APPENDIX C

AQMD PUBLIC NUISANCE INVESTIGATION POLICIES & PROCEDURES

South Coast Air Quality Management District Policies & Procedures

Subject: Public Nuisance Investigation
Date: May 1, 1989
No. C-1

1.0 POLICY

The District will investigate public nuisance complaints and issue Notices of Violation for public nuisances. This document identifies the District's authority in these areas and provides guidelines for gathering evidence to substantiate public nuisance complaints.

2.0 GENERAL

An inspector usually conducts a public nuisance investigation in response to complaints from the public. To prosecute a public nuisance violation successfully, the chief prosecutor's office needs documented evidence that the activity or condition is in violation of Health and Safety Code Section 41700. The District is both the investigative and enforcement agency for public nuisance complaints.

3.0 HEALTH AND SAFETY CODE SECTIONS 41700 AND 41705

The complete texts of Sections 41700 and 41705 are given below. In substance, the text of Rule 402 is a restatement of Sections 41700 and 41705.

> 41700. Except as otherwise provided in Section 41705, no person shall discharge from any source whatsoever such quantities of air contaminants or other material which can cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.
>
> 41705. Section 41700 shall not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.

4.0 PUBLIC NUISANCE INVESTIAGATION GUIDELINES

The inspector will conduct a public nuisance complaint investigation in accordance with the following guidelines:

a. The inspector will check the complainants' premises or adjacent areas for the emissions

complained of (examples: odors, dust fallout, paint overspray). This may require driving around in the area surrounding the source. The inspector will write in the Violation Notice Report that this was done. Additionally, the inspector will note in the report whether or not another potential source of the emission was found.

1. If evidence of emissions is found, the inspector will track the emissions upwind from the complainants by visual or olfactory observations.
2. If no evidence of emissions is found, the inspector will ask the complainants for a description of the emissions and for other information which may help to determine their source.

b. After identifying the emissions and source, the inspector, using the process of elimination, will check all possible areas surrounding the alleged or known source to exclude any other potential source.

   The inspector will inspect the source premises and establish the specific equipment or process responsible for the emissions. This involves inspecting all vents, stacks, and openings where the emissions occur or may occur, obtaining samples of emissions if possible, and checking for Permits Operate.

c. The inspector will list all persons contacted at the source premises by full name and title (Mr., Mrs., Ms.), and will also include phone number, responsibility in the incident, and information to which each person can testify if called by the prosecutor as a witness.

   The inspector may ask the complainants whether they know of other persons in the neighborhood who have complained of the emissions. If so, the inspector will request the complainants to tell these other persons to contact the District.

d. After establishing the source, the inspector will contact all complainants and, if possible, obtain samples of emissions from the complainants; premises. In more complex cases, the inspector may require a source test, air monitoring, and perhaps assistance from local health officials to establish health endangerment or natural tendency to cause injury or damage to business or property.

e. If a violation is indicated, the inspector will obtain the completed complaint forms from the complainants.

5.0 DISTRIBUTING AND COLLECTING COMPLAINT FORMS

a. Whenever possible, the investigating inspector will personally distribute a complaint form to each complainant. The inspector's report must include the time, place, and date such forms were distributed and collected.

b. The inspector will interview each complainant either at the time of the complaint or when the declaration form is collected.

c. Inspectors who assist the investigating inspection to distribute or collect nuisance complaint forms must comply with the requirements of steps a and b above.

6.0 COMPLETING THE COMPLAINT FORM

a. The complainant must list a residence location on the complaint form (attached), not a post office box number. The business address and telephone number should indicate where the complainant can be contacted from 8:00 a.m. to 4:30 p.m. Monday through Friday.

b. The complainant must complete items 1 through 8 on the form. If the information is not known or is not applicable, the complainant will indicate "not known" or "not applicable" in the space provided.

c. The inspector will check that the signature is the complainant's legal name. If the answer to item 8 is "No," the complainant must complete the declaration on the reverse side, using printing rather than hand writing.

d. The inspector will review the form and complete the "APCD USE ONLY" block.

7.0 REQUIREMENTS FOR ISSUING A PUBLIC NUISANCE VIOLATION NOTICE

a. Before a public nuisance violation notice is issued, the investigating inspector must observe, identify, or otherwise establish evidence of the emissions complained of at or near the complainants' location.

b. The investigating inspector must establish the source of the emissions and eliminate other potential sources.

c. A multiple complaint condition must be documented. As a rule, District Legal Counsel prefers that it be based on a minimum of six (6) to ten (10) complainants from separate households. However, special circumstances

may dictate that a Notice of Violation be issued if supported by fewer complainants. For example, if property damage or a potential health hazard exists, a husband and wife living at the same residence may be considered as separate complainants. A Notice should not be issued only on the basis of complaints from members of a single family living at one location.

d. The investigating inspector should complete the Notice of Violation form. In some instances another inspector may serve the notice.

e. The inspector who establishes the public nuisance violation will write all of the supporting documentation, clearly demonstrating that each element of the violation has been met. Any inspectors who assist in gathering evidence or interviewing witnesses will prepare separate reports, coordinated by the lead inspector on the violation.

APPENDIX D

RESPONSE TO COMMENTS

2010 Clean Communities Plan
Response to Comments

Several comment letters were received from members of the CCP Working Group following the initial meeting of the working group on July 16, 2008. The comments were discussed by the working group at its August 26, 2008 meeting and the draft document was revised in response to the comments. Many of the comments and suggestions are incorporated in the 2010 Draft CCP. The following paragraph summarizes the major issues. Full text of the comment letters submitted by Working Group members are attached for reference at the end of Appendix E.

A letter from two environmental groups suggested ways to better address cumulative impacts through public participation, enhanced enforcement practices, permitting practices to consider cumulative impacts, revisions to existing source-specific toxics rules, and umbrella rules to address cumulative impacts. This letter also expressed support for measures which would promote better land use decisions and allow more community participation in air quality decisions. Many of these ideas have been incorporated in the document. Regarding the issue of addressing cumulative impacts through permitting, the AQMD staff still believes the larger issue is the air toxics and emissions from existing sources. Community-03 is designed to address retrofitting and replacing older, higher emitting equipment in impacted areas. Regarding new sources, the AQMD staff will continue to evaluate tools to more directly address permitting new and modified sources in addition to be more health protective.

Three letters from sanitation and water districts focused primarily on three issues. The first concern was the subjective nature of odor and public nuisance issues and whether that fits with a toxics plan. The comments were taken into consideration and two nuisance measures are part of the 2010 Draft CCP. The AQMD staff has included these measures in the Clean Communities Plan as they are air related "community" issues. The second concern was with a measure addressing accidental exposures to hazardous substances, in that it might overlap with existing accidental release regulation of several state and federal agencies. At the time of this comment, the AQMD had proposed a measure that would require replacement of acutely hazardous materials with less hazardous materials. The AQMD has since revised its proposal to recommend evaluation of use of acutely hazardous materials on a case-by-case basis. This may be done during the CEQA process or during permitting of storage or handling of acutely hazardous materials. The third was a request to coordinate the CCP efforts with the OEHHA Cumulative Impacts and Precautionary Approach Working Group. The AQMD staff has closely followed the meetings of the OEHHA Working Group to coordinate and not duplicate efforts. The fifth letter, from the Western States Petroleum Association, urged the AQMD staff to develop the CCP within the current regulatory framework using good science and fact-based initiatives.

Responses to comments received following release of the 2010 Draft Clean Communities Plan at the April 2, 2010 Governing Board meeting are provided below. Several comments were received that suggested additions or changes in wording to clarify the meaning of the document. Changes have been made throughout the document to address these comments. Comment letters can be found in Appendix E.

General

1. **Comment:** A guidance document shouldn't be the end goal of the pilot program because it would not go far enough to address cumulative and disproportionate impacts. A guidance document may be a start but it will likely take new rules, enforcement practices, permitting processes, etc., to deal with the issue properly. An open mind should be kept as to the remedies that we may identify during the pilot projects and creation of the exposure reduction plans.

   Response: The AQMD staff agrees that a guidance document will be the start. As the AQMD staff implements the pilot program and develops the guidance document for other communities it is expected that there will be enhancements to the AQMD's existing programs. The AQMD staff will use the pilot program to identify programs that can be improved.

2. **Comment:** Add an appendix listing the status of federal NESHAPs that includes the NESHAP, the applicable district source and rule, and whether our sources already comply or are exempt from the NESHAP.

   Response: For brevity, an internet link to the EPA list of NESHAPs has been included for reference in Appendix A. The AQMD Engineering and Compliance staff enforces applicable NESHAPs through permit conditions and inspections.

3. **Comment:** In Chapter 2, please add an explanation of the other limitations of the MATES III data, including limits of our knowledge about the toxicological impacts of TACs and other chemicals, especially when it comes to susceptible and vulnerable populations, and cumulative and synergistic impacts.

   and

   The draft CCP lacks adequate discussion of the uncertainties associated with the cancer risk estimation technique. We do not believe it is sufficient to merely reference the uncertainties section of the MATES III document

   Response: A discussion of the uncertainties related to risk estimation has been added to Chapter 2. A more detailed discussion of the uncertainties and limitations of the MATES III can be found in the Executive Summary and Chapter 1 of the MATES III Final Report (September 2008).

4. **Comment:** We request revision of the statement in Chapter 2 that the Mates III Study shows the highest cancer risks from air toxics in the vicinity of the port areas, with the highest grid cell risk of about 3,700 in a million. The cited risk levels are misleading, as they refer to risk estimates that are either over water or on Port property. It

is not appropriate to use or otherwise communicate these values as being representative of residential risks.

Response: This section has been revised to indicate that the highest residential risk near the ports is 2,900 in a million.

5. **Comment:** When referring to risk reduction, the plan should be clear in stating that reductions are in estimated cancer risk from ***air toxics***, (page ES-2). We also suggest describing the regional background or total cancer risk to put the contribution from air toxics into context.

   Response: The words "air toxics" have been added on page ES-2 as suggested. The overall regional population weighted total cancer risk is discussed on Page ES-2.

6. **Comment:** The measures are conceptual and leave many potential approaches for reducing TACs on the table. The measures should be further defined before taking it to the Board for approval. Without further definition, it is difficult for stakeholders to understand what they are being asked to support. In addition, the AQMD has not analyzed its authority to adopt the measures and conduct the studies it outlines in the plan. If the District chooses to proceed without analysis of its authority to adopt the measures outlined in the plan, it should be revised to include the same disclaimer included in the 2000 ATCP that staff is seeking Board approval of the plan as a planning document for possible future actions. As a result, the Board's action is not binding and does not commit the AQMD to a definitive course of action.

   and

   We remain concerned that some measures are moving forward quickly, without the full transparency of stakeholder engagement, and without sufficient detail.

   Response: The CCP is a planning document and the measures and implementation approaches are staff's initial concept. As measures are developed staff may identify additional implementation approaches or implementation approaches identified will become more refined. If a regulatory approach is selected for implementation, the AQMD staff will analyze its authority. In addition, actual implementation approaches will be determined and fully assessed and analyzed at the time each measure is implemented. Clarifications have been made in the measures to provide more specificity, where appropriate. The suggested disclaimer has been added to the Public Process paragraph on page ES-1. The AQMD remains committed to fostering an inclusive and open dialogue among affected stakeholders in order to ensure transparency throughout the development of this plan. As the measures are further developed, staff will continue to collaborate with stakeholders to analyze and refine the measures and implementation approaches.

7. **Comment:** Pursuant to Health and Safety Code § 40922, have you analyzed any of the measures for cost effectiveness and ranked the proposed measures? If so, what method was used for the analysis and where are the results? If not, when will that analysis take place?

   Response: Health and Safety Code 40922 applies to attainment plans. The Draft 2010 CCP is not an attainment plan.

8. **Comment:** The CCP should include a discussion of how the measures will avoid conflicting with the Senate Bill 375 Vehicle Miles Traveled (VMT) reduction goals.

   Response: California's SB375 is the nation's first law aimed at controlling greenhouse gas emissions through land use, by curbing urban sprawl. Proposed measures or implementation approaches will be fully analyzed during development to ensure that they do not conflict or overlap with any existing regulations.

9. **Comment:** We would appreciate staff developing a timeline or work plan for further development of the plan and in particular of the individual measures as they begin to be implemented, especially the CERPs.

   and

   Please provide clarification on the CCP implementation process as many measures are shown as being implemented simultaneously. We recommend that SCAQMD considers phasing the implementation with a focus on the highest priorities, rather than trying to implement too many measures at one time.

   Response: An implementation schedule has been added in Chapter 4. Personnel from various parts of the AQMD will be responsible for implementation of the different measures, so simultaneous implementation is feasible. Additionally, many of the measures are interconnected. Also, many of the measures require a long lead time or have a fairly lengthy development period. Staff believes the current implementation schedule optimizes staff resources and facilitates the development of a complete, comprehensive program to address community-level air quality issues.

10. **Comment:** Please include the MATES III modeled cancer risk for the interim years of 2014 and 2020 to illustrate improvements between 2005 and 2023 in Chapter 2 in addition to Figures 2-8 through 2-10.

    Response: The maps in Figures 2-8 through 2-10 demonstrate the decrease in modeled risk from 2005 through 2023. The bar graph in Figure 2-7 shows that decrease in risk in 2014 and 2020 is primarily due to the decrease in risk from diesel PM. A graphic representation of the modeled risk for the two interim years would look similar to map for 2023 in Figure 2-10 2023. Therefore, they have not been included.

11. **Comment:** The Draft CCP would benefit from a brief description of the Ports Clean Air Action Plan (CAAP) as a recent local example of industry, air agencies, and community stakeholders effectively working together on a voluntary program. Implementation of the CAAP and the forthcoming 2010 CAAP Update represent an effective and ongoing effort to achieve real reductions in air toxics and health impacts. This discussion would provide a useful template and background to CCP Working Group members and the public.

    Response: AQMD staff agrees that the CAAP and its process is an example of agency coordination and stakeholder coordination. The AQMD acknowledges that there are aspects of the CAAP that may be useful.

12. **Comment:** A number of CCP measures addressing localized effects and cumulative impacts are similar to efforts already being implemented by the Ports through the San Pedro Bay Ports Clean Air Action Plan (CAAP), Port (CEQA) projects, and other Port initiatives.

    Response: The Ports have made progress with implementation of the CAAP. Ports of Los Angeles & Long Beach should be commended on these accomplishments. The AQMD staff agrees that there are similarities.

    The CAAP is a good community exposure risk reduction plan, however, the Draft 2010 CCP will complement the CAAP and in some areas further enhance. For example, through measures such as Community-02, additional programs beyond the CAAP can be implemented to reduce exposure to toxic air contaminants. In addition, implementation of Community-03 may identify sources in and around the port where retrofitting or replacing equipment can further reduce health risks near port communities.

13. **Comment:** The plan provides little or no background on existing measures that are already in place and which are under the jurisdiction of other regulatory agencies.

    Response: The document describes the progress made so far with federal, state, and local regulations. It also discusses regulations which result in reductions in diesel PM emissions because this is such a large part of the risk in the Basin. In addition, Appendix A provides lists of some of the key regulations. Unlike previous versions of the Air Toxics Control Plan, the 2010 CCP focuses less on traditional source-specific regulatory approaches and more on addressing cumulative impacts in communities and neighborhoods.

14. **Comment:** Please provide a definition of the term "precautionary measures", found on page 3-1.

    Response: The term "precautionary measures" was used to emphasize the District's intent to proactively address and, where possible, prevent exposures to air toxics, in addition to mitigating existing exposures. For example, early participation in land-use projects to prevent siting of incompatible land uses and outreach to educators and youth sports organizations when it is unhealthful for children to play outdoors would prevent or reduce exposure.

15. **Comment:** Please clarify why GHG offsets are to be included in the CCP, since the plan is meant to address impacts that are highly localized in nature. We do not think the CCP is the appropriate vehicle for such action, and suggest that CEQA guidelines may be a better place to deal with CEQA review of GHG emission impacts.

    Response: Greenhouse gas emissions are mentioned in the introduction to Chapter 3 only in the context that impacts to GHG emissions will be analyzed as part of the CEQA analysis during rulemaking if a regulatory approach is selected as an implementation approach for any of the CCP measures.

Community Exposure Reduction Measures

16. **Comment:** Please describe the degree of granularity that is being proposed for "micro-scale" monitoring. Also, given that there is no scientific certainty regarding causal effects for many associated health outcomes, please describe how the District intends to use qualitative data appropriately and how such data will be reconciled with quantitative data. While there is evidence to support that air pollution can have adverse health effects, a survey of existing health issues in a community cannot establish causality of those health outcomes with emissions sources in the community.

    Response: Health surveys are only one of many tools that may be used to get an initial perspective on the air quality issues in a community. The details of how they will be used will be developed during implementation of the measure.

17. **Comment:** We support the District's decision to include all sources of toxics in the CERPs and hope the District will apply the principle of "fair share" to ensure that each source category is responsible for its own contribution to the cumulative emissions impacting burdened communities.

    Response: To the extent feasible, the AQMD staff will continue to use creative mechanisms to reduce emissions from sources traditionally not regulated by the AQMD, so that they are responsible for their share of emissions.

18. **Comment:** Please provide a more detailed explanation of the criteria used to choose the pilot locations for Community-01 and how they are representative of other highly impacted communities in the Basin. Please also consider adding Wilmington as a third pilot project.

    Response: Selecting the two communities was difficult, because there are other communities in the district that can benefit from development of a Community Exposure Reduction Plan. The AQMD staff used broad-based criteria in selecting the two pilot communities to develop Community Exposure Reduction Plans. The selection of these two communities was based on health risk data from MATES III, emissions data from the AQMP, demographics, particulate matter emissions, areas with high concentrations of toxic-emitting facilities or odor nuisances in close proximity to residential or sensitive receptors, history of complaints, known air pollution sources, and community-identified air quality issues. Also, the AQMD staff considered the willingness of the community to participate in the process.

    After the two pilot programs are completed, Community-02 will be developed. Community-02 will establish a template that other cities such as Wilmington can use. Any other city that is prepared to begin at that time can start developing their Community Exposure Reduction Plan.

19. **Comment:** Please clarify the zone of influence outside of community boundaries that would be affected when developing a CERP. Could this involve facilities beyond the specific boundaries of the selected community?

    Response: A CERP could involve entities beyond the boundaries of the community. The boundaries for the CERP depend on the businesses, air quality issues, and

proximity to the community. The intent is to include an area which encompasses air-related issues affecting the community, but is not so broad that the area is not manageable.

20. **Comment:** Community stakeholders should be reflective of the entire community, including committed local businesses, non-profit organizations, local government agencies, and residents. A solutions-oriented process will address air toxics issues while allowing business to continue to serve Southern California.

    Response: The stakeholder group will include representatives from all affected entities in order to provide balance throughout the process of developing a Community Exposure Reduction Plan. Community-01 has been clarified to specify that businesses will be included in the stakeholders and a new measure, Outreach-06 was added to address outreach to businesses.

21. **Comment:** The District agreed in the CCP working group meetings to incorporate a Task Force to guide the development of each CERP. The District should clearly describe and formalize the roles of the District, the Technical Advisory Group, and any known stakeholder processes for each pilot and include this information in the next Draft Plan. To avoid duplicative efforts, staff should identify concurrent or recent activities by other agencies specific to the pilot communities and summarize the reductions.

    Response: During the development of the Community Exposure Reduction Plan, the AQMD staff will work with a stakeholder group that will include community members, elected officials, other agencies, business representatives, etc. The specific representatives and their roles will be established during the development of the Community Exposure Reduction Plan.

22. **Comment:** Several comments were received asking for more detail and more specifics on the entire CERP process and suggesting potential implementation approaches for various stages of the CERP process.

    Response: The specifics of the CERP process will be developed during the pilot program. The pilot programs will allow all stakeholders to participate in formulating the process and developing the details. Clarifications have been made to the measure where appropriate.

23. **Comment:** What is the timeline and who will be responsible for the development of the immediate action items and exposure reduction plans in Community-01?

    Response: The specific implementation schedule for Community Exposure Reduction Plans will be developed through the pilot program. In addition, the implementation schedule for "immediate action" items depends on the type of immediate action items identified, if any. The implementation timeline and responsible implementation source or agency is dependent on the issues and solutions identified in the Community Exposure Reduction Plan.

