considerations, significant noise impacts are not expected from the implementation of PR 1420.1 and will not be further evaluated in this ~~Draft~~ Final EA. Since no significant noise impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that noise impacts from the overall project are less than significant.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
XIII. POPULATION AND HOUSING. Would the project:			
a) Induce substantial growth in an area either directly (for example, by proposing new homes and businesses) or indirectly (e.g. through extension of roads or other infrastructure)?	☐	☐	☑
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☑

		Potentially Significant Impact	Less Than Significant Impact	No Impact
c)	Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	☐	☐	☑

Significance Criteria

Impacts of the proposed project on population and housing will be considered significant if the following criteria are exceeded:

- The demand for temporary or permanent housing exceeds the existing supply.
- The proposed project produces additional population, housing or employment inconsistent with adopted plans either in terms of overall amount or location.

Discussion

XIII. a) PR 1420.1 would require the construction of enclosures, control technology~~, vehicle washing stations~~ and paving of dirt areas at two existing large lead-acid battery recycling facilities in the district. Changes to operations would include additional housekeeping activities to reduce lead emissions. All changes to operation would also occur on-site. The proposed project is not anticipated to generate any significant effects, either direct or indirect, on the district's population or population distribution as no additional workers are anticipated to be required to comply with the proposed amendments. Human population within the jurisdiction of the SCAQMD is anticipated to grow regardless of implementing PR 1420.1. It is expected that any construction activities at affected facilities would use construction workers from the local labor pool in southern California. As such, PR 1420.1 would not result in changes in population densities or induce significant growth in population.

XIII. b) & c) Because the proposed project affects operations at two existing lead-acid battery recycling facilities, PR 1420.1 is not expected to result in the creation of any industry that would affect population growth, directly or indirectly, induce the construction of single- or multiple-family units, or require the displacement of people elsewhere.

Based upon these considerations, significant population and housing impacts are not expected from the implementation of PR 1420.1 and are not further evaluated in this ~~Draft~~ Final EA. Since no significant population and housing impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that population or housing impacts from the overall project are less than significant.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
XIV. PUBLIC SERVICES. Would the proposal result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:			
a) Fire protection?	☐	☐	☑
b) Police protection?	☐	☐	☑
c) Schools?	☐	☐	☑
d) Parks?	☐	☐	☑
e) Other public facilities?	☐	☐	☑

Significance Criteria

Impacts on public services will be considered significant if the project results in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response time or other performance objectives.

Discussion

XIV. a) & b) PR 1420.1 would not involve the use of flammable or combustible materials. As a result, no new fire hazards or increased use of hazardous materials would be introduced at existing affected facilities that would require emergency responders such as police or fire departments. Thus, no new demands for fire or police protection are expected from PR 1420.1 since the proposed rule amendments will not require construction activities associated with the installation of emission control devices.

XIV. c) & d) As noted in the "Population and Housing" discussion, implementation of the proposed project would not require new employees for construction because construction workers from the local labor pool in southern California would be used. Similarly, no new employees would be required to comply with PR 1420.1 because the control equipment and housekeeping operations required by the proposed project are similar to existing equipment and housekeeping requirements which are done by existing employees. As a result, PR 1420.1 would have no direct or indirect effects on population growth in the district. Therefore, there would be no increase in local population and thus no impacts are expected to local schools or parks.

XIV. e) Because the proposed project involves requirements that are similar to existing operations and the facilities are already heavily regulated, PR 1420.1 is not expected to require the need for additional government services. Permits for the enclosures and air pollution control

equipment required to comply with PR 1420.1 have already been issued or are in the process of being issued to comply with other requirements or obligations; therefore, additional permit staff would not be needed. Enforcement of PR 1420.1 is expected to be performed by the existing SCAQMD inspector. Further, the proposed project would not result in the need for new or physically altered government facilities in order to maintain acceptable service ratios, response times, or other performance objectives. There will be no increase in population and, therefore, no need for physically altered government facilities.

Based upon these considerations, significant public services impacts are not expected from the implementation of PR 1420.1 and are not further evaluated in this ~~Draft~~ Final EA. Since no significant public services impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that public resources impacts from the overall project are less than significant.

		Potentially Significant Impact	Less Than Significant Impact	No Impact
XV. RECREATION.				
a)	Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☑
b)	Does the project include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?	☐	☐	☑

Significance Criteria

Impacts to recreation will be considered significant if:

- The project results in an increased demand for neighborhood or regional parks or other recreational facilities.
- The project adversely effects existing recreational opportunities.

Discussion

XV. a) & b) As previously discussed under "Land Use," there are no provisions in PR 1420.1 that would affect land use plans, policies, or regulations. Land use and other planning considerations are determined by local governments; no land use or planning requirements will be altered by the proposed project. Further, implementation of PR 1420.1 would not increase the use of existing neighborhood and regional parks or other recreational facilities or include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment because the proposed project is not expected to induce population growth.

Based upon these considerations, significant recreation impacts are not expected from the implementation of PR 1420.1 and are not further evaluated in this ~~Draft~~ Final EA. Since no significant recreation impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that recreation impacts from the overall project are less than significant.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
XVI. SOLID/HAZARDOUS WASTE. Would the project:			
a) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	☐	☑	☐
b) Comply with federal, state, and local statutes and regulations related to solid and hazardous waste?	☐	☐	☑

Significance Criteria

The proposed project impacts on solid/hazardous waste will be considered significant if the following occurs:

- The generation and disposal of hazardous and non-hazardous waste exceeds the capacity of designated landfills.

Discussion

XVI.a) Landfills are permitted by the local enforcement agencies with concurrence from the California Integrated Waste Management Board (CIWMB). Local agencies establish the maximum amount of solid waste which can be received by a landfill each day and the operational life of a landfill. PR 1420.1 would generate additional waste from the disposal of lead contaminated baghouse filters, HEPA filters for an existing wet scrubber.

Construction

~~No demolition is expected to comply with PR 1420.1; therefore, no construction solid waste is expected from the proposed project.~~ PR 1420.1 was modified subsequent to the circulation of the Draft EA for public comment. The modifications include a requirement to add secondary lead control device to the exhaust of primary lead controlled devices used for dryers. The addition of a secondary control device at one of the affected large lead-acid battery recycling facilities would require demolition of a 52 foot by 52 foot area of concrete. The soil under the concrete area may be contaminated with lead. However, since lead is not likely to migrate through soil, SCAQMD staff estimated that two feet of soil would be required to be removed. Based on the dimensions of the area demolished and a depth of two feet, approximately 200 cubic yards of lead-contaminated debris would need to be removed. The concrete and soil would be considered hazardous waste and the facility owners/operators have stated that the debris would be sent to US Ecology Beatty Facility, Beatty Nevada.

US Ecology Beatty facility has approximately 1,300,000 cubic yards available capacity for the remaining 10 to 12 year life expectancy (108,000 to 110,000 cubic yards per year). A single disposal of 200 cubic yards of debris would be less than 0.2 percent of the annual capacity. Based on the above analysis, the additional construction waste would be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs. Therefore, PR 1420.1 is not expected to be significant for solid/hazardous waste construction waste.

Control Technology Requirements

One of the two affected facilities has been granted permits and is construction of enclosures and air pollution control systems (exhaust systems and two baghouses). Additional hazardous waste would be generated from disposing filters from the two new baghouses. The filter bags and HEPA filters are approximately 1,280 cubic yards in size are assumed to be replaced every two years. Secondary filters for the dryer are about one cubic yard in size and would be replaced annually.

The other affected facility has submitted permit applications to construct enclosures which would be controlled by existing air pollution control systems (exhaust systems, spark arrestor, and HEPA filter mist eliminator for existing scrubber). The owner/operators of this facility have stated filters would not need to be replaced more frequently because of the new enclosures, because the existing systems are currently designed to handle the additional load. Therefore, the addition of the enclosures would not alter existing hazardous waste from the baghouses. The HEPA filter for the mist eliminator is already in place, so hazardous waste from the HEPA filters for the mist eliminator is considered existing hazardous waste and not part of PR 1420.1.

Lead contaminated filters from the new baghouses would be disposed as hazardous waste, in a fashion similar to the disposal of existing filter waste, but in larger volumes.

Housekeeping Requirements

~~With the exception of vehicle washing requirements, the~~ The two existing lead-acid battery recycling facilities currently comply with the types of housekeeping requirements in PR 1420.1; however, the proposed project is expected to increase the frequency of housekeeping activities. Lead would be removed from new housekeeping operation ~~vehicle wet washing~~ wastewater by existing wastewater systems used for existing housekeeping operations at the affected facilities. The lead recovered from the wastewater treatment system is placed into the lead-acid battery recovery process to be recycled; therefore, lead from the wastewater treatment system would not be disposed at solid waste landfills. So, no new hazard waste is expected to be generated from housekeeping requirements of PR 1420.1. Therefore, it is not expected that PR 1420.1 would substantially change hazardous waste handling and disposal volumes from housekeeping requirements.

Dust from the sweepers is placed into the lead recycling process, so additional sweeping is not expected to increase hazardous solid waste.

PR 1420.1 would not alter lead management activities associated with surface impoundment ponds or reservoirs holding stormwater. PR 1420.1 includes a requirement to prevent the impoundment ponds or reservoirs holding stormwater from drying while holding lead-containing

materials. One only one existing affected facility has a surface impoundment pond. Facility operators are already required to prevent the surface impoundment pond from drying out and to wash it down until used again to hold water. Therefore, lead-containing solid waste from the surface impoundment pond is considered part of the existing setting; and no increase in hazardous waste from the management of lead-containing material at surface impoundment pond is expected from PR 1420.1

Hazardous solid waste from the affected facilities are currently sent to three Class I landfills ~~in California~~: Chemical Waste Management Kettleman Hills in Kettleman City, California, Allied Waste La Paz County Landfill in Parker, Arizona and US Ecology Beatty Facility, Beatty Nevada.

Analysis of Operational Solid/Hazardous Waste Impact ~~Noise~~ Impacts

Chemical Waste Management Kettleman Hills has a remaining capacity of 7,360,000 cubic yards with an estimated closure date of 2037. The Allied Waste La Paz County Landfill has approximately 20,000,000 cubic yards of capacity remaining for the 50 year life expectancy. US Ecology Beatty facility has approximately 1,300,000 cubic yards available capacity for the remaining 10 to 12 year life expectancy. Dividing the remaining fill capacities by life expectancies yields approximately 802,593 cubic yards available annually.

The addition of 1,280 cubic yards of lead contaminated filters every two years ~~(643~~ and one cubic yard annually~~)~~ would be 0.08 percent of the annual hazardous solid waste capacity at the three Class I landfills currently used by the affected facilities. Therefore, it is assumed that the additional hazardous solid waste from PR 1420.1 would have less than significant adverse impacts to the capacity at the three Class I landfills.

XVI.b) Existing affected facility operators currently dispose of lead contaminated baghouse filters. It is assumed that facility operators at these affected facilities comply with all applicable local, state, or federal waste disposal regulations.

Implementing PR 1420.1 is not expected to interfere with any affected facility's ability to comply with applicable local, state, or federal waste disposal regulations. Since no solid/hazardous waste impacts were identified, no mitigation measures are necessary or required.

Based on these considerations, PR 1420.1 is not expected to increase the volume of solid or hazardous wastes that cannot be handled by existing municipal or hazardous waste disposal facilities, or require additional waste disposal capacity. Further, implementing PR 1420.1 is not expected to interfere with any affected facility's ability to comply with applicable local, state, or federal waste disposal regulations. Since no solid/hazardous waste impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that solid/hazardous waste impacts from the overall project are less than significant.

		Potentially Significant Impact	Less Than Significant Impact	No Impact
XVII.	**TRANSPORTATION/TRAFFIC.** Would the project:			
a)	Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?	☐	☐	☑
b)	Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	☐	☐	☑
c)	Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☐	☐	☑
d)	Substantially increase hazards due to a design feature (e.g. sharp curves or dangerous intersections) or incompatible uses (e.g. farm equipment)?	☐	☐	☑
e)	Result in inadequate emergency access?	☐	☐	☑
f)	Result in inadequate parking capacity?	☐	☐	☑
g)	Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g. bus turnouts, bicycle racks)?	☐	☐	☑

Significance Criteria

Impacts on transportation/traffic will be considered significant if any of the following criteria apply:

- Peak period levels on major arterials are disrupted to a point where level of service (LOS) is reduced to D, E or F for more than one month.
- An intersection's volume to capacity ratio increase by 0.02 (two percent) or more when the LOS is already D, E or F.
- A major roadway is closed to all through traffic, and no alternate route is available.
- There is an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system.
- The demand for parking facilities is substantially increased.
- Water borne, rail car or air traffic is substantially altered.
- Traffic hazards to motor vehicles, bicyclists or pedestrians are substantially increased.
- The need for more than 350 employees
- An increase in heavy-duty transport truck traffic to and/or from the facility by more than 350 truck round trips per day
- Increase customer traffic by more than 700 visits per day.

Discussion

XVII. a), b) & f) As noted in the "Discussion" sections of other environmental topics, compliance with PR 1420.1 is expected to require minor construction activities (i.e., without ~~heavy~~ substantial earthmoving activities) with the installation of enclosures, ventilation and control equipment. PR 1420.1 was estimated to need 10 deliveries of equipment or other construction materials and to need nine construction worker trips on a peak construction day. Construction onsite is not expected to affect on-site traffic or parking. The additional nineteen construction trips are less than the significance threshold of 350 round trips, therefore construction activities are not expected to cause a significance adverse impact to traffic or transportation.

All operational requirements are expected to occur on-site so no additional off-site impacts from PR 1420.1. PR 1420.1 is expected to require additional sweeping; however, sweeping three times a day is not expected to affect traffic or parking on-site.

XVII. c) One affected facility is not near any airports or private airstrips. The other facility is within six miles of the El Monte Airport. Any actions that would be taken to comply with the proposed project are not expected to influence or affect air traffic patterns or navigable air space. Thus, PR 1420.1 would not result in a change in air traffic patterns including an increase in traffic levels or a change in location that results in substantial safety risks.

XVII. d) & e) The proposed project does not involve construction of any roadways or other transportation design features, so there would be no change to current roadway designs that could increase traffic hazards. The siting of each affected facility is consistent with surrounding land uses and traffic/circulation in the surrounding areas of the affected facilities. Thus, the proposed project is not expected to substantially increase traffic hazards or create incompatible uses at or adjacent to the affected facilities. Emergency access at each affected facility is not expected to be impacted by the proposed project. Further, each affected facility is expected to continue to maintain their existing emergency access. Since PR 1420.1 involves only minor construction activities and sweeping three times a day would be the only operational impact, the proposed project is not expected to alter the existing long-term circulation patterns. The proposed project is not expected to require a modification to circulation, thus, no long-term impacts on the traffic circulation system are expected to occur.

XVII. g) Affected facilities would still be expected to comply with, and not interfere with adopted policies, plans, or programs supporting alternative transportation (e.g. bicycles or buses). Since all PR 1420.1 compliance activities would occur on-site, PR 1420.1 would not hinder compliance with any applicable alternative transportation plans or policies.

Based upon these considerations, PR 1420.1 is not expected to generate significant adverse transportation/traffic impacts and, therefore, this topic will not be considered further. Since no significant transportation/traffic impacts were identified, no mitigation measures are necessary or required. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that transportation/traffic impacts from the overall project are less than significant.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
XVIII. MANDATORY FINDINGS OF SIGNIFICANCE.			
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☐	☐	☑
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)	☐	☑	☐
c) Does the project have environmental effects that will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☑	☐

Discussion

XVIII. a) As discussed in the "Biological Resources" section, PR 1420.1 is not expected to significantly adversely affect plant or animal species or the habitat on which they rely because construction and operations related to the proposed project would be located entirely within the boundaries of existing facilities in industrial areas which have already been greatly disturbed and that currently do not support any species of concern or the habitat on which they rely. PR 1420.1 is not expected to reduce or eliminate any plant or animal species or destroy prehistoric records of the past. Each site affected by the proposed project is part of an existing facility, which has been previously graded, such that PR 1420.1 is not expected to extend into environmentally sensitive areas.

XVIII. b) Based on the foregoing analyses, since PR 1420.1 will not result in significant adverse project-specific environmental impacts, it is not expected to cause cumulative impacts in conjunction with other projects that may occur concurrently with or subsequent to the proposed project. Furthermore, potential adverse impacts from implementing PR 1420.1 will not be "cumulatively considerable" because there are no, or only minor incremental impacts and there will be no contribution to a significant cumulative impact caused by other projects that would exist in absence of the proposed project. Therefore, there is no potential for significant adverse cumulative or cumulatively considerable impacts to be generated by the proposed project.

XVIII. c) Based on the foregoing analyses, PR 1420.1 is not expected to cause adverse effects on human beings. Significant adverse impacts to air quality, energy, hazards and hazardous materials, hydrology and water quality, land use/planning, solid/hazardous waste are not expected from the implementation of PR 1420.1. No impacts to aesthetics, agricultural resources, biological resources, cultural resources, geology and soils, mineral resources, noise, population and housing, public services, recreation, and transportation/traffic are expected as a result of the implementation of PR 1420.1.

As previously discussed in items I through XVIII, the proposed project has no potential to cause significant adverse environmental effects. Based on SCAQMD staffs' review of the proposed modifications to PR 1420.1, it is concluded the modifications do not alter the determination that impacts from the overall project to any of the environmental topics presented in the environmental checklist are less than significant.

APPENDIX A

PROPOSED RULE 1420.1

In order to save space and avoid repetition, please refer to the latest version of the PR 1420.1 located elsewhere in the final rule package. The PR 1420.1 version dated March 18, 2010 of the proposed rule was circulated with the Draft EA released on April 27, 2010 for a 30-day public review and comment period ending May 26, 2010.

Original hard copies of the Draft EA, which include version PR 1420.1 (dated March 18, 2010) of the proposed rule circulated with the Draft EA, can be obtained through the SCAQMD Public Information Center at the Diamond Bar headquarters or by calling (909) 396-2039.

Table B-2c (Concluded)
Concrete Paving for Lead Control Device Foundation Construction Emissions

Notes:

a) SCAQMD, estimated from survey data, Sept 2004.

b) Equipment name must match CARB Off-Road Model (see Off-Road Model EF worksheet) equipment name for sheet to look up EFs automatically.

c) SCAB values provided by the ARB, Oct 2006. Assumed equipment is diesel fueled. N2O values estimated from ratio of N2O and CH4 EF presented for on-road vehicles in the ARB Regulation for Mandatory Reporting of GHG Emissions.

d) 2009 fleet year. http://www.aqmd.gov/ceqa/handbook/onroad/onroad.html. N2O-values from ARB Regulation for Mandatory Reporting of GHG Emissions.

e) Assumed haul truck travels 40 miles.

f) SCAQMD Regional Significant Thresholds

g) ARB's CEIDARS database PM2.5 fractions - construction dust category for fugitive and diesel vehicle exhaust category for combustion.

Table B-5
Additional Emissions from Visiting Air Monitors

Description	VMT, mile/day	CO, lb/day	NOx, lb/day	VOC, lb/day	SOX, lb/day	PM10, lb/day	PM2.5, lb/day	CO2, Mton/year	CH4, Mton/year	N2O, Mton/year
Gasoline vehicle	80	0.66	0.07	0.07	0.0009	0.007	0.0044	7.3	0.0005	0.000712

Assumes sweeping twice more per day
EMFAC2007 emission factors, except for NO2, which is from ARB's Regulation for the Mandatory Reporting of Greenhouse Gases

Table B-6
Additional Emissions from Sweeping

Description	VMT, mile/day	CO, lb/day	NOx, lb/day	VOC, lb/day	SOX, lb/day	PM10, lb/day	PM2.5, lb/day	CO2, Mton/year	CH4, Mton/year	N2O, Mton/year
Medium-Duty Truck	21.0	0.39	0.43	0.05	0.0006	0.016	0.013	9.5	0.00044	0.000037

Assumes sweeping twice more per day
EMFAC2007 emission factors, except for NO2, which is from ARB's Regulation for the Mandatory Reporting of Greenhouse Gases

Table B-7
Additional Emissions from Aerial Lifts

Description	Usage, hr/day	CO, lb/day	NOx, lb/day	VOC, lb/day	SOX, lb/day	PM10, lb/day	PM2.5, lb/day	CO2, Mton/year	CH4, Mton/year	N2O, Mton/year
Aerial Lift	6	1.26	2.16	0.40	0.002	0.15	0.14	11.3	0.0004	0.0007

Assumes weekly roof washing over 50 days per year (52 weeks minus existing semi-annual washing).
Offroad2007 emission factors, except for NO2, which is from ARB's Regulation for the Mandatory Reporting of Greenhouse Gases

Table B-8
Additional Emissions from Delivery of Aerial Lifts

Description	VMT, mile/day	CO, lb/day	NOx, lb/day	VOC, lb/day	SOX, lb/day	PM10, lb/day	PM2.5, lb/day	CO2, Mton/year	CH4, Mton/year	N2O, Mton/year
Heavy-Duty Truck	80.0	0.96	3.06	0.24	0.00	0.15	0.13	15.3	0.0005	0.000038

Assumes weekly roof washing over 50 days per year (52 weeks minus existing semi-annual washing).
EMFAC2007 emission factors, except for NO2, which is from ARB's Regulation for the Mandatory Reporting of Greenhouse Gases

Table B-9
Additional Health Risk from Sweeping

Receptor Type	PM10, ton/yr	CP (mg/kg-day)-1	X/Q, (ug/m3)/(ton/yr)	Afann	MET	DBR, L/kg-day	EVF	MP	Health Risk in a Million
Worker	0.0029	1.1	60.5	1	0.53	149	0.38	1	5.7
Sensitive/Residential	0.0029	1.1	1.57	1	0.53	302	0.96	1	0.8

SCAQD Teir II analysis used to evaluate health risk.
Off-site worker assumed to be within shortest downwind distance of 25 meters.
Nearest sensitive/residential receptor 260 meters downwind from source.

Table B-10
Additional Sensitive/Residential Health Risk from Aerial Lifts

Aerial Lift PM10, ton/yr	CP (mg/kg-day)-1	X/Q, (ug/m3)/(ton/yr)	Afann	MET	DBR, L/kg-day	EVF	MP	Health Risk in a Million
0.0074	1.1	41.5	1	0.55	149	0.38	1	10.6

SCAQD Teir II analysis used to evaluate health risk.
Nearest sensitive/residential receptor 670 meters downwind from source.

Re: Exide's Supplemental Response and Comments to 1420.1 Rulemaking

Dear Mses. Chang and Nakamura:

A. Introduction.

On behalf of Exide Technologies, Inc., we are submitting these comments in order to address both the District's inclusion of a mass emissions rate limit in Rule 1420.1 and the impact of the recent proposal by Quemetco to lower the mass emissions rate limit from 0.045 pounds of lead per hour to 0.003 pounds per hour. As explained in Exide's September 21 and September 30, 2010 letters, the inclusion of the mass emissions rate limit in section 1420.1(f)(2) is legally and scientifically inappropriate. By establishing a mass emissions limit focusing entirely on stack emissions, the District improperly forecloses a facility from proposing cost-effective alternatives to satisfy the NAAQS ambient air standard. In addition, to lower the mass emissions rate limit from 0.045 lbs/hr to 0.003 lbs/hr as recently proposed is a substantial change which will threaten the economic viability of Exide's Vernon Facility to remain operating in Southern California. This would result in significant adverse economic and environmental impacts not presently evaluated in the proposed rule's existing impact assessments, necessitating subsequent or supplemental socio-economic and environmental impact assessments.

1-1

Please include these comments and the District's response to these comments in the administrative rulemaking record. We appreciate your consideration.

B. <u>If the District Imposes A Facility Mass Emissions Rate Limit, the District Must Provide For, And Allow Exide To Propose, Alternative Methods To Comply With The Lead NAAQS.</u>

The District includes a mass facility emissions rate limit of 0.045 pounds per hour as a core requirement in section 1420(f)(2), citing a need to "ensure [that] point sources are controlled to allow a 30 percent margin for fugitive emissions." [October 2010 Staff Report, 2-6]. Exide contends that Health & Safety Code Sections 40001(d), 39666(f), 40406 and 40440.8 – all statutes cited by the District for legal support – require the District to consider facility-specific alternatives to the stack mass emissions rate limit that are designed to achieve compliance with the 0.15 ug/m^3 lead NAAQS. Recognizing these legal requirements to provide for compliance flexibility, the District recently amended section 1420(f)(3) to allow a facility to apply for "an alternative [dryer] secondary lead control method that is equally or more effective for the control of lead emissions." Though Exide opposes the inclusion of any facility stack mass emissions rate limit as a core rule requirement, at a minimum, Exide requests that language similar to that added in subsection (f)(3) be included in subsection (f)(2) as follows:

1-2

> *The total facility mass lead emissions from all lead point sources shall not exceed 0.045 pounds of lead per hour. The maximum emission rate for any single lead point source shall not exceed 0.010 pounds of lead per hour. The total facility and maximum emission rates shall be based on the most recent source tests conducted pursuant to subdivision (k).* ***An alternative method that is equally or more effective to satisfy the ambient air concentration requirement in paragraph (d)(2) may be used if a complete application is submitted as part of the permit application required under paragraph (d)(3) and approved by the Executive Officer.***

This language would preserve the purpose of Rule 1420.1 while allowing the facility to design alternative cost-effective solutions to comply with the NAAQS. The District is not legally or equitably justified in mandating one method of compliance, especially since, as stated by the District in its recent response to comments, "the ambient monitors will be the ultimate test of [NAAQS] compliance." What may be appropriate or feasible for one facility may not be appropriate or feasible for another. In the end, the facility is responsible for the outcome and, thus, must have the flexibility to determine – with District approval and enforcement authority – the method by which it satisfies the NAAQS standard.

1. The District is Required to Consider Alternatives Under Health & Safety Code Section 40001.

H&S Code Section 40001(d)(1)-(3), which governs all district rulemaking to achieve the federal NAAQS, sets forth the appropriate balance between NAAQS compliance and allowing a facility to design the method by which it will comply. As stated in the statute: "A district shall allow the implementation of alternative methods of emission reduction, emissions monitoring, or recordkeeping if a facility demonstrates to the satisfaction of the district that those alternative methods will provide equivalent performance." [H&S Code § 40001(d)(1)]. If the District specifies an "emissions limit," the District shall allow the facility to include operational and effectiveness measurement elements "that can be included as permit conditions by the District to ensure compliance with, and enforcement of, the equivalent performance requirements . . . ." [H&S Code § 40001(d)(3)]. The District's mandated facility mass emissions rate limit here functions both as an emissions limit and control method. Though Exide opposes any mass emissions rate limit, at the very least Rule 1420.1 must provide for, and allow, Exide an alternative compliance method in accordance with H&S Code § 40001(d).

1-3

2. The District is Required to Consider Alternatives Under Health & Safety Code Section 39666

Attempting to impose an ATCM emissions limit on stack emissions to achieve the NAAQS lead standard, the District cites H&S Code Section 39666 as legal authority for proposed Rule 1420.1. [*See, e.g.*, Resolution]. If the District relies on section 39666, then it must satisfy its requirements. The statute provides that, where an ATCM measure "requires the use of a specified method or methods to reduce, avoid, or eliminate the emissions of a toxic air contaminant, a source may submit to the District an alternative method or methods that will achieve an equal or greater amount of reduction in emissions of, and risk associated with, that toxic air contaminant." [H&S Code § 39666(f)]. The District "shall approve" the alternative method if it is demonstrated to be enforceable and effective. [*Id.*]

1-4

As currently written, Rule 1420.1 forecloses any alternative methods of compliance, regardless of whether other methods may be equally effective. The District may not mandate a facility mass emissions rate limit without allowing the facility to propose alternatives. Again, Exide requests inclusion of the above language to rule Section(f)(2) to correct this flaw in the existing proposed rule.

3. The District Must Provide a BARCT Analysis, Considering Facility-Specific Economic and Environmental Impacts.

1-5

In its recent staff response, the District stated that Rule 1420.1 "is a Best Available Retrofit Technology (BARCT) Rule for Lead." [Staff Response to Comment 45]. BARCT is defined as "an emissions limitation that is based on the maximum degree of reduction achievable,

taking into account environmental, energy, and economic impacts by each class or category of source." [H&S Code § 40406] Exide agrees with the District that Quemetco's recent proposal to limit the mass emissions rate to 0.003 lbs/hr is unnecessary to achieve the NAAQS lead standard and cost prohibitive and, thus, does not satisfy BARCT, for the Exide facility. However, Exide contends that the District's rulemaking record is presently inadequate to even allow for Governing Board consideration as to whether the 0.045 lbs/hr facility mass emissions rate limit is BARCT under H&S Code Section 40920.6.

1-5 Cont.

Because the District states that Rule 1420.1 is a BARCT rule, Exide contends that the District must fully evaluate the rule's technical and economic feasibility, identify different control options that can achieve the emissions reduction objectives of the regulation, review the cost-effectiveness of each potential control option, make findings as to the cost-effectiveness of each option, and allow alternative means of producing equivalent reductions at any equal or lesser dollar amount per ton reduced. [H&S Code § 40920.6]. Even if Section 40920.6 does not apply directly, the District has determined that BARCT requires a 0.045 lbs/hr facility limit without properly considering the technical, economic and environmental impacts of that limit as required by Sections 40406, 40440.8 and 40922.

4. <u>The District's Socioeconomic Analysis is Insufficient Because It Does Not Adequately Consider Relative Cost-Effectiveness.</u>

The District's Socioeconomic Assessment estimates the annual total cost to comply with Rule 1420.1 will be $0.41 million for the first year and $0.32 million annually thereafter. Though the District purports to consider economics, the District does not properly consider the "availability and cost-effectiveness of alternatives" to the mass emissions rate limit as required by H&S Code Sections 40440.8 and 40922. Section 40922 (made applicable here by Section 40440.8) requires the District to consider "an assessment of the cost-effectiveness of available and proposed control measures" and states that the District's analysis "shall contain a list of the control measures from the least cost-effective to the most cost-effective." The District must also consider relative cost-effectiveness, in addition to technological feasibility and other factors. [H&S Code § 40922].

1-6

The District avoids a relative cost-effectiveness analysis and does not cite to section 40922, presumably because the District takes the position that section 40922 only applies to rules meant to control ozone, CO, NOx and SOx. The District's interpretation ignores that section 40440.8 requires a socioeconomic assessment without limit to designated criteria pollutants, and section 40440.8 (requiring a socio-economic analysis) cites to and requires analysis under section 40922. Indeed, when implementing rules designed to limit emissions of PM and ammonia from refineries (constituents other than ozone, CO, NOx and SOx), the District engaged in the 40922 incremental cost analysis that it fails to conduct here. [*Western States Petroleum Association v. SCAQMD*, 136 Cal. App. 4th 1012].

Furthermore, Section 40703 states that "in adopting any regulation, the district shall consider, pursuant to Section 40922, and make available to the public, its findings related to the cost-effectiveness of the control measure, as well as the basis for the findings and the considerations involved." The law also requires that the District "shall make reasonable efforts, to the extent feasible within existing budget constraints, to make specific reference to the direct costs expected to be incurred by regulated parties, including businesses and individuals." [H&S Code § 40703]. Here, while the District generally considered certain compliance costs to reach its $0.41/$0.32 million per year estimate, it did not adequately consider the economic impact to Exide, particularly as to the newly-proposed alternative of a 0.003 lbs/hr facility mass emissions rate limit, and the District did not properly consider cost-effective alternatives that would still result in NAAQS compliance.

1-6 Cont.

5. <u>The Clean Air Act Does Not Prohibit Increased Stack Height as a Control Option</u>.

The District rejected Exide's proposal to increase stack heights, stating that "the Clean Air Act, Section 123, prohibits using stack heights in lieu of emissions controls." [October 2010. Staff Response to Comment 8]. The District is incorrect. Under the CAA, a facility can take full credit for improved dispersion provided by any stack height up to 65 meters (200+ ft.) without any justification required as dictated by good engineering practice. Good engineering practice means "the height necessary to insure that emissions from the stack do not result in excessive concentrations of any pollutant in the immediate vicinity of the source as a result of atmospheric downwash." "In no event may the Administrator prohibit any increase in any stack height or restrict in any manner the stack height of any source." [CAA, Section 123(c); 40 CFR Part 51; *see, also*, District Rule 1401(a)(1) defining "Acceptable Stack Height" in conformance with CAA Section 123.] For the reasons summarized in its September 21, 2010 letter, Exide is significantly impacted by downwash at its stacks, which are barely taller than the facility buildings. Increasing the stack height is a legally viable alternative to satisfy the NAAQS.

1-7

C. <u>The Proposed 0.003 lbs/hr Facility Mass Emissions Rate Limit Alternative Threatens The Economic Viability Of Exide's Facility To Remain Operating In Southern California, Resulting In Significant Adverse Economic and Environmental Impacts Not Previously Considered That Require Subsequent Or Supplemental Socio-Economic and Environmental Impact Assessments</u>.

Quemetco recently proposed that the District reduce the rule's facility mass emissions rate limit from 0.045 lbs/hr to 0.003 lbs/hr, a substantial change to the existing proposed rule. For the District to consider this proposal for adoption, it must fully evaluate the proposal's significant adverse economic and environmental impacts. The District estimates a $15-20 million cost for Exide (based solely on Quemetco costs) to reduce mass emissions to this level. Exide believes this cost to be prohibitive and that it will threaten its economic viability to continue operating in Southern California, with Exide considering the option of expanding operations in facilities out

1-8

1-8 Cont.

of State [*See* concurrently submitted October 11, 2010 Exide letter]. Exide's closure as a result of "substantial changes" to the Rule (*i.e.*, a 15-fold emissions reduction above the amounts already proposed) will result in significant adverse economic impacts and direct and indirect significant adverse environmental impacts necessitating the District prepare subsequent or supplemental socio-economic environmental impact assessments. [14 CCR § 15162].

As noted by the District, Exide has an average production of 100,000 to 120,000 tons of lead per year, equivalent to approximately 11 million automotive batteries. Exide and Quemetco are the only two large lead battery recyclers in the Western United States, with the closest comparable facility in Texas. [Staff Report. at 1-7.] If Exide is forced to discontinue its Vernon Facility operations, Exide's departure would reasonably result in "significant adverse effects" not previously considered in the existing rulemaking documents, including but not limited to:

1-9

- Loss of approximately 125+ union jobs at the Vernon Facility and additional jobs in industries servicing the Vernon Facility.
- Substantial loss of lead acid battery recycling capacity in the District.
- Increased truck traffic and pollution (including diesel particulate and GHG emissions) from shipping batteries out of California or to Mexico.
- Increased risk of illegal or improper disposal of lead batteries in the District.
- Increased lead, diesel particulate and GHG and other emissions including truck traffic from Quemetco's facility closer to a residential community environment.

These impacts would require subsequent or supplemental socio-economic and environmental impact assessments; the District's existing assessments are presently inadequate and fail to analyze those foreseeable adverse impacts. [*See, e.g., Bakersfield Cit. Loc. Con, v. City of Bakersfield*, 124 Cal. App. 4th 1184 (2004) (agency must conduct a CEQA analysis if economic harm is reasonably likely to result in direct or indirect environmental impact). H&S Code § 40440.8(b)(2).] To properly consider for adoption a 0.003 lbs/hr facility mass emissions rate limit, the District must evaluate these potentially significant adverse economic and environmental impacts (which it has not done in the existing rulemaking documents) through preparation of subsequent or supplemental socio-economic and environmental impact assessments. Re-circulation and allowance for comment is also required. Obviously, this will further delay the approval of an applicable rule.

D. Conclusion.

1-10

In conclusion, Exide contends that the mass emissions rate limit is untenable and unjustified, particularly because the District has not considered cost-effective alternatives designed to satisfy the NAAQS. In addition, District consideration of Quemetco's proposal to

1-10 Cont.

lower the mass limit to 0.003 lbs/hr will threaten the economic viability of Exide's Vernon Facility, requiring further analysis of the rule's potentially significant adverse socio-economic and environmental impacts, not previously evaluated or considered in the existing rulemaking documents. We appreciate your consideration of these comments.

Very truly yours,

Randolph C. Visser

PROPOSED ALTERNATIVE 3 FOR CONSIDERATION AT THE NEXT HEARING BOARD MEETING

AGENDA NO. 36 — Adopt Rule 1420.1 – Emissions Standard for Lead from Large Lead-acid Battery Recycling Facilities

Modify subparagraph (f)(2) of Proposed Rule 1420.1

"(2) ~~The total facility mass lead emissions from all lead point sources shall not exceed 0.045 pounds of lead per hour. The maximum emission rate for any single lead point source shall not exceed 0.010 pounds of lead per hour. The total facility and maximum emission rates shall be based on the most recent source tests conducted pursuant to subdivision (k).~~"

Modify subparagraph (g)(2)(A) of Proposed Rule 1420.1

(A) A description of additional lead emission reduction measures including, but not limited to, requirements for the following:

(i) Housekeeping, inspection, and maintenance activities;

(ii) Additional total enclosures;

(iii) Modifications to lead control devices and installation of multi-stage lead control devices necessary to achieve a total facility lead emission rate of 0.045 pounds per hour from all lead point sources and a maximum emission rate of 0.010 pounds of lead per hour for any single lead point source;

~~(iv) Installation of multi-stage lead control devices;~~

(iv) Process changes including reduced throughput limits; and

(vi) Conditional curtailments including, at a minimum, information specifying the curtailed processes, process amounts, and length of curtailment.

Add subparagraph (g)(2)(D) of Proposed Rule 1420.1

(D) An implementation schedule for (g)(2)(A)(iii) to achieve a total lead emission rate of 0.045 pounds per hour from all lead point sources and a maximum emission rate of 0.010 pounds of lead per hour for any single lead point source if lead emissions discharged from the facility contribute to ambient air concentrations of lead to exceed 0.15 $\mu g/m^3$ averaged over any 30 consecutive days measured at any monitor pursuant to subdivision (j) or at any District-installed monitor no later than one year after the date of exceeding the 0.15 $\mu g/m^3$ average.

Modify paragraph (g)(4) of Proposed Rule 1420.1

(4) ~~The owner or operator shall implement measures based on the schedule in the approved Compliance Plan if~~ If lead emissions discharged from the facility contribute to ambient air concentrations of lead to exceed 0.15 $\mu g/m^3$ averaged over any 30 consecutive days measured at any monitor pursuant to subdivision (j) or at any District-installed monitor, the owner or operator shall:.

(A) Implement lead emission reduction measures based on the schedule in the approved Compliance Plan; and

(B) Notwithstanding paragraph (f)(2), meet a total facility emission rate of 0.045 pounds per hour from all lead point sources and a maximum emission rate of 0.010 pounds of lead per hour for any single lead point source no later than one year after the date of exceedance. The total facility emission rate shall be determined using the most recent source tests conducted by the facility or the District

Ms. Susan Nakamura
Planning & Rules Manager

Re: Comments on Proposed Rule 1420.1

Dear Mses. Chang and Nakamura:

Exide provides the following additional comments on proposed Rule 1420.1, and requests SCAQMD's consideration of, and response to, them prior to adopting a final rule.

With regard to the Quemetco, Inc. comments submitted to the District Board on September 22, 2010, Exide agrees with AQMD staff that the proposed lower emission rate limit of 0.003 lbs/hr of lead is unnecessary, cost prohibitive and should not be included in the final rule [October 2010 Staff Report, Appendix A, Page A-17 and 18.].

Since the proposal for the 0.003 lb/hr facility-wide lead emission rate was only submitted a little more than a week before the rule was to be approved, Exide has had little time to fully evaluate such a proposal and has the following concerns with it.

First, Exide is unsure if the control technology installed at the Quemetco facility is technically feasible and compatible with Exide's process. The Exide facility uses a fundamentally different furnace technology (blast furnace) than what Quemetco uses (electric arc furnace) to process reverberatory furnace slag. Exide has no basis for assuming that this fundamental difference is amenable to the wet electrostatic precipitator (WESP) emission control technology. Exide is aware of no other emission control technology that even claims to be able to reach the 0.003 lb/hr facility-wide level. At this point, Exide could only speculate (at best) that the WESP technology is technically feasible and could be employed at our facility. Whether emissions from our facility would also remain below 0.003 lb/hr with implementation of the WESP is unknown.

Additionally, it has been reported that Quemetco spent $18 million on installation of its emission control system, inclusive of the WESP. We have no way of knowing what portion of these costs are attributable to the regenerative thermal oxidizer (RTO) that was also installed as part of Quemetco's project. Organic emissions are not an issue from a risk perspective from our facility and we presume, therefore, that installation of a WESP to achieve the 0.003 lb/hr lead emission rate would not also require installation of an RTO. Thus, we can, at best, "guess" that the cost to achieve a 0.003 lb/hr Pb rate would be on the order of $18 million on the basis of no site or process-specific analysis.

Finally, at a cost of this magnitude, and from what we know of this control technology at this time, this proposal will threaten the economic viability of the Exide Vernon, CA recycling facility and Exide would have to consider the alternative of expanding operations at its other recycling facilities outside of California. Such would result in previously unconsidered significantly adverse socio-economic and environmental consequences including loss of jobs, loss of Basin lead acid battery recycling capacity and related air emission increases.

In follow-up to Exide's original comments on the reasons a 0.045 lb./hr. lead emission rate is not the proper control methodology for this rule, is not needed to ensure compliance with the ambient standard and should not be included in the final rule, Exide provides the following proposed alternative by which a mass emission rate could be included in the rule. Exide proposes that if compliance with the 0.15 ug/m3 ambient standard cannot be achieved by the compliance deadline of January 1, 2012, then the facility wide and individual point source mass emission rate limits would go into effect as a component of the required contingency compliance plan. [*See* enclosed Proposed Rule Alternative 3.] As the proposed rule already incorporates a compliance plan "safety valve" trigger of 0.12 ug/m^3 (80% of the 0.15 ug/m^3 NAAQS), the use of emissions rate limit as a core requirement is unnecessary. If a facility mass emission rate limit is to be considered at all, please submit this proposal to the Governing Board for consideration as well.

The SCAQMD first proposed a facility mass emissions rate of 0.045 lb./hr. in its August 31, 2010 proposed rule. At the Governing Board hearing on October 1, 2010 an alternative facility mass emissions rate of 0.003 lb./hr. was proposed. Exide has evaluated its compliance options with the Proposed Rule based on the 0.15 ug/m3 standard in the NAAQS that was amended in 2008. Neither Exide, nor the SCAQMD have had sufficient time to review the technical feasibility and economic aspects of meeting an facility Pb emission rate of 0.003 lb./hr. from stationary sources. Exide's proposal provides for existing control measures and housekeeping activities to be implemented and take effect. If additional emission reduction measures are then required to meet the 0.15 ug/m3 standard, Exide can evaluate which measures will be effective in complying with the standard, rather than relying on an arbitrary emission rate or control technology that would not be practicable for Exide's overall equipment configuration.

Exide has extensively evaluated the issue of its facility's ambient lead concentration impacts and finds that the REAL impacts are predominantly caused by two effects – fugitive emissions and stacks that are being affected by building downwash.

Several of the facility stacks are just barely taller than their adjacent buildings. Stacks that are legitimately subject to downwash in this manner can legitimately be improved by simply increasing the stack height to avoid the downwash zone. That is, the "problem" with these stacks is NOT that their emissions are too great or in any way indicative of inadequate control effectiveness, but that they are simply too short. Contrary to the Staff response on this issue [October 2010 Staff Report, Appendix A, Page A-3], neither the federal Clean Air Act nor relevant California or District rules would in any way "prohibit" the use of stack height increases to resolve adverse building downwash influences. We would be happy to provide full citations of the relevant statutes and regulations on this point.

On 6-25-2009 Exide signed a consent order with the SCAQMD that required the construction of additional total enclosures, venting them to existing control equipment, and additional housekeeping activities such as the installation of a vehicle wash station. When Exide completes the requirements of this consent order the emission rate from fugitive sources should be substantially reduced and contribute to Exide's compliance with the NAAQS.

The ultimate goal here is to help to protect public health by reducing their ambient concentrations. For heavily downwash-influenced stacks, the prescription is a redesign of the geometry rather than wasting resources on essentially unachievable emission limitations. The District's dispersion modeling exercise used to derive and back-calculate the new Subsection (f)(2) emission rate limits gave no consideration to the possibility of alternate stack physical geometries and the impact of fugitive emissions and only considered alternate emission rate scenarios to achieve modeled compliance. The District does not have the authority to impose such a narrow compliance standard, and has not properly considered all possible methods for achieving the standard. We believe that this lack of consideration of reasonable and appropriate alternatives has resulted in a proposed rule which would serve to distract and misdirect resources from the primary focus for achieving the revised NAAQS – reduction in fugitive emissions.

We respectfully request due consideration of the comments outlined above and acceptance by the District of Exide's requested revisions.

Please contact Fred Ganster at 610-921-4052 with any questions you may have regarding this submittal.

Sincerely,
EXIDE TECHNOLOGIES

COMMENT LETTER NO. 1
SHEPPARD MULLIN
OCTOBER 12, 2010

Response to Comment 1-1

Thank you for your comments. Detailed responses to comments regarding inclusion of a mass emission rate limit in PR 1420.1(f)(2), reducing the facility mass emission rate limit for point sources in PR 1420.1 from 0.045lbs/hr to 0.003 lbs/hr, and the anticipated closure of any facilities subject to PR 1420.1 are addressed below.

Response to Comment 1-2

PR 1420.1 does not specify the method or control approach that a facility must use to meet either the total facility lead point source emission rate of 0.045 lb/hr or individual point source lead emission rate of 0.010 lb/hr. Furthermore, Health and Safety Code Section 40001(d)(3) states that "if a district rule specifies an emission limit for a facility or system, the district shall not set operational or effectiveness requirements for any specific control equipment operating on a facility or system under that limit." PR 1420.1 simply requires achieving an emission rate limit and does not set any operational or effectiveness requirements for any specific emission control equipment operating on a facility or system under the proposed emission rate limit.

Regarding the commenter's objection to the facility mass emissions rate limit for point sources: based on air dispersion modeling using the most recent source tests results and stack parameters, the stack emissions of one facility subject to PR 1420.1 would exceed the ambient lead standard of 0.15 micrograms per cubic meter averaged over 30 days. As a result, Proposed Rule 1420.1 establishes a point source emission rate of 0.045 lbs/hour as a core requirement. This facility-wide emission level was derived from modeling, which demonstrates that at the point of maximum impact, the ambient concentration would be about 30 percent below the new ambient lead standard. The 30 percent "buffer" is necessary so the facility has an emissions budget for fugitive emissions. Staff believes that if the 0.045 lbs/hr emission rate limit is not established as a core requirement, at least one of the facilities subject to PR 1420.1 would most likely exceed the standard based on point source emissions alone, and would be well above the standard when fugitive emissions are included. As a result, implementation of controls would be delayed if the 0.045 lbs/hr emission rate is not required. Thus, staff's proposal of the emission rate limit as a core requirement stands.

Response to Comment 1-3

Please see response to comment 1-2.

Response to Comment 1-4

The commenter's reference to the Health & Safety Code Section 39666(f) states, "Where an airborne toxic control measure requires the use of a specified method or methods to reduce, avoid, or eliminate the emissions of a toxic air contaminant, a source may submit to the district an alternative method or methods that will achieve an equal or greater amount of reduction in emissions of, and risk associated with, that toxic air contaminant…" PR 1420.1 does not

implement an ATCM. As a result, the reference to Health and Safety Code Section 39666(d) is removed.

Response to Comment 1-5

The staff response has been revised in Response to Comment #45 in Appendix A of the Staff Report, reflecting that PR 1420.1 is not a BARCT rule. The response no longer states that PR 1420.1 is a BARCT rule. The intent of PR 1420.1 is to achieve attainment with the revised NAAQS for lead.

The commentator states that the environmental impacts of the 0.045 pound per hour facility limit were not considered as required by Health and Safety Code §40406. SCAQMD staff disagrees with this statement. Control strategies are presented in Chapter 1 of the Final EA. Each control strategy is presented and a statement is made as to whether the control strategy is expected to be used for the proposed project. Baghouses, wet scrubbers and HEPA filters are listed as control strategies that would be used. Electrostatic precipitators/wet electrostatic precipitators are strategies that are not expected to be used. No comment was received on this section of the Draft EA.

Construction and operation of the control technologies were analyzed in the aesthetics, agricultural resources, biological resources, cultural resources, geology and soils, mineral resources, noise, population and housing, public services, recreation and transportation and traffic sections of Chapter 2 of the Final EA and found to have no impacts on these environmental topics. Construction and operation of the control technologies were analyzed in the air quality, energy, hazards and hazardous materials, hydrology and water quality, land use and planning, and solid/hazardous waste sections of Chapter 2 of the Final EA and found to have no significant impacts.

Response to Comment 1-6

Regarding requirements for availability and cost-effectiveness analyses required by the Health and Safety Code Sections referenced by the commenter, the District continues to take the position that section 40922 does not pertain to lead. Although Health and Safety Code Sections 40440.8 and 40703 require these analyses, both require the analyses pursuant to section 40922 which again only pertains to ozone, CO, SOx, and NOx. It should also be noted that staff's proposal remains at the 0.045 lb/hr and 0.010 lb/hr lead emission rate for total facility and individual point sources, respectively.

Response to Comment 1-7

The commenter is correct in that stack heights legally may be altered up to the specified maximum in order to change the dispersion of lead emissions from the point sources. Staff's position, however, is that increasing the stack height or buoyancy would just be a dilution of fence line monitor concentrations, and that the same amount of lead emissions are being dispersed in the atmosphere. Lead is a persistent and would continue to accumulate on the ground in areas of dispersion. Simply changing the air dispersion of emissions without overtly reducing emissions is not in the best interest for air quality and public health.

Response to Comment 1-8

PR 1420.1 requires affected facilities to meet an emission rate of 0.045 lbs/hr total mass emission rate from all point sources of lead at the facility. The Staff Report, Environmental Analysis and Socioeconomic Analysis are based on PR 1420.1, which requires a total stack mass emission rate of 0.045 lbs/hr from all point sources of lead emissions at a facility. If the Governing Board were to direct staff to incorporate a total stack emission rate of 0.003 lbs/hr of lead, either as a core requirement, or in the contingency Compliance Plan, additional environmental and economic analyses would be needed. The Board could, however, select an option that would require the facility to evaluate the feasibility of a total stack emission rate of 0.003 lb/hr of lead if the facility triggered the need for a compliance plan. If it is determined that it is technically and environmentally feasible to lower the total stack emission rate, Rule 1420.1 could be amended and the appropriate environmental and socioeconomic analyses would be conducted.

Response to Comment 1-9

Staff's proposal is a total facility mass emission rate limit of 0.045 lb/hr and not the 0.003 lb/hr rate. This comment requests the analysis of the closure of an affected facility. As stated in Response to Comment 1-8, the closure of affected facilities because of PR 1420.1 is not expected. Therefore no analysis will be prepared for the closure of affected facilities.

Response to Comment 1-10

See response to comment 1-2 regarding the applicability of the facility mass emission rate limit. See response to comment 1-8 regarding the inclusion of a lower (i.e. 0.003 lbs/hr) facility mass emission rate limit in PR 1420.1, and the expected closure of any facilities subject to PR 1420.1.

EXIDE TECHNOLOGIES

Attention: Elaine Chang, DrPH
Deputy Executive Officer

Ms. Susan Nakamura
Planning & Rules Manager

Re: Comments on Proposed Rule 1420.1

Dear Mses. Chang and Nakamura:

Exide provides the following additional comments on proposed Rule 1420.1, and requests SCAQMD's consideration of, and response to, them prior to adopting a final rule.

With regard to the Quemetco, Inc. comments submitted to the District Board on September 22, 2010, Exide agrees with AQMD staff that the proposed lower emission rate limit of 0.003 lbs/hr of lead is unnecessary, cost prohibitive and should not be included in the final rule [October 2010 Staff Report, Appendix A, Page A-17 and 18.].

2-1 Since the proposal for the 0.003 lb/hr facility-wide lead emission rate was only submitted a little more than a week before the rule was to be approved, Exide has had little time to fully evaluate such a proposal and has the following concerns with it.

First, Exide is unsure if the control technology installed at the Quemetco facility is technically feasible and compatible with Exide's process. The Exide facility uses a fundamentally different furnace technology (blast furnace) than what Quemetco uses (electric arc furnace) to process reverberatory furnace slag. Exide has no basis for assuming that this fundamental difference is amenable to the wet electrostatic precipitator (WESP) emission control technology. Exide is aware of no other emission control technology that even claims to be able to reach the 0.003 lb/hr facility-wide level. At this point, Exide could only speculate (at best) that the WESP technology is technically feasible and could be employed at our facility. Whether emissions from our facility would also remain below 0.003 lb/hr with implementation of the WESP is unknown.

2-2 Additionally, it has been reported that Quemetco spent $18 million on installation of its emission control system, inclusive of the WESP. We have no way of knowing what portion of these costs are attributable to the regenerative thermal oxidizer (RTO) that was also installed as part of Quemetco's project. Organic emissions are not an issue from a risk perspective from our facility and we presume, therefore, that installation of a WESP to achieve the 0.003 lb/hr lead emission rate would not also require installation of an RTO. Thus, we can, at best, "guess" that the cost to achieve a 0.003 lb/hr Pb rate would be on the order of $18 million on the basis of no site or process-specific analysis.

Finally, at a cost of this magnitude, and from what we know of this control technology at this time, this proposal will threaten the economic viability of the Exide Vernon, CA recycling facility and Exide would have to consider the alternative of expanding operations at its other recycling facilities outside of California. Such would result in previously unconsidered significantly adverse socio-economic and environmental consequences including loss of jobs, loss of Basin lead acid battery recycling capacity and related air emission increases.

2-3

In follow-up to Exide's original comments on the reasons a 0.045 lb./hr. lead emission rate is not the proper control methodology for this rule, is not needed to ensure compliance with the ambient standard and should not be included in the final rule, Exide provides the following proposed alternative by which a mass emission rate could be included in the rule. Exide proposes that if compliance with the 0.15 ug/m3 ambient standard cannot be achieved by the compliance deadline of January 1, 2012, then the facility wide and individual point source mass emission rate limits would go into effect as a component of the required contingency compliance plan. [*See* enclosed Proposed Rule Alternative 3.] As the proposed rule already incorporates a compliance plan "safety valve" trigger of 0.12 ug/m^3 (80% of the 0.15 ug/m^3 NAAQS), the use of emissions rate limit as a core requirement is unnecessary. If a facility mass emission rate limit is to be considered at all, please submit this proposal to the Governing Board for consideration as well.

The SCAQMD first proposed a facility mass emissions rate of 0.045 lb./hr. in its August 31, 2010 proposed rule. At the Governing Board hearing on October 1, 2010 an alternative facility mass emissions rate of 0.003 lb./hr. was proposed. Exide has evaluated its compliance options with the Proposed Rule based on the 0.15 ug/m3 standard in the NAAQS that was amended in 2008. Neither Exide, nor the SCAQMD have had sufficient time to review the technical feasibility and economic aspects of meeting an facility Pb emission rate of 0.003 lb./hr. from stationary sources. Exide's proposal provides for existing control measures and housekeeping activities to be implemented and take effect. If additional emission reduction measures are then required to meet the 0.15 ug/m3 standard, Exide can evaluate which measures will be effective in complying with the standard, rather than relying on an arbitrary emission rate or control technology that would not be practicable for Exide's overall equipment configuration.

2-4

Exide has extensively evaluated the issue of its facility's ambient lead concentration impacts and finds that the REAL impacts are predominantly caused by two effects – fugitive emissions and stacks that are being affected by building downwash.

Several of the facility stacks are just barely taller than their adjacent buildings. Stacks that are legitimately subject to downwash in this manner can legitimately be improved by simply increasing the stack height to avoid the downwash zone. That is, the "problem" with these stacks is NOT that their emissions are too great or in any way indicative of inadequate control effectiveness, but that they are simply too short. Contrary to the Staff response on this issue [October 2010 Staff Report, Appendix A, Page A-3], neither the federal Clean Air Act nor relevant California or District rules would in any way "prohibit" the use of stack height increases to resolve adverse building downwash influences. We would be happy to provide full citations of the relevant statutes and regulations on this point.