24. **Comment:** We are concerned about the methods of information gathering outlined in the Community-01 measure, particularly the "neighborhood walks" and Investigation and Data Validation phase. Please clarify the

community input and neighborhood walk processes, with details regarding the logistics and intent of the processes.

Response: The "neighborhood walks" outlined in the CERP implementation approach will not be used for compliance audit purposes. The intent of the neighborhood walks is to allow AQMD staff to witness firsthand the neighborhood's air quality-related issues and better understand the issues raised during the community input stage. Some stakeholders may join AQMD staff during the neighborhood walks, however, AQMD will be sensitive to residents and local businesses to ensure that the size and composition of the group is not intimidating. Details and logistics of the neighborhood walks will be coordinated with all affected community members, community leaders, and businesses prior to implementation of this phase. For the neighborhood walks, AQMD staff will not enter a business unannounced. The neighborhood walks are not intended to create a hostile environment, but a positive partnership with the community, businesses, and agencies to work together and develop solutions.

In the next phase, Investigation and Data Validation, air quality-related issues brought forth by community members will be evaluated, sorted and prioritized for follow up, if necessary.

25. **Comment:** How will communities with high cumulative impacts be identified for Community-02? We are concerned that the CCP lacks a rigorous method to prioritize "at-risk" communities.

Response: The concept for Community-02 is to develop guidelines to guide other communities and local governments through the process of identifying air quality issues, gathering data, working with stakeholders, and developing a community-specific Community Exposure Reduction Plan. Implementation of this measure is not limited to communities with "high cumulative impacts." This measure is applicable to any community that is interested in developing a Community Exposure Reduction Plan.

26. **Comment:** Community-02 requires a collaborative approach to address concerns from the community, business and regulators and should forge an equitable forum for all stakeholder views and limit the potential for bias. Even with SCAQMD guidance, independent actors may abandon the rigorous approach outlined in Community-01. An independent special board, created with SCAQMD input, could referee the process to ensure that all voices are heard equally and minimize the potential for stakeholder disputes.

Response: The AQMD staff agrees that a collaborative approach is needed to address concerns from the community, business, and regulators. Through implementation of the pilot study, the AQMD will explore options to ensure that stakeholders can participate equally. The guidelines developed under Community-02 can include a section that addresses the "ground rules" of participation to ensure that the environment is non-confrontational. In addition, the communities can engage the AQMD as well as other agencies to participate to help develop elements of the Community Exposure Reduction Plan.

27. **Comment**: Further define "immediate action" and what constitutes "significant health impacts" that would trigger immediate action. Provide criteria and examples.

    Response: The AQMD staff does not have a specific definition for "immediate action" and "significant health impacts." The main idea behind this phase of the process of the pilot study is to recognize that issues may be identified that require resolution before the Community Exposure Reduction Plan is completed.

28. **Comment:** The District should not take a one size fits all approach when translating the information from the pilot projects into CERP guidelines for Community-02. This affects not just differing issues in communities, but also resources available to the community, its businesses, and local government.

    Response: Staff recognizes that each community has unique air quality issues and differing resources. Therefore, the guidelines for Community-02 will simply provide guidance and a process to follow, rather than solutions, for communities wishing to develop their own CERPs. This will allow the communities to benefit from lessons learned during the pilot program.

29. **Comment:** We support the District's approach of assisting communities that choose to engage the District in a CERP, rather than the District selection of additional communities.

    Response: Thank you for your comment.

30. **Comment:** For Community-03 we should consider initiating a process whereby community members could identify highly valued projects that may have direct or indirect impacts on air pollution but remain a priority (e.g., schools, hospitals, grocery stores, etc.). We should also consider additional permit review and mitigation measures for existing and new facilities in highly impacted communities.

    Response: If the stakeholders participating in developing the Community Exposure Reduction Plan decide to identify certain types of projects that may have indirect or direct impacts on air pollution, this can be incorporated into the Community Exposure Reduction Plan. Communities have flexibility regarding the scope of the Community Exposure Reduction Plan. These Plans can cover existing and new facilities. Land use decisions and CEQA review for land use decisions reside with the cities and counties. Regarding air quality permitting, the AQMD does have permitting authority for stationary air pollution sources. The AQMD staff will continue to evaluate tools to more directly address permitting new and modified sources to ensure adequate health protection. The AQMD staff believes that implementation of Community-03 will help to reduce emissions and exposure to air toxics from existing sources.

31. **Comment:** What would be the regulatory mechanism to assure success of the proposed implementation plans in Community-03?

    and

    What requirements will be imposed on "older" toxic emitting sources? Many "older" toxic emitting sources may be completely legal and operating in compliance with

applicable rules and regulations. This should be reflected in the Plan.

Response: Community-03 presents several implementation approaches. During the development of this measure, the AQMD staff will explore implementation approaches to ensure the success of this measure. If funding is available, sources should apply for retrofits or replacements. A regulatory approach may be used if it is determined to be necessary and appropriate. In order to achieve the greatest emission reductions, this measure seeks to focus on all existing, high emitting air toxics sources. The implementation approach of the measure has been revised to include existing permitted sources which may be in compliance with applicable regulations.

32. **Comment:** The Ports have appreciated the many opportunities they have had to partner with AQMD to fund air quality improvement projects and welcomes AQMD's funding assistance in retrofitting, repowering and replacing older, higher emitting equipment as is suggested by Community-03. Partnering and combining financial resources allows successful achievement of air quality improvement projects.

    Response: Staff agrees that partnering and combining resources is beneficial and appreciates the support of the Ports for this measure.

33. **Comment:** An overly simplified cumulative impacts approach may overstate the risks to a community if it ignores the powerful impact of distance on declining risk, inflates perceived risks and exaggerates health impacts. We caution against any approach that exaggerates risks that are already conservative and suggest that, until the methodology is fully matured, any cumulative impact assessment be paired with community level ambient monitoring as verification.

    Response: Staff agrees that quantitatively assessing cumulative impacts should be done with care to ensure that impacts are accurately assessed. The AQMD staff has not committed to any specific methodology for quantifying cumulative impacts at this point. The AQMD staff agrees that if a methodology is developed, that there are many factors that should be considered including distance, exposure duration, concentration, potency of the toxic air contaminant, etc. In addition, the AQMD staff does agree that ambient monitoring data is a useful tool to measure pollutants and can be used to verify ambient air quality in communities.

Community Participation Measures

34. **Comment:** The implementation approach under Participation-01 should explicitly include the creation of best practices guidance documents and the hosting of best practices workshops, or the training of community members to conduct best practices workshops, such as those done by the Pacoima Beautiful CARE II Team while working with auto dismantlers.

    Response: The 2010 Draft CCP includes a variety of measures to address outreach and improve communication. Through the CCP, the AQMD staff has identified several brochures for compliance and permitting for businesses and training and outreach for local governments and schools for implementation of CEQA that seem to fit the

concept of a best practices guidance document. A new measure, Business Outreach and Assistance (Outreach-06) has been added to the document and includes the best practices guidance document as one of the proposed implementation approaches.

35. **Comment:** In Participation-03 the CARE program has very limited funding and we can expect EPA to fund only one or two CARE projects within the district.

    Response: The AQMD staff understands that funding may be challenging. The AQMD staff is committed to investigate state and federal funding opportunities to help implement this measure as well as Community-03. There may be other types of programs such as Carl Moyer and the SOON program where specific funding is available and sources can qualify for.

Communication and Outreach Measures

36. **Comment**: We suggest including a risk communication element in the Clean Air Toolbox in Outreach-01.

    Response: A risk communication document has been added as one of the elements for the Clean Air Toolbox.

37. **Comment:** We respectfully suggest that the AQMD creates or improves programs that highlight the changes that businesses are implementing in order to reduce air pollutants and decrease exposures.

    Response: A new measure, Business Outreach and Assistance (Outreach-06) has been added that proposes development of a forum on the AQMD website where business owners can discuss and share solutions to compliance issues based on experience, and provide opportunities to showcase technologies or best practices that can help facilities achieve compliance and reduce air toxic emissions.

38. **Comment:** Outreach-01 should acknowledge the limitations of the ARB Land Use Guidance (e.g., it only deals with proposals to site residents near sources and not sources near residents) and try to fill the gaps (e.g., no proposal for a minimum buffer zone between refineries and communities).

    Response: CARB's Land Use document is an excellent start at highlighting incompatible land uses and recommending siting distances for specific land uses. The AQMD staff agrees that there are areas of CARB's Land Use document that can be enhanced. The 2010 Draft CCP discusses in Agency-01 the development of a new document titled "Proximity Matters" that will go beyond CARB's Land Use document to identify land uses that were not identified. In addition this measure discusses the use of "Reverse" CEQA analysis for sensitive land uses.

39. **Comment:** In Outreach-01 the implementation approach should include the conveyance of compelling and well told success stories.

    Response: The AQMD staff agrees that there is value in sharing air quality success stories. The 2010 Draft CCP has a couple of measures that will encourage communication of air quality success stories. Outreach-02 includes the "Ask AQMD" forum to address public inquiries and concerns. Through this forum, the AQMD

staff anticipates that compelling air quality success stories will develop that can be shared with the public. Partcipation-01 and -02 will encourage local agencies and schools that take the clean air pledge to share their air quality success stories also. As discussed in these measures, the AQMD staff envisions that these stories can be posted on the AQMD's website for other organizations. In addition, the AQMD staff has added a measure Outreach-06 which encourages businesses to communicate their success stories. The idea is to encourage other businesses and agencies to be pro-active on air quality issues.

Agency Coordination Measures

40. **Comment:** Agency-01 should include submitting detailed CEQA comments upon proposed incompatible land use decisions being made by other agencies.

    Response: Through the AQMD's CEQA Inter-Governmental Review (IGR) section, the AQMD staff currently provides comments to lead agencies regarding incompatible land uses. The AQMD staff references the CARB land use document as well as other studies regarding health effects of living near freeways and busy highways. The AQMD staff intends to continue commenting on CEQA projects as well as conducting outreach to local government regarding compatible land uses.

41. **Comment:** Agency-01 should conduct a formal study of agencies and schools with projects in EJ areas that do not send us their CEQA documents. We should send them formal request letters and take legal action if necessary to assure that we have timely notification and a meaningful opportunity to comment on their CEQA documents.

    Response: The AQMD staff is aware that not all lead agencies are sending their CEQA documents to the AQMD. AQMD staff estimates that the agency is not receiving 30 to 50 percent of CEQA documents for projects within the district. As discussed in Agency-01 the AQMD staff is proposing additional outreach and training to agencies and schools. The AQMD staff is considering issuing participation certificate to local cities, counties, and other government agencies to encourage participating in training and outreach activities.

42. **Comment:** Will AQMD be forming an agency stakeholder group for collaboration and input into the development of these measures? We believe that an agency stakeholder group needs to be involved now as AQMD develops the measures.

    Response: The AQMD staff has not yet defined the public process for implementing these measures. The public process may include a variety of different approaches such as a stakeholder working group, public workshop, or a more informal public process of meeting with stakeholders and interested parties.

43. **Comment:** How does AQMD define "sensitive land use? The Ports support the "reverse CEQA analysis" for school siting but would like to better understand AQMD's intention in expanding this for other "sensitive land use projects."

Response: During the development of this measure the AQMD staff will better define "sensitive land use." It is expected that "sensitive land use" would be similar to how this term is used under CEQA which includes residential and other sensitive land uses such as schools, hospitals, etc.

Monitoring and Compliance Measures

44. **Comment:** We understand that the facility "Hot List" is an informal and internal reference and suggest removing it as an implementation approach from Compliance-01.

    Response: The "Hot List" is an internal document and has been removed as an implementation approach. It is mentioned in the background of the measure only.

45. **Comment:** Please add the following items to Table 3-1 in Compliance-01:
    - Issue a study on how other agencies resolve complaints to see if we can learn from others.
    - Provide each complainant with a complaint identification number, a pamphlet with information about the SCAQMD's complaint response process and applicable rules, and an opportunity to appeal any decision to a higher level of authority within the agency.
    - Provide complainants an opportunity for feedback regarding level of satisfaction with resolution to complaints and suggestions for improvements.
    - Track complaint trends and provide regular update reports to the Stationary Source Committee and Governing Board on trends and issues.

    Response: Compliance-01 has been modified to indicate that the AQMD staff will contact other agencies that receive complaints to discuss how they track complaints and their complaint resolution process. The AQMD staff will determine if these other agencies manage complaints in a manner that can enhance our program.

    As discussed in Compliance-01, the AQMD staff will be investigating the development of an enhanced compliance and feedback system, including assigning a tracking or case number that the public can track their complaint.
    The AQMD currently has a compliance brochure that is readily distributed to the public and businesses. In addition during townhall meetings and other public outreach activities the AQMD staff generally distributes these to brochures to the public.

    The AQMD staff is always open to feedback from the public and businesses regarding suggestions to improve its compliance programs. The AQMD will periodically work with complainants to seek feedback.

    The AQMD staff currently keeps records of all complaints and tracks overall trends. In the past, when compliance issues arise surrounding a specific source or industry the AQMD staff has reported to the Stationary Source Committee. The AQMD staff will continue to produce compliance data for the Stationary Source Committee as specific issues arise. The AQMD staff will consider more frequent compliance reports, if needed and as resources permit.

46. **Comment:** Compliance-01 - AQMD staff ~~may also enter into~~ *will propose* agreements with other agencies and

organizations for enforcement, such as the California Highway Patrol and code enforcement, to optimize the resources devoted to enforcement of air regulations.

Response: Compliance-01 will be revised to state that the, "AQMD staff will propose where appropriate, agreements with other agencies and organizations for enforcement..."

47. **Comment:** Text in the Compliance-02 measure suggests that the AQMD is implementing at least a portion of the agenda of advocacy groups. This should be implemented using a public exchange where the targeted facilities have an opportunity to rebut the claims of community members.

    Response: The Compliance-02 measure does not intend to alter the District's existing complaint response protocols, policies, or compliance procedures. This measure aims to improve public awareness of air quality issues and encourage engagement in the compliance process. As allowed under existing policies and when warranted, sources targeted by complainants will be informed of the nature of any complaints against them and will be afforded the opportunity to communicate with AQMD enforcement staff during the complaint investigation process. Enforcement staff may take statements from facility representatives and complainants, document observations of facility and environmental conditions, and use factual information to determine the validity of any complaints against the facility. This measure, along with the remainder of the CCP measures, will be further refined using a public process with input from a diverse stakeholder group.

48. **Comment:** The "one-click" complaint provision should be carefully designed so as not to become a "click it and ticket" feature.

    Response: The "one-click" complaint tool is one of several potential tools that AQMD staff will evaluate for development, and would be utilized in coordination with and as a supplement to the District's existing air quality complaint reporting procedures (i.e., 1-800-CUT-SMOG hotline). Complaint response protocols will continue to ensure efficient, timely, and equitable response actions. As required by existing policies, enforcement staff must verify the validity of complaints received based on an objective evaluation of the circumstances surrounding the complaint. Any violation notices or "tickets" issued would also be dependent upon staff's objective confirmation of a violating act or condition.

Source Specific Measures

49. **Comment:** A number of aerospace and electronics manufacturers employ lead soldering as part of normal operations and the emissions are extremely low. Staff should consider this when amending Rule 1420 in order to avoid unnecessary administrative burdens on facilities that use lead but have no or *di minimis* emissions.

    Response: The purpose of amending Rule 1420 is to ensure AQMD compliance with the 2008 NAAQS for lead. Based on this goal, the AQMD staff will consider all facilities that process lead and develop appropriate requirements during rule development.

50. **Comment:** Use of hazardous materials is currently regulated by several state and federal agencies. How does the proposed CEQA review in Stationary-04 interact with existing programs and requirements? Does it apply to a specific project or the entire facility? Please provide a more detailed discussion of District authority under CEQA, especially since hazardous material use is more traditionally managed through other statutes and direct regulation.

    and

    Table 2-2 should include toxics control regulations that cover storage, handling, and risk management of hazardous materials such as federal EPA's and Cal-EMA's Risk Management Plan rules. We recommend that the District seek comments from Cal-EMA and regional Certified Unified Program Agencies (CUPAs).

    Response: The district does not intend to regulate the storage, handling, and risk management of hazardous materials. The intent of the measure is not to duplicate or conflict with the authority or programs of other agencies. References to the other agencies have been added to the measure and, if appropriate, the AQMD will work with the other agencies during the implementation of the measure. The most likely approach will be to use the CEQA review process to evaluate new and modified sources utilizing acutely hazardous materials. The goal of the evaluations will be to reduce or eliminate the exposure to an acutely hazardous material during an accidental release. This has been clarified in the measure and a commitment to work with the other agencies has been added.

51. **Comment:** An analysis of substitutions for acutely hazardous materials (Stationary-04) may be appropriate as part of CEQA analysis, however there is nothing in the California Health and Safety Code that authorizes the SCAQMD to impose a requirement on permitting to determine if less hazardous materials can be substituted into a proposed process. We do not believe that requiring process modifications during permitting is appropriate and believe there should be some objective standards specified and there should be a presumption that an existing process that has worked and not created problems at a facility should be allowed to continue.

    Response: Implementation approaches for the measures are conceptual and the AQMD's authority will be assessed if an approach is chosen for implementation. The measure has been reworded to say that staff will perform an evaluation of new uses of acutely hazardous materials to identify where less hazardous materials can be substituted. The most likely approach will be to use the CEQA process to evaluate new and modified permits that will be using acutely hazardous material and alternatives, if needed, to reduce or eliminate the exposure to an acutely hazardous material during an accidental release. The evaluations will assess new uses of acutely hazardous materials and will consider potential trade-offs and other potential adverse impacts from alternatives while ensuring that no other environmental impacts are introduced. If this implementation approach is chosen for development, public input would be part of the development process.

52. **Comment:** CCP's Risk Reduction Goals May Be Substantially Achieved with CARB's Programs (DRRP) - Stationary-05 could achieve DPM reductions beyond those

already anticipated. These mandates were developed weighing the economic and practical feasibility of early retirements, and still relied on considerable saturation with Tier IV engines by 2020. Even with delays in rule implementation because of the economy, the recession has resulted in substantial emissions reductions consistent with the 2007 AQMP.

The Sanitation Districts have already committed to extensive engine replacements at the highest tier available. In many cases the engines are used in specialized equipment like compacters, crawlers, grinders, excavators, etc. Replacement or repowering cannot take advantage of economies of scale. Hence requirements for further controls from this niche equipment will not go as far in reducing emissions as if the monies were spent on other alternatives.

Response: The AQMD staff agrees that CARB's diesel risk reduction program will reduce diesel emissions. Some diesel reduction measures require retrofits or rely on natural turnover. Depending on the useful life, the turnover rate may be up to 10 years and on the outset 30 to 40 years. The objective of this measure is to reduce exposure to diesel particulate through a variety of measures. Heavily impacted communities cannot wait 10 to 30 years for fleets or equipment to turnover.

53. **Comment:** The Sanitation Districts have committed more than $18 million since 1998 on clean fuels, engine replacements or repowering projects (including $3.8 million for a CNG/LNG station) and in one solid waste management facility under construction (Puente Hills Intermodal Facility), have:

- Committed to using low emitting or alternative fuels for equipment;
- Implemented design features to improve traffic flow to reduce traffic and idling emissions;
- Extracting a commitment from Union Pacific Railroad to use locomotives with the newest emissions control, use no more than two locomotives at a time, and other effective design measures;
- Investigated innovative technologies (with SCAQMD staff) in preparation for this and other heavy-duty uses throughout the Sanitation Districts.

Response: These types of measures that you will be implementing at the Puente Hills Facility are the types of measure that are needed from all diesel facilities. The AQMD staff agrees that measures to reduce exposure to diesel particulate should be built into the design of implementation of new projects.

54. **Comment:** Many of these commitments are above and beyond measures called for in existing state programs. Expecting further emissions reductions would be extremely burdensome and potentially infeasible for facilities already at BACT levels or are operating equipment at the latest tier. Any indirect source measure like Stationary-05 should consider investments already made, especially for essential public services that cannot reduce emissions by attrition, down-sizing or relocation.

Response: The implementation approach for this measure has not been established yet. One approach discussed in the CCP is to develop a menu of options where facilities can develop a Diesel Reduction Plan. The AQMD staff understands that there are facilities that are proactive and

they may have measures that they are currently implementing, similar to those that may go into a Diesel Reduction Plan. The concept of this measure is to provide a wide range of strategies and options that will reduce the exposure to diesel PM. Some of these measures may require capital investments, while other measures address operational changes to reduce idling, improve traffic flow, location of diesel sources away from residents and sensitive receptors, scheduling of deliveries, etc.

55. **Comment:** What is the AQMD's statutory authority for the regulatory options outlined in the Stationary-05 measure, which seeks to regulate mobile sources?

    and

    Some of the options discussed in Stationary-05 are pre-empted under federal law. For example, potential approaches such as "vehicular scheduling and operating changes," fall under the purview of the ICC Termination Act of 1995.

    Response: The AQMD staff presented a general concept for Stationary-05. The applicability, implementation approach and specific requirements have not yet been established. As this measure is developed, the AQMD will do a legal analysis regarding the agency's legal authority to implement such a measure.

56. **Comment:** What level of CEQA analysis is the AQMD proposing for the rulemaking effort outlined in Stationary-05?

    Response: If this measure is developed as a rule, the AQMD staff will prepare the appropriate CEQA document. Regardless of the implementation approach, this measure will be developed with public input.

57. **Comment:** When will a draft proposed indirect source rule and preliminary draft staff report be ready for review?

    Response: Please refer to Chapter 4 for the proposed implementation schedule for development and implementation of proposed measures.

58. **Comment:** How will the terms in Stationary-05 be defined and what is the scope of "facility" and "businesses that rely on diesel mobile sources?" Will the ultimate definition include the Ports? What is the basis of the applicability and the specific options in the "menu of options?"

    Response: The purpose of identifying measures is to present initial concepts for control approaches. Specifics of the measure such as applicability, definitions, requirements, exemptions etc. will be established during development of the control measures. The AQMD staff will seek public input from a wide variety of stakeholders, including the ports, during this public process. It is too early in the development of this measure to provide specifics about the measure and the implementation approach.

59. **Comment:** Stationary-05 - Pursuant to Health and Safety Code § 40727, where are the findings of Necessity, Authority, Clarity, Consistency, Non-Duplication, and Reference? When and how will these be developed?

Response: If this measure is developed through a regulatory approach, the AQMD staff is required to make findings pursuant to the Health and Safety Code. These findings will be included in the Draft Staff Report.

60. **Comment:** Under Stationary-05 who would conduct and pay for proposed traffic studies to improve the flow of traffic and vehicle scheduling? When would these need to be completed; what triggers the need to conduct one? Would any part of the proposed rule affect a truck's ability to leave truck routes to deliver/pick up goods?

    Response: It was not intended that this measure require formal traffic studies, but that one option may be for the operator to assess the traffic flow into, out of, and within the facility to reduce idling and queuing of trucks. The concept of this measure is to develop a menu of options that affected facilities can select. No compliance dates have been established yet, as this is too specific at this time. As this measure is developed, the applicability, specific requirements, compliance dates, etc. will be developed.

61. **Comment:** Under Stationary-05 what changes to CARB's guidelines in reference to AB 2588 is the AQMD seeking? Please clarify the process through which the District plans to work with CARB to modify AB2588 guidelines to address mobile sources. Will the public receive notice of any action in this regard?

    Response: The AQMD staff currently uses CARB's Health Risk Assessment (HRA) guidelines for estimating health risks for AB2588 (Rule 1402) facilities. It may be necessary to pursue modifications to the AB2588 HRA Guidelines to include these mobile sources that enter the facility. If CARB modifies its HRA Guidelines, it is the AQMD staff's understanding that CARB would implement those changes through a public process.

62. **Comment:** Under Stationary-05 the Draft 2010 CCP says the District will initiate development of an indirect source rule containing an applicability criteria that will account for diesel PM emissions, exposure, and proximity to residential/sensitive receptors. If, as staff has indicated verbally, this is intended for new and existing facilities, and the facility operator will be the targeted party that should be included in the next draft. If the District takes this approach, implementation options should only include things over which the operator has control. Also, since offsite emissions are to be included, geographic limits should be given for what would be attributed to the facility.

    Response: Further clarification to the measure has been made. The measure applies to new, existing, and modified facilities. As outlined in the measure, the initial concept would be a menu of options that a facility can select from to provide flexibility to the operator. Whether this means a new program, rule, or guidance document will be determined when the measure is developed and input from all stakeholders will be considered at that time. Specifics regarding the applicability, definitions, the specific options, approach, requirements, etc. will be established during development of this measure. Regardless of the approach, this measure will be developed through a public process.

63. **Comment:** In Stationary-05, please remove the reference to rail yards and the San Bernardino health risk assessment or revise the measure to reflect improvements since 2005.

Omitting the progress to date leaves the impression nothing has been done.

Response: A sentence has been added to Stationary-05 to state that, "Risks at the rail yards have decreased and are expected to decrease further over time due to adopted regulations and fleet turnover; however, the residual health risk still remains elevated."

64. **Comment:** Despite considerable investment in clean air technologies and a proven track record of innovation and success in reducing emissions and nuisance impacts, often voluntarily, many of our facilities may be unfairly impacted by components of the CCP, particularly the diesel magnet measure and odor/public nuisance provisions.

    Response: As those measures are developed and implemented the AQMD staff will work with all stakeholders to identify additional approaches to minimize potential impacts and to acknowledge facilities that have implemented measures voluntarily. Since the programs for these measures have not yet been developed, it is too early to determine what, if any, impact will occur on a those facilities that have voluntarily implemented proactive measures.

Public Nuisance Measures

65. **Comment:** Capital and resources have been devoted to odor related nuisances, often voluntarily. This proactive approach to address community concerns may not be acknowledged by the CCP. Proactive businesses should be rewarded for reaching out to communities instead of subjected to new costly requirements. Permitting analysis should recognize these efforts rather than placing onerous requirements on voluntarily installed odor control equipment.

    Response: The AQMD acknowledges and commends businesses, including the County Sanitation Districts of LA County, who have been proactive to reduce emissions and/or odors generated from their facilities.

66. **Comment:** We support the Public Nuisance Investigation Policy in Appendix C, including requirements for a minimum of six unique complaints and verification by an inspector before an NOV is issued. An unbiased approach is needed due to the episodic and subjective nature of odors which makes it difficult to trace to a confirmed source. Relaxing the standard for confirming and issuing an NOV may lead to installation of unwarranted controls. Any potential change to this policy should make the procedure less arbitrary, and seek to solidify a factual, documentable and impartial basis for complaints. Furthermore, we would not support any change to Section 41700 of the H&SC.

    Response: The AQMD staff understands your concern. As the AQMD staff further investigates options to address odor nuisances, the AQMD staff will work with stakeholders.

67. **Comment:** We are concerned with the statement in Nuisance-01 that amendments to Rule 402 or Health and Safety Code Section 41700 may be necessary.

    Response: This is one of the proposed implementation approaches for the measure. If amending Rule 402 is chosen as an implementation approach, rule development

will follow the normal process with full public participation and analysis of all impacts.

68. **Comment:** We believe source-specific odor nuisance rules proposed under Nuisance-02 will punish the many for the sins of the few and that the District's resources should be concentrated on sources causing problems. We also question the District's statutory authority for adopting rules purporting to prevent a public nuisance that would affect a facility that is not causing a public nuisance.

    Response: Developing source-specific odor nuisance rules is one of the proposed implementation approaches for this measure. If this approach is chosen, such rules may be similar to Rule 410 – Odors from Transfer Stations and Material Recovery Facilities (MRFs) which was adopted in 2006 and addresses an industry with inherent odor issues. If a regulatory approach is chosen, legal authority will be assessed at that time and rule development will follow the normal process, including conducting any necessary environmental and economic analyses.

69. **Comment:** Staff should consider how SB 1224 (Wright) might affect its nuisance rules.

    Response: SB 1224 authorizes local air pollution control districts to adopt regulations, consistent with protecting the public's health, and safety, and quality of life, that ensures district staff and resources are not used to investigate complaints determined to be repeated and unsubstantiated, alleging a nuisance odor violation. The law sunsets January 1, 2014. The AQMD staff will consider SB1224 when, and if, it begins evaluating and considering amendments to Rule 402 in early 2011.

APPENDIX E

COMMENT LETTERS

Comment Letters Received after April 2, 2010 Release of the 2010 Draft CCP

Comment Letters Received after July 16, 2008 Initial Working Group Meeting

THE CALIFORNIA RAILROAD INDUSTRY

October 8, 2010

Elaine Chang, Deputy Executive Officer
Susan Nakamura, Planning and Rules Manager
South Coast Air Quality Management District
21865 East Copley Drive
Diamond Bar, CA 91765

Re: Revised 2010 Draft Clean Communities Plan (CCP)

Dear Dr. Chang and Ms. Nakamura:

The California Railroad Industry, the Class I railroads operating in California (the Railroads), appreciates the opportunity to comment on the South Coast Air Quality Management District's (the District) Revised Draft Clean Communities Plan (Revised Draft) distributed to the Working Group members on September 16th. We understand that the CCP is a plan, and therefore many of the measures remain at the conceptual level, and there will be additional opportunities for stakeholders to participate in the development and implementation of each measure. However, we remain concerned that some measures are moving forward more quickly, such as the Community Exposure Reduction Plans (CERPs), with an insufficient level of detail and without full transparency for stakeholder engagement.

Additionally, we would like to reiterate and expand upon two main concerns that were raised previously in an industry coalition comment letter.[1] First, we believe that District staff should further define the measures before taking the plan to the Governing Board for approval. Second, the District has not analyzed its authority to adopt the measures it outlines in the plan.

Without further definition of the measures, it will be difficult for stakeholders to understand exactly what we are being asked to support. We recognize the collaborative approach the District is taking in the CCP, and note that there are multiple measures that focus on partnering with other agencies. Given that specific measures, such as Stationary-05, duplicate efforts by CARB and EPA that are already underway, we think that details regarding the implementation approach and potential areas of overlap with other agencies should be identified before plan adoption, and reflected in the final draft of the CCP. The collaborative nature of the CCP makes it all the more important for the District to incorporate a greater level of detail before the CCP is approved, so

[1] The California Supply Chain Jobs Alliance comments on the 2010 Draft Clean Communities Plan, July 7, 2010.

- **BNSF Railway Company**
- **Union Pacific Railroad Company**

that the Board can evaluate the best use of Staff resources in developing measures, given parallel activities by other agencies in the same areas. We look forward to continuing to work with the District and other stakeholders on developing plans and strategies that address community concerns while avoiding a burdensome patchwork of regulations and requirements.

Community 01- Community Exposure Reduction Plan (CERP)

Community Selection Criteria

The District should clearly describe its evaluation criteria for selecting the Pilot Communities for the CERPs, and provide further detail about why San Bernardino and "Boyle Heights and surrounding areas" were selected over other communities the District evaluated. Additionally, we note that the District selected these two communities without discussion or participation by stakeholders, and although the Board has not yet approved the CCP, the Revised Draft implementation schedule lists "Phase I: Select Two Pilot Communities" as "completed".[2] Additionally, The District has indicated in working group meetings that it is already taking action to direct resources to and to conduct further research on these communities through initiatives such as the Memorandum of Agreement (MOA) between CARB, US EPA, SJVAPCD, and SCAQMD[3], and has implied that the work under the MOA influenced the selection of the communities, but this information is not provided in the Revised Draft.

While the District lists several factors considered when selecting the Pilot Communities, many communities could qualify to be selected as a Pilot Community given the below listed criteria:

> *The selection of these two communities was based on health risk data from MATES III, emissions data from the AQMP, demographics, particulate matter (PM) emissions, areas with high concentrations of toxic-emitting facilities in close proximity to residential or sensitive receptors, history of complaints, known air pollution sources, and community-identified air quality issues.*[4]

The District should provide more detail regarding how these communities compare to the remainder of the South Coast Air Basin (SCAB), and which other specific communities the District considered. Given that a goal of the pilot projects is to test new strategies that can be considered for use in other communities, the District should also outline how these communities are representative of other highly impacted communities in the SCAB.

[4] Revised 2010 Draft Clean Communities Plan, p. 3-9

Community Input

Information gathered by the neighborhood walks, individual conversations with the community, and other informal information gathering, should be followed up by one or more noticed CERP working group meetings before the Investigation and Data Validation stage. Neighborhood walks and websites are both good approaches to understanding a community and its issues, but they don't facilitate dialogue or increase understanding of all stakeholders. Engaging in dialogue before moving on to investigation can help close incomplete feedback loops, facilitate early troubleshooting, and clear the path to solutions.

Include potential elements and scope limitations of the CERPs

It would be helpful if the District would provide further information regarding their expectations for scope and primary components that will be in each CERP. The response to comments acknowledges that the District received several requests for more detail on the CERPs, and we continue to believe it is reasonable for the District to add more structure to the scope of the CERPs in advance of approving the CCP. We understand the specific strategies in the CERPs will be developed with the community, but there should be an underlying structure that the District has in mind given its expertise in air quality issues. For example, since these are called Exposure Reduction Plans "tailored to address air-related issues in specific communities"[5], we assume the ultimate goal is to reduce exposure within the community by some measurable amount. How will the District set the goal or goals of the plan? How will the plan's success be measured? Will the scope of potential actions be limited to those that are feasible and directly result in exposure reductions? Will proposed measures include those that only measure TACs in the community (e.g. air monitors)? Additionally, staff has verbally indicated there will be educational and economic development components to the plan (e.g. training for green jobs). The CCP needs to clearly identify the plan elements and scope before it goes to the Board for approval in order to minimize confusion, clarify expectations early in the process, and avoid misdirecting time and resources on work that is outside the scope of the primary goals of this exercise.

Investigation and Data Validation

We support the step of investigation and data validation; however, we have strong reservations regarding the use of health surveys to verify air quality issues. Although there is evidence to support that air pollution can have adverse health effects, a survey of existing health issues in a community cannot establish causality of those health outcomes with emissions sources in the community. Many diseases and health conditions have multiple causes and are not exclusively caused by environmental exposures.

[5] Revised 2010 Draft Clean Communities Plan, p. 3-8

Community-03: Greening Communities through Accelerated Toxic Emission Reduction Projects for Existing Sources

We agree that seeking incentive funds is the best means to encourage retrofitting equipment at existing facilities. Additionally, we agree with the District's conclusion that prohibiting permits in specific communities that are identified as cumulatively impacted will unnecessarily inhibit newer, cleaner facilities from replacing older facilities.

Identifying disproportionately impacted communities

Under the implementation approach for Community-03, the Revised Draft has added "Identify disproportionately-impacted communities and assess cumulative impacts."[6] We also understand that the District is following OEHHA's "Cumulative Impacts" methodology. The California Council for Economic and Environmental Balance (CCEEB) has submitted significant comments on the shortcomings of the Cumulative Impacts methodology, and shared these comments with the District. We support the comments provided by CCEEB.

Stationary-05: Indirect Sources

The California Railroad Industry commented on the CCP previously as part of a coalition, and we reiterate our statement that the measure remains conceptual and lacks sufficient detail in the key areas of implementation approach, scope, and statutory authority.

We also requested that the District provide information regarding their statutory authority to pursue the implementation approaches under indirect sources. The District replied in their response to comments:

> *The applicability, implementation approach and specific requirements have [not] yet been established. As this measure is developed, the AQMD will do a legal analysis regarding the agency's legal authority to implement such a measure.*[7]

We reiterate that the District should not wait until it begins to develop the measure or program to provide this analysis. Instead it should provide the Board and public stakeholders with this information before approving the CCP. The 2000 AQCP contained a brief section on legal authority that recognized the limitations of the District's authority over mobile sources, and after summarizing ARB and EPA mobile source programs, stated "these programs combined have

[6] Revised 2010 Draft Clean Communities Plan, p. 3-15
[7] Revised 2010 Draft Clean Communities Plan, Appendix D, p. 11

produced and will continue to produce significant toxic reductions."[8] It would be reasonable for the District to include the same basic legal analysis for the CCP, since it has effectively replaced the ATCP.

Completing the legal analysis now will provide the Working Group members, and the Governing Board Members with critical information regarding the feasibility of pursuing the approaches suggested in the measure, and avoid setting unrealistic expectations.

Broadening language to include rail traffic

The Railroads note that the District has revised Stationary-05 to broaden the scope from addressing diesel truck traffic emissions, to "diesel mobile source emissions" and in one line has been clarified to specifically mention rail traffic:

> *The purpose of this measure is to reduce exposure of diesel PM emissions from new, existing, and modified facilities with diesel mobile source ~~truck~~ emissions including, but not limited to, large warehousing facilities, distribution facilities, delivery facilities, and rail facilities. Additionally, facilities whose business is not primarily associated with ~~truck traffic~~ diesel mobile sources, such as manufacturing facilities, may be included due to increased diesel PM emissions from truck or rail traffic for deliveries of raw materials and distribution of finished products.*[9]

As the District is well aware, some of the options discussed in Stationary-05 are preempted under federal law. The Railroads have submitted comments on multiple occasions to the District, the Ports, and the ARB regarding preemption by the ICC Termination Act of 1995 (ICCTA), and note that some of the potential approaches the District considers in Stationary-05, including "vehicular scheduling and operating changes", fall under the purview of ICCTA.

Although the District has revised the CCP to clarify that they intend the Stationary-05 measure to address "new, existing, and modified facilities with diesel mobile source emissions,"[10] the list of potential implementation options should only consider actions over which the facility operator has control. Additionally, the measure currently includes offsite emissions, but does not provide any further qualifying information. This information should be included in the CCP goes to the Board.

The CCP lists several steps and potential approaches to addressing indirect sources under Stationary-05, many of which are resource intensive. For example:

[8] SCAQMD Air Toxic's Control Plan Final Draft, 2000, p.18
[9] Revised 2010 Draft Clean Communities Plan, p. 3-56
[10] Revised 2010 Draft Clean Communities Plan, p. 3-56

> *...use of accelerated fleet turnover, minimization of truck routes in or near neighborhoods, truck idling requirements, automated truck gates, and pre-scheduling of deliveries.... Strategies to reduce diesel PM emissions may include developing an indirect source rule for diesel or requiring health risk assessments similar to the ones CARB required for the rail yards. Other possible approaches would include ways to reduce idling, traffic studies to improve the flow of truck diesel vehicle traffic and vehicular scheduling and operating changes.*[11]

CARB did not require health risk assessments (HRAs) for the rail yards. The HRAs were completed as an element of the voluntary but enforceable 2005 Memorandum of Understanding (MOU) between Union Pacific Railroad, BNSF Railway, and CARB. The emission inventories and modeling were extremely resource intensive for the Railroads and the HRAs were completed by the ARB. The entire HRA process completed under the MOU took several years to complete. The District should consider how its limited resources would impact a decision to pursue this approach. Similarly, the Railroads have completed traffic evaluation studies for some of their yards to evaluate operational changes suggested by community members, such as truck gate relocation. These studies were also very expensive, but provided important information regarding cost effectiveness of emission reductions and highlighted potential operational interruptions, and other operational concerns including safety issues.

Legal Analysis

The District has not analyzed its authority to adopt the measures it outlines in the plan. The District's response to comments in the Revised Draft, indicates that staff intends to postpone analysis of authority until it begins developing each separate measure, and identifies possible implementation approaches,

> *As measures are developed staff may identify additional implementation approaches or implementation approaches identified will become more refined. If a regulatory approach is selected for implementation, the AQMD staff will analyze its authority.*[12]

We continue to believe that such an analysis should be conducted before the plan is approved, and should be included with the plan when it is circulated to the public. Our comments are submitted while awaiting the District's analysis of its authority to pursue these matters and the submittal of these comments is not concurrence as to District authority. If the District chooses to proceed without this analysis, we suggest the CCP at least be revised to include the same disclaimer that was part of the 2000 Air Toxics Control Plan:

[11] Revised 2010 Draft Clean Communities Plan, p. 3-56
[12] Revised 2010 Draft Clean Communities Plan, Appendix D, p. D-3

Staff is seeking the Board's approval of the plan as a planning document for possible future actions. As a result, the Board's action is not binding and does not commit the AQMD to a definitive course of action.[13]

We also note that the analysis of District authority set forth in the 2000 Air Toxics Control Plan should not itself be relied upon nor does the authority cited support the CCP. For example, the 2000 Air Toxics Control Plan states, at page 9, that:

...the AQMD has historically affected emissions through trip reduction programs. The AQMD has authority for certain trip reduction programs, fleet-type rules, and diesel fuel combustion rules through H&SC Sections 40447.5 and 40447.6.