On 6-25-2009 Exide signed a consent order with the SCAQMD that required the construction of additional total enclosures, venting them to existing control equipment, and additional housekeeping activities such as the installation of a vehicle wash station. When Exide completes the requirements of this consent order the emission rate from fugitive sources should be substantially reduced and contribute to Exide's compliance with the NAAQS.

2-5

The ultimate goal here is to help to protect public health by reducing their ambient concentrations. For heavily downwash-influenced stacks, the prescription is a redesign of the geometry rather than wasting resources on essentially unachievable emission limitations. The District's dispersion modeling exercise used to derive and back-calculate the new Subsection (f)(2) emission rate limits gave no consideration to the possibility of alternate stack physical geometries and the impact of fugitive emissions and only considered alternate emission rate scenarios to achieve modeled compliance. The District does not have the authority to impose such a narrow compliance standard, and has not properly considered all possible methods for achieving the standard. We believe that this lack of consideration of reasonable and appropriate alternatives has resulted in a proposed rule which would serve to distract and misdirect resources from the primary focus for achieving the revised NAAQS – reduction in fugitive emissions.

2-6

We respectfully request due consideration of the comments outlined above and acceptance by the District of Exide's requested revisions.

COMMENT LETTER NO. 2
EXIDE COMMENT LETTER
OCTOBER 12, 2010

Response to Comment 2-1

Staff understands that Wet Electrostatic Precipitator (WESP) control technology installed at the commenter's facility may result in different emission rates than those achieved at another facility subject to PR 1420.1 utilizing the WESP technology. AQMD staff agrees that additional time is needed to further evaluate the technical feasibility, potential environmental impacts and economic impacts of such a proposal. Staff's proposal is to retain the total facility lead emission rate of 0.045 lb/hr.

Response to Comment 2-2

Proposed Rule 1420.1 requires as a core requirement that affected facilities achieve a total stack emission rate of 0.045 lbs/hr. AQMD staff agrees that additional time is needed further evaluate the technical feasibility, potential environmental impacts and economic impacts of lowering the stack emission rate to 0.003 pounds per hour. Staff's proposal is to retain the total facility lead emission rate of 0.045 lbs/hr.

Response to Comment 2-3

PR 1420.1 requires affected facilities to meet an emission rate of 0.045 lbs/hr total mass emission rate from all point sources of lead at the facility. The Staff Report, Environmental Analysis and Socioeconomic Analysis are based on PR 1420.1, which requires a total stack mass emission rate of 0.045 lbs/hr from all point sources of lead emissions at a facility. If the Governing Board were to direct staff to incorporate a total stack emission rate of 0.003 lbs/hr of lead, either as a core requirement, or in the contingency Compliance Plan, additional environmental and economic analyses would be needed. The Board could, however, select an option that would require the facility to evaluate the feasibility of a total stack emission rate of 0.003 lb/hr of lead if the facility triggered the need for a compliance plan. If it is determined that it is technically and environmentally feasible to lower the total stack emission rate, Rule 1420.1 could be amended and the appropriate environmental and socioeconomic analyses would be conducted.

Response to Comment 2-4

Based on air dispersion modeling using the most recent source tests results and stack parameters, the stack emissions of one facility subject to PR 1420.1 would exceed the ambient lead standard of 0.15 micrograms per cubic meter averaged over 30 days. As a result, Proposed Rule 1420.1 establishes a point source emission rate of 0.045 lbs/hour as a core requirement. This facility-wide emission level was derived from modeling, which demonstrates that at the point of maximum impact, the ambient concentration would be about 30 percent below the new ambient lead standard. The 30 percent "buffer" is necessary so the facility has an emissions budget for fugitive emissions. Staff believes that if the 0.045 lbs/hr emission rate limit is not established as a core requirement, at least one of the facilities subject to PR 1420.1 would most likely exceed the standard based on point source emissions alone, and would be well above the standard when

fugitive emissions are included. As a result, implementation of controls would be delayed if the 0.045 lbs/hr emission rate is not required. Thus, staff's proposal of the emission rate limit as a core requirement stands.

Regarding the comments on stack height, staff agrees that stack heights may be legally altered up to the specified maximum in order to change the dispersion of lead emissions from the point sources. Staff's position, however, is that increasing the stack height or buoyancy would just result in a dilution of fence line monitor concentrations, and that the same amount of lead emissions are being dispersed in the atmosphere. Lead is a persistent and would continue to accumulate on the ground in areas of dispersion. Simply changing the air dispersion of emissions without overtly reducing emissions is not in the best interest for air quality and public health.

Response to Comment 2-5

AQMD staff agrees that the completion of additional total enclosures, vented to existing control equipment as well as additional housekeeping activities should help to reduce fugitive emissions.

Response to Comment 2-6

See response to comment 2-4 regarding stack height. Air dispersion modeling conducted in support of this rulemaking used the most recent stack parameters. The AQMD maintains that it does have the authority to set an emission standard. Furthermore, Health and Safety Code Section 40001(d)(3) states that "if a district rule specifies an emission limit for a facility or system, the district shall not set operational or effectiveness requirements for any specific control equipment operating on a facility or system under that limit." PR 1420.1 simply requires achieving an emission rate limit and does not set any operational or effectiveness requirements for any specific emission control equipment operating on a facility or system under the proposed emission rate limit. See response to comment 1-2 in the letter from Sheppard Mullin dated October 12, 2010.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 35

PROPOSAL: 2010 Clean Communities Plan

SYNOPSIS: The 2010 Clean Communities Plan builds from existing traditional toxic regulatory approaches and includes 23 measures designed to address cumulative air toxics exposure in communities and neighborhoods throughout the South Coast Air Quality Management District. The 2010 Clean Communities Plan includes measures to address reductions of air toxics and air related nuisance issues at the community level. Increased community participation, communication and outreach, agency coordination, enhanced monitoring and compliance programs as well as traditional source-specific measures.

COMMITTEE: Stationary Source, September 19, 2008, April 16, 2010, and September 24, 2010, Reviewed.

RECOMMENDED ACTION:
Approve the 2010 Clean Communities Plan as a planning document for possible future actions.

Barry R. Wallerstein, D.Env.
Executive Officer

EC:LT:SN:CAM

Background

The 2010 Clean Communities Plan is a planning document that outlines the overall control strategy for the South Coast Air Quality Management District's (AQMD's) air toxics control program. The Clean Communities Plan is an update to the Air Toxics Control Plan (ATCP) developed in 2000 and the subsequent Addendum in 2004. Over the past two decades, the AQMD's toxics regulatory program has focused on individual source categories that emit a specific toxic air contaminant. Although significant progress has been made to reduce air toxic emissions from individual sources there are communities throughout the district that are impacted by multiple toxic

emitting sources that surround these communities. The combined or cumulative effect of multiple toxic emitting sources on these communities can be substantial. The 2010 Clean Communities Plan continues to build on the district's source-specific air toxics program while addressing cumulative air quality impacts.

Clean Communities Plan

The objective of the 2010 Clean Communities Plan is to reduce the exposure to air toxics and air-related nuisances throughout the district, with emphasis on cumulative impacts. The Clean Communities Plan includes 23 measures in seven groups that utilize a variety of different implementation approaches such as community participation, increased outreach and communication, additional agency coordination, and enhanced monitoring and compliance programs. Many of these approaches will require the participation from all sectors such as community representatives, agencies, elected officials, and businesses. In addition, many of the measures work together. Figure 1 shows the overall structure and lists the measures in the Clean Communities Plan.

Figure 1
Clean Communities Plan Structure and Measures

The centerpiece of the Clean Communities Plan is the Community Exposure Reduction Measures which includes a pilot study for two communities to develop Community Exposure Reduction Plans and development of a template so other communities can develop a Community Exposure Reduction Plan. Implementation of Community

Exposure Reduction Measures relies on many of the other measures in the 2010 Clean Communities Plan reach the goal of creating "clean communities."

Public Process
A Working Group was formed in order to ensure that public input and comments were considered in the early development of the Clean Communities Plan. Members included representatives from communities, environmentalists, industry, the AQMD, and other government agencies. The CCP Working Group met throughout the process of developing and reviewing the plan. In addition to Working Group meetings, many other briefings and meetings were held during development of the CCP. The AQMD staff briefed the Stationary Source Committee three times, the Environmental Justice Advisory Group three times, and the Local Government and Small Business Assistance Advisory Group twice. Outside meetings included presentations to the California Supply Chain Jobs Alliance, Los Angeles County Chamber of Commerce, a San Bernardino Town Hall Meeting, and several meetings attended by staff from the AQMD Legislative and Public Affairs office.

The Draft 2010 Clean Communities Plan was released for public review and comment at the April 2, 2010 Board meeting. The draft document was revised based comments from the Working Group and the public and presented in a Public Workshop on September 28, 2010. Comments received after the Public Workshop have been addressed in the final version of the 2010 CCP.

Legal Mandates
The Clean Communities Plan is a planning document for air toxics and it is not required by state or federal law. The Clean Communities Plan will not be submitted as part of the State Implementation Plan and it will not be a legally binding document. Development and implementation of specific measures may require partnership with other agencies, the regulated community, environmental groups, and the public. If rules are developed, each rule will go through the appropriate public review, socioeconomic assessment, and CEQA process. Applicable documents will be prepared at the time individual measures are developed. On this basis, the plan is exempt from the California Environmental Quality Act requirements. A copy of the Notice of Exemption is attached to this Board letter.

Recommendation
The AQMD staff recommends that the 2010 Clean Communities Plan be approved as a planning document for possible future actions.

B. 2010 Clean Communities Plan
C. Notice of Exemption

ATTACHMENT A

RESOLUTION NO. 10-_____

A Resolution of the AQMD Governing Board Approving the 2010 Clean Communities Plan.

WHEREAS, the 2010 Clean Communities Plan is an update to the March 2000 Final Draft Air Toxics Control Plan and the 2004 Addendum, fulfills the AQMD Governing Board direction set forth in the September 2003 Environmental Justice Workplan; and

WHEREAS, the 2010 Clean Communities Plan is not required by any federal or state regulation, or the AQMD's Air Quality Management Plan (AQMP); and

WHEREAS, the 2010 Clean Communities Plan will not be submitted for inclusion in the State Implementation Plan (SIP); and

WHEREAS, the 2010 Clean Communities Plan is a planning document designed to assist future regulatory programs and rule development efforts to reduce exposure to air toxics; and

WHEREAS, although the results of MATES III show regional reductions in health risk from exposure to toxic air contaminants, health risk is still elevated and some communities are disproportionately impacted; and

WHEREAS, the 2010 Clean Communities Plan builds on the existing air toxic programs, with greater emphasis on cumulative impacts; and

WHEREAS, the objective of the 2010 Clean Communities Plan is to reduce the exposure of air toxics and air-related nuisances in communities in the district; and

WHEREAS, the AQMD staff is aware that small business representatives have expressed concern that the "neighborhood walks" that are part of the pilot for Community Exposure Reduction Plans could negatively impact local businesses; and

NOW, THEREFORE BE IT RESOLVED, that the AQMD Governing Board directs staff to periodically report to the Stationary Source

Committee on the implementation Clean Communities Plan, including the status of development of methodologies to quantify cumulative impacts at the community level and to provide any issues raised by local businesses during neighborhood walks when implementing Community-01; and

NOW, THEREFORE BE IT RESOLVED, that the AQMD Governing Board directs staff to continue working toward development of methodologies to quantify cumulative impacts at the community level; and

NOW, THEREFORE BE IT RESOLVED, that the AQMD Governing Board approves the Clean Communities Plan dated November 2010; and

NOW, THEREFORE BE IT RESOLVED, that the AQMD Governing Board directs staff to update/revise, as appropriate, the Clean Communities Plan. Revisions or updates should reflect improvements in scientific tools for monitoring, emissions inventory, and modeling projections, when available.

Preface

The 2010 Clean Communities Plan (CCP, formerly the Air Toxics Control Plan) is the result of a collaborative effort by SCAQMD staff with input from community representatives, business representatives, local government officials, and partnering government agencies. The CCP builds from the existing traditional regulatory approaches and incorporates new implementation approaches to address cumulative air toxics exposure in communities and neighborhoods throughout the South Coast Air Quality Management District (District).

The 2010 CCP utilizes a variety of implementation approaches and tools to address exposure to air toxics at the community level and develop solutions. The CCP is an “action” plan which identifies activities for the public, community representatives, agencies, elected officials, and the regulated industries to help identify air quality issues in their neighborhoods and work together to develop solutions.

Executive Summary

Introduction

The 2010 Clean Communities Plan (CCP) is a planning document that outlines the overall control strategy for the South Coast Air Quality Management District's (AQMD's) air toxics control program. The plan is the continuing effort and update to both the Air Toxics Control Plan (ATCP) developed in 2000 and the subsequent Addendum in 2004. The 2010 CCP is comprised of traditional source-specific control measures and measures to address cumulative toxic impacts that affect neighborhoods and communities within the South Coast Air Quality Management District (District).

Public Process

A CCP working group was formed in the second half of 2008 in order to ensure that public input and comments were considered in the early development of the new measures. Members included representatives from communities, environmentalists, industry, the AQMD, and other government agencies. On April 2, 2010 the AQMD staff released the first draft of the CCP for public review. The AQMD staff reconvened the CCP working group to further discuss and receive additional input on the Draft CCP. The Revised Draft Clean Communities Plan was released at a Public Workshop held on September 28, 2010. Additional comments received after the Public Workshop were incorporated in the 2010 Clean Communities Plan to be presented to the Governing Board for approval in November 2010. As with previous versions of the ATCP, staff is seeking the Board's approval of the plan as a planning document for possible future actions. As a result, the Board's action is not binding and does not commit the AQMD to a definitive course of action.

Regulatory Progress

Federal, state, and AQMD rules, regulations, and programs have led to significant progress in reducing toxic air contaminant exposure. The AQMD's air toxics regulatory program regulates over 10,000 sources in the region such as, but not limited to, hexavalent chromium plating and finishing, hexavalent chromium spraying operations, perchloroethylene dry cleaners, benzene emissions from gasoline dispensing, and diesel-fueled stationary engines. In addition, the AQMD's regulatory program requires that every new and modified permitted source meet specific toxic requirements ensuring that these sources meet stringent air toxics requirements. During the past decade a number of local, state, and federal regulations have addressed diesel particulate emissions from idling trucks and school buses, fleet rules, locomotives, cargo handling equipment, heavy duty trucks, and transport refrigeration units to name a few.

Current District Average Cancer Risk

CARB and AQMD source-specific rules have markedly reduced exposure to toxic air contaminants. The results of the Multiple Air Toxics Exposure Studies (MATES II and MATES III) air quality monitoring have shown some regional reductions in exposure to key toxic air contaminants (TACs) and reduced cancer risk throughout the District. During the MATES III study period, the overall regional population

weighted estimated cancer risk from air toxics was approximately 853 in a million as compared to 931 in a million in MATES II. The greatest contributor to estimated cancer risk in both MATES II and III is diesel exhaust. In MATES III diesel exhaust accounts for 83% of the total estimated cancer risk from air toxics. MATES III is based on 2005 emissions inventory data and 2004-2006 monitoring data.

Many of the recently adopted diesel rules and regulations have implementation dates after 2005 and will not be fully implemented until 2010 and beyond. As a result, the reductions from diesel regulations are not realized in MATES III. Exposure reductions from implementation of current diesel regulations with future effective dates will occur as rules are fully implemented.

Future Population District Average Cancer Risk

The AQMD staff used projected toxic emissions estimates based on adopted rules and regulations with future effective compliance dates and short-term measures from the 2007 Air Quality Management Plan (AQMP). Based on these emissions projections, continued implementation of existing rules and regulations, and 2007 AQMP/State Implementation Plan (SIP) short-term measures, overall regional estimated risk from air toxics is expected to be reduced by 75 percent by 2023. Regionally, the 2023 population weighted estimated cancer risk from air toxics is expected to be approximately 210 in a million. Although many areas will have substantial reductions, the residual or remaining risk in some communities will be well above 200 in a million and of concern. Risk levels in between 2010 and 2023 are, as expected, much higher.

Chapter 1 of the September 2008 "Final Report, Multiple Air Toxics Exposure Study in the South Coast Air Basin, Mates-III, South Coast Air Quality Management District" provides the following discussion of perspectives of risk on pages 1-3 and 1-4:

> It may be useful to compare risks estimated from assessments of environmental exposures to the overall rates of health effects in the general population. For example, it is often estimated that the incidence of cancer over a lifetime in the U.S. population is about 1 in 4, to 1 in 3. This translates into a risk of about 300,000 in a million. It has been also estimated that the bulk of cancers from known risk factors are associated with lifestyle factors such as tobacco use, diet, and being overweight. One such study, the Harvard Report on Cancer Prevention, estimated that of cancers associated with known risk factors, about 30% were related to tobacco, about 30% were related to diet and obesity, and about 2% were associated with environmental pollution related exposures.

Limitations of Data Results

Because MATES III is based on regional modeling and shows average risk over a fairly large area, some neighborhoods and communities with elevated risk may not be identified. In addition, areas may show elevated health risk that is due to pollution transport from nearby areas. However, impacts from toxic emissions are generally localized and most heavily affect nearby receptors. Therefore, the 2010 CCP will go beyond the MATES III findings and take a closer look at toxic exposure at the community level.

Need for the Clean Communities Plan

AQMD rules, along with state and federal rules and regulations establish the foundation of the AQMD's air toxics regulatory program. These rules and regulations reduce air toxics from

thousands of sources throughout the District. However, even with an existing broad-based air toxics regulatory program, there are areas throughout the District where there are clusters of toxic emitting sources that, when combined together, can have substantial cumulative effects on neighborhoods. In addition, although the results of MATES II and MATES III have shown regional reductions in exposure to key TACs and reduced cancer risk throughout the District, future projections of MATES III show unacceptable cancer risk levels regionally. Local health risks in some communities are expected to be even more concentrated and elevated. Therefore, in addition to the traditional District-wide approach to air toxic programs, the CCP will include measures to address localized effects and cumulative impacts in communities and neighborhoods.

Clean Communities Plan Approach

The 2010 CCP builds upon the 2000 ATCP and 2004 Addendum to the ATCP. The CCP will continue to utilize traditional source-specific rules to address air toxics, but put greater emphasis on cumulative effects and neighborhood and community air-related issues.

The solution for cumulative air quality impacts is multi-faceted. The complexity is that the issues and solutions are community-specific. The CCP utilizes a variety of implementation approaches and tools to address exposure to air toxics at the community level and develop solutions. During the past several years, AQMD has realized the need for further action at the community level and has worked with highly impacted communities through Town Hall meetings, public outreach, and its compliance program. The CCP is designed as an "action" plan that calls for action by the public, community representatives, agencies, elected officials, and the regulated industries to help identify air quality issues in their neighborhoods and work together to develop solutions.

The CCP includes a pilot measure that will work with two communities to develop a Community Exposure Reduction Plan (CERP) that is tailored to the issues within those specific communities. Solutions to individual issues identified in each community will vary. Lessons learned from the CERP development will be formulated into a guidance document for other communities to follow when developing their own CERP. To address cumulative impacts throughout the District, the CCP provides a variety of implementation approaches to address existing high emitting toxic sources, encourage informed land use decisions for future projects, education and outreach programs for the public and agencies, and enhanced compliance programs.

Document Format

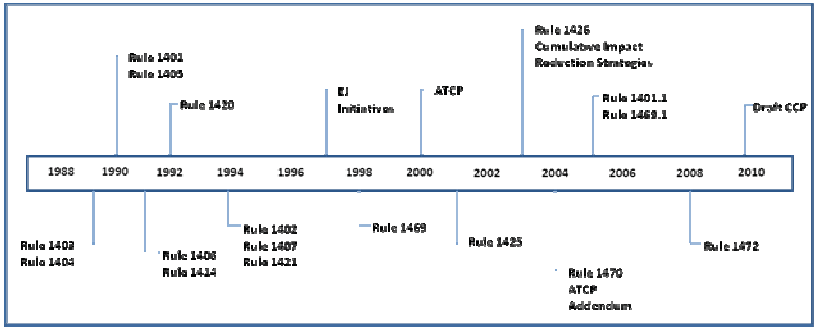
Chapter 1 of this document provides background information on toxic air contaminants (TACs) and summarizes federal, state, and local regulatory efforts to reduce air toxics exposure, including the 2000 Air Toxics Control Plan and its 2004 Addendum. Chapter 2 describes the progress made in reducing exposure to TACs in the District. A discussion on AQMD's Multiple Air Toxics Exposure Studies has been included with key findings relating to regional risk posed by various TACs within the District. Also included are historical, current, and projected air toxic levels, based on data and analyses of AQMD toxic inventories, AQMP and ATCP-related emission reductions, and risk models. Chapter 3 describes the measures and implementation approaches for the CCP and how they are integrated. It also details the specific measures of the CCP. Chapter 4 includes the implementation schedule for each of the measures presented in Chapter 3.

Chapter 1: Background

Introduction

The AQMD's air toxics program began in 1990 with the adoption of Rule 1401 – New Source Review of Toxic Air Contaminants. In 1994, Rule 1402 - Control of Toxic Air Contaminants from Existing Sources, which incorporates the state AB2588 Toxics "Hot Spots" Program, was adopted. During the past two decades, much of the focus has been on regulating individual source categories that emit a specific toxic air contaminant. The AQMD's air toxics program currently has 15 source-specific rules that target toxic emission reductions. In addition, criteria pollutant source-specific rules such as some coating and solvent rules also achieve concurrent air toxics emission reductions. Figure 1-1 shows the development of AQMD's air toxics program.

Figure 1-1
Development Timeline of AQMD's Air Toxics Program



During the past decade, the AQMD's Air Toxics Control Plan and Cumulative Impact Reduction Strategies have been strong influences in the AQMD's air toxics regulatory program as they provided the structure for the AQMD's current air toxics program. The following provides an overview of these two plans and the AQMD's regulatory program.

2000 Air Toxics Control Plan (ATCP)

In March 2000, the AQMD's Governing Board approved the Air Toxics Control Plan (ATCP) which was the first comprehensive plan in the nation to guide future toxic rulemaking and programs. The ATCP was developed to lay out the AQMD's air toxics control program which built upon existing federal, state, and local toxic control programs as well as co-benefits from implementation of State Implementation Plan (SIP) measures. The concept for the plan was an outgrowth of the Environmental Justice principles and the Environmental Justice Initiatives adopted by the Governing Board in October 1997. Monitoring studies and air toxics regulations that were created from these initiatives emphasized the need for a more systematic approach to reducing toxic air contaminants. The intent of the plan was to reduce exposure to air toxics in an equitable and cost-effective manner that promotes clean, healthful air in the District. The plan proposed control strategies to reduce toxic air contaminants in the District implemented between years 2000 and 2010 through cooperative efforts of the AQMD, local governments, CARB and US-EPA.

2003 Cumulative Impact Reduction Strategies

The AQMD's Governing Board approved a cumulative impacts reduction strategy in September 2003. The resulting 25 cumulative impacts strategies were a key element of the 2004 Addendum to the ATCP. The strategies included rules, policies, funding, education, and cooperation with other agencies. Some of the key AQMD accomplishments related to the cumulative impacts reduction strategies were:

- Rule 1401.1 which set more stringent health risk requirements for new and relocated facilities near schools
- Rule 1470 which established diesel PM emission limits and other requirements for diesel-fueled engines
- Rule 1469.1 which regulated chrome spraying operations
- Rule 410 which addresses odors from transfer stations and material recovery facilities
- Intergovernmental Review comment letters for CEQA documents
- AQMD's land use guidance document
- Additional protection in toxics rules for sensitive receptors, such as more stringent requirements for chrome plating operations and diesel engines located near schools

2004 Addendum to the ATCP

The Addendum to the ATCP (Addendum) was published by the AQMD in 2004 and served as a status report regarding implementation of the various mobile and stationary source strategies in the 2000 ATCP and introduced new measures to further address air toxics. The main elements of the Addendum were to:

- address the progress made in implementation of the 2000 ATCP control strategies;
- provide a historical perspective of air toxic emissions and current air toxic levels;
- incorporate the Cumulative Impact Reduction Strategies approved by the Board in 2003 and additional measures identified in the 2003 AQMP;
- project future air toxic levels to the extent feasible; and
- summarize future efforts to develop the next ATCP.

Significant progress has been made in implementing most of the AQMD strategies from the 2000 ATCP and the 2004 Addendum. The California Air Resources Board (CARB) has also made notable progress in mobile source measures via its Diesel Risk Reduction Plan, especially for goods movement-related sources, while the US-EPA continues to implement their air toxic programs applicable to stationary sources as discussed below.

Federal Toxics Regulatory Programs

Under Section 112 of the Clean Air Act (CAA), US-EPA is required to regulate sources that emit one or more of the 187 federally listed hazardous air pollutants (HAPs)[1]. In order to implement the CAA, approximately 100 National Emission Standards for Hazardous Air Pollutants (NESHAPs) have been

[1] Hazardous air pollutant (HAP) is the term used in the Clean Air Act for air toxics which are pollutants that are known or suspected of causing cancer or other serious health effects. The federal HAPs are listed on the US-EPA website at http://www.epa.gov/ttn/atw/orig189.html. The State of California adopted the original list of 189 HAPs from the Clean Air Act (Title 17 CCR 93000-93001) and refers to them as toxic air contaminants (TACs). In addition to the original list, the state identifies additional TACs using the procedure in H&S Code Sections 39660-39664.

promulgated by US-EPA for major sources (sources emitting greater than 10 tons per year of a single HAP or greater than 25 tons per year of multiple HAPs). The AQMD can either directly implement NESHAPs or adopt rules that contain requirements at least as stringent as the NESHAP requirements. However, since NESHAPs often apply to sources in the District that are controlled, many of the sources that would have been subject to federal requirements already comply or are exempt.

In addition to the major source NESHAPs, US-EPA has also controlled HAPs from urban areas by developing Area Source NESHAPs under their Urban Air Toxics Strategy. US-EPA defines an area source as a source that emits less than 10 tons annually of any single hazardous air pollutant or less than 25 tons annually of a combination of hazardous air pollutants. The Clean Air Act (CAA) requires the US-EPA to identify a list of at least 30 air toxics that pose the greatest potential health threat in urban areas. US-EPA is further required to identify and establish a list of area source categories that represent 90 percent of the emissions of the 30 urban air toxics associated with area sources, for which Area Source NESHAPs are to be developed under the CAA. US-EPA has identified a total of 70 area source categories with regulations promulgated for more than 30 categories so far. Appendix A lists key NESHAPs recently adopted or amended by US-EPA.

The federal toxics program recognizes diesel engine exhaust as a health hazard, however, diesel particulate matter itself is not one of their listed toxic air contaminants. Rather, each toxic compound in the speciated list of compounds in exhaust is considered separately. Although there are no specific NESHAP regulations for diesel PM, diesel particulate emission reductions are realized through federal regulations including diesel fuel standards and emission standards for stationary, marine, and locomotive engines; and idling controls for locomotives.

State Air Toxics Regulatory Program

The California air toxics program was based on the CAA and the original federal list of hazardous air pollutants. The state program was established in 1983 under the Toxic Air Contaminant Identification and Control Act, Assembly Bill (AB) 1807, Tanner. Under the state program, toxic air contaminants are identified through a two-step process of risk identification and risk management. This two-step process was designed to protect residents from the health effects of toxic substances in the air.

As part of its risk management efforts, CARB has passed state Air Toxic Control Measures (ATCMs) to address air toxics from mobile and stationary sources. Some key ATCMs for stationary sources include reductions of benzene emissions from service stations, hexavalent chromium emissions from chrome plating, perchloroethylene emissions from dry cleaning, ethylene oxide emissions from sterilizers, and multiple air toxics from the automotive painting and repair industries.