These sections, however, provide extremely narrowly defined authority that does not include any power to regulate rail activity. Given the clear lack of statutory authority, and preemption under ICCTA, we believe it is even more important to examine legal authority before embarking on a program that purports to be directed at developing measures that would be unlawful.

Thank you for the opportunity to express our views. If you have any questions or concerns, please call me at 415-421-4213 x 12 or Sarah Weldon at 415-421-4213 x 34.

Sincerely,

Kirk Marckwald

Diamond Bar, CA 91765

Dear Ms Marshall:

Comments on the 2010 Draft Clean Communities Plan

The Sanitation Districts of Los Angeles County (Sanitation Districts) appreciate this opportunity to comment on the 2010 Draft Clean Communities Plan (draft CCP). The Sanitation Districts are a consortium of 23 special districts that provide environmentally sound, cost effective management of wastewater and solid wastes for about 5.7 million people in Los Angeles County and, in the process, convert these wastes into resources such as reclaimed water, energy and recycled materials. Although, the Draft CCP is largely a collection of conceptual programs at this point, its design as an "action plan" that will "continue to build on and strengthen existing source-specific rules" such as Rule 402 and/or those in Regulation XIV is still of concern to us as explained below.

The Draft CCP Needs More Specificity

For example, despite participating and commenting in working group meetings and the public workshop, we are still concerned that the draft CCP lacks a rigorous method to prioritize "at-risk" communities. Without a strong scientific underpinning, the draft CCP has no mechanism to avoid triggering a rush for relief by regulators from alarmed communities swayed by perceived risk. *As proposed, risk reduction efforts will arguably be made in communities most capable of expressing the greatest alarm, instead of communities actually disproportionably impacted by air pollution.* If our goal is to protect communities in greatest need, the process cannot be derailed by subjective perceptions of risk.

DM # 1696023-v2

Recycled Paper

Similarly, we are concerned that the *scope* of the Community Exposure Reduction Plans (CERP) will be guided by factors not directly influencing risk (see: Community-01, and Response to Comment 21). Such an arbitrary scoping approach only addresses *perceived* risk drivers. Without a science-based approach grounded in emissions and exposures to prioritize sources, SCAQMD may have difficulty resisting pressures to act based on public perceptions. We question, for example, if the pressures to further regulate stationary sources will be lessened by the draft CCP despite the fact that 92% of the weighted risks in the Basin per MATES III are from mobile sources. We believe that a defendable scientific approach to tackle cumulative impacts must assess all sources to identify appropriate and meaningful risk reduction measures, even those under the jurisdiction of other regulatory agencies.

SB 375 Nexus

The net effect of community-specific risk or nuisance reduction measures could be a further distancing of businesses from communities and their employee base. This seems to run counter to the goals of SB 375. Compliant businesses may find it easier to shut-down, relocate or avoid certain communities altogether than to endure the increased oversight and uncertainty resulting from this program. The draft CCP measures could inadvertently disperse our manufacturing industry which would exacerbate mobile source emissions as VMT increases. The SB 375 regional VMT targets will only be achieved if businesses are in close proximity to the communities they serve and the employees they hire. The draft CCP should include a discussion of how the measures will avoid conflicting with the SB 375 VMT reduction goals.

Voluntary Acts Should Not Be Excessively Burdened

We appreciate your effort to respond to our comments from our letter of June 30, 2010. However, we feel that SCAQMD has missed the point behind our concern that, despite our considerable investment in clean technologies (acknowledged in the Response to Comments 35, 36, 47 and 48 in Appendix D), we still face considerable regulatory and permitting challenges that often frustrate our abilities to be a good neighbor. For example, SCAQMD did not address nor offer any remedy in the revised draft to burdensome permit conditions that caused us to shut down three, voluntarily-installed odor control units. We feel the draft CCP should provide a mechanism to reward such voluntary acts.

Specific Comments on the CCP

- On Page 3-1, please provide a definition of "precautionary measures."
- Table 3-1 (Page 3-3): "older" toxic emitting sources may be completely legal and in compliance with all applicable rules and regulations of all regulatory agencies. This possibility should be reflected in the Plan.
- Page 3-12, Phase 5 Development of CERP: Please clarify the legal basis behind limiting a facility's operating hours during certain times of the day if it is operating in compliance with all of its permits.
- OUTREACH-06 is helpful and constructive.
- A "hot list" (p. 3-44) is one step away from an "enemies list." Maybe this list should be posted on the SCAQMD website once the mechanics as to how to be removed from the listing are explicitly stated.
- COMPLIANCE-02: The last paragraph on page 3-45 whereby "well-informed advocates will help to identify air quality issues in the community" suggests that SCAQMD is directly implementing at least a portion of the agenda of advocacy groups. At the very least, this should be done during a public exchange where the targeted facilities have an opportunity to rebut the claims.
- COMPLIANCE-02, page 3-47: The "one-click complaint" provision should be designed so as not to become a "click it and ticket" feature.

We look forward to future revisions of this work, and we anticipate providing more comments as we track the progress of the CERPs for Boyle Heights and San Bernardino. If you have any questions regarding these comments, please do not hesitate to contact me at (562) 908-4288, extension 2113.

Very truly yours,

Stephen R. Maguin

RE: Comments on Revised 2010 Draft Clean Communities Plan

Dear Dr. Chang and Ms. Nakamura:

We are writing to submit our concerns to the South Coast Air Quality Management District (District) regarding the Revised 2010 Draft Clean Communities Plan (CCP).

FuturePorts is an advocacy organization representing the entire goods movement supply chain, and tens of thousands of workers in California. The organization was founded on the principle of balance between our economy and our environment. Our efforts are focused on finding solutions to challenges facing the maritime industry, and to ensure the continued economic contribution to the Southern California region, and to the nation made by the goods movement industry.

We hope that our comments can help support successful design and implementation of the objectives in the CCP, and provide the District Staff (Staf) further insight into industry's concerns with this program. We look forward to continued engagement in the CCP and its measures they are implemented.

We understand that the CCP represents Staff's initial concepts and therefore much of the detail typically covered in a rulemaking or incentive program is absent. We further understand that there will be additional opportunities for stakeholder engagement as each measure is developed and implemented. However, we remain concerned that some measures are moving forward more quickly, without the full transparency of stakeholder engagement, and without sufficient detail.

We look forward to continuing to work with the District and other stakeholders on developing plans and strategies that address air quality issues within a community while avoiding a fragmented patchwork of requirements and regulations. To help facilitate this process, the Staff should further define measures to address the issues outlined below before taking the plan to the Board for approval.

Community 01- Community Exposure Reduction Plans

Selected Pilot Communities

We remain concerned that the District has not clearly communicated its evaluation criteria for selecting the Pilot communities for the CERPs.

The CCP lists several categories the District evaluated when considering Pilot selection, without providing any detail about how the District compared the selected Pilot communities – the city of San Bernardino and the broadly defined "Boyle Heights and surrounding areas" – to other communities that could face similar circumstances. The District should provide more detail on their selection of these communities, how they compared to the remainder of the South Coast and which other locations the District considered. Given that the one of the goals of the pilot projects is to test new strategies that can be used for other community plans, we ask staff for more details on how these communities are representative of other impacted communities in the region.

Community Input

Neighborhood walks and informational websites are helpful tools that can foster increased communication between the community and air quality regulators, but on their own they are insufficient to facilitate dialogue to share understanding between all stakeholders. Information gathered in the neighborhood walks, individual conversations with the community, and other informal gatherings should be followed up by one or more notified meetings of a CERP Working Group before the Investigation and Data Validation stage. Engaging in dialogue before moving onto the investigation stage can help close incomplete feedback loops, facilitate early troubleshooting, and expedite a pathway to solutions.

Investigation and Data Validation

> *Efforts will be focused on identifying and quantifying specific air contaminants affecting the community, and where necessary, health surveys or risk assessments may be conducted to evaluate risks to public health.*[1]

We support the step of investigation and data validation, and we appreciate that quantitative data is not always available; however, we have reservations regarding the use of health surveys verify air quality issues. Many diseases and health conditions have multiple causes and cannot be exclusively attributed to environmental exposure. While there is evidence to support that air pollution can have adverse health effects, a survey of existing health issues in a community cannot establish causality of those health outcomes with emissions sources in the community

Overall approach in measures Community 01-03

We support the District's general approach of using voluntary incentive programs to identify and pursue the cost effective emission reductions from existing facilities. New equipment and facilities are more efficient and emit fewer pollutants, and existing sources hold the greatest potential for maximizing additional emissions reductions in a cost-effective manner.

Stationary-05: Indirect Sources

Implementation Approach

Before the CCP is approved by the District Board, it should be revised to include a clearer outline of potential options and clarify which options will be concurrently pursued.

[1] *Revised Clean Communities Plan, September 2010, p. 3-11*

Identifying multiple options will provide greater clarity on the intent of this measure and will enable the working group to discuss it more effectively. FuturePorts commented on the CCP previously as part of an industry coalition, and requested the District provide information regarding their statutory authority to pursue the implementation approaches under the indirect sources. The District responded in appendix D of the CCP,

> *The applicability, implementation approach and specific requirements have yet been established. As this measure is developed, the AQMD will do a legal analysis regarding the agency's legal authority to implement such a measure.*[2]

The District should identify potential implementation options and provide legal analysis for each implementation option before taking the CCP to the Board for approval. Completing the legal analysis now will provide the Working Group members, and the District's Board Members with valuable information regarding the feasibility of pursuing the approaches suggested in the measure, and avoids setting unrealistic expectations.

Applicability Criteria

Given that the District has revised the CCP to clarify that they intend the Stationary-05 measure to address "new, existing, and modified facilities with diesel mobile source emissions,"[3] the list of potential implementation options should only consider actions over which the facility operator controls. Additionally, the measure currently includes offsite emissions, but does not provide any indications of the geographic limits of the offsite emissions that could be attributed to a facility. This information should be included in the next Draft Plan.

Approaches that Support a Healthy Economy

Part of maintaining a healthy community is sustaining a strong economy. Therefore, community stakeholders should be reflective of the entire community, including committed local businesses, non-profit organizations, local government agencies, and residents. A solutions-oriented process will address the identified air toxics related issues through actions while allowing business to continue to serve Southern California.

We look forward to participating in the working group, and any task force created to work on the CERPs, to further develop and implement the Clean Communities Plan. Should you have any questions, please do not hesitate to contact me at ewarren@futureports.org or 310.982.1323, or Sarah Weldon at sarah@ceaconsulting.com or 415.421.4213 x 34.

Sincerely,

Elizabeth Warren

Subject: Comments on the Draft 2010 Clean Communities Plan

Dear Ms. Nakamura:

The California Cleaners Association (CCA) is the leading statewide association for dry cleaners and industry professionals. CCA is also affiliated with the national association, DryCleaning and Laundry Institute (DLI). Together we represent more than 4,000 dry cleaning professionals.

CCA is also a member of the Small Business Alliance. CCA and the Small Business Alliance share similar concerns about the Community Exposure Reduction Plan (CCP). We have strong concerns about the CCP plan. Specifically we are concerned about the method of Investigation and also Neighborhood Walks.

Unwarranted and unnecessary harassment of small businesses that are operating within the limits and conditions of their valid permits will not serve to improve relations in any community. Dry cleaners in California reported horrible July sales figures, with an average 3.3% decline from 2009. The recession and increased regulation of the industry is causing many dry cleaners to close their doors.

We would respectfully suggest that AQMD creates or improves programs that highlight the changes that small businesses are doing to decrease exposures.

Thank you for considering our request. We are available to answer any questions or provide additional information if desired.

Subject: Comments on the Draft 2010 Clean Communities Plan

Dear Ms. Nakamura:

The California Small Business Alliance appreciates the opportunity to provide comments on the draft Clean Communities Plan (CCP).

As you may be aware, the Alliance is a coalition of California trade associations committed to protecting small business interests. Alliance members play an active part on relevant committees, task forces, policy forums and working groups advising agencies about the processes, costs, and compliance challenges that small businesses face and assist them in identifying cost-effective and least economically debilitating measures to regulate this vital segment of our state's economy.

We were pleased to be invited to participate in the South Coast Air Quality Management District's (District) CCP Working Group. Over the past two years we listened attentively to the discussion and points made by the Staff and other stakeholders. We also shared our recommendations and reservations to the other working group members.

We share the District's concern about the harm that toxic air contaminants can pose for all people who reside in the South Coast Air Basin. Further, we support the District's hypothesis that public awareness and education can play a vital role in helping to reduce exposure to toxic air contaminants. Yet, while we believe that certain elements of the draft CCP do have merit and would serve this purpose, we have grave concerns about other elements of the CCP that, if left unchanged, could have a devastating impact on many small businesses.

Ms. Susan Nakamura, Planning and Rules Manager October 8, 2010
South Coast Air Quality Management District / Comments on Draft 2010 Clean Communities Plan

Community-01: Community Exposure Reduction Plan (Multiple TACs, other pollutants)

Background

We generally agree with Staff's statement that: *"Toxic emissions throughout the District have been reduced through implementation of AQMD's air toxics regulatory program for source and industry categories such as chrome plating, dry cleaning, and gasoline dispensing, as well as more stringent state and federal fuel and tail pipe emission standards to reduce air toxic emissions from on- and off-road mobile sources." Reducing toxic air contaminants from these individual source categories has benefits to all communities. Some communities, however, may have a disproportionate number of toxic sources that are clustered together resulting in a higher concentration of toxic emissions. The combined effect or cumulative effect of toxic emissions on these communities can result in an elevated exposure to toxic air contaminants. Data from the AQMD's MATES III shows that in some communities the toxic emissions are more concentrated."* These data were compiled, analyzed, reviewed and validated over time employing a number of accepted scientific protocols. The implementation approach that is described in the draft CCP, however, is a striking and deeply disturbing departure from the rigid discipline used in earlier studies (i.e., *MATES II and III, Cumulative Impacts Reduction Strategy, AQMP, accumulation of air monitoring data, etc.)* in that it appears from a reading of the CCP that any criticism or accusation made by a member of the public against a small business - substantiated or not - will rise to the level of an "air-related issue," and be put on the agenda for a "Neighborhood Walk."

One would think - even expect - that the District's years of success in presenting Town Hall meetings in conjunction with its Complaint Response Program, Air Quality Complaint Line, Clean Air Connections Program, regular inspections, and being able to boast of having the most open and inclusive system for rule development of any air quality management agency in the nation would have yielded a bounty of grievances from every community in its jurisdiction, and an impressive number of follow-up opportunities by the Staff. In these very difficult economic times when agencies in all levels of government are under extreme pressure from voters to cut spending and balance their budgets, and small businesses are struggling just to keep their doors open, it seems uncaring and unnecessary to add another program to accomplish the same purpose. Moreover, when we read that the implementation of the CCP "will (not 'may') be more resource-intensive" than these other programs this only adds to our frustration.

Neighborhood Walks

A reading of this section of the CCP raised considerably more questions than it answered. It also caused the greatest amount of concern among our small business members.

Much like the paragraph in the CCP, entitled *Community Input*, this section suggests that Staff will convene some number of meetings within the targeted communities for the purpose of eliciting complaints from people attending these meetings, including elected officials.

Once this has been done, it appears that this group or crowd of indeterminate size, including some number of District staff, will then walk through the community to whatever businesses have been singled out by the complainants at the community meeting. Upon arriving at a targeted business our reading of this section of the CCP suggests that the members of this group or crowd

Ms. Susan Nakamura, Planning and Rules Manager October 8, 2010
South Coast Air Quality Management District / Comments on Draft 2010 Clean Communities Plan

will stop at a point near a targeted business and again listen to individual issues about air quality. It is not at all clear exactly where this group or crowd will assemble in proximity to a targeted business, only that it will be "near." We observed when reading Chapter 3: Agency - 01, "Promoting Better Land Use Decisions," that Staff recognizes the significance of "proximity" when it pertains to land use decisions, as referenced in the draft CCP under the heading of *"Proximity Matters - Advisory to Planner."* Clearly, the same degree of awareness and sensitivity does not extend to the feelings and concerns of small business owners who are dreading the thought of having groups of dissidents descending on their businesses or in close proximity thereto.

A number of additional questions were raised when Alliance members discussed this particular point. For example: "Does the term "near" mean the group or crowd might assemble in front of the loading dock of the business? In front of the main entrance? Will the size of the group or crowd impede customer ingress and egress? Since the CCP calls for elected officials to be a part of the group or crowd, it is likely - even preferred by some- to have the media present? How long will these assemblies remain near a targeted business? What is the expected size of a typical group or crowd?

It is also unclear if someone in the group or crowd will invite or require the business owner to come outside and talk to the assembly. A small drycleaner with only one employee may not have the time to engage in conversation with visitors. The same might be said of the owners of a body shop or gasoline dispensing station who may have the same difficulty. This also raises concerns about the expectations of the group or crowd. Will they expect to be able to enter the premises and look around? To what extent will a small business owner's operations be disrupted or has this even been considered?

In this section of the CCP, the Staff has written: *"This hands-on approach will allow the AQMD staff to gather valuable information about the community's air quality issues while providing an opportunity for local residents and businesses to voice their concerns directly to the AQMD in a more familiar and informal setting."* We have no other choice but to conclude from this statement that absolutely no consideration has been given to the needs and concerns of the small business owner.

Investigation and Data Validation

In the last meeting of the CCP Working Group, the Staff was unambiguously clear that the intended use for the CCP was to be a guidance document for future rule making, and that it would not have the force of a rule and would not be used for compliance audit purposes. A reading of Phase 3: *Investigation and Data Validation*, and Phase 4: *Implementation of Immediate Actions*, however, only succeeded in adding to our confusion and concern in that it is clear that whatever "air quality-related issues" are discovered during these Neighborhood Walks they will all be sorted and prioritized for immediate or non-immediate attention. What is less obvious to us is what the word "attention" means and how these issues will be remedied and what punishment, if any, will befall a business owner who was not expecting to be inspected.

OCT-08-2010 03:43 PM Bill La Marr 714 778 0763 P.05

Ms. Susan Nakamura, Planning and Rules Manager October 8, 2010
South Coast Air Quality Management District / Comments on Draft 2010 Clean Communities Plan

In summary, we believe that the current draft CCP is dangerously deficient in the way it describes certain key elements of the plan. In these distressful times small businesses have little more than their reputation and good will to sustain them. Unwarranted and unnecessary harassment of small businesses that are operating within the limits and conditions of their valid permits will not serve to improve relations in any community.

We appreciate your consideration of our comments on the Draft CCP, and look forward to working with the Staff to develop a plan that furthers air quality goals. We also ask that when the final CCP is written and released it does not disregard the dire financial condition of this state nor unnecessarily complicate the formidable task that our elected officials have asked of small business owners; that being to help grow our economy back to prosperity.

Sincerely,

Bill La Marr
Executive Director

SENT VIA E-MAIL

Ms.Cheryl Marshall
Program Supervisor
South Coast Air Quality
Management District
21865 Copley Drive
Diamond Bar, CA 91765

Re: Comments on Revised Draft Clean Communities Plan

Dear Ms. Marshall:

On behalf of the Southern California Air Quality Alliance (SCAQA) I hereby submit comments on the above referenced matter. SCAQA is a non-profit corporation with members whose operations in the South Coast Air Quality Management District will likely be affected by the SCAQMD's implementation of the Clean Communities Plan (CCP).

In general, we support the approach taken by District staff in looking at all potential sources of adverse impacts on communities and developing a holistic approach to addressing impacts in cooperation with other government agencies, community representatives (both elected and non-elected) and local businesses. We especially appreciate the District's recognition that there are limits on its authority that require it to defer to other levels of government with authority to act, and in those circumstances to provide expertise and advice regarding air quality impacts and potential mitigation measures.

Having said that, we also have significant concerns regarding several specific provisions of the revised draft CCP, most notably the measures identified as Stationary-04, Nuisance-01 and Nuisance-02. These proposed measures have the potential for the District to assert authority which it has not been granted pursuant to either federal or state law, or to "rewrite" the public nuisance law (Health and Safety Code Section 41700) to make it easier for the District to prosecute alleged nuisances.

Stationary-04

Stationary-04 as described in the draft CCP calls for an alternatives analysis to be done to determine if "less hazardous materials" can be substituted into a proposed process. I would like to note that there is nothing in the California Health and Safety Code that authorizes the SCAQMD to impose such a requirement in the permit process. Arguably this can be done as part of a CEQA analysis, where alternatives must be analyzed if a significant impact is identified. However, I have been advised that some of our members have already experienced situations where permitting engineers, in the absence of a specific rule requirement or CEQA analysis, are refusing to issue a permit unless the

6601 Center Drive West
Suite 500
Los Angeles, CA 90045
Attn: Curtis L. Coleman
(310) 348-8186 Ph
(310) 861-1484 Fax

permit applicant agrees to process modifications. We do not believe that such an *ad hoc* and potentially arbitrary process is appropriate. We believe that there should be some objective standards specified and that there should be a presumption that an existing process that has worked and has not created problems at a facility should be allowed to continue.

Nuisance-01

With respect to Nuisance-01 we are concerned with the statement in the draft CCP that amendments to Rule 402 or Health and Safety Code Section 41700 may be necessary. These provisions have been in place for many years and there is no evidence that I can see that they are inadequate. We do agree that it makes sense to conduct a full review of the SCAQMD's process of investigating and enforcing alleged odor nuisance, and that there may be merit in reviewing orders for abatement involving odor nuisances to see if there are common requirements that have resulted in resolution of the alleged problems. We will be watching this measure closely as it is developed further, and will provide additional comments as the need arises.

Nuisance-02

In our view, Nuisance-02 will punish the many for the sins of the few. We believe that the District's resources are best concentrated on sources that are causing problems, rather than heaping additional regulatory requirements on sources that are not causing problems. We are also concerned about the lack of statutory authority for adopting these types of regulations. The District has authority to adopt regulations to achieve ambient air quality standards and to limit emissions of air toxics. I can find no statutory provision authorizing the District to adopt rules purporting to prevent a public nuisance that would affect a facility that is NOT causing a public nuisance. The closest provision would appear to be Health and Safety Code Section 42310.7, which provides limited authority to prevent a release of a toxic air contaminant from a facility located within 1,000 feet of a school, but this again deals with an imminent threat and provides for a response on a case-by-case basis.

Thank you for the opportunity to comment on the revised draft CCP, and feel free to contact the undersigned if you have questions regarding these comments.

Very truly yours

RE: Comments on Draft Clean Communities Plan (September 2010 revised draft)

Dear Dr. Chang and Ms. Nakamura,

The California Council for Environmental and Economic Balance (CCEEB) is a coalition of business, labor, and public leaders that advances strategies for a strong economy and a healthy environment. Thank you for allowing us another opportunity to comment on the draft Clean Communities Plan (CCP or "the Plan").

CCEEB supports the Plan in concept, and appreciates the hard work and dedication of staff at the South Coast Air Quality Management District (SCAQMD) in putting this draft forward. However, we continue to have questions regarding how the Plan will be implemented, as described in our letter to the SCAQMD on July 2, 2010. (Attached) This letter was omitted from Appendix E in the September 2010 revised draft Plan, and many of our questions were left unanswered in staff responses to comments in Appendix D.

CCEEB also has concerns regarding the way that the draft Plan portrays the current air toxics situation in the South Coast Air Basin. First, the draft Plan lacks adequate discussion of the uncertainties associated with the cancer risk estimation technique. SCAQMD staff may be familiar with risk estimates and the uncertainties associated with them, but many members of the public who read this document may not be. We do not believe it is sufficient to merely reference the uncertainties section of the MATES III document (as has been done on page 2-6). This information is important enough to be presented in this document, and should be presented up front before risk estimates and their interpretation are presented. At a minimum, qualifying language from the MATES III Final Report should be repeated on pages 2-6 and 2-7 of the draft Plan in the section on *Limitations of Data Results*, and readers should be referred to this material in the executive summary of the report. For example, the MATES III final report explains that:

> *"The estimates of health risks are based on the state of current knowledge, and the process has undergone extensive scientific and public review. However, there is uncertainty associated with the processes of risk assessment. This uncertainty stems from the lack of data in many areas necessitating the use of assumptions. The assumptions are consistent with current scientific knowledge, but are often designed to be conservative and on the side of health protection in order to avoid underestimation of public health risks.*
>
> *"As noted in the OEHHA risk assessment guidelines, sources of uncertainty, which may either overestimate or underestimate risk, include: (1) extrapolation of toxicity data in animals to humans, (2) uncertainty in the estimation of emissions, (3) uncertainty in the air dispersion models, and (4) uncertainty in the exposure estimates. Uncertainty may be defined as what is not known and may be reduced with further scientific studies. In addition to uncertainty, there is a natural range or variability in the human population in such properties as height, weight, and susceptibility to chemical toxicants.*
>
> *"Thus, the risk estimates should not be interpreted as actual rates of disease in the exposed population, but rather as estimates of potential risk, based on current knowledge and a number of assumptions. However, a consistent approach to risk assessment is useful to compare different sources and different substances to prioritize public health concerns."*[1]

When referring to risk reduction, the Plan should be clear in stating that reductions are in estimated cancer risk from ***air toxics***. For example, on page ES-2, the draft should state: "…overall regional *estimated* risk *from air toxics* is expected to be reduced by 75 percent by 2023. Regionally, the 2023 population weighted *estimated* cancer risk *from air toxics* is expected to be approximately 210-in-a-million." [Added language shown in italics] CCEEB also suggests describing the regional background or total cancer risk to put the contribution from air toxics into context. The MATES III final report includes a useful section on *Perspectives of Risk* that is worth repeating in the draft Plan.[2]

Second, the Plan provides little to no background on existing measures that are already in place and which are under the jurisdiction of other regulatory agencies. The Plan does not sufficiently recognize these in-place measures and regulations, the concomitant benefits that have accrued as a result of these measures, and the reductions already achieved by many companies and public agencies. This information is essential to provide an accurate picture of the current situation.

In light of the above, CCEEB reiterates and amplifies comments made at the September 21, 2010 CCP Working Group meeting by CCEEB and several of its members. Specifically:

- **Stationary-02 and -04, authority**: Please explain in greater detail the basis for the SCAQMD's authority to implement these measures given that the SCAQMD does not have delegated authority to enforce environmental standards for lead paint or the storage and use of hazardous materials, nor to mandate the assessment of alternatives and subsequent changes in use of process chemicals. The SCAQMD should review current rules and regulatory programs

[1] SCAQMD, *Multiple Air Toxics Exposure Study in the South Coast Air Basin, MATES III, Final Report*, September 2008, page ES-6 and ES-7.
[2] ibid., pages 1-3 and 1-4.

to determine whether a gap exists before identifying a need for these control measures. For example, the background provided for Stationary-04 on page 3-53 should clearly identify why current Process Hazard Analysis and Risk Management Plans are insufficient. We note that the 2000 SCAQMD Air Toxics Control Plan included a brief section on SCAQMD's legal authority and the complementary authorities of other agencies. CCEEB suggests that a similar discussion be included in the current draft Plan, particularly for new control strategies under consideration.

- **Stationary-04, Table 2-2**: The table on page 2-4 should include toxics control regulations that cover the storage, handling, and risk management of hazardous materials, such as federal EPA's and Cal-EMA's Risk Management Plan rules.

- **Stationary-04, outreach to CUPAs**: CCEEB recommends that the SCAQMD seek comments from Cal-EMA and regional Certified Unified Program Agencies (CUPAs) on Stationary-04 before finalizing the Plan. While CCEEB agrees with the SCAQMD that it is important to coordinate with the CUPAs on implementation, it is equally important to have the CUPAs engaged in the design and development of this measure to minimize agency overlap and to prevent inconsistencies that might arise between programs. For example, rather than including a separate measure for SCAQMD implementation in the CCP, it might be more efficient and effective to develop a coordinated approach with Cal-EMA.

- **Community-01, business outreach**: Please include a section on outreach to local businesses under *Phase 2: Community Input.* Partnering with the local business community early in the process helps to foster cooperation and to ensure that measures are tailored to the specific needs of each community.

- **Community-03, Table 4-1, assessing cumulative impacts**: it is unclear by what method or process the SCAQMD plans to (1) identify disproportionately impacted communities and (2) assess cumulative impacts in prioritized communities. Please expand on this section. CCEEB notes that quantitative assessments are time and resource intensive, whereas qualitative assessments can result in uncertain and potentially biased findings. We also caution that the screening methodology proposed by Cal/EPA and the Office of Environmental Health Hazard Assessment is in the very early stages of development, and guidance on how to apply this method will probably not be finalized by mid-2011, the time when the SCAQMD hopes to implement this work.

- **Table 4-1, Measures Implementation Schedule**: It is not clear how the dates for implementation were identified and many measures are shown as being implemented simultaneously. CCEEB recommends that SCAQMD consider phasing the implementation with a focus on the highest priorities, rather than trying to implement too many measures at the same time.

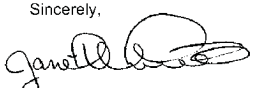
We thank the SCAQMD and its staff for their leadership in exploring innovative new strategies that reflect the active participation of a diverse range of public stakeholders. CCEEB believes that such collaborative approaches are necessary to address the full range of factors that contribute to cumulative and disproportionate

impacts from exposure to toxic air contaminants. We hope that our comments support the successful adoption and implementation of the Plan.

Sincerely,

Bill Quinn
CCEEB Chief Operating Officer

Sincerely,



Janet Whittick

RE: Comments on Draft Clean Communities Plan

Dear Elaine and Susan,

The California Council for Environmental and Economic Balance (CCEEB) is a coalition of business, labor and public leaders, which advances strategies for a strong economy and a healthy environment. Our members operate numerous permitted facilities in the South Coast Air Basin. We thank you for allowing us to comment on the draft Clean Communities Plan ("CCP") and for the ongoing opportunity to participate in the CCP Working Group.

CCEEB commends the South Coast Air Quality Management District ("District") and its staff for work on the draft Plan and the attention given to effectively reducing emissions of air toxics and cumulative impacts in already burdened communities. We hope that our comments can help support successful design and implementation of its objectives.

The holistic approach embodied in the Plan is of great interest, since it might be able to capture the wide range of emission sources and source categories—and the several agencies that regulate these—that collectively contribute to cumulative emissions. The Plan also incorporates land use decision-making in a meaningful way. Because so many proposed measures are still conceptual, and because the Plan relies a great deal on collaborative solutions, CCEEB asks staff to develop a more detailed timeline or workplan for further development and implementation of the measures and a schedule for the advisory and working group(s) so that stakeholders can plan their participation based on which issues are agendized for each meeting.

Given that the sole focus of the Plan is on localized exposure to air toxic emissions (with the exception of odor nuisances), CCEEB was surprised to learn of the language contained in the errata sheet that the Governing Board approved as part of the Resolution adopting Regulation XXVII (Climate Change).

> *"BE IT FURTHER RESOLVED, that the AQMD Board directs staff when developing the Clean Communities Plan, to add a component to help ensure that Board-approved greenhouse gas offset policies are implemented properly in CEQA review, so that potential impacts of foregone criteria pollutant or toxic air contaminant emissions are minimized."*

CCEEB asks the District to explain why GHG offsets are to be included in the CCP, since the Plan is meant to address impacts that are highly localized in nature. We do not think the Plan is the appropriate vehicle for such action, and suggest that CEQA guidelines may be a better place to deal with CEQA review of GHG emission impacts. As we come to understand the background and implications of the Resolution language, we hope to provide further comments.

What follows are more detailed comments on the draft CCP, organized around the main sections.

Community Plans and Accelerated Toxics Reductions (C-01, C-02 and C-03)

Based on the draft Plan and discussion at the CCP Working Group[1], it is our understanding that the two pilot projects in the City of San Bernardino and the community of Boyle Heights are meant to test new strategies to reduce exposure to air toxics. Lessons learned from the pilots will then be used to develop a guidebook for other communities and local governments so that they, too, may develop tailored Community Exposure Reduction Plans (CERPs). Finally, lessons learned from the pilots will influence Community-03, in which the District will implement voluntary and incentive-based strategies to achieve additional reductions of air toxic emissions in key communities, after first identifying and prioritizing communities based on the level of cumulative impacts.

Selecting and Prioritizing Communities and Geographic Boundaries

Given that the goal of the pilot projects is to test new strategies that can be applied to other communities, CCEEB asks staff for more details on the criteria used to select San Bernardino and Boyle Heights, and how these communities are representative of highly impacted communities in the air basin. We also ask the District to establish clear and transparent criteria and a methodology for identifying and prioritizing communities (Communities-03), including a definition of what is considered "highly impacted", and recommend that this work be reviewed by the CCP Working Group or other stakeholder advisory before finalizing any results.

In terms of Community-01 and the pilot projects, we are still unclear whether the selection of San Bernardino and Boyle Heights has been finalized, and what actions have been taken so far to develop CERPs for these communities. It would be good to provide these details to the CCP Working group along with the selection criteria.

With respect to the actual geographic boundaries of the CERPs, CCEEB asks staff to clarify whether there is a zone of influence outside of community boundaries that would be affected. For example, would sources outside of the communities ever be included in CERP measures? What if these sources are in another jurisdiction? This information is important to ensure that the right

[1] April 15, 2010 meeting

stakeholders and jurisdictions are involved in development of the CERPs from the very beginning.

Public Participation
CCEEB thanks the District for considering our recommendation that it convene a stakeholder technical advisory group to help guide the design and development of the pilot projects and the guidebook. We hope that CCEEB and its members may be able to assist with this effort.

When establishing the advisory group, we suggest that the District lay out ground rules for dialogue to help stakeholders representing diverse interests more readily collaborate on effective solutions and reach consensus to the maximum extent possible. Such ground rules could also describe how District staff will resolve conflict among stakeholders. These rules should also apply to any working group working on development of each CERP.

Investigation and Data Verification
CCEEB appreciates steps to prioritize community air quality issues and to sort issues based on agency responsibility. We particularly support efforts to engage and coordinate with other agencies to support multi-agency solutions.

In terms of additional data collection and "micro-scale monitoring", we ask staff to describe the degree of granularity that is being proposed. We also ask staff to consider adding a risk communication element to this phase so that all stakeholders can come to a shared understanding of the analytic results. This, in turn, would support collaboration during the CERP development stage to follow.

CCEEB appreciates that quantitative data is not always available, and that qualitative data could be used to fill in gaps in the quantitative analysis. Given that there is no scientific certainty regarding causal effects for many associated health outcomes, we ask staff to describe how the District intends to use qualitative data appropriately, and how such data will be reconciled with quantitative data. For example, a community health survey cannot draw conclusions regarding air toxic exposures, although it can show correlations. This may be an area where the technical advisory group could provide guidance.

Sources Covered and Control Strategies
CCEEB supports the District's decision to include all sources of air toxics in the CERPs as well as the focus on replacement and retrofit of existing sources. This strategy recognizes the fact that new equipment and facilities are more efficient and emit fewer pollutants, and that existing sources hold the greatest potential for maximizing additional emissions reductions in a cost-effective manner.

We hope that the District will also apply the principle of "fair share" to ensure that each source category is responsible for its own contribution to the cumulative emissions impacting burdened communities.

In terms of Phase 4 of the pilots, we ask staff to clarify what constitutes "significant health impacts" that would trigger "immediate action" by the District. It would be useful to include the criteria used for making such a determination, and to provide examples of the type of "immediate actions" that might result.

Finally, with respect to C-01, C-02 and C-03, we suggest that the CCP and any CERP acknowledge programs and efforts at other agencies that affect air toxics in impacted communities. For example, the ARB manages a Diesel Risk Reduction Program that aims to reduce on-road and off-road mobile source emissions of air toxics by 85% by 2020. These future-year reductions should be included in the plans.

Outreach-01: Clean Air Toolbox

CCEEB appreciates staff's willingness to convene a stakeholder technical advisory group to assist with development and review of materials for the Clean Air Toolbox. We further suggest that this measure include a risk communication element to improve the public's understanding of air quality issues and ways to reduce exposure to air toxics.

To the extent possible, we encourage staff to leverage work being conducted by other agencies. For example, the Department of Toxic Substances Control, as part of its Green Chemistry Initiative, is working to launch a public outreach campaign to educate consumers about toxic chemicals in household products. Similarly, EPA has an extensive education program on indoor air quality.

Compliance-01: Enhancements to Compliance Program

CCEEB understands that the facility "Hot List" was an informal reference used internally by enforcement staff. If the list is to remain an informal and internal reference, then we recommend removing it from the draft Plan. If, on the other hand, the District decides to formalize the "Hot List" as part of the CCP, then we ask that staff make explicit what this list is, how it can be used, and the process by which facilities are added or removed.

Stationary-01: Lead Emissions

CCEEB notes that a number of aerospace and electronic manufacturers employ lead soldering as part of normal operations, and that this soldering has no or extremely low emissions because the low temperatures fail to result in volatilization. We ask staff to consider this distinction and to avoid unnecessary administrative burden on facilities that use lead, but have no or di minimis emissions. As rulemaking proceeds, we hope to be actively engaged in any amendments to Rule 1420.

Stationary-02: Lead Paint, pre-1978 buildings

CCEEB understands that the California Department of Public Health and county public health agencies have delegated authority to enforce the new EPA standard. We ask staff to clarify the breadth of this proposed measure, and how implementation of public outreach and/or rulemaking will complement work begin done by the health agencies.

Stationary-04: Alternative Assessment for Use of Acutely Hazardous Materials

Use of hazardous materials is currently regulated by several state and federal agencies, including but not limited to Cal-OSHA, Cal-EMA and Certified Unified Program Agencies, DTSC, the Department of Transportation, and EPA. As part of compliance, facilities must complete Process Hazard Analyses and Risk Management Plans.

CCEEB is unclear how the proposed CEQA review interacts with existing programs and requirements, and whether review is meant to apply to a specific project or the entire facility. We would appreciate a more detailed discussion in the CCP of District authority under CEQA, especially since hazardous material use is more traditionally managed through other statutes and direct regulation.

In general, CCEEB believes that management of hazardous materials should remain in those agencies with clear authority and direct expertise. We suggest that strategies targeting hazardous materials be moved to Agency-02 to enable multi-agency coordination and to avoid duplicative and overlapping efforts.

Stationary-05: Indirect Sources

CCEEB understands that this measure is meant to complement existing diesel emissions reduction programs at the ARB and EPA. It would be useful if staff could include a more detailed discussion of how the different programs interact in order to show consistency and avoid duplication of efforts. This is particularly important in terms of ARB's Diesel Risk Reduction Program; although this program is mentioned, it is not clear how the indirect source measure might work in concert with it.

Somewhat similarly, the draft Plan mentions the 2006 health risk assessments (HRAs) conducted by the ARB at major rail yards, but fails to describe the significant progress made over the interim. For example, the San Bernardino rail yard has cut diesel PM emissions by roughly 45 percent since 2005. Reductions of this magnitude are significant and should be incorporated into the measure; that, or reference to the rail yard HRAs should be removed as it seems out of context.

Finally, we would appreciate clarification on how "applicability criteria" will be established, especially since the District has indicated that the criteria would be developed mid-2010. As the District moves forward, CCEEB hopes to be actively engaged in any Indirect Source Review rulemaking.

Nuisance Rules (N-01 and N-02)

CCEEB appreciates the District's work to improve the science and practice of odor detection and to enhance Rule 402, and recognizes that odor issues account for the majority of complaints filed with the District. We encourage staff to work closely with both communities and facilities as it develops new approaches.

During the CCP Working Group discussion[2], the term "toxic odors" was used. We are unfamiliar with this term; if staff decides to include this concept as part of the nuisance rules, then we ask the District to establish a precise definition (e.g., concentration level, length of exposure, etc.), as well as explanation of how a toxic odor differs from emissions of air toxics.