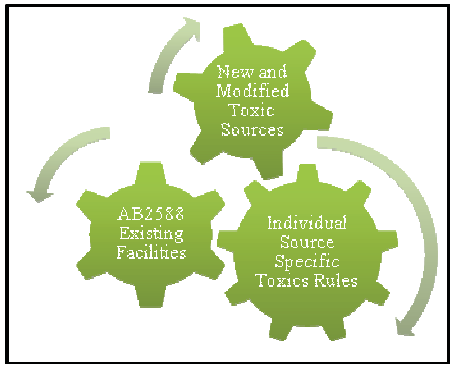
Many of CARB's recent ATCMs are part of the CARB Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (DRRP) which was adopted in September 2000 (http://www.arb.ca.gov/diesel/documents/rrpapp.htm) with the goal of reducing diesel particulate matter emissions from compression ignition engines and associated health risk by 75

percent by 2010 and 85 percent by 2020. The DRRP includes strategies to reduce emissions from new and existing engines through the use of ultra-low sulfur diesel fuel, add-on controls, and engine replacement. In addition to stationary source engines, the plan addresses diesel PM emissions from mobile sources such as trucks, buses, construction equipment, locomotives, and ships. Appendix A lists key ATCMs recently adopted or amended by CARB.

AQMD's Toxics Regulatory Program

The AQMD's current toxics regulatory program is composed of three major components: rules that address new and modified toxic sources, AB2588 facilities (existing toxic sources), and source-specific toxic rules which can be an equipment or industry category. Figure 1-2 provides an overview of these three components of the AQMD's toxics regulatory program.

Figure 1-2: AQMD's Existing Regulatory Program



New and Modified Toxic Emitting Sources

The AQMD has two rules addressing new and modified sources. Rule 1401 sets health risk thresholds for air toxic emissions from new, modified, and relocated sources. The rule lists nearly 300 TACs that are evaluated during the AQMD's permitting process for new, modified or relocated sources. During the past decade, more than 80 compounds have been added or had risk values amended. The addition of diesel particulate matter from diesel-fueled internal combustion engines as a TAC in March 2008 was the most significant of recent amendments to the rule.

Rule 1401.1 sets risk thresholds for new and relocated facilities near schools. The requirements are more stringent than those for other air toxics rules in order to provide additional protection to school children.

Existing Toxic Emitting Facilities (AB2588)

Rule 1402 sets health risk thresholds for existing facilities. Depending upon facility-wide air toxic emissions, the program requires emissions inventories, health risk assessments (HRAs), public notices, public meetings, and/or risk reduction. The AB2588 Toxics "Hot Spots" Program is implemented through Rule 1402. There are currently about 600 facilities in the AQMD's AB2588 program. Since 1992 when the state Health and Safety Code incorporated a risk reduction requirement in the program, the AQMD has reviewed and approved over 300 HRAs, 44 facilities were required to do a public notice, and 21 facilities were subject to risk reduction. Currently, over 96 percent of the facilities in the program have cancer risks below ten in a million and over 98 percent have acute and chronic hazard indices of less than one.

Source-Specific Rules and Regulations

The 2000 Air Toxics Control Plan and 2003 Cumulative Impacts Strategies were two documents that influenced the

AQMD's rulemaking efforts during the past decade. Source-specific rules address either a source or industry category.

Under the AQMD's toxic regulatory program there are 15 source-specific rules that target toxic emission reductions that regulate over 10,000 sources such as metal finishing, spraying operations, dry cleaners, film cleaning, gasoline dispensing, and diesel-fueled stationary engines to name a few. In addition, other source-specific rules targeting criteria pollutant reductions also reduce toxic emissions, such as Rule 461 which reduces benzene emissions from gasoline dispensing and Rule 1124 which reduces perchloroethylene, trichloroethylene, and methylene chloride emissions from aerospace operations. Figure 1-3 provides a summary of the source-specific rule and targeted toxic air contaminant.

Figure 1-3
AQMD's Source-Specific Toxics Rules

In addition to the AQMD's stationary source-specific rules, the AQMD's toxics regulatory program includes a series of rules to address diesel emissions from certain types of mobile source fleets in the District.

Other AQMD Programs to Address Toxics

Exposure to air toxics emissions is also addressed through other AQMD programs such as environmental justice, projects that undergo California Environmental Quality Act (CEQA) review, AB2766 subvention funding projects, and Carl Moyer. These programs are summarized below.

AQMD's CEQA Intergovernmental Review Program

The AQMD staff, through its Intergovernmental Review (IGR) provides comments to lead agencies on air quality analyses and mitigation measures in CEQA documents. The following are some key programs and tools that have been developed more recently to strengthen air quality analyses, specifically as they relate to exposure of mobile source air toxics:

- AQMD's Mobile Source Committee approved the "Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Emissions" (August 2002). This document provides guidance for analyzing cancer risks from diesel particulate matter from truck idling and movement (e.g., truck stops, warehouse and distribution centers, or transit centers), ship hotelling at ports, and train idling.
- Cal-EPA and CARB's "Air Quality and Land Use Handbook: A Community Health Perspective" (April 2005), provides recommended siting distances for incompatible land uses.
- Western Riverside Council of Governments Air Quality Task Force developed a policy document titled, "Good

Neighbor Guidelines for Siting New and/or Modified Warehouse/Distribution Facilities" (September 2005). This document provides guidance to local government on preventive measures to reduce neighborhood exposure to toxic air contaminants from warehousing facilities.

Environmental Justice (EJ)

Environmental justice has long been a focus of the AQMD. In 1990, the AQMD formed an Ethnic Community Advisory Group that was recently restructured as the Environmental Justice Advisory Group (EJAG). EJAG's mission is to advise and assist AQMD in protecting and improving public health in AQMD's most impacted communities through the reduction and prevention of air pollution.

In 1997 the Governing Board adopted four guiding principles and ten initiatives (http://www.aqmd.gov/ej/history.htm) to ensure environmental equity. In 1997 the Governing Board expanded the initiatives to include the "Children's Air Quality Agenda" focusing on the disproportionate impacts of poor air quality on children. Some key initiatives that have been implemented were the MATES II and MATES III studies; the Clean Fleet Rules, the Cumulative Impacts strategies; funding for lower emitting technologies under the Carl Moyer Program; the Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning; a guidance document on Air Quality Issues in School Site Selection; and the 2000 Air Toxics Control Plan and its 2004 Addendum. Key initiatives focusing on communities and residents include the Clean Air Congress; the Clean School Bus Program; Asthma and Air Quality Consortium; Brain and Lung Tumor and Air Pollution Foundation; air quality presentations to schools and community and civic groups; and Town Hall meetings.

Technological and scientific projects and programs have been a large part of the AQMD's EJ program since its inception. Over time, the EJ program's focus on public education, outreach, and opportunities for public participation have greatly increased. Public education materials and other resources for the public are available on the AQMD's website (www.AQMD.gov) and examples of ways the public can get involved can be found at http://www.aqmd.gov/ej/getting_involved.htm.

AB 2766 Subvention Funds

AB2766 subvention funds, money collected by the state as part of vehicle registration and passed through to the AQMD, is used to fund projects of local cities that reduce motor vehicle air pollutants. The Clean Fuels Program, funded by a surcharge on motor vehicle registrations in the AQMD, reduces TAC emissions through co-funding projects to develop and demonstrate low-emission clean fuels and advanced technologies, and to promote commercialization and deployment of promising or proven technologies in Southern California.

Carl Moyer Program

Another program that targets diesel emission reductions is the Carl Moyer program which provides grants for projects that achieve early or extra emission reductions beyond what is required by regulations. Examples of eligible projects include cleaner on-road, off-road, marine, locomotive, and stationary agricultural pump engines. Other endeavors of the AQMD's Technology Advancement Office help to reduce diesel PM emissions through co-funding research and demonstration projects of clean technologies, such as low-emitting locomotives.

Chapter 2: Progress to Date and Future Projections

Regulatory Progress

Results of the Multiple Air Toxics Exposure Studies (MATES) have helped to guide the AQMD's air toxics regulatory program. The 2000 ATCP identified a list of ten toxic air contaminants (TACs) based on the results of the second Multiple Air Toxics Exposure Study (MATES II) conducted in 1998 and 1999 that were primarily responsible for cancer risk in the AQMD. Of this list of ten, six TACs contributed to over 90 percent of the average risk in the District. These six TACs and their contribution to risk, based on the MATES II study, are as follows:

Table 2-1
Top Six MATES II Contributors to Cancer Risk

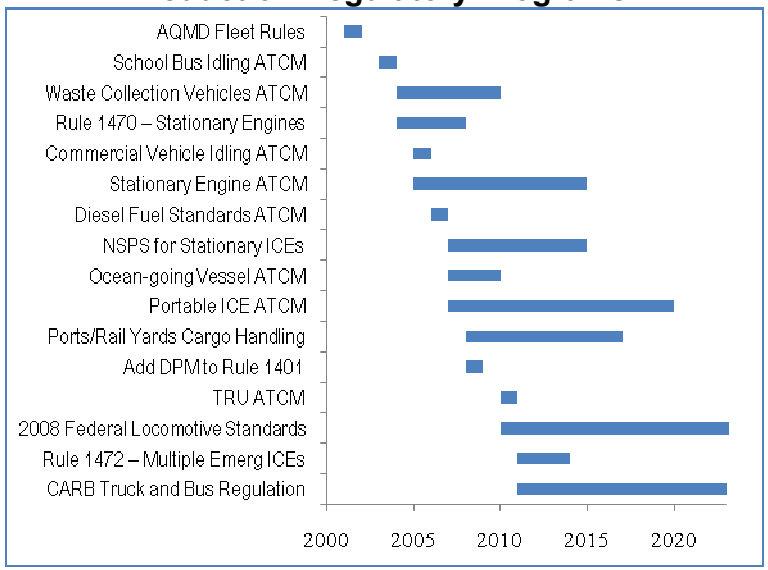
Toxic Air Contaminant	Risk Contribution (%)
Diesel particulate	72.0
1,3-butadiene	8.4
Benzene	6.5
Formaldehyde	2.0
Hexavalent chromium	1.8
Perchloroethylene	0.8

The above toxic air contaminants were the focus of many of the measures in the 2000 ATCP. The AQMD and CARB have aggressively adopted and amended regulations to reduce these TACs. The following provides an overview of the progress in adopting regulatory and other programs to address these six TACs during the past 10 years.

Diesel Particulate Matter

Significant regulatory progress has been made to reduce diesel particulate from stationary and mobile sources. Figure 2-1 provides a summary of regulatory programs that have been adopted since the 2000 ATCP to address diesel particulate emissions. Figure 2-1 shows the implementation start date and when the rule or regulation is at full implementation. Most rules and regulations have an initial implementation date after 2005 and will not be fully implemented until 2010 and beyond.

Figure 2-1
Implementation Timeline of Diesel PM Emission Reduction Regulatory Programs



The following summarizes key AQMD, state, and federal diesel regulatory programs that have been adopted during the last decade.

AQMD's Stationary Diesel-Fueled Engines
In April 2004 the AQMD's Governing Board adopted Rule 1470 which affects approximately 4,900 facilities with diesel-fueled engines and implements the state ATCM for stationary diesel-fueled engines. Rule 1470 establishes requirements for new and existing stationary diesel-fueled engines. Implementation of Rule 1470 is expected to reduce diesel PM emissions by 73 tons per year or more by 2020.

In March 2008 diesel PM from internal combustion engines was added to the list of TACs for Rules 1401 and 1402. At the same time, Rule 1472 was adopted to address facilities with multiple emergency diesel engines. In addition to these toxics rules, Rule 1110.2, which sets oxides of nitrogen (NOx), volatile organic compound (VOC), and carbon monoxide (CO) emission limits for gaseous- and liquid-fueled engines, was amended in 2008. Implementation of amended Rule 1110.2 essentially eliminates use of new stationary prime diesel engines due to the stringency of NOx emission limits.

AQMD's Clean Fleet Rules
AQMD's Clean Fleet Program has reduced diesel PM emissions from mobile sources through rules for street sweepers, public fleet vehicles, buses, refuse vehicles, school buses, and airport ground access vehicles. The fleet rules result in reductions of diesel PM emissions by requiring replacement of fleet vehicles with alternative-fueled vehicles.

CARB's Diesel Risk Reduction Plan
CARB's Diesel Risk Reduction Plan (DRRP) proposed the development of new emissions standards for new stationary and mobile diesel-fueled engines, retrofit requirements for in-use engines, and requirements for ultra low-sulfur content diesel fuel needed by the advanced diesel PM emission controls. Emission standards for new diesel-fueled engines take a phased-in approach to allow time for development of engine technology. Ultra low-sulfur fuel requirements were effective in 2006, allowing adequate time for fuel reformulation and for refineries to re-tool and produce the fuel in sufficient quantities. Add-on controls for existing engines require the use of ultra-low sulfur fuel, so implementation dates for these requirements were developed based on the availability of the fuel. In addition, the process for developing each new air toxics regulation is lengthy in order to ensure that requirements are feasible and cost effective and to allow full public participation.

Many ATCMs for diesel-fueled engines have been adopted by CARB as a result of the Diesel Risk Reduction Plan. Diesel PM emissions sources addressed by ATCMs so far include:

- Stationary Engines
- Portable Engines
- School Bus Idling
- Solid Waste Collection Vehicles
- Transport Refrigeration Units
- Commercial Motor Vehicle Idling
- Mobile Cargo Handling Equipment at Ports and Intermodal Rail Yards
- Ocean-going Vessels within California Waters

US-EPA's Diesel Emission Reductions
During the past 10 years, US-EPA has addressed diesel emissions through several regulations and programs. In addition to diesel fuel standards, US-EPA sets emission standards for on-road diesel fueled engines used in trucks and buses. US-EPA also promulgated emission standards for stationary diesel engines, including PM standards, in July 2006 (Standards of Performance for Stationary Compression Ignition Internal Combustion Engines). More stringent NOx and PM emission standards for locomotives and marine engines were adopted in May 2008 (Control of Emissions of Air Pollution from Locomotive Engines and Marine Compression-Ignition Engines Less Than 30 Liters per Cylinder).

Summary of Regulatory Progress of AQMD Source – Specific Rules for Key TACs

Table 2-2 summarizes source-specific toxic rules that have been adopted or amended during the past 10 years, the number of affected sources, and emission reductions, if quantified. The AQMD's air toxics regulatory program is as or more stringent than state and federal air toxics programs. As such, many of the AQMD's rules incorporate requirements from state ATCMs and federal NESHAPs.

Hexavalent Chromium

Other key accomplishments have been with amendments to Rule 1469 which affects 130 chromium plating and chromic acid anodizing facilities. The 2003 amendments to Rule 1469 reduced hexavalent chromium emissions by 48 pounds per year. Rule 1469.1, a new rule for hexavalent chrome spraying operations, applies to 70 facilities and will reduce hexavalent chrome emissions by an estimated 85 percent.

Perchloroethylene from Dry Cleaning and Film Cleaning

In December 2002, the AQMD's Governing Board amended Rule 1421 which reduced perchloroethylene emissions from dry cleaners. Implementation of this rule affects approximately 2,100 dry cleaners throughout the District and is expected to result in approximately 850 tons of perchloroethylene emissions reduced by 2021. In addition, Rule 1425, adopted in 2001, affects 37 motion picture film cleaning facilities and reduced perchloroethylene emissions by 39.5 tons per year from film cleaning operations.

Benzene from Gasoline Dispensing and Reformulated Gasoline

Amendments to Rule 461 which require vapor recovery devices on gasoline dispensing nozzles are expected to reduce benzene emissions by about 35.9 tons per year affecting over 5,500 facilities. Benzene emissions are primarily from mobile sources and have been reduced by reformulated gasoline and vehicle turnover.

1,3-Butadiene and Formaldehyde

Formaldehyde and 1,3-butadiene emissions are products of fuel combustion. They are primarily attributable to mobile sources. CARB reformulated gasoline requirements and mobile source regulations addressed these TACs. Vehicle turnover has also reduced these TACs.

Other TACs

Source-specific rules for criteria pollutant reductions have also reduced air toxic emissions by eliminating their use in coatings and solvents. For example, a 2001 amendment to Rule 1124 which affects 237 aerospace facilities decreased emissions of methylene chloride, perchloroethylene, trichloroethylene, and

hexavalent chromium. Rules 1168 and 1171 also prohibit the use of methylene chloride and additionally prohibit the use of trichloroethylene in adhesive and sealant operations, and perchloroethylene in adhesive, sealant, and solvent cleaning operations. Rule 1426, a rule for metal finishing, reduces emissions of nickel and other toxic metals through improved housekeeping and recordkeeping requirements.

Table 2-2 – AQMD Air Toxics Control Regulations – Stationary Sources

Rule	Topic	Key Adoption / Amendment Dates	TAC	Affected Facilities	Estimated Reductions
1421	Dry Cleaning Operations*	12/6/2002 (amended)	Perchloroethylene	2100	849 tons total by 2021
1425	Motion Picture Film Labs	3/16/2001 (adopted)	Perchloroethylene	55	39.5 tons/yr (including NESHAP reductions)
1426	Metal Finishing	5/2/2003 (adopted)	Nickel, Cadmium, Lead, Copper, Chromic Acid	268	Not quantified
1469	Hexavalent Chromium Emissions from Chrome Plating Operations**	5/2/2003 (amended) 12/5/2008 (amended)	Hexavalent Chromium Hexavalent Chromium	~130	48 lbs/yr 0.87 lbs/yr
1469.1	Hexavalent Chromium Emissions from Spraying Operations	3/4/2005 (adopted)	Hexavalent Chromium	70	Baseline reduction of 85% (total emissions not quantified)
1470	Stationary Diesel-Fueled Engines***	4/2/2004 (adopted)	Diesel PM	4900	73 tons/yr or more by 2020
1472	Multiple Stationary Emergency Standby Diesel-Fueled IC Engines	3/7/2008 (adopted)	Diesel PM	~150	Not quantified
461	Gasoline Transfer and Dispensing	4/21/2000 (amended) 6/3/2005 (amended)	Benzene	~5500	35.9 tons/yr (benzene) 0.007 ton/yr (benzene)
1122	Degreasing Operations	5/9/2009 (amended)	Perchloroethylene, 1,1,1-Trichloroethane Trichloroethylene Methylene Chloride	251	295.7 tons/yr
1124	Aerospace Operations	9/21/2001 (amended)	Perchloroethylene Hexavalent Chromium Trichloroethylene Methylene Chloride	237	Facility's toxicity-weighted VOC and particulate emissions by 90 and 99 percent when Rule 1402 levels are exceeded
1156	Cement Manufacturing Facilities	3/6/2009 (amended)	Hexavalent Chromium	2	32 lbs/yr of total PM (hexavalent chromium not quantified)

*Implements ATCM for Emissions of Perchloroethylene Emissions from Dry Cleaning Systems, and the NESHAPS for Perchloroethylene Dry Cleaning Facilities
**Implements Hexavalent ATCM for Decorative and Hard Chrome Plating and Chromic Acid Anodizing Facilities
***Implements ATCM for Stationary Compression Ignition Engine

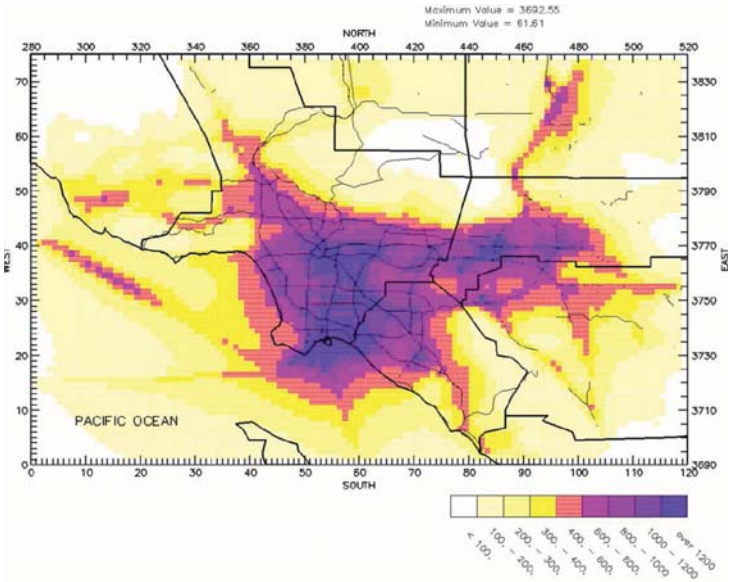
Current District Average Cancer Risk

In March 2006, the AQMD staff completed the Multiple Air Toxics Exposure Study III (MATES III)[2], a two-year toxic air contaminant monitoring and evaluation study conducted in the District. During the MATES III study period, the overall District estimated cancer risk from air toxics based on the fixed monitoring site data was approximately 1,200 per million as compared to 1,400 per million in MATES II. The overall District population weighted estimated cancer risk from air toxics was approximately 853 in a million as compared to 931 in a million in MATES II. The greatest contributor to cancer risk was diesel exhaust, accounting for an estimated 83 percent of the total.

MATES III is based on 2005 emissions inventory data and 2004-2006 monitoring data. Many of the recently adopted diesel rules and regulations have implementation dates after 2005 and will not be fully implemented until 2010 and beyond. As a result, the reductions from diesel regulations are not realized in MATES III. Exposure reductions from implementation of current diesel regulations with future effective dates will occur as rules are fully implemented.

Modeling analysis shows the highest estimated cancer risks from air toxics surrounds the port areas, with the highest grid cell risk of about 3,700 in a million. Following the ports, the next highest estimated risk is in the Central Los Angeles area extending southeast following the Interstate 5 Corridor. The highest grid cell cancer risk in a residential area is in Long Beach along the coast just northeast of the port, with about 2,900 in a million risk due to significant nearby diesel sources such as ships, trains, and trucks. Modeling analysis also showed pronounced exposure along freeways and near intermodal facilities. Figure 2-2 shows the MATES III modeled risk from all sources.

Figure 2-2
MATES III Modeled Risk from All Sources



As shown in Table 2-3 below, based on cancer potency weighting of the emissions inventory, the primary contributors to estimated cancer risk from air toxics were diesel particulate, benzene, 1,3 butadiene, hexavalent chromium, and formaldehyde. Other TACs contributed to less than one percent of the cancer risk.

[2] Final Report, Multiple Air Toxics Exposure Study in the South Coast Air Basin, Mates-III, South Coast Air Quality Management District, September 2008.

Table 2-3
2005 Risk from Simulated
Individual Toxic Air Contaminants

Toxic Compound	Cumulative Risk (per million)	Percent Contribution
Diesel	703.76	82.5
Benzene	44.53	5.2
1,3 Butadiene	30.45	3.6
Hexavalent Chromium	23.41	2.7
Primary Formaldehyde	11.78	1.4
Sec Formaldehyde	9.61	1.1

On-road and off-road mobile sources contribute nearly 93 percent of the potency weighted carcinogenic risks and stationary sources contribute about 7 percent. Carcinogenic emissions from on-road, point, and area source categories decreased by 12 percent, 66 percent, and 42 percent, respectively, and off-road carcinogenic emissions are essentially unchanged compared to MATES II.

Ambient levels of most substances measured were lower during the period of the MATES III study compared to that of the MATES II study of 1998-99, reflecting the success of various control strategies to reduce exposure to air toxics. Diesel PM emissions decreased by an estimated 2.5 percent from MATES II to MATES III, largely due to state and AQMD regulation of stationary diesel-fueled engines. Hexavalent chromium emissions were reduced by approximately 13 percent, largely due to amendments to the AQMD's chrome plating rule and the new rule for chrome spraying operations. A 50 percent reduction in benzene emissions and a 73 percent reduction in 1,3 butadiene emissions were seen and are attributed primarily to mobile source emission reductions associated with vehicle turnover and the use of reformulated gasoline. Perchloroethylene emissions have decreased by 78 percent, primarily because of 2002 amendments to the AQMD's perchloroethylene dry cleaning rule. Additional future perchloroethylene reductions are anticipated as Rule 1421 is fully implemented.

It should be noted that there are uncertainties in estimating risk. These uncertainties, as they relate to MATES III, are discussed in the Executive Summary (page ES-6) and in Chapter 1 of the September 2008 "Final Report, Multiple Air Toxics Exposure Study in the South Coast Air Basin, Mates-III, South Coast Air Quality Management District." The following is from pages ES-6 and ES-7 of the Executive Summary of MATES III:

> There are also uncertainties in the risk potency values used to estimate lifetime risk of cancer. This study used the unit risks for cancer potency established by OEHHA and the annual average concentration measured or modeled to calculate risk. This methodology has long been used to estimate the relative risks from exposure to air toxics in California and is useful as a yardstick to compare potential risks from varied sources and emissions and to assess any changes in risks over time that may be associated with changing air quality.
>
> The estimates of health risks are based on the state of current knowledge, and the process has undergone extensive scientific and public review. However, there is uncertainty associated with the processes of risk assessment. This uncertainty stems from the lack of

data in many areas necessitating the use of assumptions. The assumptions are consistent with current scientific knowledge, but are often designed to be conservative and on the side of health protection in order to avoid underestimation of public health risks.

As noted in the OEHHA risk assessment guidelines, sources of uncertainty, which may either overestimate or underestimate risk, include: (1) extrapolation of toxicity data in animals to humans, (2) uncertainty in the estimation of emissions, (3) uncertainty in the air dispersion models, and (4) uncertainty in the exposure estimates. Uncertainty may be defined as what is not known and may be reduced with further scientific studies. In addition to uncertainty, there is a natural range or variability in the human population in such properties as height, weight, and susceptibility to chemical toxicants.

Thus, the risk estimates should not be interpreted as actual rates of disease in the exposed population, but rather as estimates of potential risk, based on current knowledge and a number of assumptions. However, a consistent approach to risk assessment is useful to compare different sources and different substances to prioritize public health concerns.

Limitations of Data Results

MATES III uses regional air quality modeling of emissions inventories and monitoring data to calculate cancer risk. Under the MATES approach, toxic emissions are averaged over a 2 kilometer (km) by 2 kilometer grid. This approach provides a regional perspective of generally where there are elevated toxic emissions and risk throughout the District. This approach, however, does not capture clusters of emission sources concentrated within a small section of the 2 km by 2 km grid since these emissions will be averaged over the entire grid. This methodology may not adequately characterize exposure at a community level.

Because MATES III is based on regional modeling and shows average risk over a fairly large area, some neighborhoods and communities with elevated risk may not be identified. In addition, areas may show elevated health risk that is due to pollution transport from nearby areas. However, impacts from toxic emissions are generally localized and most heavily affect nearby receptors. Therefore, the 2010 CCP will go beyond the MATES III findings and take a closer look at toxic exposure at the community level. While conventional regulatory programs will continue to further reduce the overall community exposure, more needs to be done to address neighborhoods and communities which are more heavily impacted due to their proximity to multiple toxic sources.

Future Toxic Emission Projections

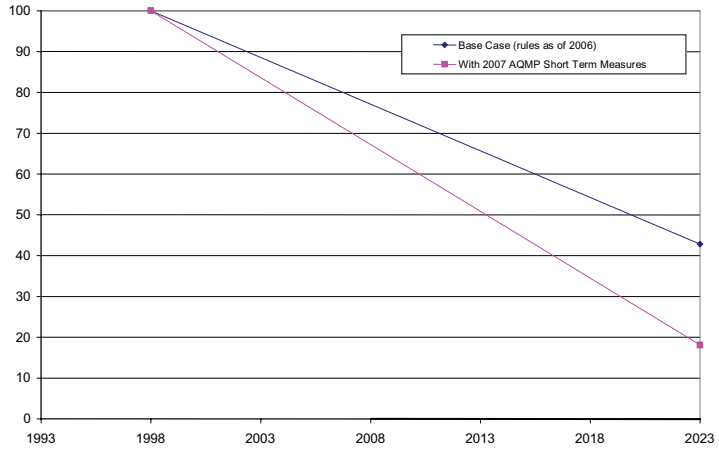
As previously discussed, many of the diesel PM reductions are not captured in MATES III as the rules and regulations will not be fully implemented until after 2005. The AQMD used 2002 reported stationary source emissions as the base year to develop emission inventories for past and future years. Additional emissions data obtained from CARB, California Department of Transportation, and the Southern California Association of Governments were included to produce a more accurate and comprehensive emissions inventory.

The AQMD staff projected future baseline emissions inventories from the 2002 base year accounting for emission

reductions and controls required by rules adopted as of June 30, 2006 and most CARB rules adopted by June 2005. Specific growth factors were then applied for factors such as population, industry, and motor vehicle activity. Toxic emissions for the selected years were then calculated by applying the latest CARB speciation profiles to the total organic gases and PM emissions.

Figure 2-3 shows projected reductions in toxic emissions from 1998 to 2023 using 1998 as the base year and including implementation of the 2007 AQMP Short Term Measures. Although the AQMP measures are primarily intended for criteria pollutant emission reduction, concurrent reductions are achieved for toxics emissions resulting from criteria pollutant reductions of total organic gases and PM. This co-benefit is also reflected in previous AQMP efforts.