Finally, we note that SB 1224 (Wright) is moving through the Legislature with no opposition. Staff should consider how this bill might affect its nuisance rules.

[2] May 20, 2010.

Chapter 2, Figures 2-8 through 2-10

On pages 2-9 and 2-10 of the Draft, the District includes figures for the MATES III model estimated district cancer risk for 1998, 2005, and 2023. Please also include the MATES III modeled cancer risk for the interim years of 2014 and 2020. This data is already in the appendixes, but would be helpful to include here to illustrate the significant improvements expected between 2005 and 2023.

Thank you again for considering our comments. We look forward to working with the District and its staff on the further development and implementation of the Clean Communities Plan. Should you have any questions, please do not hesitate to contact me (billq@cceeb.org or ext. 15) or Janet Whittick (janetw@cceeb.org or ext. 11).

Sincerely,

Bill Quinn
CCEEB Chief Operating Officer

The California Supply Chain Jobs Alliance

Elaine Chang, Deputy Executive Officer
Cheryl Marshall, Program Supervisor
South Coast Air Quality Management District
21865 East Copley Drive
Diamond Bar, CA 91765

RE: Comments on Draft Clean Communities Plan

Dear Elaine and Cheryl:

Thank you for taking the time to meet with representatives of our coalition to explain the 2010 Draft Clean Communities Plan (Draft Plan). The California Supply Chain Jobs Alliance (CSCJA), a coalition of Southern California supply chain businesses and trade associations, appreciates the opportunity to comment on the Draft Plan. We hope that our comments can help support successful design of the final plan objectives and provide the staff further insight into industry's concerns with this program. We look forward to continued involvement in any subsequent drafts and stakeholder group meetings and the implementation of the plan measures.

There are two major concerns that CSCJA has with the plan. First, the South Coast Air Quality Management District (District) has not analyzed its authority to adopt the measures and conduct the studies it outlines in the plan. Such an analysis must be conducted before the plan is finalized. Our comments are submitted pending the District analysis of its authority to pursue these matters and the submittal of comments is not concurrence as to District authority. Second, the measures are conceptual and leave many potential approaches for reducing toxic air contaminants (TACs) on the table. We believe that District staff should further define the measures before taking the plan to the District Board for approval. Without further definition of the measures, it will be difficult for all the stakeholders to understand exactly what we are being asked to support. We look forward to continuing to work with the District and other stakeholders on developing plans and strategies that address community concerns while avoiding a burdensome patchwork of regulations and requirements.

Additionally, CSCJA would like to continue to participate in a clear and transparent process. We would appreciate staff developing a timeline or work plan for further development of the plan, and in particular of the individual measures as they begin to be implemented. This will be particularly important in the development of the Community Exposure Reduction Plans (CERPs).

Community-01: Community Exposure Reduction Plans

Community Selection Criteria. In order to fully understand this measure, we would appreciate District staff providing an explanation of the criteria used to choose the pilot locations. Given the goal of the pilot projects is to test new strategies that can be applied to other communities, we

ask staff for more details how these communities are representative of other highly impacted communities in the air basin.

Additionally, the District agreed in the Clean Communities Plan (CCP) working group meetings to incorporate a Technical Advisory Group or Task Force to guide the development of each CERP. The District should clearly describe and formalize the roles of the District, the Technical Advisory Group, and any other known stakeholder processes for each pilot and include this information in the next Draft Plan. Additionally, to avoid duplicate efforts, the staff should identify any concurrent or recent activities by other agencies specific to the pilot communities and summarize the estimated emission reductions.

Please include potential elements and scope limitations of the CERPs. Please provide further information regarding the CERP scope and content. For example, since these are called Exposure Reduction Plans, we assume the ultimate goal is to reduce exposure within the pilot community by some measurable amount. Will the scope of potential actions be limited to those that directly result in exposure reductions? Will proposed measures include those that only measure TACs in the community (e.g. air monitors)? If the District plans to include educational and economic development components, that information should be in the next Draft Plan. How will the District staff develop the geographic boundaries? Without clear guidance as to what the community plan will include, it will be difficult to ensure the right stakeholders are at the table. Clarifying these issues now will help avoid misdirecting time and resources on work that is outside the scope of the primary goals of this exercise.

Investigation and Data Verification. Please provide more detail regarding scope and examples of potential data and analysis. For example, there has been some discussion of including health surveys in the data and analysis. The parameters of the health surveys have not been discussed; however, a community health survey cannot draw conclusions regarding air toxics exposure or derived causes of any health issues. We do not agree with including data collection that lacks a direct nexus to emissions sources.

The Draft Plan also indicates the CERPs will be more qualitative and based on community input, neighborhood walks, and town hall meetings. It also indicates there will be quantitative research such as "go[ing] beyond MATES III findings [to] take a closer look at toxic exposure at the community level." How is the District planning to reconcile the qualitative with the quantitative research in each CERP? Qualitative insights should be informed and supported by quantitative research. The District should clarify to what degree of granularity it can feasibly take the quantitative data at the community level.

It is necessary to further define "immediate action." In Phase 4 of the pilots, we ask staff to clarify what constitutes "significant health impacts" that would trigger "immediate action" by the District. The District should include the criteria used for making such a determination and to provide examples of possible resultant "immediate actions."

How will disagreements be resolved? The District has stated its intent for the development of CERPs to be "a collaborative process among all stakeholders to seek effective solutions."[1]

[1] Page 3-11, April 2010 Draft Clean Communities Plan

Given the variety of interested stakeholders with diverse views, the District should outline a clear protocol for resolving points of conflict in the CERP work plan and include how minority opinions will be included in the final product.

Community-02: Community Guidance for Reducing Air Toxic Exposure

When translating the information learned in the CERPs into guidelines, the District should be careful not to take a one size fits all approach, not just due to differing issues in the community, but also the resources available to the community, its businesses, and local government. We support the District's approach of assisting communities that chose to engage the District in a CERP, rather than the District selecting additional communities with which to implement CERPs.

Stationary-05: Indirect Sources

We understand this is a conceptual measure, but the vague wording makes it difficult to provide constructive and informative comment. For example, the District's "Implementation approach" compiles a menu of options to reduce exposure that could involve 1) modifying AB 2588 guidelines, 2) requiring health risk assessments for all indirect sources, 3) developing an indirect source rule for diesel, 4) various specific operational measures, or 5) developing incentives to voluntarily turnover fleets. The next Draft Plan should include a clearer outline of potential options and clarify which options will be concurrently pursued. Identifying multiple options will provide greater clarity on the intent of this measure and will enable the working group to discuss it more effectively. Also, please provide the statutory authority for each regulatory option the District is considering, including authority and process through which the District plans to work with the California Air Resources Board (ARB) to modify the AB 2588 guidelines to address mobile sources.

Applicability Criteria. The Draft Plan also states the District will "initiate development of an indirect source rule containing an applicability criteria that will account for diesel PM emissions, exposure to diesel PM, and the proximity to residential and sensitive receptors."[2] Staff has verbally indicated this is intended for existing and new facilities, and in most cases the facility operator, which is often the tenant, is the targeted party. If this is the case, this information should be included in the next Draft Plan. If the District takes this approach, the list of potential implementation options should only include actions over which the facility operator controls. Lastly, the measure currently includes offsite emissions, but does not provide any indications of the geographic limits of the offsite emissions that could be attributed to a facility. This should be included in the next Draft Plan.

Update to reflect current rail yard emission reductions. Please either remove the reference to the rail yards and to the San Bernardino rail yard health risk assessment, or revise Stationary-05 to reflect improvements since 2005. BNSF Railway and Union Pacific have made significant improvements at Southern California yards, and particularly at Commerce and San Bernardino rail yards, since 2005. Omitting this progress to date leaves the reader with the incorrect notion that nothing has been done to reduce emissions.

[2] Page 3-53, April 2010 Draft Clean Communities Plan

Approaches that Support a Healthy Economy

Part of maintaining a healthy community is sustaining a strong economy. Therefore, community stakeholders should be reflective of the entire community, including committed local businesses, non-profit organizations, local government agencies, and residents. A solutions-oriented process will address the identified air toxics related issues through actions while allowing business to continue to serve Southern California.

Figures 2-8 through 2-10 in Chapter 2

On pages 2-9 and 2-10 of the Draft Plan, the District includes figures for the MATES III model estimated District cancer risk for 1998, 2005, and 2023. Please also include the MATES III modeled cancer risk for the interim years of 2014 and 2020 to illustrate the improvements between 2005 and 2023.

We look forward to participating in the working group, and any task force that is created to work on the CERPs, to further develop and implement the Clean Communities Plan. Should you have any questions, please do not hesitate to contact me at ewarren@futureports.org or 310.982.1323, or Sarah Weldon at sarah@ceaconsulting.com or 415.421.4213 x 34.

Sincerely,

Elizabeth Warren

Port of LONG BEACH

San Pedro Bay Ports Clean Air Action Plan

June 30, 2010

Ms. Cheryl Marshall
Program Supervisor
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Re: 2010 Draft Clean Communities Plan

Dear Ms. Marshall:

The Port of Los Angeles and the Port of Long Beach (Ports) appreciate the opportunity to provide comments on the draft 2010 Clean Communities Plan (CCP). The Ports are pleased to see that a number of the CCP measures address localized effects and cumulative impacts to air quality and health risk in communities and neighborhoods, which are similar to efforts already being implemented by the Ports through the San Pedro Bay Ports Clean Air Action Plan (CAAP), our California Environmental Quality Act (CEQA) projects, and other Port initiatives. For example:

- One of the CAAP's foundations is the commitment "to expeditiously and constantly reduce the public health risk associated with port-related mobile sources, and implement programs in the near-term that will achieve this goal."

- The Ports have developed an aggressive risk reduction target for diesel particulate matter (DPM)-related residential cancer risk of 85% by 2020. This DPM risk reduction target is consistent with the Air Resources Board (ARB) statewide 85% risk reduction goal for goods movement.

- The Ports also developed a Draft San Pedro Bay-wide Emission Reduction Standard which is (1) by 2014, reduce emissions of nitrogen oxides (NOx) by 22%, sulfur oxides (SOx) by 93%, and DPM by 72% to support attainment of the federal fine particulate matter (PM) standard in the air basin; and (2) by 2023, reduce emissions of NOx by 59% to support attainment of the federal 8-hour ozone standard in the air basin, with additional reduction targets of 92% for SOx and 77% for DPM.

- These are more than just theoretical goals – the Ports have effected real-life success in actual emissions reductions. The recently-released Ports' 2009 Emissions Inventories show combined emission reductions of 52% diesel particulate matter (DPM), 34%

The San Pedro Bay Ports Clean Air Action Plan was developed with the participation and cooperation of the staff of the US Environmental Protection Agency, California Air Resources Board and the South Coast Air Quality Management District.

nitrogen oxides (NOx) and 50% sulfur oxides (SOx) since the 2005 baseline year. At current pace, the Ports have exceeded their interim emission reduction milestones and are on track to meet the Draft CAAP Emission Reduction Standards.

- Through the 2006 CAAP and 2010 CAAP Update, the CEQA process for Port projects and otherwise, the Ports are actively engaged with our neighboring communities, environmental groups, business stakeholders and federal, state and local agencies in a collaborative process. These collaborations result in balancing and addressing issues of human health impact reduction, neighborhood livability, personal livelihood, education, air quality, water quality, social networks, and social equity.

Comments on AQMD'S 2010 Draft Clean Communities Plan (CCP)

We look forward to having the opportunity to continue to comment through the process of further development of and finalizing the CCP. The following represent our initial comments based upon the preliminary information provided in the draft CCP.

CCP Measures Agency-01, Agency-02, Compliance-01 and Compliance-02

As noted in the CAAP Update, the Ports feel it is essential that local municipalities make informed land-use planning decisions in the areas surrounding the ports in order to avoid aggravating potential health risk impacts. Thus, in concept, the Ports support measures such as Agency-01, which promotes better land use decisions. The Ports have had a long history, through the CAAP and otherwise, of cooperative effort with the AQMD, ARB, the United States Environmental Protection Agency (EPA) and other agencies. The Ports strongly believe that such collaboration has aided in the success of the CAAP and the emissions reductions that have been achieved. Thus, in concept, the Ports support measures such as Agency-02, which seeks Multi-Agency Coordinated Response to solve complex environmental issues.

After such a successful strategy of collaboration among agencies, the Ports' first general comment on the CCP is that any CCP measure that intends to regulate or affect other agencies such as the Ports, should use the same collaborative approach and include such agencies in development of such measures. The CCP measures Agency-01, Agency-02, Compliance-01, Compliance-02, and perhaps additional CCP measures (since it is difficult to determine from the draft CCP), appear to intend to involve other governmental agencies in a coordinated effort; however, the description of both the development and implementation of such measures is vague and it is difficult for other agencies to understand exactly the AQMD's intended role and expectations of the agencies. Therefore, at this time, we have the following questions related to CCP Measures Agency-01, Agency-02, Compliance-01 and Compliance-02:

1. Will AQMD be forming an agency stakeholder group for collaboration and input into the development of these measures? While there is mention of establishing an "Interagency Task Force" in the implementation stage of Agency-02 after the CCP

Plan is adopted, we believe that an agency stakeholder group needs to be involved in consultation and input now, as AQMD develops the measures, and not only after adoption.

2. The Ports support the "reverse CEQA analysis" for school siting but would like to better understand AQMD's intention in Agency-01 to expand this requirement for other "sensitive land use projects." How does AQMD define "sensitive land use projects"?

CCP Measure Community-03

The Ports have appreciated the many opportunities they have had to partner with AQMD to fund air quality improvement projects such as the Proposition 1B Alternative Fuel Truck Grant program, the Wilmington/San Pedro school air filtration project and the PHL Tier 2 Modernization. We therefore welcome the AQMD's funding assistance in retrofitting, repowering and replacing older, higher emitting equipment as is suggested by CCP Measure Community-03. We have found that partnering and combining our respective financial resources allows successful achievement of air quality improvement projects to a greater extent than as individual agencies.

CCP Measure Stationary-05

The Ports have concerns, however, with CCP Measure Stationary-05, which develops approaches for reducing DPM exposure by targeting "indirect sources" of air pollution. By attempting to regulate mobile sources, Stationary-05 appears to tread into regulatory areas that are under the authority of ARB or EPA. This measure may also duplicate efforts already underway by such agencies and the Ports, such as our aggressive CAAP measures. We believe that it would be counter-productive and unnecessary to develop potentially contradictory regulatory approaches for the Ports and other agencies that are already successfully implementing collaborative programs to decrease DPM emissions.

The indirect source rule discussed in the CCP has potentially wide reaching effects. However, as the CCP does not contain any draft language of the proposed indirect source rule, it is not possible to comment specifically about it and we reserve the right to do so at a future point in time in response to actual draft rule language. The CCP's discussion of the proposed rule is vague enough that it is possible, but unclear, that it would apply to the Ports, their tenants, and other associated businesses. The Ports are concerned about this potential and would like clarity as to AQMD's intentions and direction. Therefore, the Ports have a series of preliminary questions designed to gain a better understanding of the AQMD's intended rulemaking process for this proposed indirect source rule and the regulatory direction of the CCP:

1. Stationary-05 seeks to regulate mobile sources of air pollution. Upon what authority are you relying in the creation of Stationary-05 and related rules?

2. What level of CEQA analysis is the AQMD proposing for this rulemaking?

3. When will a draft of the proposed indirect source rule and preliminary draft staff report be ready for review?

4. The Ports want to understand how the terms found in Stationary-05 are going to be defined and their intended scope:
   a. How is "facility" to be defined?
   b. What are "businesses that rely on diesel mobile sources"?
   c. Do you intend the ultimate definition to include the Ports? Either as a "facility" or "business that rel[ies] on diesel mobile sources?
   d. Upon what is the applicability criterion going to be based?

5. Pursuant to Health and Safety Code § 40727: Where are the findings of Necessity, Authority, Clarity, Consistency, Non-Duplication, and Reference? When and how will these be developed?

6. Pursuant to Health and Safety Code § 40703:
   a. Have you identified the affected businesses? If so, who are they?
   b. Have you made efforts to determine the direct cost to the affected businesses? If so, what are they?

7. Proposed traffic studies to improve the flow of traffic and vehicle scheduling:
   a. Who would conduct and pay for these?
   b. When would these need to be completed; what triggers the need to conduct one?
   c. Would any part of the proposed rule affect a truck's ability to leave truck routes to deliver/pick up goods?

8. What changes to CARB's guidelines in reference to AB 2588 is the AQMD seeking? Will the public receive notice of any action in this regard?

9. Pursuant to Health and Safety Code § 40922:
   a. Have you analyzed any of the measures for cost effectiveness and ranked the proposed measures?
   b. If so, what method was used for the analysis and where are the results?
   c. If not, when will that analysis take place?

10. Have the socioeconomic impacts of the proposed indirect source rule been addressed?
    a. If so, where are the results?
    b. If not, when will that analysis take place?

Other General Comments on the CCP

Additionally, we would like to ask the District to revise its statement (page 2-5 of the Draft 2010 CCP) that the Mates III Study shows the highest cancer risks from air toxics in the vicinity of the port areas, with the highest grid cell risk of about 3,700 in a million. The cited risk levels are misleading, as they refer to risk estimates that are either over water or on Port

property. It is not appropriate to use or otherwise communicate these values as being representative of residential risks.

We also believe the Draft CCP would benefit from a brief description of the Ports CAAP as it is a recent local example of industry, air agencies, and community stakeholders effectively working together on a voluntary program. Implementation of the CAAP and the forthcoming 2010 CAAP Update represent an effective and ongoing effort to achieve real reductions in air toxics and health impacts. Discussion of the CAAP in the CCP would provide a useful template and background to both CCP Working Group members and the public as the CCP is finalized.

Thank you for this opportunity to provide comments. If you would like to discuss any of the above comments or need further information from us, please contact Heather Tomley, Port of Long Beach, at (562) 590-4160 or Kevin Maggay, Port of Los Angeles, at (310) 732-3975.

Very truly yours,

Richard D. Cameron

File No. 31-380.10B

Ms. Susan Nakamura
Planning and Rules Manager
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765

Dear Ms. Nakamura:

Comments on the Draft 2010 Clean Communities Plan

The Sanitation Districts of Los Angeles County (Sanitation Districts) appreciates this opportunity to comment on the Draft 2010 Clean Communities Plan (CCP). As you may be aware, the Sanitation Districts are a consortium of 24 public agencies that provides environmentally sound, cost effective management of wastewater and solid wastes for about 5.7 million people in Los Angeles County and, in the process, convert these wastes into resources such as reclaimed water, energy and recycled materials. The Sanitation Districts' solid waste management system serves a large portion of Los Angeles County, including active sanitary landfills, recycle centers, transfer/materials recovery facilities, refuse-to-energy facilities, and gas-to-energy facilities. Additionally, the Sanitation Districts operate an extensive network of wastewater treatment and reclamation facilities that reduce the dependence of this area on increasingly diminishing allocations of imported water.

Our principal interest in this plan lies in the fact that despite both a considerable investment in clean air technologies and a proven track record of innovation and success in reducing emissions and nuisance impacts, often through voluntary efforts, many of our facilities may nevertheless be unfairly impacted by components of the CCP once implemented. The proposed Diesel magnet measure and additional odor/public nuisance provisions are troublesome to us.

The CCP's Risk Reduction Goals May Be Substantially Achieved Given CARB's Already Aggressive Commitment to Reduce Toxics

The most likely way that the proposed indirect source measure, STATIONARY – 05 can achieve reductions beyond those already anticipated to occur is through an extremely aggressive early retirement program of nearly all Diesel equipment. As shown in the CCP Figures 2-3 through 2-10, the existing slate of state programs, most notably the ARB's Diesel Risk Reduction Plan, will significantly and rapidly reduce emissions and exposure to toxics throughout the Basin. These new mandates were developed weighing the economic and practical feasibility of early retirements, and yet still relied on considerable saturation with Tier IV engines by 2020. Even with delays in rule implementation being contemplated by CARB as a result of the severe economic downturn, the recession has indeed resulted in substantial overall emissions reductions consistent with the 2007 AQMP (with some help from improved modeling assumptions).