Figure 2-3
Toxicity Weighted Emission Reductions from 1998 to 2023



Figures 2-4 through 2-6 show the percent contribution to District-wide risk for the largest contributors for 2005 and projected years 2014 and 2023, including implementation of the Short Term Measures in the 2007 AQMP.

Figure 2-4

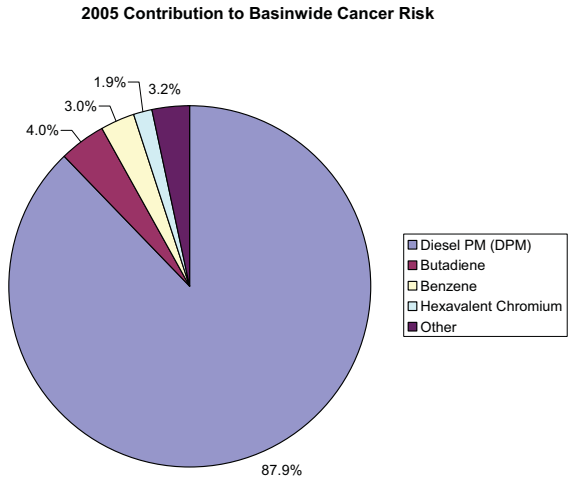


Figure 2-5

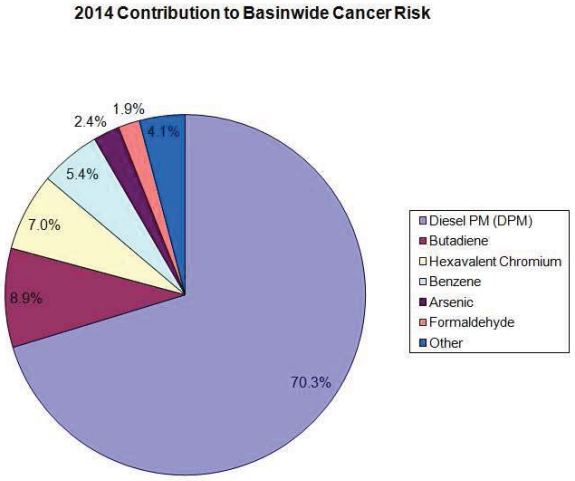

Figure 2-6

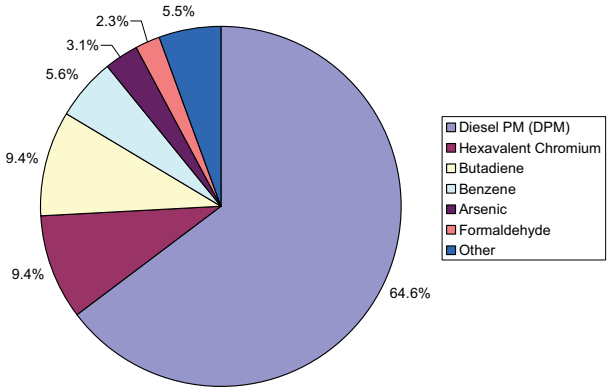
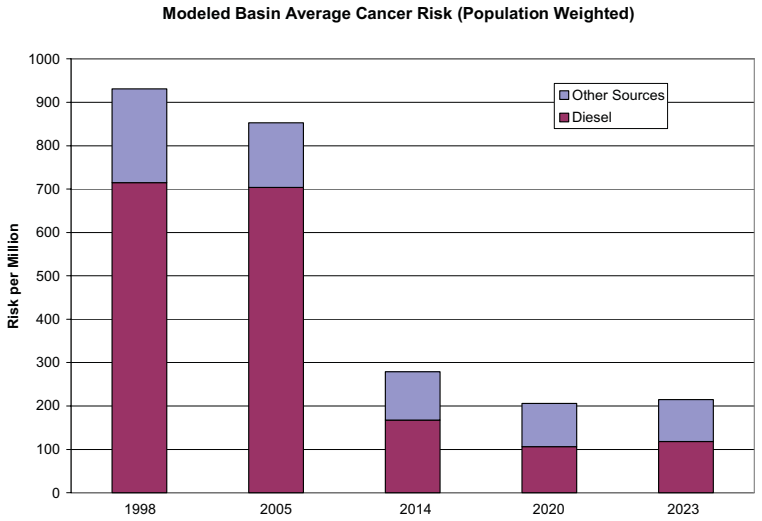


Modeled Future District Average Cancer Risk

Implementation of the AQMP, previous versions of the ATCP, and CARB programs have reduced toxic emissions during the past few years. However, these programs and regulations address toxic air pollution on a regional level. Figure 2-7 shows the modeled District average cancer risk for selected years.

Figure 2-7



Figures 2-8 through 2-10 show the modeled estimated risks distributed throughout the District for selected years. The figures show significant reductions in overall regional risk through 2023, however, the modeled District average risk is expected to be at 200 in a million. Although many areas will have substantial reductions, the residual or remaining risk in some areas is expected to still be elevated. In addition, there may be a need to accelerate reductions beyond existing regulations in some highly impacted communities.

Figure 2-8
1998 MATES III Model Estimated District Cancer Risk

2005 MATES III Model Estimated District Cancer Risk

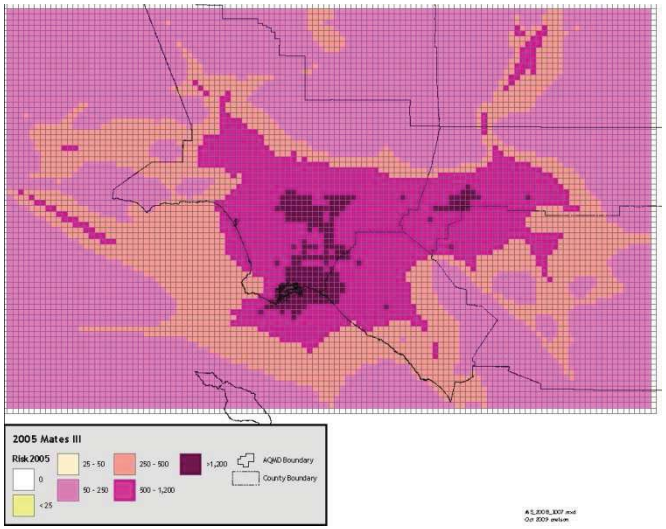

Figure 2-10
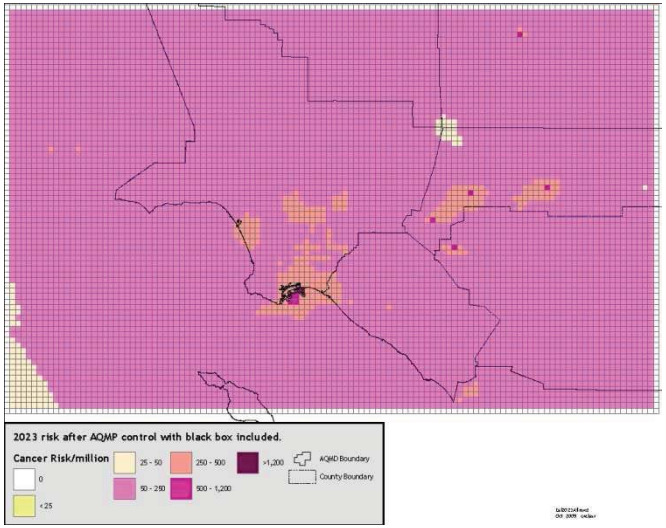
2023 Model Estimated District Cancer Risk



Need for the CCP

AQMD rules, along with state and federal rules and regulations establish the foundation of the AQMD's air toxics regulatory program. These rules and regulations reduce air toxics from thousands of sources throughout the District. However, even with an existing broad-based air toxics regulatory program there are areas throughout the District where there are clusters of toxic emitting sources that, when combined together, can have substantial cumulative effects on neighborhoods. In addition, although the results of MATES II and MATES III have shown regional reductions in exposure to key TACs and reduced cancer risk throughout the District, future projections of MATES III shows unacceptable cancer risk levels regionally. Local health risks in some communities are expected to be even more concentrated and elevated.

The 2010 CCP is needed to address toxic air pollution at localized areas of concern where higher cancer risk levels and other air-related issues exist. During the past several years, AQMD has realized the need for further action at the community level and has worked with highly impacted communities through Town Hall meetings, public outreach, and its compliance program. Therefore, in addition to the traditional District-wide approach to air toxic programs, the CCP will include measures to address localized effects and cumulative impacts in communities and neighborhoods. The approach of the CCP is to utilize a variety of implementation approaches and tools to address exposure to air toxics at the community level and develop solutions. The CCP is designed as an "action" plan that calls for action on behalf of the public, community representatives, agencies, elected officials, and regulated industries to help identify air quality issues in their neighborhoods and work together to develop solutions.

Chapter 3: CCP Measures

Introduction

The overall objective of the 2010 CCP is to reduce exposure to air toxics and air-related nuisances. The CCP utilizes a variety of different implementation approaches and includes measures that will continue to build on and strengthen existing source-specific rules while identifying new source-specific categories. In addition, a greater emphasis will be placed on addressing cumulative impacts in neighborhoods and communities. Other solutions focus on precautionary measures and public education in order to prevent exposure rather than mitigation. Improving communication within and among government agencies is another example of strategies proposed to provide more efficient infrastructure to address air toxic related problems. To reach the goal of creating "clean communities", the plan takes two approaches; a District-wide Approach, the more traditional approach, which benefits the entire South Coast Air Quality Management District, and a Community Approach which focuses on localized air quality issues and benefits communities and neighborhoods throughout the District.

The CCP is a planning document. The measures and implementation approaches are initial concepts. As measures are developed, staff may identify additional implementation approaches or implementation approaches identified will become more refined. If a regulatory approach is selected for implementation, the AQMD staff will analyze its legal authority, environmental impacts including greenhouse gas emissions, and socioeconomic impacts. In addition, the AQMD staff will develop measures through a public process.

Measures

Figure 3-1 shows the groups of measures that comprise the CCP. The individual CCP measures contain a brief description of an air quality issue, the purpose of the measure, and implementation approaches for each measure. The sidebars on the measures briefly summarize the objective and the implementation approaches. Many of the CCP measures are intended to work in coordination with other measures to provide a comprehensive approach to address air quality issues. Table 3-1 lists the measures in the CCP, briefly describes the implementation approach for each measure, and notes the relationship with other measures.

Figure 3-1
Clean Communities Plan Structure and Measures

TABLE 3-1
Summary of CCP Measures

Measure/Objective	Implementation Approach	Related Measures
Community Exposure Reduction Measures		
Community-01: Community Exposure Reduction Plan AQMD staff will develop Community Exposure Reduction Plans tailored to address air-related issues in specific communities.	Six-phase pilot study: • Phase 1: Selection of two pilot communities • Phase 2: Stakeholder Input • Phase 3: Investigation and Data Validation • Phase 4: Implementation of Immediate Action Items • Phase 5: Development of Community Exposure Reduction Plan • Phase 6: Implementation of Community Exposure Reduction Plan	• Community-02 • Community-03
Community-02: Community Guidance for Reducing Air Toxic Exposure Provide a process for communities and local governments to follow in developing Community Exposure Reduction Plans with AQMD assistance.	• Develop a process, somewhat similar to the process followed in the pilot study of Community-01, that will guide communities and local governments to develop CERPs with AQMD assistance • Update the process as experience is gained in developing CERPs	• Community-01 • Community-03 • Outreach-01
Community-03: Greening Communities through Accelerated Toxic Emission Reduction Projects for Existing Sources Reduce existing toxic emissions from older toxic emitting sources in residential communities disproportionately impacted by toxic emission sources.	• Identify disproportionately-impacted communities and assess cumulative impacts • Retrofit or replace existing toxic sources • Establish funding for emission reduction programs • Provide outreach and education for permitted and unpermitted sources of emissions	• Community-01 • Community-02 • Outreach-01
Community Participation Measures		
Participation-01: Clean Communities Pledge Develop a “Clean Communities Pledge” that will encourage local government participation in air quality training and outreach programs.	• Develop a “Clean Communities Pledge” • Recognize achievements of participating members	• Outreach-01 • Agency-01
Participation-02: Clean Schools Pledge Empower schools to take practical steps to reduce school children’s exposure to air pollution. Increase participation and awareness of AQMD programs and guidelines among local school districts.	• Develop a “Clean Schools Pledge” • Advocate school participation in air quality-related programs • Recognize achievements of participating members	• Outreach-03

Measure/Objective	Implementation Approach	Related Measures
Participation-03: Enhanced AQMD Community Meetings Further engage the public to inform the AQMD of air quality issues in communities.	• Continue and enhance existing AQMD community meetings to include round table discussions to further understand community concerns	• Outreach-05
Communication and Outreach Measures		
Outreach-01: Clean Air Toolbox for Local Governments, Communities, and Schools Develop a series of guidance documents that communities can use for planning, making land use decisions, identifying clean air solutions, and key agency contacts for addressing air issues.	Develop a "Clean Air Toolbox" that includes: • "Proximity Matters" advisory document for planners • CARB's "Land Use Planning Handbook" • Educational and outreach materials	• Community-02 • Community-03 • Participation-01 • Agency-01
Outreach-02: Community Dialogue Improve public access to community-level air quality information by establishing an enhanced and open dialogue between local communities and the AQMD.	• "Ask AQMD" online forum • Electronic tools	N/A
Outreach-03: "Playing it Safe" Campaign Increase public awareness for parents, educators, coaches, and youth organizations of when outdoor activities should be curtailed due to air quality concerns. Provide education on the effects of exposure to different air quality situations. Provide sources of additional information.	• Develop a "Playing it Safe" campaign to provide information on the AQMD website on situations when outdoor activities should be curtailed and potential health effects for children • Develop outreach materials and provide info on AQMD website on situations when outdoor activities should be curtailed and potential health effects for children	• Participation-02
Outreach-04: Cleaner Choices to Reduce School Children's Exposure to Toxics Increase public awareness for parents, educators, and children to make daily choices that will reduce children's exposure to air toxics.	• Educational material development • Recommendations to reduce exposure to toxics	N/A
Outreach-05: Advocating Toxic-Free Choices Educate the public and increase awareness of ways to minimize or avoid toxic exposure through brochures and online Community Health Bulletins.	• Use several approaches including Community Health Bulletins on TACs, AQMD website enhancements, and brochures to proactively disseminate information to the public on health concerns from TACs and avoiding or minimizing exposure	• Participation-03

Measure/Objective	Implementation Approach	Related Measures
Outreach-06: Business Outreach and Assistance Increase outreach efforts of AQMD's Small Business Assistance Program. Enhance existing services for assistance on permitting and compliance. Develop additional resources available to all businesses.	• Add other means to disseminate information regarding AQMD's Small Business Assistance Program • Develop an air quality compliance outreach program • Develop an online forum on AQMD's website where the business community can communicate and share air quality solutions	• N/A
Agency Coordination Measures		
Agency-01: Promoting Better Land-Use Decisions Provide additional tools for local governments to be more proactive and make better informed land-use decisions.	• "Proximity Matters" advisory for planners • Siting requirements in source-specific toxic rules • "Reverse" CEQA analysis for sensitive land uses • Outreach and training • Early consultation for new projects • Preliminary site assessment • CEQA project tracking	• Participation-01 • Outreach-01
Agency-02: Multi-Agency Coordinated Response Improve multi-agency communication by combining jurisdictional efforts to solve complex cross-media issues. Improve agency coordination efforts to resolve air pollution related public health issues.	• Establish an "Interagency Task Force" • Establish process to address recurring issues • Develop an interagency information sharing system	• Stationary-04
Monitoring and Compliance Measures		
Compliance-01: Enhancements to AQMD's Compliance Program Assess compliance presence and response time. Identify mechanisms to improve feedback with the public for reported incidents.	• Assess how resources are deployed to improve compliance presence and response • Investigate the development of an enhanced tracking and feedback system • Agreements with other agencies	N/A
Compliance-02: Increased Public Awareness and Participation to Enhance Compliance Enhance AQMD's compliance program through additional public participation in compliance activities.	• Public education on air quality issues • Outreach to improve public awareness and participation • Enhanced air quality complaint reporting	N/A

Measure/Objective	Implementation Approach	Related Measures
Source Specific Measures		
Stationary-01: Lead Emissions Reduce lead exposure to the public from lead-related activities. Comply with the NAAQS for lead adopted in 2008.	• Action plan development • Amend Rule 1420 to address smaller lead-emitting facilities	N/A
Stationary-02: Lead Paint for Pre-1978 Structures Further reduce lead exposure to children from renovation or demolition of existing sources. Innovative approaches to reduce lead exposure. Assist in enforcing new US-EPA standard.	• Public outreach and online information • Determine feasibility of development of more stringent lead rules	N/A
Stationary-03: Identifying New Sources Proactively identify potential air toxic sources in the District through rigorous and systematic research methods.	Develop a multi-step approach for identifying sources emitting selected, highly toxic air contaminants including: • Literature searches • Evaluation of rare and exotic TACs • Investigative monitoring and sampling	N/A
Stationary-04: Alternative Assessment for Use of Acutely Hazardous Materials For new or modified sources, use CEQA process to evaluate substitution of acutely hazardous materials with less hazardous materials, where possible.	• Where applicable, during the permitting and CEQA review process, evaluate uses of acutely hazardous materials to identify where less hazardous alternatives can be substituted • Work with other agencies to ensure that substitutions do not duplicate and are not in conflict with other programs	• Agency-02
Stationary-05: Indirect Sources Develop approaches for reducing exposure to diesel PM from facilities with associated diesel-fueled vehicle emissions.	Multi-step approach to reduce diesel PM emissions from sources associated with diesel mobile source emissions: • Step 1: Establish applicability criteria • Step 2: Develop list of implementation options for diesel PM reduction • Step 3: Compliance Plan submittal • Step 4: Diesel Reduction Plan	N/A
Public Nuisance Measures		
Nuisance-01: Nuisance Rule Enhance effectiveness of AQMD Nuisance Rule 402.	• Evaluate and consider revisions to Rule 402 and "Policies and Procedures on Public Nuisance Investigation"	N/A

Measure/Objective	Implementation Approach	Related Measures
Nuisance-02: Source-Specific Nuisance Rules Address nuisance issues through industry-specific rules or programs.	• Identify persistent odor issues and develop industry-specific rules or programs to reduce odors • Conduct research on a systematic, scientifically-based odor nuisance resolution practice	N/A

COMMUNITY-01
Community Exposure Reduction Plan (Multiple TACs, other pollutants)

Measure Objective

- *AQMD staff will develop Community Exposure Reduction Plans tailored to address air-related issues in specific communities*

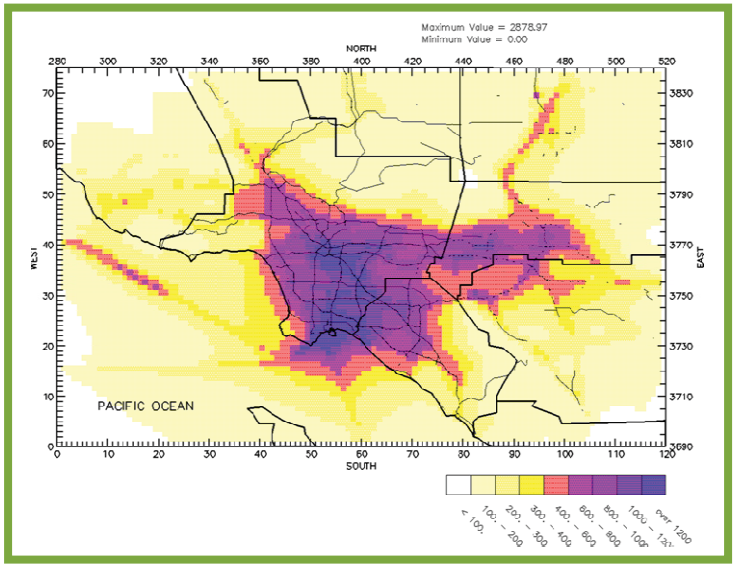
Implementation Approach

This measure will be implemented as a pilot study in the following six phases:

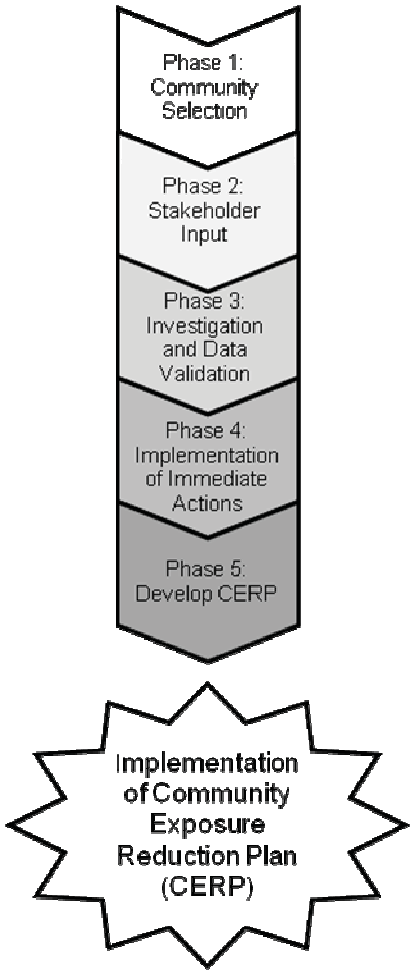
- *Phase 1: Community Selection for two Pilot Communities*
- *Phase 2: Stakeholder Input*
- *Phase 3: Investigation and Data Validation*
- *Phase 4: Implementation of Immediate Action Items*
- *Phase 5: Development of Community Exposure Reduction Plan*
- *Phase 6: Implementation of Community Exposure Reduction Plan*

Background

Toxic emissions throughout the District have been reduced through implementation of AQMD's air toxics regulatory program for source and industry categories such as chrome plating, dry cleaning, and gasoline dispensing, as well as more stringent state and federal fuel and tail pipe emission standards to reduce air toxic emissions from on- and off-road mobile sources. Reducing toxic air contaminants from these individual source categories has benefits to all communities. Some communities, however, may have a disproportionate number of toxic sources that are clustered together resulting in a higher concentration of toxic emissions. The combined effect or cumulative effect of toxic emissions on these communities can result in an elevated exposure to toxic air contaminants. Data from the AQMD's MATES III shows that in some communities the toxic emissions are more concentrated. In addition, through the AQMD's Complaint Response Program and Town Hall Meetings, the AQMD staff has learned that many neighborhoods face unique air pollution and toxic issues not identified through MATES or air monitoring data. This control measure is designed to address those specific issues for specified neighborhoods with elevated cumulative toxic emissions.



The concept of this measure would overlay on the AQMD's existing traditional air toxics regulatory program and is designed to address community-specific air toxics issues. This control measure will focus on individual communities where AQMD staff will work with community representatives to identify specific air-related issues and to develop solutions. Issues



that cross agency jurisdictions and responsibilities will also be addressed through enhanced cross-agency communication and designation of responsibilities discussed further in proposed CCP measure Agency-02. Through this interactive process, the AQMD staff will develop, with the input of the community, a Community Exposure Reduction Plan that will outline specific measures to be implemented for that community to reduce exposure to air toxics and minimize public nuisances.

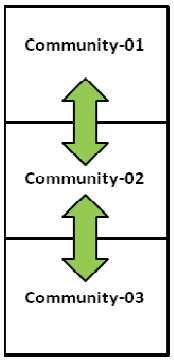
Implementation Approach

This measure will be implemented as a pilot study in six phases: Phase 1: Community Selection; Phase 2: Stakeholder Input; Phase 3: Investigation and Data Validation; Phase 4: Implementation of Immediate Actions; Phase 5: Development of Community Exposure Reduction Plan; and Phase 6: Implementation of Community Exposure Reduction Plan. The final product is a Community Exposure Reduction Plan containing specific elements to be implemented to reduce cumulative air toxic emissions in the community. Because this approach is tailored to an individual community, actual implementation is expected to vary based on the number, type, and extent of each community's air quality issues. This process is more resource intensive than a traditional source-specific regulatory approach, however, the result will be a customized plan to address issues specific to that community.

Phase 1: *Community Selection*

At the onset, the following two pilot communities are recommended: City of San Bernardino and Boyle Heights and surrounding areas. The selection of these two communities was based on health risk data from MATES III, emissions data from the AQMP, demographics, particulate matter (PM) emissions, areas with high concentrations of toxic-emitting facilities in close proximity to residential or sensitive receptors, history of complaints, known air pollution sources, and community-identified air quality issues. The willingness of the community to participate in the process of providing input, and developing and implementing an exposure reduction plan is important for this program to be successful. The AQMD staff will continue to work with other communities through the Community Guidance for Reducing Toxic Exposure measure (Community-02).

Related Measures



Phase 2: *Stakeholder Input*

Input from stakeholders in the community is critical in the identification of air quality related issues in a particular community. Meeting with community members, local businesses, and elected officials will help the District to better understand the air quality concerns of the community and prioritize potential solutions based on health impacts and community feedback. Partnering with local businesses early in the process helps to foster cooperation and to ensure measures are tailored to the specific needs of the community. Interaction with District staff will help to build an open line of communication, allowing for status updates of ongoing investigations and air pollution mitigation efforts, and enabling the community and businesses to actively participate in the ongoing improvement of their environment. This phase will be implemented through a variety of approaches as discussed below.

Neighborhood Walks

The AQMD staff will walk through the neighborhood to better understand air quality issues raised during the stakeholder input stage. Some stakeholders may join the AQMD staff during the neighborhood walks; however, the AQMD will be sensitive to residents and local businesses to ensure that the size and composition of the group is not intimidating. The AQMD staff believes that neighborhood walks are an important part of this process to better understand the air quality issues residents and businesses are facing on a daily basis. The walks will not be used for compliance audit purposes and will be used to allow AQMD staff to witness firsthand the neighborhood's air quality-related issues. This phase will give AQMD staff an understanding of the community's perspective and will help with the development of practical, real-world solutions to address the community's concerns. During the "Neighborhood Walks," AQMD staff will speak directly with community members near their homes and businesses to listen to individual issues about air quality. For the "neighborhood walks" the AQMD will not enter a business unannounced. This hands-on approach will allow the AQMD staff to gather valuable information about the community's air quality issues while providing an opportunity for local residents, local government, and businesses to voice their concerns directly to the AQMD in a more familiar and informal setting.

Community Exposure Reduction Plan (CERP) Website

The AQMD staff will also provide an electronic interface for community members to track the progress of the pilot program and ask questions. A website will be made available for community

members to view detailed information about their neighborhood's Community Exposure Reduction Plan (CERP). The community's CERP webpage will include information such as: key contacts at the AQMD; background information about the CERP process; information about the community and its history of air quality related issues; progress reports of ongoing investigation and/or mitigation efforts; notifications of upcoming community meetings and other events; written reports of findings from air monitoring, and health studies; and a summary of steps taken to address the community's air quality concerns. The CERP web page will give the community round-the-clock access to information about the air quality issues most important to them, will allow the community to ask the AQMD questions, and will enable community members to remain involved throughout the process of cleaning their community's air.

Phase 3: *Investigation and Data Validation*

In Phase 3, air quality-related issues will be sorted and prioritized. Any issues that require immediate action will go directly to Phase 4 and will be addressed and implemented before development of the Community Exposure Reduction Plan. For non-immediate actions, air quality issues will be sorted by those that are solely, partially, and not within the AQMD's jurisdiction. Sorting the issues by jurisdiction will help to identify additional agencies that the AQMD will be coordinating with to help identify solutions. Those issues that are solely and partially within the AQMD's jurisdiction will be further investigated. Where deemed necessary, further investigation can include, but is not limited to, additional analysis of existing controls, source of air issue, data collection and analysis, micro-scale monitoring, and identification of control strategies. This information will help AQMD staff to pinpoint air contaminants of concern and their sources so that a comprehensive exposure reduction plan can be developed to address those specific contaminants and sources.

The complexity and duration of the investigation phase will vary depending on the unique circumstances faced by each community. AQMD staff will work closely with the community and businesses, and partner with other agencies to determine the extent of the investigation phase. Efforts will be focused on identifying and quantifying specific air contaminants affecting the community, and where necessary, health surveys or risk assessments may be conducted to evaluate risks to public health. Where air quality issues cross other agency jurisdictions or responsibilities, the AQMD staff will coordinate multi-agency solutions.