Given the considerations the state weighed in forging its plan, there's very little leeway to accomplish much else without causing severe economic and operational disruption. The Sanitation Districts for example, have already committed to extensive engine replacements at the highest tier available. In many cases, these engines are used in specialized equipment like compacters, crawlers, grinders, excavators, etc., and not for mass produced vehicles or equipment like a typical 18 wheeler. Replacement or repowering of this specialized equipment cannot take advantage of economies of scale. Hence requirements to exact further controls from this niche equipment will not go as far in reducing emissions as if those same monies were spent on other alternatives.

The Sanitation Districts have committed over $18 million since 1998 on clean fuels, engine replacements or repowering projects for this kind of equipment (including $3.8 million for a CNG/LNG station). Moreover, in one solid waste management facility currently under construction (the Puente Hills Intermodal Facility), the Sanitation Districts have:

- Committed to using low emitting or alternative fuels for its equipment including its forklifts, yard holsters and a switch locomotive;
- Implemented numerous design features at that facility such as an access road under a major thoroughfare generally improving local traffic flow (thereby reducing traffic and idling emissions created in the project area), extracting a commitment from Union Pacific Railroad to use locomotives with the newest emissions control technology commercially available, and receiving commitments to use no more than two locomotives at one time at the facility, in addition to other effective design measures;

- Investigated innovative technologies in conjunction with SCAQMD staff such as retrofit DPFs with SCR and alternative fuel off-road vehicles in preparation for this and other heavy-duty uses throughout the Sanitation Districts.

Please note that many of these commitments are above and beyond measures called for in the existing state programs. To expect further emissions reductions would be extremely burdensome and potentially infeasible for facilities that have already installed BACT throughout or are operating equipment at the latest tier level. We suggest that any indirect source measure like STATIONARY – 05 consider the clean air investments already made when crafting specific measures from the CCP, especially for financially challenged essential public services that cannot reduce emissions by attrition, down-sizing or relocation.

The Existing Mechanism to Control Odors Is Very Effective

Similar to the extensive commitment that Sanitation Districts has invested in trimming its Diesel emissions, far greater capital and resources have been devoted to combating odor related nuisances. At our largest wastewater treatment facility, the Joint Water Pollution Control Plant (JWPCP) in Carson, the Sanitation Districts have expended $71.5 million on voluntary projects largely designed to address odor concerns in the community since 2000. The extensive scope of this commitment includes:

- Several areas within Primary Treatment, namely the inlet works forebays, grit chambers, interconnecting channels, sedimentation tank batteries, and raw sludge and skimmings wet wells, have been retrofitted with airtight, flat, gasketed, aluminum covers at a cost of approximately $6.5 million to contain odors. Air trapped underneath these covers, excluding the sedimentation tank batteries, is directed to a $10 million state-of-the-art, two-stage treatment process featuring biotrickling scrubbers followed by activated carbon scrubbers.
- Air trapped under the sedimentation tank covers, skimmings trough covers and primary effluent channel covers is directed to another two-stage biotrickling/activated carbon system. Three independent systems, installed at a cost of $32 million, mitigate odors from each of the primary treatment sedimentation tank batteries.
- A $23 million project to control odors from the Solids Processing biosolids storage silos, biosolids conveyors, and truck loading stations

provides for the collection of the foul air and its transport to two independent biofilter treatment systems.

- The Sanitation Districts continues to conduct award-winning odor control research at the JWPCP including the development of the aforementioned biotrickling filter, now an industry standard. A team of consulting engineers, design engineers, operations engineers, research engineers, operators, maintenance workers, electrical and instrumentation technicians, and chemists are continually engaged in the effort to operate, maintain, and upgrade the JWPCP's odor control systems.

- Several facilities have extensive community outreach programs such as the JWPCP's Citizens Advisory Committee, chaired by a member of the community, and a dedicated hotline for residents to call and report potential nuisance occurrences.

Accordingly, we are concerned that our proactive approach to address community concerns may not be acknowledged by the CCP. As discussed during the April 22, 2010 CCP Working Group meeting, stakeholders believe that proactive businesses should be rewarded for reaching-out to communities instead of subjected to new and potentially costly requirements.

We continue to support the Public Nuisance Investigation Policy in Appendix C of the CCP, including the requirements that a minimum of six unique complaints in concert with on-site verification by an SCAQMD inspector be necessary before an NOV is issued. This mechanism to handle these complaints has proven its effectiveness for decades. As the CCP notes, the episodic nature of odors makes it difficult to trace the problems to a confirmed source. Hence, it is imperative that an unbiased process is the foundation for any SCAQMD action. Please note that because of the subjective nature of smell, whether an odor is assigned to a source may be strongly influenced by that person's opinion of that facility, warranted or not. Our experience continues to show that the few odor complaints currently investigated by JWPCP staff, for example, often are attributable to other sources. To relax the standard for confirming the source and issuing an NOV would invite numerous false positives which may require the installation of unwarranted controls. Any potential change to this policy should make the procedure less arbitrary, and seek to solidify a factual, documentable and impartial basis for complaints. Furthermore, we would find it very difficult to support any change to Section 41700 of the H&SC.

Recognition of Voluntary Permit Units Will Advance the Goals of the CCP

We wish to point out that despite our commitment to abating odors, occasionally, through over-regulation, the SCAQMD makes it difficult for us to follow through on that commitment. For example, last year, the Sanitation Districts decommissioned three *voluntarily installed* odor control units and handed back to the SCAQMD the associated permits because of restrictive permit conditions. Specifically, these odor control units were voluntarily installed as a precautionary measure to further reduce the likelihood of an odor complaint, but permit conditions unrelated to odor control effectively required media replacement on a weekly instead of quarterly basis and other monitoring provisions. The economic and operational burden to regularly and rapidly change out the media exceeded the capabilities of our odor control staff, and the units were reluctantly taken off-line.

We respectfully request that SCAQMD recognize and reward such voluntary measures to control potential odors through a permitting process that recognizes voluntary actions. As illustrated above, burdensome requirements will negatively incentivize enterprise and discourage obvious cost-effective solutions.

A Cumulative Impacts Approach May Overstate the Risks

Several of the COMMUNITY proposals require an assessment of the cumulative risks to the community. Although the methodology to perform this analysis has yet to be defined, we caution against using a simplified approach like the one recently adopted by the BAAQMD in their revised CEQA Guidelines. That approach simply and conservatively adds up the MICRs from each of the facilities and other sources such as freeways within a 1000 foot radius of a new source or receptor. This overly simplified approach ignores the powerful impact of distance on declining risk as exemplified by Fig. 3-2 in the CCP.

Such an additive approach would greatly inflate the perceived risks and alarmingly exaggerate the health impacts to the community. In considering methodologies to determine cumulative impacts, we caution against any approach designed from the outset to exaggerate risks that are already conservative. We suggest instead that, until the methodology for assessing cumulative risks is fully matured, any cumulative impact assessment be paired with community level ambient monitoring as a verification tool.

COMMUNITY - 02 Should Foster A Collaborative Approach

As discussed during the CCP Working Group meetings, a collaborative approach is needed to address concerns from the community, business and regulators. If the

CCP is to succeed, no party should act independently. COMMUNITY – 02 should be structured to forge an equitable forum for all stakeholder views and limit the potential for a biased approach.

Independent actors, even with SCAQMD guidance, may abandon the rigorous approach outlined in COMMUNITY – 01. Without a neutral party to resolve disputes and ensure that all stakeholder views are weighed dispassionately, the proposed process may not be successful. To minimize the potential for disputes, perhaps an independent special board created with SCAQMD input could referee the process and ensure that all voices are heard equally.

We appreciate your consideration of our comments on the Draft CCP, and look forward to working with staff to develop a plan that furthers air quality goals. If you have any questions regarding these comments, please do not hesitate to contact me at (562) 908-4288, extension 2113.

Very truly yours,

Stephen R. Maguin

RE: Clean Communities Plan

Dear Dr. Chang and Ms. Nakamura:

Thank you for the invitation to attend the 2008 Clean Communities Plan Working Group (CCPWG) meeting on July 16. As you know, the Western States Petroleum Association (WSPA) has been an active participant on working groups and projects such as these since the mid-1980's. We, along with the South Coast Air Quality Management District (SCAQMD), the California Air Resources Board (CARB), and the US Environmental Protection Agency (USEPA), have been involved in numerous legislative and regulatory projects to document exposure, reduce risk, and improve overall communication with the community.

Specifically, in addition to the 18 rules the District cited as part of their air toxics program, WSPA and agencies have worked on and actively participated in:

- AB377 (California Chemical Risk Management)
- AB2588 (Toxic Hot Spots)
- USEPA TRI requirements
- USEPA and OES release requirements
- SCAQMD and CARB Community outreach efforts
- CARB Gasoline and diesel reformulation
- CARB Barrio Logan Project
- CARB Harbor Communities Monitoring Project
- CARB CHAPIS (emissions mapping)
- RWQCB GIS mapping
- Certified Unified Program Agency (CUPA)

These activities have resulted in reduced emissions, reduced exposure, and documented reductions in risk. While we understand and accept the need to be vigilant in finding new ways to reduce our footprint on the environment, risks from petroleum facilities are well within regulatory criteria/limits.

Thus, we were pleased to be invited to attend the Clean Communities Plan Working Group because of the many efforts described above. We listened attentively to the discussion and the points made by Staff and the other participants. In response to your request, attached are our thoughts.

Programmatic Design

Perhaps our foremost concern is that the CCPWG efforts must take place within the current regulatory context. As indicated above, the State of California has a rigorous and robust program to regulate emissions to manage and control risks. Any effort proposed by CCPWG must take place within this regulatory framework.

Also, the SCAQMD should embark on this project with an understanding that the State of California has designed its regulatory strategy to reduce risks to residents. In other words, rather than concentrating on emissions – which may or may not have an impact on health risk to human receptors, the State has rightly concentrated on reducing risks associated with air pollutants. This approach has been successful and any program developed by the SCAQMD should be consistent with and incorporate risk-based elements.

Hazard Identification

Also we noted that in your presentation at the CCPWG, you mentioned possible activities with regard to hazards from accidental releases. It appeared you were contemplating material substitution programs for chlorine, ammonia and perhaps other materials. As was noted at the meeting, there are several programs already in place to deal with these possible hazards. Any proposed actions for material substitutions need to consider all impacts (e.g. energy and resource use) before recommendations are made on the most appropriate technology.

Fact-Based Objectives

We notes that the Objectives of the CCPWG were to reduce exposure, address cumulative exposure from multiple sources, increase agency communication, improve communication to the public and emphasize community-based solutions. These goals need to be accomplished within the current regulatory framework and under the aegis of good science and fact-based initiatives. Specifically, the CCPWG should concentrate on reducing exposure where such reductions result in reductions in risk. Absent that linkage, the benefit of any emission reduction would be undefined and un-definable. The need for fact-based objectives will also ensure that consensus reached by the group will result in real and quantifiable improvements in the environment.

Exposure Reduction Programs

As stated earlier, exposure reduction programs certainly would be beneficial if those reductions resulted in reduced risk. Potential Emission Reduction Programs should be viewed in light of current risk reduction requirements of the State and the SCAQMD. We recognize there may be unique opportunities that occur at facilities from time to time where a facility could voluntarily reduce emissions due to changes in equipment or processes. However, the unique situations where such reductions are possible should not be construed as the norm or as the basis for further regulation. Rather, any such examples should be recognized as the efforts of a company going beyond what is required, as a demonstration of their commitment to the environment.

We urge the SCAQMD to be very careful when defining specific compounds or facilities as needing special focus. While all need to be vigilant to ensure that facilities are indeed permitted and operating under the correct emission limits. WSPA would be concerned if the CCPWG somehow highlighted a specific facility or groups of facilities for focused review or enforcement. No area or facility or groups of facilities should be identified as needing enhanced regulatory attention without specific and fact-based criteria. Public sentiment is not a basis for enhanced regulatory action.

Program Priorities

At the meeting, the District noted that some regions or areas would be highlighted for additional study such as those conducted for Mira Loma. Bearing in mind the comments noted above, any highlighting of a region for study should be based on accurate and reliable indicators of risk. While we certainly appreciate recent efforts to document the current environment, for example the MATES3 study, we would reiterate the need for ground-truthing to establish a firm and consistent baseline that facilitates a reliable risk assessment and risk management. Areas for study in this Working Group should not be defined simply by anecdotal or one-off measurements. The Wilmington HCM study has been a good example of how difficult it is to consistently measure localized exposure, convert exposure to risk, and identify risk reduction measures. Even more difficult is deciding whether any specific receptor site might be actually affected by air pollutants or which source might have actually released the emission.

Once again, we look forward to participating on this project and to continuing dialogue.

Sincerely,

970 W. 190th Street, Suite 770, Torrance, California 90502

Los Angeles County Sanitation Districts
August 6, 2008

Dear Susan/Cheryl:

We appreciate your letting us submit these comments after your deadline.

1. We do not understand how a "new source review" approach to odors would work.

a) Establish an odor compound list: What would this accomplish? Any compound or collection of compounds, depending upon its concentration, can eventually become obnoxious to the perceiver. Potentially this would be a long list as every industry would have its own, possibly unique, inventory of compounds.

b) Rule 410-type OMPs and performance requirements don't seem compatible with NSR-type rules.

2. Accidental exposures has been a highly regulated area ever since Bhopal and Section 112 (r) of the 1990 federal CAA Amendments. For years we have had to comply with Cal OSHA PSM (Process Safety Management) requirements and RMPPs (Risk Management and Prevention Plans) and finally the Cal ARP (California Accidental Release Program). CalARP contains three different program levels with varying requirements depending upon past history of accidental releases, the type of industry or specific determinations made by the AA (Administrative Agency). Program 3 constitutes the most restrictive program. Additional requirements are being considered at the national level.This year Congressional committees have debated the merits of H.R. 5577 (principal issue is that Department of Homeland Security has jurisdiction over chemical plant security) versus H.R. 5533 (EPA has jurisdiction). It is our guess that one of these will probably work its way through the 111th Congress.

Potential federal legislation aside, our principal concern with switching from chlorine gas to sodium hypochlorite is the additional salt concentration that would result in the tertiary water we discharge and the impact of that salt on our groundwater recharge operations. The recharge basins are marginal in their ability to accept any more salts. Someone within LACSD much more erudite than me can explain this to you in much greater detail if you would like.

Please conside that the wastewater industry's safety record as a whole with gaseous chlorine has been outstanding. We also have a very great need for the $$$ otherwise spent on switching for the sake of switching to improve other parts of our infrastructure (like crumbling sewers).

The efficacy of gaseous chlorine versus 12% hypochlorite solution would cause delivery truck traffic to increase between three and four times what it is now. Also, instead of truck deliveries from production facitilites in Santa Fe Springs across the 605 Fwy from here, hypochlorite would have to come over from Sparks, Nevada.

Gregory M. Adams

Eastern Municipal Water District
August 7, 2008

Susan/Cheryl,

Unfortunately, I did not know about the July 16 meeting where the 2008 Clean Communities Plan concepts were presented, but I have obtained a copy of the presentation (thank you Cheryl) and have the following comments:

1. Based upon my review of the first couple of slides that discuss the approach and principal objectives, it appears that the plan is focused on continuing the efforts of the past air toxics control plans in furthering reductions of toxics, reducing the public's exposure to toxics and also to introduce mitigation or strategies to address the cumulative risk from toxics exposure. In fact, the first two thirds of the presentation are focused on toxics, better intergovernmental coordination and a better community presence/coordination. Hence, I am a little perplexed as to why issues such as odors (e.g. public nuisance) have been brought into this plan. Especially since issues such as odors were not brought up in earlier meetings/discussions of the toxics working gorup that had been meeting in late 2007 and early 2008 (that has subsequently been subsumed by this new workging group). First, you can never eliminate all complaints or perceived public nuisance issues. Second, the District already has programs in place to address public nuisance issues (Rule 402 & SCAQMD internal policies and practices, NSR for Toxics - Rules 1401, 1402). Maybe before we include strategies like developing an odor new source review program, we should evaluate SCAQMD internal program policies and practices to see if there are areas that might be improved or modified that could provide more benefit in reducing odor complaints and public nuisance cases that a new regulatory program. It also seems like the list of potential compounds could be endless. Also, what is an odor to one person could be an aroma to another and all odors are not harmful to a person's health. Anyway, it seems that there needs to be a lot more discussion of this issue.

2. Under the slide titled "Accidental Exposures" the concept of requiring the wastewater treatment industry to replace chlorine gas as a disinfectant with a "safer alternative" seems to be overreaching. Our industry is already heavily regulated by CAL-OHSA (e.g. safety), CAL-ARP and EPA regulations. And switching from chlorine gas to sodium hypochlorite would require an immense investment in captial infrastructure and costs, including higher O&M costs. Many sewage plants may not have the available space to store the equivalent amount of solution as can currently be stored in liquid chlorine storage vessels. As our industry has an incredible safety record regarding the use of chlorine gas, and since I have not heard of any public concerns regarding this use, I am again caught off-guard as to how this became an issue. Hazardous material regulations heavily regulate the transport of chlorine and other hazardous material regulations along with EPA/State of California RMP and PSM regulations regulate our use of the chlorine. This proposal (to replace with an alternative) would be adding more, unnecessary regulation upon what already exists.

Thank you for the opportunity to provide comment on this. I look forward to working with you on this plan.

Daniel McGivney

Metropolitan Water District of Southern California
August 8, 2008

Hello Cheryl and Susan,

First, thank you for the opportunity to comment and to participate in this working group. I would like to offer a few comments that reiterate some of the issues discussed at the first meeting on July 16th.

1. **Nuisance Program** – It is unclear why this element would be included in the Clean Communities Plan, which is mostly geared towards air toxics. I understand that SCAQMD already implements various internal policies and procedures that address public nuisance odors. I am not aware of gaps in these existing programs that would need to be addressed with a new program. In trying to make the plan more comprehensive to include odors, the air toxics focus of the plan may be somewhat diluted. Additionally, the science of investigating odors is quite different from air toxics; e.g. people have different odor perceptions and although some odor thresholds may be low, it doesn't necessarily mean that a chemical may be present at levels hazardous to health. As somewhat of a coincidence, on July 24th, I attended an Odor Awareness Workshop (presented by GEI Consultants) that our Water Quality group sponsored. The workshop included some discussion of this last point, as well as discussion of odors of importance, investigating odors, and odor intensity, among other topics.
2. **Accidental Exposures** – Another proposed element of the Clean Communities Plan looks to reduce and prevent exposures to toxics from accidental releases from such chemicals, as ammonia and chlorine. Employee safety, public safety, and accidental releases of these chemicals and many others are already heavily regulated under existing federal and state regulations, such as Cal-OSHA "Process Safety Management", Cal-ARP "Risk Management Plans and "Accidental Release Program", DOT for transportation, and EPA for water sector vulnerability assessments. There are also Federal legislative proposals pending that propose to capture water and wastewater chemicals under DHS chemical facility security regulations. It would be beneficial to review these existing and upcoming regulatory requirements before incorporating this element into the plan with potentially new (and overlapping) sets of regulations. The Process Hazard Analysis (PHA) component and other elements of these current regulations should already meet the objective of reducing and preventing accidental releases/exposures that is in the Clean Communities plan.
3. **Alignment with OEHHA Efforts** – As we discussed at the July meeting, OEHHA recently formed a cumulative impacts group which is slated to come up with recommendations (risk-based) in Summer 2009. It is important that the Clean Communities Plan is aligned with these OEHHA efforts and recommendations, so they can be integrated into the plan, as applicable. I understand that SCAQMD is represented on this OEHHA group.

Please call me if you have any questions. I look forward to the next meeting on August 26th.