***Phase 4:** Implementation of Immediate Actions*

This phase would begin implementation of actions found in Phases 2 and 3 that warrant immediate action. Air-related problems that require immediate attention may be characterized by issues resulting in significant health impacts to residential and sensitive receptors, rapid depletion or irreparable damage to natural resources within a community, and violation(s) of existing local, state, or federal air regulations. These immediate action items will later be recognized in the Community Exposure Reduction Plan for the community. For issues requiring immediate action that fall under the purview of other agencies, the AQMD will relay information and provide assistance, if necessary, to allow for timely resolution.

***Phase 5:** Development of Community Exposure Reduction Plan*

In this phase the AQMD staff will develop a Community Exposure Reduction Plan providing solutions that will address the localized air quality issues identified in Phases 1 through 4. The CERP will be developed through a public process which will include comments and suggestions from community members, academia, local governments, and local businesses. Issues brought up at various forums including public workshops and working group meetings will be addressed throughout the process to allow for a dynamic, comprehensive CERP. At a minimum, the CERP will include the geographical boundary of the selected community. The plan will also identify all air polluting sources (permitted, non-permitted, mobile, indirect, etc.) within the community, including their respective and most current TAC emissions inventory. A profile for compliance items such as complaint history and Notice to Comply/Notice of Violation information will also be included for each source or region within the community. Other information, such as relevant health studies may be included.

The CERP will ultimately recommend a number of general and community-specific control strategies that will be implemented to accomplish maximum toxic exposure reduction. General control strategies will include less complex solutions based on those found in AQMD's existing rules and regulations and CARB's Land Use Guidance Document. Community-specific control strategies will be the product of information derived from Phases 2 through 4. It is expected that some solutions may require the assistance and cooperation of local government or other agencies, such as local ordinances or zoning changes. This would be a collaborative process among all stakeholders to seek effective solutions. The San Pedro Bay Ports Clean Air Action Plan (CAAP) is an example of a community-based exposure reduction plan that incorporated a stakeholder

process. Some solutions may be technology-based, such as installation of pollution controls or fuel changes. Other solutions may be to seek funding to mitigate emissions where feasible, or require operational changes such as relocating a truck entrance, establishing buffer zones, or limiting operations during certain times of the day.

Phase 6: *Implementation of the CERP*

An implementation schedule for all control strategies within the AQMD's jurisdiction will be included in the first CERP developed under this pilot study. Once developed and approved, the CERP will be monitored by both the AQMD and the respective community through a feedback and resolution element in order to ensure timely progress and success of scheduled control strategies, and to make modifications to any portion of the CERP resulting from unforeseen or new issues that develop. AQMD staff will update the Stationary Source Committee and the Governing Board's Environmental Justice Advisory Committee on the CERP progress and solicit input regarding potential CERP modifications on an as needed basis.

In addition to implementation of measures, the CERP will also include ongoing efforts for the community. Ongoing efforts may include, but are not limited to, ambient air monitoring in the affected community; partnerships with public health agencies and/or universities to conduct additional health studies in impacted areas; agency coordination for air quality issues that cross agency jurisdictions; and more frequent inspections of facilities suspected of contributing to the community's air quality related concerns. AQMD partnerships with public health agencies and universities may include health surveys, or studies of air pollution-related health issues in impacted communities. Past health studies have been funded through grants or from other sources such as AQMD's Health Effects Research Fund upon approval of the Governing Board. Findings from these studies may be used to influence air quality related public health decisions, develop new air pollution reduction and/or health programs, increase knowledge of the relationship between air quality and public health, and to further support air quality improvement policies. In conjunction with other CERP elements, these studies will help to provide a comprehensive investigation and action plan to address the community's air quality concerns.

COMMUNITY-02
Community Guidance for Reducing Air Toxic Exposure

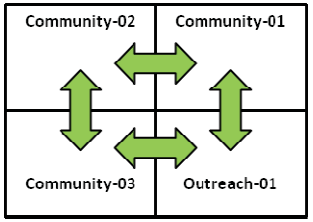
Measure Objective

- *Provide a process for communities and local governments to follow in developing Community Exposure Reduction Plans with AQMD assistance*

Implementation Approach

- *Develop a process, somewhat similar to the process followed in the pilot study of Community-01, that will guide communities and local governments to develop CERPs with AQMD assistance*
- *Update the process as experience is gained in developing CERPs*

Related Measures



Background

Under Community-01, the AQMD staff will work with the community, business representatives, and local government to develop a Community Exposure Reduction Plan (CERP) through the six step process described in Community-01. The objective of this measure is to develop a process, somewhat similar to the process used in Community-01, which can be used for other communities and local governments allowing them to develop their own Community Exposure Reduction Plans with assistance from the AQMD staff. This AQMD-assisted process can be used by communities with fewer, less complex air quality issues.

The AQMD staff will develop guidelines based on existing air quality information and knowledge gained from the pilot study. The AQMD-developed guidelines will provide general information and tools needed to guide other communities and local governments through the process of identifying air quality issues, gathering data, working with stakeholders, and developing a community-specific CERP with solutions tailored to their air-quality issues.

Implementation Approach

The AQMD staff will develop a process, based on the process used in the pilot study, to be used by local governments and communities. The AQMD staff will provide assistance as communities follow the process and develop a community-specific CERP. Tools provided will include those found in the Clean Air Toolbox in Outreach-01 as well as a handbook with a menu of options of solutions to various air quality issues.

Periodic updates to the process and the handbook will be made based on knowledge gained as other communities go through the CERP process. Updates will incorporate concepts, data, and successful solutions obtained from pilot CERPs under Community-01 and AQMD-assisted CERPs under this measure. The AQMD may also solicit suggestions for improving the process through AQMD's webpage, existing town hall meetings, and community meetings. Additionally, the handbook will include funding sources and grants such as US-EPA's Community Action for a Renewed Environment (CARE) program, to help implement solutions to various air quality issues.

COMMUNITY-03
Greening Communities through Accelerated Toxic Emission Reduction Projects for Existing Sources (Multiple TACs, other pollutants)

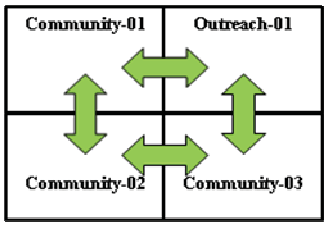
Measure Objective
- *Reduce existing toxic emissions from older toxic emitting sources in residential communities disproportionately impacted by toxic emission sources*

Implementation Approach
- *Identify disproportionately-impacted communities and assess cumulative impacts*
- *Retrofit or replace existing toxic sources*
- *Establish funding for emission reduction programs*
- *Provide outreach and education for permitted and unpermitted sources of emissions*

Background
Under the AQMD's permitting program, new, relocated, and modified sources must comply with AQMD's Regulation XIII for traditional air pollutants and risk requirements of Rule 1401 and Rule 1401.1 before a permit can be issued. Since Rule 1401 was adopted in 1990, existing sources may have permits that were issued prior to its adoption or before certain TACs were listed, and hence were not subject to a risk evaluation during permitting. If a source permitted before 1990 is modified, Rule 1401 would be triggered and a risk evaluation would be performed. Rule 1402 applies to existing facilities that emit toxic air contaminants and sets facility-wide health risk thresholds. Under Rule 1402, facilities may be required to submit inventories of air toxics if requested by the AQMD staff. Based on an estimate of the facility's health risks, additional requirements may include health risk assessments, public notification, and/or risk reduction.

During meetings of the CCP Working Group the AQMD staff received written comments requesting that the AQMD staff examine permitting practices to consider cumulative impacts for communities which are already heavily impacted by existing sources of toxic air pollution. It is the AQMD staff's understanding that some representatives from environmental and community groups desire a program that would prohibit new permits that result in toxic emissions in specific communities that cannot tolerate any new toxic sources due to its existing, elevated health risk. The AQMD staff is concerned that a program that limits new permits in certain areas may also eliminate the ability for newer, cleaner sources to replace older, higher polluting sources. Part of the AQMD's permitting process requires that new, relocated, and modified sources be evaluated under New Source Review regulations, be equipped with Best Available Control Technology (BACT), and meet specific toxic requirements. Another concern is that limiting new permits in certain areas may adversely affect the local economy of that community while providing little air quality benefit. Furthermore, since AQMD does not permit all emission sources (e.g., mobile sources), restricting AQMD permits in certain communities does not necessarily assure that there will be no increases in emissions. There is a need, however, to provide outreach and education for

Related Measures



permitted and unpermitted sources of emissions regarding the AQMD and ways to minimize impacts on the community. Assessing cumulative impacts in communities is also a concern of the AQMD, and staff will continue to work toward developing methodologies to quantitatively assess cumulative impacts. In addition, the AQMD staff will continue to monitor US-EPA's efforts to further address environmental justice issues in permitting.

Implementation Approach

Existing sources, particularly older sources, generally have higher emissions since new permitted sources must be equipped with the current BACT, and, if required under Rule 1401, BACT for toxic air contaminants (T-BACT). Instead of limiting new permits in highly impacted areas, the AQMD staff is recommending that this measure focus on existing, higher emitting sources, including those which are permitted and otherwise in compliance with applicable regulations. This measure seeks to encourage retrofitting existing sources with pollution control equipment or replacement of existing sources with cleaner sources, particularly in communities that are disproportionately impacted.

Retrofitting and Replacing Existing Toxic Sources

Under this control measure, emission reduction projects can be implemented that will reduce emissions from older, higher emitting sources through either retrofitting or replacing existing equipment with newer cleaner equipment in these highly impacted areas. Projects will likely focus on the highest emitting sources in the community that will produce the greatest benefit in reducing exposure to toxic air contaminants. In addition, these projects would reduce emissions beyond existing rules and regulations. The AQMD staff will take the lead on this measure.

This measure will coordinate with other programs such as, but not limited to, MATES III and AB2588 to prioritize communities in the District and emission reduction projects in highly impacted communities. This measure will be implemented with Community-01 and Community-02. Staff anticipates that during implementation of Community-01, emission reduction projects will be identified in these pilot study areas. As Community-02 is developed and implemented, it is likely that emission projects will be identified in these areas as well.

Establish Funding for Emission Reduction Programs
To help fund retrofit and replacement projects, funding opportunities will be explored via re-directing existing funding sources or identifying new funding sources, including state or federal grant programs, such as the US-EPA's Community Action for a Renewed Environment (CARE) program (additional tools and resources may be found on the US-EPA's CARE website at: http://www.epa.gov/care/basic.htm). Implementation of projects will be ongoing and based on funding. To further assist funding activities, the AQMD will develop and promote a "Good Neighbor Challenge" to challenge businesses to submit emission reduction proposals to the AQMD. The AQMD staff will explore the possibility of either co-funding or providing assistance in securing available federal or state grant and funding opportunities to implement selected emission reduction projects. Selection for awarding funding for proposals will be based on several factors including a project's total emission and exposure reduction potential, feasibility, completion time, and cost considerations. Another possible source of funding may come from penalties and fines received from violations of AQMD rules. To the extent feasible, monies would be used to fund projects in the community where the violation occurred.

Provide Outreach and Education for Permitted and Unpermitted Sources of Emissions
To help better educate sources on how to identify ways to minimize exposure to the community, the AQMD staff will work with permitted and unpermitted facilities. This could include meeting with the owners and training. The tools in the "Clean Air Toolbox" (Outreach-01) would also be used to educate the sources.

PARTICIPATION-01
Clean Communities Pledge

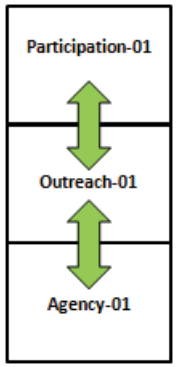
Measure Objective

- *AQMD to develop Clean Communities Pledge that will encourage local government participation in air quality training and outreach programs*

Implementation Approach

- *Develop a "Clean Communities Pledge" for local cities, counties, and other government agencies*
- *Recognize achievements of participating members*

Related Measures



Background

Implementation of the Clean Communities Plan will rely in part on participation by local government. The AQMD staff needs local government to participate in training and public outreach activities to better educate local government on air quality issues that they are in position to decide on. The objective of this measure is to ask local governments to take a "Clean Communities Pledge" that is simply their commitment to participate in training activities to increase awareness of compatible land uses, CEQA air quality analyses, air related health effects, and how AQMD can assist in addressing air-related nuisance complaints. The objective is to provide information to planners and decision makers so they can make better informed decisions in their community. In addition, as part of the Clean Communities Pledge, local government can help with outreach activities to inform their residents and businesses about AQMD programs and AQMD contact information regarding air quality, permits, or compliance issues. Local governments that take the Clean Communities Pledge will signal to their community a commitment to understand air quality issues and willingness to enhance activities to address such issues. The Clean Communities Pledge is an important aspect of the Clean Communities Plan as it will encourage local government participation in the implementation of the Clean Communities Plan.

Implementation Approach

Development of "Clean Communities Pledge"

The AQMD will develop a "Clean Communities Pledge" that local cities, counties, and other government agencies can voluntarily take that would include commitments to participate in various air quality training and outreach activities. To be recognized as taking the Clean Communities Pledge, the pledge must be approved either by government officials of the city or county such as, but not limited to, the City Council, Board of Supervisors, Planning Commission, etc.

Recognizing Participation and Achievements

Those cities and counties that take the Clean Communities Pledge would be recognized on the AQMD's website. In addition, cities and counties can submit information on how their

community is addressing air quality issues or air quality achievements made to reduce or prevent air quality problems within their community for posting on the website. Other incentives for participation would be developed.

PARTICIPATION-02
Clean Schools Pledge

Measure Objective

- *Empower schools to take practical steps to reduce school children's exposure to air pollution*
- *Increase participation and awareness of AQMD programs and guidelines among local school districts*

Implementation Approach

- *Develop a pledge for local school districts to express their commitment to participate in training and air quality improvement activities*
- *Advocate school participation in air quality-related programs*
- *Recognize achievements of participating members*

Background

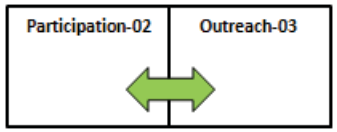
An important component of the Clean Communities Plan is reducing children's exposure to toxic air contaminants. Since children spend a substantial amount of time at school, it is important that school officials better recognize the critical role that clean air plays in children's health and development, and take action to reduce children's exposure to air pollution and help clean the air in their community. The AQMD staff needs school districts and individual schools to participate in training and public outreach activities to better educate school leaders on air quality issues that they are in position to decide on. The objective of this measure is to ask school districts and individual schools to take a "Clean Schools Pledge" that represents their commitment to participate in training activities to increase awareness of school siting issues, CEQA air quality analyses, air related health effects, and resources available to assist in improving the air quality in and around their schools. Participation in the "Clean Schools Pledge" will signal to the school community (parents, staff, students, etc.) a commitment to better understand air quality issues and willingness to participate in training and air quality improvement activities.

Implementation Approach

Development of "Clean Schools Pledge"

The AQMD will develop a "Clean Schools Pledge" for school districts and individual schools to voluntarily express their commitment to participate in training and air quality improvement activities. The "Clean Schools Pledge" will incorporate other AQMD air toxics education and outreach programs, such as the "Playing it Safe" campaign (Outreach-03). Simple solutions such as limiting school bus/delivery truck/automobile idling near schools, limiting outdoor school activities during periods of poor air quality, conducting outdoor school activities at times and locations where children will be least impacted by local air pollution (e.g., away from high traffic roads and avoiding peak traffic times), and replacing old diesel-fueled school buses with low-emitting buses, can make significant reductions in the amount of air pollutants children may be exposed to while at school. Other proactive steps, such as developing policies to avoid constructing schools near major roadways or industrial facilities, can also help to prevent and reduce children's exposure to toxic air contaminants.

Related Measures



Recognizing Participation and Achievements

Each school district or individual school that has taken the pledge would be recognized on AQMD's website which would also include additional information on specific efforts and achievements made to reduce or prevent air quality exposures at their schools.

PARTICIPATION-03
Enhanced AQMD Community Meetings

Measure Objective

- *Further engage the public to inform the AQMD of air quality issues in communities*

Implementation Approach

- *Continue and enhance existing AQMD community meetings to include round table discussions to further understand community concerns*

Related Measures

Background

There are many sources of information available that help the AQMD staff understand air-related issues that exist within a given community. From a compliance perspective, community air-impact evaluations may be based on facility compliance status, complaint information, and surveillance activity. Ambient air monitoring studies and TAC emissions inventories are some examples of scientific approaches that the AQMD utilizes to assess air quality within communities. These indicators, however useful, do not give a complete understanding of how the community stands in terms of air-related issues.

Input and accounts from community members who experience air-related issues on a daily basis, both known and unknown to the AQMD, are a good source to identify neighborhood air quality issues. The purpose of this measure is to continue engaging the public to better inform the AQMD of air quality issues.

Implementation Approach

This measure will further engage the public to inform the AQMD of community air-related issues through the enhancement of the current community meetings. Enhancements will be implemented by AQMD's Public Affairs Office through the proposal of a new community meeting format and process that would generate local gatherings of diverse groups of key stakeholders including residents, local business representatives, health agencies, universities, and public/private agencies. Initial concepts are to revise the current format for community meetings to include multiple interactive "round table" discussions that would take place within several smaller groups that include individuals from differing stakeholder groups in order to encourage community representatives to speak more openly in a more intimate and less formal setting. Among other goals, this meeting format would seek to elicit input and collaborative ideas for addressing air-related issues and also build support for action at local and state levels. In addition to collaborating with key stakeholder groups, these meetings may serve as an opportunity for AQMD staff to direct communities to additional resources for help in addressing other environmental issues, such as water quality or hazardous wastes. For example, grants from the US-EPA's Community Action for a Renewed Environment (CARE) program, a competitive grant program

that offers communities an innovative way to address the risks from multiple sources of toxic pollution in their environment, may help provide monetary support for communities working towards addressing multi-media environmental issues. Additional resources may be found on the US-EPA's CARE website at: http://www.epa.gov/care/basic.htm.

OUTREACH-01
Clean Air Toolbox for Local Governments, Communities, and Schools

Measure Objective

- *Develop a series of guidance documents that communities can use for planning, making land use decisions, identifying clean air solutions, and key agency contacts for addressing air issues*

Implementation Approach

- *Develop a "Clean Air Toolbox" that includes:*
  - *"Proximity Matters" advisory document for planners*
  - *CARB's "Land Use Planning Handbook"*
  - *Educational and outreach materials*

Background

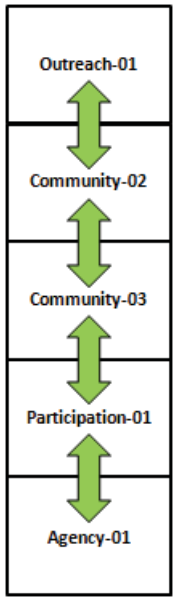
There is no single location for communities to access information when addressing local air quality issues. This measure proposes to develop a "Clean Air Toolbox" for local governments, communities, and schools that will include a series of informational and guidance documents such as "Proximity Matters" advisory document for planners (Agency-01); sample idling ordinances; and signage ideas for idling diesel sources. The modules in the toolbox can then be used to address any air quality issue that arises. The toolbox can be used for planning, making land use decisions, identifying clean air solutions, and contacting key agencies.

Implementation Approach

The "Clean Air Toolbox" will provide a single location on the AQMD website where up-to-date information can be made available. Links will be provided to documents available throughout the AQMD website. The toolbox will be a general resource for local governments, communities, and the general public to reference when addressing air quality issues. For example, the toolbox can be used by local governments for general plans or land use decisions; school districts when siting new schools or renovating; and communities for identifying or finding solutions to local air quality issues. The toolbox would also be used to educate facilities that are sources of toxic emissions of ways to minimize impacts on the community (Community-03 and Participation-01). Examples of modules that may be provided in the toolbox include:

- CARB's "Land Use Planning Handbook: A Community Health Perspective"
- "Proximity Matters" advisory document (Agency-01)
- AQMD's "Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning"
- AQMD's "Air Quality Issues in Site Selection Guidance Document"
- Risk communication document
- Educational and outreach materials
- Handbook with menu of options of solutions for air quality issues (Community-02)

Related Measures



- AQMD regulations and permitting requirements
- AQMD and other agency contact information

The toolbox will be updated periodically. Additional modules will be added as needs are identified and new materials are developed.

OUTREACH-02
Community Dialogue

Measure Objective

- *Improve public access to community-level air quality information by establishing an open dialogue between local communities and the AQMD*

Implementation Approach

- *Institute the "Ask AQMD" forum to address public inquiries and concerns*
- *Enhance existing web-based tools including the MATES III interactive map, to include more detailed information regarding toxic air contaminants and source-specific emissions and development of new tools to improve two-way communication with communities*

Background

As public awareness of air quality issues increases, there is a need for enhanced public access to information regarding the impacts of air quality on specific communities. Existing District tools provided for public use, such as the Facility INformation Detail (FIND) system, MATES III Carcinogenic Risk Interactive Map, and the 1-800-CUT-SMOG® hotline, allow the public to find facility-specific data related to compliance history and air emissions and information on cancer risk as well as providing a method to report air quality complaints. A web inquiry system is provided to answer questions from the public. An AQMD application for the iPhone™ has been developed for the public to provide enhanced access to real-time and forecasted air quality levels for user-selected areas, air quality news, calendar of AQMD events, and mechanisms to report smoking vehicles. These existing tools are good methods to help the public obtain air quality information and report concerns, however, their current format does not allow for an exchange of information between the AQMD staff and affected communities.

This measure seeks to enhance the AQMD's communication with the public by creating an open dialogue and flow of information between communities and AQMD staff. The concept is to provide more opportunities for the public to ask air quality related questions and the AQMD staff to respond. This is a more casual and accessible type of approach where the public can make inquiries about air issues in their community.

Implementation Approach

"Ask AQMD" Forum

One approach to establish a dialogue between the public and AQMD is to develop an "Ask AQMD" webpage within the AQMD's website to enhance the existing web inquiry system and allow the public to submit questions and concerns regarding air quality issues in their communities. Responses to public questions and concerns will be sent directly to the requestor via email. In addition, general information and responses to commonly asked questions will be posted on the webpage. Complaints and air quality incidents will still be reported via the District's 1-800-CUT-SMOG hotline, but other informational requests may be submitted to the

"Ask AQMD" forum via email or directly through the AQMD website. Multiple questions or concerns regarding a specific community or topic will be used as a trigger for a public outreach effort such as a town hall meeting, news release, or other means of disseminating information to the public. This online tool will provide a convenient outlet for the public to express concerns about the air quality in their community, and will enable the District to respond to and address community concerns in an expedient manner.

Electronic Tools

Another method of facilitating dialogue with the public is to enhance the AQMD's online tools available for the public to find information about the air quality in their community. Existing tools, such as FIND, will be evaluated to determine what steps could be taken to make them more user-friendly by redesigning the format, providing on-line tutorials, and translation into multiple languages. Enhancements to the MATES III interactive risk map will help the public access more detailed information regarding cancer risk in their communities. Some concepts to enhance the MATES III interactive map include information that identifies the toxic air contaminants (TACs) being emitted within each geographical area, sources contributing to the cancer risk in the area, and health information regarding the TACs identified on the map. Individuals can then utilize this information in conjunction with the District's FIND system to retrieve detailed compliance history and air emissions data for facilities in their specific neighborhood. Users will be able to pinpoint which TACs are contributing to risk in their community, which sources are emitting the TACs of concern, and the health risks associated with the pollutants in their community. In addition, new electronic tools may be developed to improve two-way communication with communities using avenues such as webinars, cell phones, and other multi-media tools.

OUTREACH-03
"Playing it Safe" Campaign *(All Pollutants)*

Measure Objective
- *Increase public awareness for parents, educators, coaches, and youth organizations of when outdoor activities should be curtailed due to air quality concerns*
- *Provide education on the effects of exposure to different air quality situations*
- *Provide sources of additional information*

Implementation Approach
- *Develop a "Playing it Safe" campaign*
- *Develop outreach materials and provide information on AQMD website on situations when outdoor activities should be curtailed and potential health effects for children*

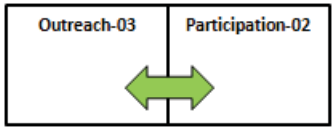
Background
Participating in outdoor activities during wild fires, high wind days, or near a construction site can increase children's exposure to fine particulates, some of which are toxic. Depending on the source of pollution and the meteorological conditions, conducting outdoor activities, particularly strenuous activities, may be harmful to children, especially for those with respiratory diseases. Children may be more susceptible to the harmful effects of air pollution than adults because their respiratory systems are still developing and they breathe more air per pound of body weight. Fine particles can lodge in the lungs and cause irritation or other effects. Over the long-term they can cause decreased lung function and can lead to diseases such as asthma, bronchitis, emphysema, and possibly cancer. Short term exposures can result in health problems such as eye irritation, respiratory irritation, and headaches. A need exists for greater awareness of circumstances when outdoor activities should be curtailed due to harmful air quality conditions.

Implementation Approach
This measure will be used in conjunction with the "Clean Schools Pledge" (Participation-02) to provide a more proactive approach to communicating with parents, educators, coaches, and youth organizations to increase awareness of health effects of air quality and when there is a need to curtail outdoor activities.

"Playing it Safe" Campaign
The objective of this control strategy is to develop a "Playing it Safe" campaign to increase public awareness of certain types of air quality situations where outdoor activities should be curtailed and to increase awareness of the potential health effects for children. These situations are generally temporary in nature, so providing a proactive public outreach and education program will be more health protective than providing notification during or after the air quality event.

Outreach Material Development and Website Enhancements
The AQMD staff would develop educational material for parents, educators, coaches, and youth organizations providing

Related Measures



specific information on when outdoor activities should be curtailed. Educational materials will include a "Playing it Safe" brochure with key information about specific air quality situations to be aware of, potential health effects, and tips for "Playing it Safe." This control strategy will also include updated information on the AQMD website and where additional information can be obtained. Information will include children's health advisories which will also be disseminated through available networking services such as Facebook, Twitter, and text and email alerts.

OUTREACH-04
Cleaner Choices to Reduce School Children's Exposure to Toxics *(All TACs)*

Measure Objective
- *Increase public awareness for parents, educators, and children to make daily choices that will reduce children's exposure to air toxics*

Implementation Approach
- *Develop education materials for parents, educators, and children on how to reduce exposure to toxic substances*
- *Provide practical recommendations on how the public can reduce their exposure to toxics*

Background
There are a variety of toxic sources that surround children in their daily lives. Some examples include consumer products containing toxic compounds; toxic diesel particulate matter from idling diesel school buses; toxic exhaust fumes from vehicles on nearby freeways; pesticides; and commercial and industrial businesses conducting processes resulting in toxic emissions.

Agency regulatory efforts have helped to decrease toxic levels from a variety of sources that children may be exposed to. For example, the Department of Toxic Substances Control regulates toxic chemicals in consumer products, the Department of Pesticide Regulation regulates pesticides, and CARB regulates idling of diesel-fueled vehicles. However, exposure to some of these sources can simply be eliminated or reduced through use of cleaner less-polluting products or avoidance of some sources. The objective of this control measure is to increase awareness of these types of sources and to educate parents, teachers, administrators, and children of cleaner less-polluting choices to reduce children's exposure to harmful air toxics.

Implementation Approach
Educational Material Development

The AQMD staff will develop educational brochures for parents and educators that identify sources of toxic air pollution that may be harmful to children, such as diesel exhaust from idling diesel buses; gasoline exhaust from idling cars; diesel exhaust from portable diesel generators used for school events such as carnivals or sporting events; and lead paint from buildings. Brochures will also explain associated health problems resulting from both short and long term exposures, such as eye and respiratory irritation, asthma, and lung damage from exposure to diesel exhaust and neurological damage from lead paint.

Recommendations to Reduce Exposure to Toxics

In addition, this control strategy will include recommendations to keep children safe from

exposure to toxics by providing a list of safe pesticides, school supplies, other consumer products, and toxic-free cleaning products through AQMD's "Clean Air Choices" certification program. This measure will include recommendations regarding the benefits of carpooling, clean-fueled school buses, and ideas for safer walking routes to avoid certain types of toxic emitting businesses such as gasoline stations, rail yards, active construction sites, and busy highways.

OUTREACH-05
Advocating Toxic-Free Choices (All TACs)

Measure Objective

- *Educate the public and increase awareness of ways to minimize or avoid toxic exposure through brochures and online Community Health Bulletins on TACs*

Implementation Approach

- *Use several approaches including Community Health Bulletins, AQMD website enhancements, and brochures to proactively disseminate information to the public on health concerns from TACs and avoiding or minimizing exposure*

Background

People are exposed to toxic air contaminants on a daily basis from a variety of different pollution sources and chemicals. Some types of pollution sources are not as well known to the general public, such as living near a freeway or exposure to mercury from handling a broken fluorescent light bulb. This measure seeks to better inform the public of sources of toxic air contaminants and their health impacts, so the public can make more informed decisions to protect themselves and their families.

The public may or may not be aware of potential exposure from such activities as refueling their cars, breathing fumes from diesel trucks, or exercising outdoors during episodes of poor air quality. In addition, the public may not be aware of exposure to toxic air contaminants from nearby industrial sources, roadways, and ports. The objective of this measure is to increase awareness of these types of sources and educate the public so they can make better informed decisions.

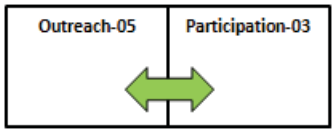
Implementation Approach

This measure will be used in conjunction with the Enhanced Community Meetings (Participation-03) to provide a more proactive approach to educate the public regarding exposure to toxic air contaminants and ways to minimize exposure. Several approaches will be used to educate the public and increase awareness of ways to minimize or avoid exposure to toxic air contaminants.

Community Health Bulletins and AQMD Website Enhancements

Community Health Bulletins on specific TACs will be developed. The health bulletins will be posted on the District's website and accessible via links on the MATES III Carcinogenic Risk Interactive Map. The public will be able to use the MATES interactive map to find out which TACs are contributing to the cancer risk in a specific area and how those TACs can impact the air quality in their community. The Health Bulletins will include information regarding individual

Related Measures



TACs, including a summary of health effects associated with the TAC, potential sources of the TAC, and suggestions for simple actions residents can take to help reduce their exposure. Health Bulletins will help to raise community awareness of risks associated with TACs and will provide practical actions that can be taken to minimize exposure.

Communities near Pollution Sources

Communities that are imbedded amongst industrial and commercial sources and/or freeways and busy highways have unique air quality challenges. The AQMD staff will develop other materials that will provide advice to community members on how to minimize exposure and steps they can take to help improve air quality in their neighborhood, such as scheduling outdoor activities during non-business hours or choosing routes for walking or biking that avoid areas of highest exposure.

Other Educational Materials

The AQMD staff will develop a brochure with suggestions for avoiding or minimizing exposure, such as not standing near the nozzle when refueling automobiles; using electric rather than gas-powered gardening equipment; avoiding exposure to idling diesel trucks; and proper disposal of hazardous household items such as batteries, fluorescent light bulbs, and electronics. Another educational brochure could provide the public with suggestions on avoiding or minimizing exposure to air toxics when selecting a place to live. Practical ideas for residents to ask about their residence may include questions regarding proximity to freeways or major roads; proximity to industrial facilities that emit toxic air contaminants; the age of the house; and whether lead paint and/or asbestos building materials are present. This information will enable residents to assess general air quality in and around their prospective new home and identify potential air quality hazards. Other opportunities to disseminate these messages to the public could include public service announcements on radio, television, the AQMD website, and AQMD telephone line "hold" messages.

OUTREACH-06
Business Outreach and Assistance

Measure Objective
- *Increase outreach efforts of AQMD's Small Business Assistance Program*
- *Enhance existing services for assistance on permitting and compliance*
- *Develop additional resources available to all businesses*

Implementation Approach
- *Add other means to disseminate information regarding AQMD's Small Business Assistance Program*
- *Develop an air quality compliance outreach program*
- *Develop an online forum on AQMD's website where the business community can communicate and share air quality solutions*

Background
The AQMD Small Business Assistance Office helps small business owners and operators to comply with AQMD Rules and Regulations, permitting requirements, and provides assistance on how to conduct recordkeeping through a variety of services offered. Other services include assistance on resolving AQMD fee-related disputes, providing information to businesses regarding available grants, and assistance with the AQMD variance process. These free services are provided onsite, by phone or email, and at AQMD Headquarters, and are offered to eligible businesses with 100 or fewer employees or with annual gross revenues up to $5 million. Various small business events are also attended and/or hosted throughout the year to provide additional communication opportunities between business owners and AQMD staff.

The objective of this measure is to increase efforts for outreach to businesses to improve compliance with AQMD rules and regulations, to allow businesses to become more familiar with AQMD requirements, and to reduce emissions from business. This measure is designed for all businesses, with focus on outreach to small businesses located in impacted areas, and would encourage communication and sharing of air quality solutions.

Implementation Approach
Currently, outreach of AQMD's existing small business assistance service is carried through a variety of methods. These include providing presentations and/or information via visits to chambers of commerce, trade associations, and economic development entities, through attendance at business-friendly community events, via the AQMD website and AQMD iPhone application. Further outreach is provided through handouts at small business events, field compliance staff's distribution of pamphlets to small businesses when conducting inspections and complaint investigations, and through public notices included as supplements to mailouts.

Enhanced Outreach
As part of this initiative, the Public Advisor will continue its current efforts, as well as increase efforts, by making information available through public service announcements on television, radio, YouTube, and AQMD telephone line "hold" messages. The Public Advisor will

additionally conduct an assessment of its current role and function to determine if additional steps need to be taken to meet the needs of the business community. AQMD staff will work with businesses, where appropriate, to develop outreach material for compliance with AQMD rules, pollution prevention process changes, material substitution, and other methods to encourage pollution prevention practices. AQMD staff will also reach out to contact businesses within the two pilot communities of Community-01 in order to seek out input from businesses to better determine their financial needs for compliance. AQMD staff would then utilize the information gathered to craft programs directly responsive to those needs, to facilitate the reduction of emissions from businesses. AQMD's Legislative & Public Affairs Division (L&PA) will additionally enhance awareness of the AQMD Ombudsmen to facilitate business retention, and will brief federal and state legislators and regulatory agencies to inform them of the CCP efforts, showcase successes, and advocate for adequate funding for all elements of the CCP, particularly in regards to incentives for business compliance.

Air Quality Compliance

Staff will develop additional assistance materials that provide frequently asked questions and answers specific to different business categories. Staff will also enhance existing assistance materials through the development of an air quality compliance outreach program that will be available on the AQMD website and accessible to all businesses. In addition to existing available tools on guidance for permit applications, the program will include:

- AQMD rule summaries;
- "What to Expect During an AQMD Inspection";
- Best practices guidance document, with empahsis on pollution prevention; and
- Tips on compliance.

Online Business Assistance Forum

Staff will also look into developing a forum on the AQMD website where business owners can discuss and share solutions to compliance issues based on experience. The forum will also allow for interaction with the AQMD for popular issues, topics, and questions that are posed to staff. The AQMD will explore opportunities to showcase technologies that can help facilities. In addition, facilities that pioneer new Best Available Control Technologies standards can be highlighted on AQMD's website and other media.

AGENCY-01
Promoting Better Land-Use Decisions

Measure Objective

- *Provide additional tools for local governments to be more proactive and make better informed land-use decisions*

Implementation Approach

- *"Proximity Matters" advisory to planners*
- *Siting requirements in source specific toxic rules*
- *"Reverse" CEQA Analysis for Sensitive Land Uses*
- *Outreach and training*
- *Early consultation for new projects*
- *Preliminary site assessment*
- *CEQA project tracking*

Background

Through its Intergovernmental Review (IGR) program, the AQMD staff comments on other lead agencies' California Environmental Quality Act (CEQA) projects. The AQMD staff reviews and provides comments on the adequacy of the air quality analysis and mitigation measures in the CEQA document. The AQMD staff also informs lead agencies about incompatible land uses where sensitive receptors, such as schools and residences, may be exposed to toxic air contaminants. The AQMD staff often references the California Air Resources Board's "Land Use Planning Handbook: A Community Health Perspective" which recommends siting distances for sensitive receptors and various land uses. For example, designing a project with a buffer zone between sensitive receptors and freeways can substantially reduce the exposure to toxic air contaminants. As shown in Figure 3-2, the cancer risk is significantly reduced by distancing receptors 1,000 to 1,500 feet from the freeway.[3] Once a land use decision is made and the project is built, reducing the exposure to neighborhoods or communities to toxic emissions becomes more difficult. The AQMD staff believes that the CEQA process can be a preventative approach to inform lead agencies about incompatible land uses, allowing the lead agency to modify the design of the project before it is approved and built.

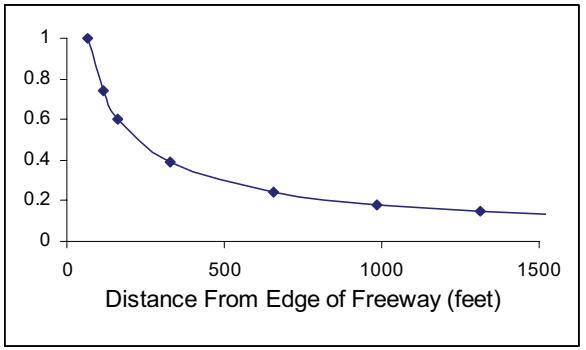


Figure 3-2: Relative Cancer Risk from Freeway as a Function of Downwind Distance

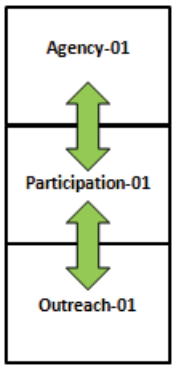
In general, CEQA requires that impacts imposed from the proposed project on the surrounding environment be evaluated. CEQA includes additional requirements for schools. CEQA requires

[3] Rochelle S. Green, Svetlana Smorodinsky, Janice J. Kim, Robert McLauglin, Bart Ostro, Proximity of California Public Schools to Busy Roads, Environmental Health Perspectives, January 2004

Related Measures



that new schools evaluate the impacts imposed from the proposed school project on the surrounding environment, and the health risk at the school from hazardous emitting facilities within ¼ mile of the proposed school site and freeways and busy traffic corridors within 500 feet of the school boundary. Thus, for schools, CEQA requires that the lead agency evaluate the "outward" impacts that the proposed school imposes on the surrounding environment and the "inward" impacts that surrounding sources could impose on the proposed school.

Implementation Approach

This measure will consist of a variety of enhancements to the AQMD's existing programs to assist local government and schools to make informed land use planning decisions to minimize exposure of toxic air contaminants to sensitive receptors. A summary of these enhancements is as follows:

"Proximity Matters" Advisory to Planners

The AQMD staff will further enhance CARB's siting recommendations to add additional source categories and update recommendations if needed. An advisory document called "Proximity Matters" will be developed for planners that incorporates principles of the CARB's "Air Quality and Land Use Handbook: A Community Health Perspective" and additional information to reduce exposure to toxic air contaminants. This advisory document will include technical information, in a user friendly format, regarding air toxics, health effects, and the importance of buffer zones.

Siting Requirements in Source-Specific Toxic Rules

Some of AQMD's toxics rules and CARB's Air Toxics Control Measures (ATCMs) specify siting requirements for certain new toxic sources such as minimum distances for new toxic sources relative to sensitive receptors. The AQMD staff will continue to evaluate other toxic rules to update siting recommendations as necessary. The AQMD staff will consolidate siting recommendations from existing toxics rules for sensitive land uses and will make this information available on its website for local planning agencies, school districts, and the public.

"Reverse" CEQA Analysis for Sensitive Land Uses

During the past few years, some lead agencies with residential development projects have conducted health risk assessments to evaluate the "inward" impacts that existing surrounding sources, such as freeways, may impose on the proposed residential development projects. This "reverse-type" CEQA analysis of the potential effects of the surrounding environment on the

proposed project is currently required where impacts may occur for school projects. Other sensitive land uses, such as residential developments should be required to conduct a reverse CEQA analysis. The AQMD staff will, as directed by the Governing Board at its May 2009 retreat, provide comments that request lead agencies to conduct the "reverse" CEQA analysis for sensitive land use projects.

AQMD staff will also look into using other types of health assessments and studies as possible additional information to quantify air-related health impacts from a project. Some examples include studies on air-related non-cancer health effects. In recent years, studies relating to exposure of ultrafine particles formed from vehicle tailpipe emissions along areas of vehicle traffic have been of concern. When inhaled, ultrafine particles are deposited along human airways and easily migrate due to their minute size, to the central nervous system and organs throughout the body including the heart and brain. In addition, ultrafine particles increased surface areas allow for transport of much larger amounts of toxic compounds into the body.

Outreach and Training

Although the AQMD receives about 50 CEQA documents a month, the AQMD staff estimates that about 30 percent of agencies and schools do not send their CEQA documents to the AQMD for review. The AQMD staff will inform local governments, schools, and the public about the AQMD's Intergovernmental Review program and again request receipt of local CEQA documents. In addition, the AQMD staff will host a series of workshops to educate consultants, local planners, school districts, and the public about the AQMD's role in reviewing and commenting on CEQA projects. The workshops would likely cover a variety of air quality related CEQA issues such as the different types of air quality analyses needed in a CEQA analysis, significance thresholds, calculation methodologies, appropriate emission factors, default assumptions, compatible land uses, and mitigation measures. The AQMD staff is considering issuing participation certificates for these workshops. The "Clean Communities Pledge" (Participation -01), a voluntary pledge that local cities, counties, and other government agencies can take that includes commitments to participate in various air quality training and outreach activities, can be used to encourage participation.

Early Consultation for New Projects
The AQMD staff will more actively encourage early consultation with local governments and schools to ensure that siting and design considerations can be incorporated into the proposed project in its early stages of planning. Often a lead agency will consult with the AQMD staff during the CEQA review period after the design of the proposed project is well established. Early consultation allows more flexibility to design a project to minimize potential exposure to air toxics.

Preliminary Site Assessment
When the AQMD staff receives a request from a school district to identify hazardous emitting facilities, the AQMD staff identifies all permitted facilities and does a physical inspection of the area to identify non-permitted facilities and area sources that may potentially emit air toxics or have odorous operations. The AQMD will look into developing a service available to local governments where staff would conduct a preliminary site assessment for a sensitive land use that would identify permitted facilities within ¼ mile of the proposed project and provide a list of past complaints and violations in the area. AQMD staff will also conduct a visual inspection of the area surrounding the proposed project to identify potential non-permitted sources that may adversely affect sensitive receptors. This type of service would require a fee for AQMD staff time and material. Criteria will also be developed to prioritize and accept site assessment requests. Because this type of program is very resource intensive, the AQMD staff is recommending implementation as a pilot program for a period of 12 months to ensure that existing resources are sufficient and to assess the effectiveness of this service.

CEQA Project Tracking
There is also the possibility for development of a web-based geographic information system (GIS) map displaying selected areas and concentrations of emissions sources that are undergoing the CEQA review processes. This tool can be used by the AQMD and other agencies and local governments to track development of new projects and geographically see trends in developments such as increases in warehouses in specific areas or land use trends for siting housing developments near freeways.

AGENCY-02
Multi-Agency Coordinated Response

Measure Objective

- *Improve multi-agency communication by combining jurisdictional efforts to solve complex cross-media issues*
- *Improve agency coordination efforts to resolve air pollution related public health issues*

Implementation Approach

- *Establish an "Interagency Task Force"*
- *Establish process to address recurring issues*
- *Develop an interagency information sharing system*

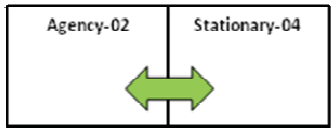
Background

Public concerns regarding the environment frequently involve multi-media pollution issues which fall under the jurisdiction of several regulatory agencies. For example, if a community is concerned about odors or toxic emissions from a nearby landfill, they may require support from several agencies, including the Department of Resources Recycling and Recovery, AQMD, Regional Water Quality Control Board, Department of Toxic Substances Control, the local city/county government, and possibly other agencies. Efforts have been made at the state level to improve inter-agency communication, however, there is a remaining need to have a streamlined, coordinated response from multiple government agencies when multi-media environmental pollution issues arise. In addition, there are opportunities for improved communication and coordination during multi-agency responses to air quality related incidents and emergencies.

The AQMD participates in programs with other government agencies to coordinate efforts, such as emergency response for local police, fire, and health departments where sampling and monitoring support is provided for emergency events such as fires, explosions, toxic spills, and toxic gas releases at industrial and commercial facilities. Other efforts include the AQMD's Engineering & Compliance (E&C) Toxics/Waste Management unit's regular communication with agencies such as the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board, and the California Department of Resources Recycling and Recovery (CalRecycle) where issues such as compliance, permitting and complaints are addressed. The AQMD's Engineering & Compliance unit for gasoline dispensing operations is also an active participant in a regional taskforce which coordinates fire safety, water, and air quality issues. Although the AQMD currently works to communicate regularly with some agencies, improvements can be made to establish more frequent, regular multi-agency meetings to address non-emergency air quality issues.

AQMD staff has received comments about multi-media issues that are air-related, however sometimes resolution of the issue is outside of the AQMD's jurisdiction or authority. Similarly, it

Related Measures



is expected that other agencies also receive complaints for issues that are within the AQMD's jurisdiction and authority. Some environmental issues may straddle several agencies or may not be the distinct responsibility of any one specific agency. Pollution issues that have multi-media impacts require coordination among various agencies. Better coordination between agencies will help to address issues raised by the public and will ensure agency efforts are not duplicative or in conflict with each other. Agency coordination is also important for emergencies such as accidental releases and fires. The participation of several agencies has sometimes resulted in duplicative efforts for sampling and monitoring which complicate resolution of the issue. Better coordination is needed in order to develop a more comprehensive solution for public health and safety issues.

Implementation Approach

The purpose of this measure is to improve multi-agency communication and coordination efforts to resolve air pollution related public health issues. Jurisdictional efforts of various governmental agencies could be combined to address complex cross-media environmental issues and provide a more comprehensive response. For air quality related issues, AQMD enforcement staff will take the lead and involve other agencies such as health and fire departments, local planning departments, CARB, and DTSC, as appropriate.

Establish an "Interagency Task Force"

Under this measure, an "Interagency Task Force" would be created with the list of participating agencies. AQMD staff will establish a list of agencies, their general responsibilities, and the name and contact information for their representative on air quality issues. This information will be posted on the AQMD website along with links to the agency websites.

Establish Process to Address Recurring Issues

To better understand specific issues raised by the public that require multi-agency coordination, the AQMD staff will take the lead to convene meetings with other agencies on an as needed basis. Public input will also be solicited. The objective of these meetings will be to gather specific, relevant information from the public regarding issues and concerns, and to develop a process to address and resolve recurring issues. Each approach to resolve issues raised may vary depending on the nature and extent of the issue and the agencies involved.

Develop an Interagency Information Sharing System

To ensure that air quality-related issues that are raised by the public to other agencies are being addressed, the AQMD staff will develop a process whereby agencies can share information with each other regarding complaints and community issues. Agencies can share public communication and complaint information received by their respective agencies, as well as monitoring and compliance information such as notices to comply, notices of violations, and settlements. This will better ensure that agencies are informed about community issues and that agencies are fully aware of compliance actions that other agencies may be implementing at common facilities. The AQMD staff can conduct periodic meetings with other agencies to discuss unresolved air-quality related issues. Action items and issues derived from multi-agency working group meetings will be reported to the AQMD's Stationary Source Committee on an as needed basis.

COMPLIANCE-01
Enhancements to AQMD's Compliance Program

Measure Objective
- *Assess compliance presence and response time*
- *Identify mechanisms to improve feedback with the public for reported incidents*

Implementation Approach
- *Assess how resources are deployed to improve compliance presence and response*
- *Investigate the development of an enhanced compliance feedback and tracking system for the public*
- *Agreements with other agencies to optimize compliance resources*

Background
The AQMD staff receives over 5,000 complaints from the public annually through its toll-free 24-hour 1-800-CUT-SMOG line. Complaints received range across various air-related issues such as odors, smoke, overspray, and fugitive dust. Depending on the nature of the complaint, the date and time received, and the accuracy of information provided, the AQMD, under most circumstances, dispatches an inspector to conduct a field investigation. The AQMD staff currently maintains a "Hot List" of facilities that have received multiple complaints or have compliance issues. In addition, facilities notify the AQMD via the 1-800-CUT-SMOG line of equipment breakdowns and rule-related notifications of various air-related activities (e.g., asbestos abatement activities, tank degassing, and soil decontamination) which are relayed to the compliance staff for follow-up action. Compliance reports are created and data analyses are performed in order to develop facility profiles and track compliance progress.

Although the infrastructure for enforcement activities has been established by the AQMD, issues such as compliance response time, limited availability of staff to respond to complaints received associated with after hour operations, and fleeting air quality-related nuisance problems still remain. In addition, at times when a member of the public notifies the AQMD of an air-related issue, they may not always be apprised of ongoing activities such as the status of the investigation. This measure will focus on improving AQMD's current enforcement program by enhancing compliance presence, response times, investigation, and compliance feedback for the public.

Implementation Approach
Assess Deployment of Compliance Resources
Implementation approaches for this measure would include assessment of how compliance resources are deployed. Criteria would also be developed to proactively facilitate more focused enforcement presence. AQMD staff will look into automating notification, facility breakdown,

and complaint information to field inspectors to further allow for improved compliance response time.

Investigate Development of Tracking and Feedback System

The AQMD is concerned with increases in complaint trends and currently tracks trends for complaints received. However, problems with generic complaint descriptions, unidentified sources, and unconfirmed complaints present difficulties when assessing the data for accurate trends. The AQMD staff will investigate the development of an enhanced compliance tracking and feedback system where the community can interact with compliance staff regarding air related issues that are assigned a tracking or case number. Additional and more detailed inputs for complaint information requested will also be investigated. AQMD staff will explore development of an automated process to inform the public how their complaint was resolved to improve complaint handling and resolution. Other means to communicate with the public could include internet-based filing to serve as a central repository for certain types of air quality information. In addition, ways to integrate the latest technologies for compliance monitoring equipment and remote communication/data devices will also be researched to improve compliance effectiveness and response out in the field. The AQMD staff is always open to feedback from the public and businesses regarding suggestions to improve its compliance programs. The AQMD will periodically work with complainants to seek their feedback.

Studies and Agreements with Other Agencies

The AQMD staff will contact other agencies that often deal with community issues and complaints to discuss how they receive and resolve complaints and their complaint resolution process and use findings to determine if there are mechanisms to enhance AQMD's complaint response program. AQMD staff will propose where appropriate, agreements with other agencies and organizations for enforcement, such as the California Highway Patrol and code enforcement, to optimize the resources devoted to enforcement of air regulations.

COMPLIANCE-02
Increased Public Awareness and Participation to Enhance Compliance

Measure Objective
- *Enhance AQMD's compliance program through additional public participation in compliance activities*

Implementation Approach
- *Public education on air quality issues*
- *Outreach to improve public awareness and participation*
- *Enhanced air quality complaint reporting*

Background
The AQMD has adopted a sufficient number of regulations, many of which are implemented through permit conditions. An effective compliance/enforcement program is needed to ensure the intended emissions and health risk reductions are achieved. A major component of the AQMD's compliance program is field inspections where inspectors conduct visual inspections of permitted equipment, observe a facility's operations, review records, and verify compliance with permit conditions and regulatory requirements. Field inspections allow the AQMD to physically verify compliance with AQMD rules and regulations. The AQMD currently has over 100 field inspectors conducting regular inspections at over 28,000 facilities annually in the District. Facilities are inspected at various frequencies depending on factors such as facility size and complexity, processes conducted at the facility, past compliance history, and federal or state funded mandates.

The public is also a key component in the success of AQMD's compliance program. The AQMD periodically receives information from the public on air-related issues resulting from both permitted and unpermitted facilities and activities. Despite available mechanisms and pathways for public input, some air related incidents are either reported well after the fact or unreported due to a lack of community awareness of the AQMD and its role in air pollution related issues. In other cases, the public may be unclear on how to report incidents to the AQMD and the necessary information required for effective enforcement of air related issues. Furthermore, businesses have often expressed concerns that unfair business competitiveness exists between compliant and non-compliant facilities. A well informed public can assist the AQMD in identifying businesses that are operating without proper permits or air pollution control equipment.

The objective of this measure is to enhance AQMD's compliance program through additional public participation in compliance activities. The AQMD staff believes compliance efforts can be improved with assistance from the public. Although the AQMD employs a staff of highly trained, knowledgeable inspectors, increased public participation in the compliance process can help strengthen the District's compliance efforts by enabling the public to closely monitor air quality related activities in their neighborhoods. A well-informed public will help to identify air quality

issues in the community, make the AQMD's complaint response process more efficient by providing more accurate information, and minimize AQMD staff time spent responding to issues which may not be within AQMD jurisdiction.

Implementation Approach

Enhanced compliance can be achieved through improved public communication with the AQMD and increased outreach activities, including informing and educating the public regarding AQMD's compliance program and air quality complaint reporting and response procedures.

Public Education on Air Quality Issues

Training sessions conducted by staff on how to recognize air related problems and when to contact the AQMD would be offered to help educate the community regarding air quality compliance. The AQMD staff can also educate the public on AQMD's jurisdiction and compliance issues. Training content would include information such as: AQMD's roles and responsibilities; responsibilities of other government agencies; AQMD's rule enforcement procedures; typical sources and types of dust/smoke/odors or other air quality nuisances; air quality complaint referral process; permitting procedures; and other general air quality information. Training materials could be made accessible through the AQMD website and also at other local agency offices.

Outreach to Improve Public Awareness and Participation

A multi-media public outreach effort will be initiated to further promote the AQMD's existing air quality complaint reporting procedure (i.e., 1-800-CUT-SMOG hotline). Currently, the AQMD readily distributes 1-800-CUT-SMOG pamphlet to the public and businesses. Additional efforts to promote the CUT-SMOG hotline would include an increased presence on the internet, such as creating "links" on city/county and other public agency websites to the AQMD's "Making Air Quality Complaints" YouTube video, basic information on air quality complaint reporting, and directions for the public about the CUT-SMOG hotline and other complaint reporting methods. In addition, software applications for mobile devices have been developed to provide information on how to report smoking vehicles through the CUT-SMOG hotline, such as the AQMD application for the iPhone.

Enhanced Air Quality Complaint Reporting
AQMD's website would include enhanced information on various compliance and complaint reporting procedures and online filing of complaints. Website enhancements would include a "one-click complaint" feature, which allows the public to submit air quality related complaints via a link on the front page of the AQMD's website. Other complaint reporting methods may include an air quality complaint "texting" mechanism, which would allow the public to use their cell phones to send the AQMD text messages with air quality complaint information.

Periodic Community Meetings would also be used to enhance outreach and other possible mechanisms to improve communication between the community and AQMD. To further enhance outreach efforts and to facilitate greater public awareness of environmental issues, AQMD will advocate public participation in environmental education programs, such as those funded or led by US-EPA (see the following link for resources on US-EPA's Environmental Education programs - http://www.epa.gov/enviroed/index.html).

STATIONARY-01
Lead Emissions

Measure Objective
- *Reduce lead exposure to the public from lead-related activities*
- *Comply with the 2008-adopted NAAQS for lead*

Implementation Approach
- *Action plan development*
- *Amend Rule 1420 to address smaller lead-emitting facilities*

Background
Adverse health effects of exposure to lead emissions include neurodevelopmental effects in children; increased blood pressure and related cardiovascular conditions in adults; and possibly cancer. Secondary lead smelting, foundries, and lead-acid battery manufacturing and recycling are examples of stationary source operations that result in emissions of lead. General aviation airports are also a source of lead emissions because the fuel used in piston airplanes and helicopters still contains lead. Reduction of lead emissions in the air from both stationary and mobile sources reduces the amount of lead deposited to soil which is an additional pathway for lead exposure.

On October, 15, 2008, the US-EPA adopted a new National Ambient Air Quality Standard (NAAQS) for lead of 0.15 micrograms/cubic meter ($\mu g/m^3$) to be attained no later than 5 years after final attainment designations are made. The previous standard was 1.5 $\mu g/m^3$. No later than 18 months after final designations are made, states are required to submit State Implementation Plans outlining how the standard will be achieved. Various lead use and processing operations are regulated by US-EPA, the state, and AQMD Rule 1420 – Emissions Standard for Lead. Rule 1420 applies to all nonvehicular sources of lead emissions and contains requirements for emission levels, controls, housekeeping, and monitoring.

Implementation Approach
This measure will address the new NAAQS for lead emissions. It will focus on lead emissions from all lead emitting facilities beginning with the largest lead emitters which currently may have difficulties meeting the new lead standard.

Action Plan Development
Implementation of this measure will require analysis of the impacts of the new lead standard on affected industries, which includes a review of lead emissions for all facilities that use or process lead-containing materials. AQMD staff will work with affected facilities to gather information on typical industry and facility processes/practices and develop lead emission control strategies. Implementation of this measure will include development of an action plan which incorporates

additional emission control requirements, housekeeping, cleanup, and monitoring requirements to achieve the new NAAQS for lead.

Amend Rule 1420

Rule development is currently underway for Proposed Rule 1420.1, specifically for large lead-acid battery recyclers, the largest stationary source of lead emissions, to help ensure attainment with the lead NAAQS by US-EPA deadlines. Special requirements for the siting of new lead-emitting sources close to sensitive receptors are also a part of the proposed rule. A working group list including affected facilities, environmental groups, and other governmental agencies has already been established and worked with the AQMD staff during rule development for Proposed Rule 1420.1. This purpose of this measure is to develop an amendment to Rule 1420 for smaller lead-emitting facilities.

STATIONARY-02
Lead Paint for Pre-1978 Structures *(Lead)*

Measure Objective
- *Further reduce lead exposure to children from renovation or demolition of existing sources*
- *Innovative approaches to reduce lead exposure*
- *Assist in enforcing new US-EPA standard*

Implementation Approach
- *Public outreach and online information*
- *Determine feasibility of development of more stringent lead rule(s)*

Background
Lead-containing paint was commonly used to paint houses and other structures constructed before 1978 when lead paint was banned. The paint presents a health hazard when disturbed during renovation and repair activities. US-EPA has adopted a rule with lead standards for renovation of pre-1978 structures which takes effect in April 2010. The regulation requires notification before renovating six square feet or more of painted surfaces in a room for interior projects or more than twenty square feet of painted surfaces for exterior projects in housing, child care facilities and schools built before 1978. Contractors conducting renovations that disturb lead-based paint will also be required to be certified and follow specific work practices to prevent lead contamination. Young children are particularly susceptible to the neurodevelopmental effects of lead.[4]

Implementation Approach
This measure was developed because of the potential health impacts of lead exposure, particularly for children. Reduction of lead emissions from renovation activities for houses, apartments, childcare facilities and schools would also reduce the amount of airborne lead deposited to soil and water which are additional pathways for lead exposure.

Public Outreach and Online Information
The implementation approach would include education and outreach to increase public awareness of the health impacts associated with exposure to lead, particularly for children. Brochures developed under CCP measure Outreach-04 would include information on children's exposure to lead paint and the associated health effects. The AQMD website will provide links to other agency websites with information on lead paint related issues. Elements of the lead abatement certification process can be provided on the AQMD website along with a list of certified contractors.

---

[4] U.S. Department of Health and Human Services, Public Health Service Agency for Toxic Substances and Disease Registry, "Toxicological Profile for Lead," August 2007.

Determine Feasibility of Development of More Stringent Lead Paint Rules

Under this approach, AQMD staff will evaluate the need and feasibility of more stringent lead paint rules. During the feasibility analysis, staff will determine if a gap exists and the need for additional rules. Approaches could take the form of a program or rule to implement the US-EPA standard or require specific work practices conducted by certified lead abatement contractors. More stringent requirements including notifications for lead abatement activities and ambient air monitoring clearances upon renovation completion may be required. Additional requirements for the maintenance of lead painted buildings and structures where children may be exposed to paint chips or paint dust will also be considered. If a new rule is developed, the AQMD staff will consider resource impacts and program effectiveness in the scope of the rule.

STATIONARY-03
Identifying New Sources

Measure Objective

- *Proactively identify potential air toxic sources in the District through rigorous and systematic research methods*

Implementation Approach

- *Develop a multi-step approach for identifying sources emitting selected, highly toxic air contaminants involving:*
  - *Literature searches*
  - *Evaluation of rare and exotic TACs, and*
  - *Investigative monitoring and sampling*

Background

The AQMD has an extensive air toxics program covering a wide variety of sources. The AQMD also implements state Air Toxics Control Measures (ATCMs) and federal National Emissions Standards for Hazardous Air Pollutants (NESHAPs) where there is no source specific AQMD rule. In the first half of 2008, ambient air sampling conducted by the AQMD detected elevated levels of hexavalent chromium in the Rubidoux area. Extensive additional sampling and modeling traced these emissions to loading, unloading, and transferring of clinker material containing hexavalent chromium that was stored in the open at a cement plant located in Riverside. This was an unconventional source of hexavalent chromium and highlighted the need to find other unconventional sources of toxic air contaminants (TACs) that may pose a significant public health risk. The objective of this measure is to proactively identify potential sources of highly toxic air emissions through a systematic scientific approach.

Implementation Approach

The following is a sample of some of the approaches and techniques the AQMD staff will use to take additional steps to proactively identify unknown sources:

- Develop a concentrated list of TACs prioritized by highest toxicity values and examine and analyze existing air quality data to identify areas with higher than average concentrations
- Literature searches of high potency TACs for unconventional uses of these TACs and verifying if there are any sources in the District that use these TACs
- Evaluation of exotic and rare TACs that may be used in the District
- Investigative monitoring and sampling in identified areas of unconventional TAC use
- Enhanced air quality data analysis, including routine air quality monitoring and targeted studies, to help identify emissions sources
- Analyze existing data, collect additional data, and/or perform testing from sources, such as the metal finishing industry, to determine if further air toxic regulation is needed

If a source or a group of sources are found that are determined to pose an elevated health risk, the AQMD staff will bring them into Rule 1402 or possibly develop a source-specific rule.

STATIONARY-04
Alternative Assessment for Use of Acutely Hazardous Materials

Measure Objective

- *For new or modified sources, use CEQA process to evaluate substitution of acutely hazardous materials with less hazardous materials where possible*

Implementation Approach

- *Where applicable, during the permitting and CEQA review process, evaluate new uses of acutely hazardous materials to identify where less hazardous alternatives can be substituted*
- *Work with other agencies to ensure substitutions do not duplicate and are not in conflict with other programs*

Background

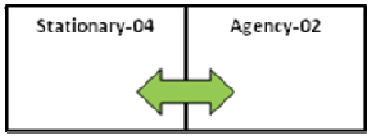
Acutely hazardous materials are used in a variety of processes throughout the district. Examples of some acutely hazardous materials include hydrogen fluoride, anhydrous ammonia, chlorine, and sodium hydroxide.[5] Replacements for some acutely hazardous materials are available. Refineries in the district have eliminated the transport and use of hydrogen fluoride over the past two decades using modified less hazardous alternatives. In addition, most new and modified permits for Selective Catalytic Reduction systems use aqueous instead of anhydrous ammonia. Some alternatives may come with tradeoffs in performance, efficiency, cost, and other environmental effects. The purpose of this measure is to decrease the potential for adverse health impacts due to the accidental release of acutely hazardous materials. It should be noted that the intent is not to regulate storage, transport, reporting, or any other activities that are already controlled by other regulating entities.

Implementation Approach

The most likely approach will be to use the CEQA process to evaluate substitution of less hazardous materials when permitting new and modified sources to reduce or eliminate the exposure to an acutely hazardous material during an accidental release. The AQMD staff will evaluate new uses of acutely hazardous materials and will consider potential trade-offs and other potential adverse impacts from alternatives while ensuring that no other environmental impacts are introduced. In addition, the AQMD staff will work with other agencies such as the state Certified Unified Program Agencies, California Emergency Management Agency (Cal-EMA), California Department of Occupational Safety and Health (Cal-OSHA), California Department of Toxic Substances Control (DTSC), U.S. Department of Transportation (DOT), and U.S. Environmental Protection Agency (US-EPA) to ensure that substitution assessments do not duplicate and are not

[5]List of Acutely Hazardous Materials, California Code of Regulations, Title 8, Section 5189, California Department of Industrial Relations, April 2009 <http://www.dir.ca.gov/title8/5189a.html>.

Related Measures



in conflict with other programs. Substitutions have been required in some instances, however using a more systematic approach during permitting would ensure that substitutions could be made wherever feasible.

STATIONARY-05
Indirect Sources *(Diesel PM)*

Measure Objective

- *Develop approaches for reducing exposure to diesel PM from facilities with associated diesel-fueled vehicle emissions*

Implementation Approach

- *Use a multi-step approach to reduce diesel PM emissions from sources associated with diesel mobile source emissions*
  - *Step 1: Establish Applicability Criteria*
  - *Step 2: Develop List of Implementation Options for Diesel PM Reduction*
  - *Step 3: Compliance Plan Submittal*
  - *Step 4: Diesel Reduction Plan*

Background

The AQMD's MATES II and III studies both showed diesel particulate matter (diesel PM) as the largest contributor to the District's cancer risk from toxic air pollutants. On average, diesel particulate, primarily from mobile sources, contributes approximately 83 percent of the cancer risk from toxic air pollutants in the District. Diesel fuel currently remains the primary fuel used for heavy duty trucks, locomotives, ships, and cargo handling equipment.

Studies have shown that the cancer risk from air toxics is elevated in communities that surround sources with diesel emissions. In 2006, the California Air Resources Board (CARB) conducted health risk assessments for 18 major railyards in the state. The results of the health risk assessments showed that nearly all of the railyards in the District had cancer risks from diesel emissions greater than 100 in a million, with the highest cancer risk from a Burlington Northern Santa Fe railyard in San Bernardino of 2,500 in a million. Risks at the rail yards have decreased and are expected to decrease further over time due to adopted regulations and fleet turnover; however, the residual health risk still remains elevated.

Because of the potency of diesel particulate and the high diesel particulate emissions, the health risk from other facilities that are associated with diesel mobile sources, such as warehouse and distribution centers, solid waste facilities, rock quarries, airports, and other types of businesses that rely on diesel mobile sources are expected to be elevated, particularly in densely populated neighborhoods. For example, many facilities rely on diesel-fueled trucks to deliver raw materials and distribute product. While the vehicle trips are peripheral to their main business, they may be a significant source of diesel PM emissions and impacting nearby receptors. Currently diesel PM emissions from mobile sources that either exclusively operate onsite or go offsite are not accounted for when a facility-wide health risk assessment is done which leads to an underestimate of the health risk to the surrounding neighborhood from these sources.

Progress in reducing diesel PM emissions from mobile sources has been made through the AQMD fleet rules requiring the use of alternative-fuel vehicles, cleaner diesel vehicles, and retrofitting or early retirement of older diesel vehicles. These rules only apply to diesel vehicles used by or under contract to government agencies and only for certain uses, such as street sweepers, trash trucks, airport access, transit buses, and school buses. In addition, significant progress in diesel PM emission reductions are also expected due to implementation of CARB's regulations and DRRP which is targeting an 85 percent reduction in diesel risk on average by 2020. Even if the District achieves these reductions in diesel PM, there will still be elevated health risks from diesel PM in the District. In addition, some diesel PM reduction measures accomplished through CARB's plan and US-EPA regulations will take a decade or more to be fully implemented as shown in Figure 2-1 of Chapter 2.

Implementation Approach

The purpose of this measure is to reduce exposure of diesel PM emissions from new, existing, and modified facilities with diesel mobile source emissions including, but not limited to, large warehousing facilities, distribution facilities, delivery facilities, and rail facilities. Additionally, facilities whose business is not primarily associated with diesel mobile sources, such as manufacturing facilities, may be included due to increased diesel PM emissions from truck or rail traffic for deliveries of raw materials and distribution of finished products. The basic approach to this measure is to establish criteria for applicability and, for a facility that meets the criteria, provide a menu of options that can be implemented to reduce diesel particulate exposure. Implementation may be developed in the form of a rule or any other appropriate implementation approach such as a guidance document which may require working with CARB to change their guidelines on mobile sources under AB2588. This measure will be implemented in several steps.

The AQMD staff may initiate development of an indirect source rule containing an applicability criteria that will account for diesel PM emissions, exposure to diesel PM, and the proximity to residential and sensitive receptors.[6] AQMD staff will compile a menu of options that facility

[6] Based on the Ninth's Circuit decision, local air district regulations addressing railroad emissions may be upheld and harmonized with the Interstate Commerce Commission Termination Act of 1995, but only if the regulations have been incorporated into a State Implementation Plan.

operators can implement. Potential options include, but are not limited to, use of accelerated fleet turnover, minimization of truck routes in or near neighborhoods, idling requirements, automated truck gates, and pre-scheduling of deliveries. AQMD staff will start development of an implementation schedule for facilities to submit a compliance plan outlining what measures they will implement to reduce exposure to diesel PM emissions. A Diesel Reduction Plan will be developed based on the findings of Steps 1 and 2. Strategies to reduce diesel PM emissions may include developing an indirect source rule for diesel or requiring health risk assessments similar to the ones CARB required for the rail yards. Other possible approaches would include ways to reduce idling, traffic studies to improve the flow of diesel vehicle traffic and vehicular scheduling and operating changes. This may require faster implementation of strategies in CARB's Diesel Risk Reduction Plan. Incentives for facilities would be developed to voluntarily accelerate turnover of fleets switching to equipment using alternative fuels or retrofitting with diesel particulate filters. Several implementation approaches are possible. If a regulatory approach is pursued, staff will conduct an analysis of the AQMD's regulatory authority.

NUISANCE-01
Nuisance Rule (Odors/Nuisances, Possibly TACs and Criteria Pollutants)

Measure Objective
- *Enhance effectiveness of AQMD Nuisance Rule 402*

Implementation Approach
- *Evaluate and consider revisions to Rule 402 and "Policies & Procedures on Public Nuisance Investigation"*

Background
Public nuisance issues relating to the release of air contaminants are addressed by the AQMD through enforcement of Rule 402 – Nuisance, adopted in 1976. The rule is generally a restatement of the text found in the California Health and Safety Code Sections 41700 and 41705. Air quality complaints that may result in a public nuisance situation are received through the AQMD's 24-hour complaint line (1-800-CUT-SMOG) and may be immediately dispatched to an inspector for investigation depending on the nature of the complaint, date and time received, and accuracy of the information provided. Complaints are responded to by communication with the complainant and investigation of the complaint site. Violations under Rule 402 require verification of the nuisance by the inspector with each of a considerable number of complainants (typically 6 persons from different households), and must be traced to a confirmed source. These requirements support AQMD's ability to meet the definition of "public nuisance". AQMD "Policies & Procedures on Public Nuisance Investigation" is provided in Appendix C of this document.

Although overall numbers of complaints received by the AQMD has decreased during the last decade, a need to develop public nuisance prevention strategies still exists. Federal, state and local rules and regulations continue to reduce emissions of criteria pollutants and toxic air contaminants from various sources, however, eliminating public nuisance issues associated with processes at these sources remains a challenge. Affected communities experience problems ranging from odors at landfills, rendering facilities, and refineries; overspray from painting operations; and dust exposure from outdoor operations to name a few. Resolving odor related nuisances can be problematic due to dissipation of often intermittent odors prior to verification, and weather and wind conditions making it difficult to trace problems to a source. Establishing public nuisance violations can also be difficult when only a few complaints are made to the AQMD, preventing enforcement staff from concluding that it is a "public" nuisance and there that has been a violation under Rule 402.

Implementation Approach
Evaluate and Consider Revisions to Rule 402 and Public Nuisance Procedures
The first step of this measure is to evaluate Rule 402 implementation and determine ways for the

AQMD staff to be more proactive in resolving nuisance issues. During this first step, AQMD staff will evaluate options of how "public" nuisance may be defined and the process to address recurring nuisance complaints. Evaluations may result in amendments to Rule 402 and "Policies & Procedures on Public Nuisance Investigation" to provide for a more systematic and prompt response to nuisance incidents. This may result in the need to amend existing rules and policies and procedures or amendments to Health and Safety Code Section 41700. In addition, the District may use legal tools, such as Orders for Abatement (administrative sanctions which can be used to require a facility to mitigate odors or other air pollution impacts), to address public nuisances originating from individual facilities. Another concept the AQMD is considering is the development of a new rule requiring facilities with recurring odor nuisance issues to submit odor management plans requiring odor control equipment or operational modifications.

NUISANCE-02
Source-Specific Nuisance Rules (Odors/Nuisances, Possibly TACs and Criteria Pollutants)

Measure Objective
- *Address nuisance issues through industry-specific rules or programs*

Implementation Approach
- *Identify persistent odor issues and develop industry-specific rules or programs to reduce odors*
- *Conduct research on a systematic, scientifically-based odor nuisance resolution practice*

Background
Approximately 50 percent of the air quality complaints received by the AQMD involve the reporting of odor events. Some events cannot be attributed to a known source or are a product of unpredictable events such as breakdowns or emergencies. For those that are regularly associated with particular industries and processes, odor prevention may be possible through the development of rules or programs specific to industries or sources such as waste water treatment plants and landfills.

One of the measures in the 2004 Addendum to the Air Toxics Control Plan was to develop a pilot program for odor mitigation. Rule 410 – Odors from Transfer Stations and Material Recovery Facilities (MRFs) was adopted in 2006 as the first AQMD rule to address odor nuisances. Combined with AQMD Rule 402 – Nuisance, a comprehensive strategy for prevention and mitigation is available for transfer stations and material recycling facilities. The rule reduces the possibility of odors from the subject facilities by requiring site-specific odor management practices. The purpose of this measure is to use this approach or other types of programs to address nuisance issues from other industries.

Implementation Approach
The first step in implementing this measure would be to evaluate odor complaints received by the AQMD to identify types of facilities or processes with odor issues occurring on a regular basis. Approaches to this measure could take the form of additional rules modeled after Rule 410 or some other type of program to reduce odors from specific sources. Requirements may include performance requirements, odor minimization plans, or community notification and reporting requirements.

Another approach currently in early development is researching a new systematic, scientifically-based odor nuisance resolution practice to be developed by the academic community and the AQMD. A contract with a UCLA team of olfactory experts was recently approved to enhance AQMD's ability to better characterize nuisance odors and enhance potential mitigation measures

to resolve odor complaints. AQMD staff will look into developing new rules or policies for odor nuisances based on findings of the study.

Chapter 4: Implementation Schedule

Implementation Schedule

The CCP, like the previous air toxics plans, addresses specific sources of air toxics and nuisance. Further, it enhances compliance efforts making them more accessible, understandable, and responsive to the public. It contains elements to improve coordination with other government organizations. It also focuses on education and outreach to increase awareness of toxic exposure and better alternatives for the public and schools. In order to address these highly impacted areas and their unique circumstances, an integral part of the CCP is a community-based approach which provides an opportunity for input from stakeholders in the community and focuses on the cumulative impacts of individual communities and neighborhoods.

Due to the varied scopes and complexities of each measure, full implementation of the CCP will depend on AQMD staff resources and availability of members from the community and other governmental regulatory entities. Resource needs will be assessed more fully as each measure is implemented. Stakeholders for each program will be included in the process of developing implementation approaches. Once implementation approaches are developed, the AQMD staff will assess resource needs. The AQMD will endeavor to use existing resources wherever possible to implement the measures. If needed, staff resources may be reallocated and projects reprioritized. Some additional resources may be needed for some measures. For example, increasing off-hour compliance presence and additional outreach activities may require additional staffing and changes to computer programs may require additional contract funding. As needs are identified during implementation of each measure, the annual budget process will be used to allocate resources subject to Board approval. Periodic reports will be made to the Stationary Source Committee regarding resource needs.

Table 4-1 lists all the measures of the CCP along with a schedule describing when specific actions for each are proposed to begin. It should be noted that the AQMD staff will need some lead time for implementing the agreed upon approaches. The implementation schedule presented in this chapter accounts for this lead time and may be changed if additional lead time is needed.

Table 4-1

CCP Measures Implementation Schedule

Measure	Proposed Action	Implementation Date
Community-01 Community Exposure Reduction Plan	• Phase 1: Select two pilot communities • Phase 2: Collect Stakeholder Input • Phase 3: Investigate and Validate Data • Phase 4: Implementation of Early Action Items • Phase 5: Develop Community Exposure Reduction Plan • Phase 6: Implement Community Exposure Reduction Plan	Completed Ongoing 2011-2013 2011-2012 Late 2011 2012+
Community-02 Community Guidance for Reducing Air Toxic Exposure	• Develop CERP process similar to the process followed in the pilot study to guide communities and local governments to develop CERPs with AQMD assistance • Update CERP process as experience is gained in developing CERPs	Beginning 2013 As needed
Community-03 Greening Communities Through Accelerated Toxic Emission Reduction Projects for Existing Sources	• Identify disproportionately-impacted communities and assess cumulative impacts • Provide outreach for permitted and unpermitted sources • Establish funding for emission reduction programs • Retrofit or replace existing toxic sources	Mid 2011 Mid 2011 and ongoing Beginning in 2011 Mid 2011 and ongoing
Participation-01 Clean Communities Pledge	• Develop Clean Communities Pledge and outreach for participation • Recognize achievements of participating members	Mid 2011 Mid 2011 and ongoing
Participation-02 Clean Schools Pledge	• Develop Clean Schools Pledge and outreach materials • Advocate school participation in air quality-related programs • Recognize achievements of participating members	Early 2011 Mid 2011 and ongoing Mid 2011 and ongoing
Participation-03 Enhanced AQMD Community Meetings	• Continue and enhance existing AQMD community meetings to include round table discussions to further understand community concerns • Develop new community meeting process to include local gatherings of diverse groups of key stakeholders (residents, local business representatives, health agencies, universities, public/private agencies)to seek input and collaborative ideas for addressing air-related issues	Beginning late 2010 Beginning late 2010
Outreach-01 Clean Air Toolbox for Local Governments, Communities, and Schools	• Establish "Clean Air Toolbox" website and add existing tools • Develop "Proximity Matters" advisory document for planners • Develop sample anti-idling ordinances and signage for idling trucks and trains • Develop additional tools	Early 2011 and ongoing Early 2011 Beginning in 2012 Ongoing

Table 4-1

CCP Measures Implementation Schedule

Measure	Proposed Action	Implementation Date
Outreach-02 Community Dialogue	• Begin development of "Ask AQMD" online forum • Develop additional tools to improve two-way communication with communities • Enhance MATES III interactive risk map	Beginning 2011 Beginning mid 2011 and ongoing 2011
Outreach-03 "Playing it Safe" Campaign	• Begin developing "Playing it Safe" Campaign • Provide outreach and information on AQMD website on situations when outdoor activities should be curtailed	Early 2011 Mid 2011
Outreach-04 Cleaner Choices to Reduce School Children's Exposure to Toxics	• Develop education materials for parents, educators, and children on how to reduce exposure to toxic substances • Provide practical recommendations on how the public can reduce their exposure to toxics	Late 2010 Late 2010
Outreach-05 Advocating Toxic-Free Choices	• Begin development of health bulletins and brochures identifying air toxic sources • Begin using several approaches including Community Health Bulletins, AQMD website enhancements, and brochures to proactively disseminate information to the public	Early 2011 Mid 2011
Outreach-06 Business Outreach and Assistance	• Add other means to disseminate information regarding AQMD's Small Business Assistance Program • Develop an air quality compliance outreach program • Develop an online forum on AQMD's website where the business community can communicate and share air quality solutions	Early 2011 Mid 2011 Mid 2011
Agency-01 Promoting Better Land-Use Decisions	• Develop tracking system for CEQA projects • Develop "Proximity Matters" advisory to planners • Evaluate feasibility of providing a preliminary site assessment service for land use planners • Implement "Reverse" CEQA Analysis for Sensitive Land Uses • Begin outreach and training • Develop and add siting requirements to source specific toxic rules	Currently in progress Early 2011 Mid 2011 Mid 2011 and ongoing Mid 2011 Ongoing
Agency-02 Multi-Agency Coordinated Response	• Establish list of participants for the Interagency Task Force • Establish process to address recurring issues • Develop interagency information sharing system	Early 2011 Mid 2011 Late 2011

Table 4-1

CCP Measures Implementation Schedule

Measure	Proposed Action	Implementation Date
Compliance-01 Enhancements to AQMD's Compliance Program	• Assess how resources are deployed to improve compliance presence and response • Investigate the development of an enhanced compliance feedback and tracking system • Enter agreements with other agencies to optimize compliance resources	Beginning late 2010 2012 Mid 2011
Compliance-02 Increased Public Awareness and Participation to Enhance Compliance	• Encourage additional public participation in compliance activities through training and outreach • Enhanced air quality complaint reporting	Beginning Early 2011 2012
Stationary-01 Lead Emissions	• Amend Rule 1420 to address smaller facilities	2012
Stationary-02 Lead Paint for Pre-1978 Structures	• Develop materials for public outreach and online information • Determine feasibility of more stringent lead rule(s)	Early 2011 Mid 2012
Stationary-03 Identifying New Sources	• Develop a multi-step approach for identifying sources emitting selected, highly toxic air contaminants	Beginning 2011
Stationary-04 Alternative Assessment for Use of Acutely Hazardous Materials	• Where applicable, during the permitting and CEQA review process, evaluate uses of acutely hazardous materials to identify where less hazardous alternatives can be substituted • Work with other agencies to ensure substitutions do not duplicate and are not in conflict with other programs	Mid 2012 Mid 2012
Stationary-05 Indirect Sources (Diesel PM)	• Develop multi-step approach to reduce diesel PM emissions from sources associated with diesel-fueled vehicle emissions	Beginning early 2012
Nuisance-01 Nuisance Rule	• Evaluate and consider revisions to Rule 402 and "Policies & Procedures on Public Nuisance Investigation"	Early 2011
Nuisance-02 Source-Specific Nuisance Rules	• Identify persistent odor issues and develop industry-specific rules or programs to reduce odors • Conduct research on a systematic, scientifically-based odor nuisance resolution practice	Mid 2012 Ongoing

APPENDIX A

KEY FEDERAL, STATE, AND LOCAL TOXIC AIR REGULATIONS

Table A-1
Examples of the AQMD Air Toxics Control Program

Source Category	Target TAC(s)
Toxic New Source Review Rule 1401 amended several times to add new TACS and most recently on 3/7/2008 to add diesel PM from internal combustion engines.	Various TACS, Diesel PM
Toxic Emitting Facilities near Schools Rule 1401.1 adopted 11/4/2005.	Various
Control of Toxic Air Contaminants from Existing Sources Rule 1402 amended 3/17/2000 to add industry categories and committed to assessing the need for source specific rules. Rules 461, 1421, 1425, 1426, 1469 were either adopted or amended. Reports to the Board for no further action on ethylene oxide, rubber and furniture stripping industries.	Various
Aerospace Coating Operations Rule 1124 amended 9/21/2001.	Perchloroethylene, Hexavalent Chromium, Trichloroethylene, Methylene Chloride
Perchloroethylene Film Cleaning and Printing Rule 1425 adopted 3/16/2001.	Perchloroethylene
Perchlorethylene Dry Cleaners Rule 1421 amended 12/6/2002 to phase out perchloroethylene.	Perchloroethylene
Gasoline Dispensing Rule 461 amended 3/7/2008 to incorporate more stringent emission limits and housekeeping requirements.	Benzene, Hexane, Toluene, Ethylbenzene, Xylene
Chrome Plating Rule 1469 amended twice on 5/2/2003 and 12/5/2008 to make emission limits more stringent and enhance housekeeping requirements.	Hexavalent Chromium
Hexavlent Chrome Spraying Rule 1469.1 adopted 3/4/2005.	Hexavalent Chromium

Table A-1
Examples of the AQMD Air Toxics Control Program

Source Category	Target TAC(s)
Other Metal Finishing Rule 1426 adopted 5/2/2003 to gather information from other types of plating with TAC emissions.	Nickel, Cadmium, Copper, Lead
Single Diesel Engines Rules 1470 adopted 4/2/2004.	Diesel PM
Multiple Standby Emergency Diesel Engines Rule 1472 adopted 3/7/2008.	Diesel PM