Janet

Communities For a Better Environment/
East Yard Communities for Environmental Justice
August 12, 2008

Dear Elaine:

We are writing these comments in response to the staff presentation and discussion on July 16th during the stakeholder meeting for the *2008 Clean Communities Plan (CCP)*. We appreciate the opportunity to share with staff the expectation of our community members who are increasingly vulnerable to cumulative impact of pollution in their neighborhoods. We recognize that AQMD has come a long way in acknowledging the severity of the problems in disproportionately impacted communities throughout the Basin since we first started this dialogue about cumulative impact about 10 years ago. In July of 1998 Communities for a Better Environment published its report, *Holding Our Breath,* assessing the cumulative impact issues in the Southeast Los Angeles communities and making recommendations, many of which apply even to this day. We hope that the *2008 CCP* will offer effective regulatory solutions to addressing the issues that environmental justice groups have identified over the past decade.

Based on the staff presentation, it appears that the CCP process lacks a much needed focus on cumulative impact, and we believe that a specific cumulative impact sub-category needs to be added to the items forming the umbrella of CCP. We believe there are four broad areas to consider in addressing cumulative impact in environmental justice communities: Promoting meaningful public participation, engagement and access; significantly ratcheting up enforcement practices; improving the permitting process by including cumulative impact analysis in the criteria for the new and existing facilities; revising appropriate source specific rules and umbrella rules as well as designing new ones.

AQMD staff have correctly underlined the issue of public participation, community outreach, and enhanced community engagement as one of the central issues to addressing any environmental justice and cumulative impact problems. We strongly support the staff recommendation to increase AQMD¢s efforts in enhancing the capacity of communities to participate in air quality decisions that impact their quality of life. We believe investing in community dialogue based on respect for the community (experience), who has the first hand knowledge of impacts, will greatly benefit the residents, AQMD and the business community. We will provide staff with a list of best practices on this topic in our future comments. We also believe that AQMD can learn from evaluating its past experiences of interacting with community and draw important lessons when it has fallen short.

Another area that AQMD staff emphasized in its presentation is enforcement. We have seen many improvements in this area over the past years, and we appreciate the effort of AQMD enforcement staff in responding to community complaints and following up with appropriate disciplinary actions as warranted. However, AQMD has not been proactive in its enforcement, and we believe there are many additional measures that AQMD could adopt in enhancing its enforcement regime in disproportionately impacted communities. Allocation of necessary resources, enhanced monitoring, building the capacity of community to interact with enforcement staff, offering appropriate trainings to community members, increasing the understanding/sensitivity of enforcement staff of environmental justice issues, and a number of other measures would greatly benefit our communities. Again, we will provide AQMD with a list of necessary changes in this area in our future comments and discussions.

The next and one of the most significant policy areas that AQMD needs to reexamine pertains to its source specific rules, umbrella rules and permitting practices. Improving permitting practices for new facilities and affecting the behavior of existing facilities based on revising current rules are central to any serious attempts to address cumulative impact. As it currently stands, the regulatory model of AQMD regulates facilities without much consideration to other facilities in a neighborhood. If a new polluting facility applies for a new permit (or permit to expand), AQMD permitting staff look at the existing rules and the final permitting decision offers no consideration to the cumulative level of pollution in the neighborhood. Whether there are five other highly pollution sources in the neighborhood or none does not have any bearing on the District¢s decision to issue the permit. In other words, cumulative impact currently is not a consideration for issuing permits, and we strongly believe it should be.

This issue is closely related to the way source specific rules and umbrella rule such as 1401 and 1402 are designed. The rules currently fail to account for cumulative impact criteria. At the heart of addressing cumulative impact is fixing this great regulatory flaw. Source specific rules and umbrella rules should be revised to take into account the whole picture. The health protective approach requires placing the community at the center and looking at the impacts from the perspective of the impacted community.

We also would strongly support AQMD in expanding its effort to reach out to planners and educating them about the air quality impacts of their decisions. AQMD expertise can provide much needed guidance for cities in designing better plans, assessing impacts of different projects as well developing criteria to account for cumulative impact throughout the CEQA process. We also believe that AQMD, as a responsible agency, should assume a more aggressive posture in commenting on proposed projects in disproportionately impacted communities.

We understand that all this is a great undertaking, and it will influence many operational aspects of AQMD in rule-making, permitting, enforcement and other areas. However, we believe the negative health impacts borne by vulnerable communities throughout the years warrants commitment to action on this issue, and it is in fact long overdue. We are interested in engaging with AQMD staff and other interested stakeholders to suggest practical and effective approaches to arrive at a health protective regulatory structures with a focus on addressing cumulative impacts.

Sincerely,

Bahram Fazeli

Diamond Bar, California 91765

RE: SCAQMD Clean Communities Plan

Dear Ms. Nakamura and Ms. Marshall,

CCEEB commends the South Coast Air Quality Management District ("the District") for its commitment to issues of environmental justice. The proposed 2008 Clean Communities Plan ("the Plan") is an ambitious undertaking and, as far as we are aware, one of the first attempts to directly address cumulative impacts by an environmental regulatory agency in California. We understand that this document and framework are proposed in lieu of the air toxics control plan update anticipated based on the MATES II results. We trust that the District's effort will be informed by other contemporary work efforts, such as the Cumulative Impacts and Precautionary Approaches project at Cal/EPA's Office of Environmental Health Hazard Assessment (OEHHA).

At this time CCEEB wishes to bring to your attention two overarching concerns along with additional specifics.

In general, CCEEB notes that the Plan goes well beyond control of air toxics, which has been the subject of past air toxics control plans. For example, the Plan includes sections on nuisance and hazardous material bans. On the other hand, the Plan fails to adequately address mobile sources, which account for 94% of the risk from air toxics in the basin based on the MATES III study. Staff should consider the scope and focus to ensure that proposed measures are within the District's purview and result in quantifiable and measureable reduction in risk to public health.

The Plan, as currently proposed, sets up a program that results in "redlining," that is, the limitation or prohibition of stationary sources solely based on location and regardless of actual emissions, on-site control technologies, or relative contribution to the risk measured and/or modeled by MATES III. CCEEB has long opposed redlining in any form, but particularly in cases where mobile sources play such a significant role. Besides the inequity problem, misdirected focus diverts resources while failing to address real public health problems.

CCEEB very much thanks the District for the opportunity to comment and to participate in the work group. We look forward to discussing our viewpoints with staff and other stakeholders. Our more specific observations on the plan are organized below, according to the organization of the Plan.

Future Year Modeled Estimated Risk

We want to confirm the District's commitment to prepare, as part of both the draft and final plans, an emission inventory of toxic air contaminants for future years - including the years 2010, 2015, and 2020. CCEEB believes that the inventory should be based on all measures that have been approved by the ARB and the SCAQMD, as well as measures that are proposed in the AQMP and the SIP. The inventories should also be based on the best available source emission inventories, and not limited to the inventories prepared as part of the AQMP. In conjunction with the future year toxic air contaminant inventories, CCEEB believes that the District should also prepare maps showing basin-wide modeled estimated risk (similar to MATES III Figure ES-4), as well as charts which illustrate the change in air toxic risks (similar to MATES III Figure ES-5).

Community-Based Solutions

Community Exposure Study (COMMUNITY-01)

Phase 1: Community Screenings

Currently, there is no commonly accepted methodology to "screen" communities of concern. The District should carefully consider its work in this area, as it will set precedent. We encourage staff to coordinate with the state's effort (Office of Environmental Health Hazard Assessment) in this regard.

Regarding the proposed criteria, the relative weighting of each screening criterion should be transparent and clearly articulated in advance. As much as possible, prioritization should be based on fact-based risk assessment, not simply the perception of risk. First, this directs resources to the most at-risk communities, so that even in its pilot stage, the Plan will deliver real and near-term results where they are needed most. Second, this guarantees the protection of all communities, even those in which civic engagement may be low. The District might consider adding a capacity-building element to the Plan to ensure that all communities have the resources and education they need to engage in the process.

The screening process should be open for periodic review and adjustment. In some cases, the District may wish to correct program design flaws based on lessons learned during the implementation phase. In other cases, actual emissions and/or risk levels may change over time, whether for good or bad. Given the scientific and political uncertainty, it makes sense to allow for later course corrections.

Phase 2: Community Input

Environmental policy issues are frequently scientifically-complex and contentious. Because of the complexity of the issues, before a dialogue can begin in earnest, all stakeholders must be in agreement on what the issues, assumptions and facts—what is known as a "shared understanding" of a problem. In the absence of clearly identified

issues, assumptions and facts up front, it becomes difficult to engage in productive and meaningful dialogue, let alone reach consensus. Mutually agreed-to clarification can only save time and reduce conflict later in process.

Because of the diversity of interests and various levels of trust among stakeholders, an objective third-party facilitator can play an important role in maintaining the credibility of the process. A neutral facilitator can assist with probing questions when the dialogue is stalled, help explore differences, and help to ensure that areas of agreement become the principle guide posts for moving the dialogue forward.

Other agencies, local government, planners, and other experts must be brought into the process as appropriate. For example, if a community identifies problems associated with the impact of new development, land use planners and decision-makers should be at the table. Transportation planners, public health officials, and education groups are other examples.

Phase 3: Community-Based Solutions

The process for developing an exposure reduction plan should be closely tied to the actual emissions burden faced by a community. Thus, the common understanding of the issues, assumptions and facts, held by all stakeholders, is a critical outcome of phase two above.

In the third phase, the District might consider organizing the community plans around general categories based on the nature and type of impact, even where these overlap (for example, mobile sources, existing permitted sources, new sources, land use planning and siting issues, communities subject to intensive goods movement activities, and cross media). First, this helps establish a close problem-cause connection to proposed solutions. Second, classification helps the study and translation of lessons learned to other areas facing similar issues.

If permitted facilities are likely to be affected, bring business and industry representatives into the process at the earliest point possible. Too often stakeholders meet late in the process when interests are already vested and positions entrenched. Moreover, stakeholders often have divergent understandings of the project or proposal being addressed; eliminating misconceptions early on facilitates collaborative solutions.

Likewise, if the focus of concern falls partially or largely outside of the District's jurisdiction, ensure that the appropriate agency, authority, or decision-maker is part of the process at the earliest point possible. Whenever possible, the District should attempt to leverage existing programs and funding sources.

All parties should work together to develop consensus criteria by which proposed measures will be evaluated. District staff should provide detailed analysis of each measure, generally based on these criteria, and not wait until rulemaking proceedings.

Useful analysis might include, but is certainly not limited, to:

- Net benefit, expressed primarily in terms of reduced risk
- Ancillary or "co-benefits"

- Direct costs, both in terms of compliance costs and program costs
- Indirect or external costs, e.g., grid reliability, energy affordability, economic activity
- Funding mechanisms, including potential funding sources (e.g., existing funding sources or new?) and funding responsibility (e.g., emission sources or the general public)
- Role of other agencies and entities; coordination with other efforts
- Impact of anticipated benefits from regulations and legislation, including AB 32, AB 118, and ARB on-road and off-road diesel rules

Options to Address Cumulative Impacts

> *"Cumulative impacts means the exposures, public health or environmental effects from the combined emissions and discharges in a geographic area, including environmental pollution from all sources, whether single or multi-media, routinely, accidentally, or otherwise released. Impacts will take into account sensitive populations and socio-economic factors, where applicable and to the extent data are available."*
>
> *–Cal/EPA working definition*

CCEEB agrees that the importance of cumulative impacts warrants special consideration and CCEEB supports a comprehensive approach to assessing the causes and solutions of cumulative impacts. However, CCEEB is concerned that the approach proposed by staff is unnecessarily narrow. Focusing on one piece of the puzzle—in this case, only permitted sources—fails to address the "cumulative" part of cumulative impacts. Instead, this narrow focus risks the prospect of penalizing those permitted that have already contributed their fair share of emission reductions for the benefit of air quality in the basin. As the District knows, permitted sources account for 2%-6% of the risk from air toxics, so even eliminating all stationary sources would achieve only a marginal benefit to public health.

The underlying challenge is how to address problems like cumulative impacts within the confines of our existing regulatory system—that is, fixing gaps in decision-making processes. While it is tempting to simply make current and new rules more stringent, this ignores the broader systemic failures that got us here in the first place, and may not even result in improved public health outcomes.

At the very least, all air emission source categories must be considered: stationary, mobile, and indirect. To the fullest extent possible, each source category should be responsible for its "fair share" of emission reductions, based on sound scientific analysis. For sources that lie outside of the District's jurisdiction, responsible agencies should be brought into the process and made partners in this work. Land-use planning and transportation planners must be part of the discussion, too, for surely they play a role in addressing cumulative impacts.

Differential Toxic Fees

If additional funding or a new funding source is needed, the District should evaluate all funding mechanisms including existing fee and tax revenues. Any funding mechanism that is predicated on the "polluter pays" principle should ensure that each source category pays its fair share and that no source category is expected to subsidize reductions in another. Since mobile sources are 94% of the risk from air toxics, we are troubled that staff only proposes fees for permitted sources (2%-6% of risk). Notwithstanding the extraordinary demands on existing mobile source revenues, the existence of these revenue mechanisms should not be overlooked when discussing solutions to cumulative impacts, the principle cause of which are mobile sources.

With regard for any potential stationary source fee mechanism, the District should not invent another fee system. Rather, the District should utilize its existing fee structure, directing fees as needed to the most cost-effective measures for reducing cumulative impacts. This results in greater uniformity across the entire basin. As new communities are added to the program, fees will not need to be restructured block-by-block or facility-by-facility, resulting in a confusing patchwork of tiered fees.

The District should evaluate how a cumulative-impact-based toxic fee interacts with CEQA mitigation fees and local government authority. For example, the District could inadvertently discourage development in areas in which local government is trying to encourage economic growth. Coordination between the District and local land use authorities may also be necessary to ensure that permitted sources are not assessed duplicate fees used ostensibly for the same purpose.

Differential Requirements through Source-Specific Alternative Assessments

(See comments under Source-Specific Programs)

Monitoring and Enforcement

Enhanced Enforcement Program (ENFORCEMENT-01)

CCEEB supports this section as we currently understand it, but note a lack of detail. Improving district communication with and response to communities is an important foundation to the Plan, without which, other measures will surely fail.

Enhanced Community Response (ENFORCEMENT-02)

Accurately verifying and responding to community complaints is of utmost importance. For the greatest effectiveness, the geographic area for each hot list area should be finely drawn in order to maximize limited resources. For example, if a "hot" spot covered multiple point sources or multiple source categories, then resources become diffused and enhanced enforcement may not be effective. Likewise, CCEEB would be concerned if facilities would arbitrarily fall under enhanced enforcement because of their type of operations rather than their complaint record or actual emissions history.

We are concerned with the proposal to recognize clean facilities. Past efforts to do this have failed to devise commonly acceptable criteria by which to define what is "clean". Criteria must recognize differences in size and complexity from site-to-site. CCEEB opposes any criteria based on overall emissions.

Source-Specific Programs

Facilities Using Acutely Hazardous Materials (STATIONARY-04)

Several other stakeholders have commented regarding their specific concerns to this section. CCEEB supports the argument that other programs and agencies already regulate the use of hazardous materials and that new oversight by the District seems duplicative. The District should first identify what regulatory gaps it is trying to fill and then coordinate with responsible agencies, should a need arise.

More generally, CCEEB believes that regulations should be based on risk management and not outright chemical bans. Chemicals are not inherently risky. Rather, risks result from a combination of several factors including a chemical's potential hazard, potential routes of exposure, and dose-response relationships.

If the District does move in favor of chemical-by-chemical bans, then CCEEB strongly encourages staff to employ full life-cycle analysis that takes into account the concepts of "sustainable chemistry". Sustainable chemistry focuses on the end application or service delivered, comparing all of the potential options (materials and processes) across the full life-cycle. However, we believe that this full scope of evaluation falls well outside of the District's primary mission; the objectives of this section can better be met through enhancing inter-agency coordination and partnership.

Agency Coordination

In general, CCEEB strongly supports measures that improve district coordination with local government and other agencies. Whenever possible, the District should attempt to leverage existing programs and funding sources by building partnerships with other authorities.

Staff could include greater specificity as to which local government entities (e.g., MTA, planning commissions, etc.) and which agencies (e.g., Air Resources Board, Department of Toxic Substances Control, Office of Environmental Health Hazard Assessment, etc.) might be included and at which point in its processes.

Nuisance

CCEEB recognizes that odors contribute to the "cumulative impact" borne by a community and, as such, should be a consideration. We are interested to learn more about what direction staff might take, especially given the highly subjective nature of nuisance complaints and the potential for abuse. We note that nuisance is defined in California Civil Code § 3479 and regulated under Health and Safety Code § 41700 and expect that any district rule will be consistent with State law.

CCEEB is interested to learn more about how the District might copy the nuisance rule employed by the Bay Area air district and what changes this would make to existing practices. An important aspect of the Bay Area approach is that inspectors attempt to verify odors immediately following complaints. Sufficient safeguards should be built into any nuisance rule so that it cannot be abused.

We would disagree, however, with rules that presume a problem exists based on a given category of sources or facilities, especially if this results in increased stringency even in circumstances where no nuisance has been reported.

Education and Outreach

Whenever practical, the District should partner with outside organizations or programs dedicated to environmental and public health information and education. Partnerships greatly increase both the quality and reach of public education and outreach. Community groups and associations are another good conduit for information to the public and can certainly play a significant advisory role.

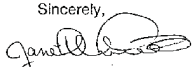
Review Procedure

CCEEB believes it is important that there continue to be open discussion and ample opportunity for review and comment. The District's process for the development of the CCP should ensure that the following principles are adhered to:

- Continued monthly meetings with the CCP Working Group.
- District to release the draft CCP.
- District to hold a public CCP Working Group meeting no earlier than seven days after releasing the draft plan.
- District to provide 21-day comment period starting the day after the public meeting of the CCP Working Group.
- The District will place all comments on the CCP website.
- The final staff report should contain a "response to comments" section.

We look forward to ongoing discussions with the District, its staff, and other interested stakeholders as the Plan is developed. We hope these comments are productive and constructive. Thank you.

Sincerely,



Janet Whittick
CCEEB

APPENDIX F

GLOSSARY

2010 Clean Communities Plan
Glossary

Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987, Connelly) is an Assembly Bill which was enacted in 1987, and requires stationary sources to report the types and quantities of certain substances routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, to identify facilities having localized impacts, to ascertain health risks, to notify nearby residents of significant risks, and to reduce those significant risks to acceptable levels.

California Environmental Quality Act (CEQA) is a statute that requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible. CEQA was adopted in 1970 and intended to: inform governmental decision-makers and the public about potential environmental effects of a project; identify ways to reduce adverse impacts; offer alternatives to the project; and disclose to the public why a project was approved.

Cancer Risk is the increased probability that an individual exposed to an average air concentration of a chemical will develop cancer when exposed over 70 years. Cancer risks are often expressed on a per-million basis for comparative purposes. As an example, a cancer risk of 100 in a million at a location means that the individuals staying at that location for 70 years have a 100 in a million chance of contracting cancer. (Multiple Air Toxics Exposure Study [MATES-II], Final Report, SCAQMD, March 2000)

Cumulative Air Pollution Impact is an adverse health effect, risk or nuisance from exposure to pollutants released into the air from multiple air pollution sources. (White Paper on Potential Control Strategies to Address Cumulative Impacts From Air Pollution, SCAQMD, August 2003)

Environmental Justice means the equitable environmental policymaking and enforcement to protect the health of all persons who live or work in the AQMD, regardless of age, culture, ethnicity, gender, race, socioeconomic status, or geographic location, from the health effects of air pollution. (White Paper on Potential Control Strategies to Address Cumulative Impacts From Air Pollution, SCAQMD, August 2003)

Health Risk Assessment means a detailed comprehensive analysis prepared to evaluate and predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations and to assess and quantify both the individual and population wide health risks associated with those levels of exposure. (Air Toxics "Hot Spots" Information and Assessment Act of 1987, CA Health and Safety Code, Part 6, Division 26, Section 44306)

Multiple Air Toxics Exposure Study (MATES) is a series of three studies conducted to quantify the magnitude of

population exposure risk from existing sources of selected toxic air contaminants in the South Coast Air Quality Management District.

Sensitive Receptor locations include schools, hospitals, convalescent homes, day-care centers, and other locations where children, chronically ill individuals, or other sensitive persons could be exposed. (Risk Assessment Procedures for Rules 1401 and 212, Version 7.0, SCAQMD, July 2005)

Toxic Air Contaminant (TAC, or "Air Toxic") is an air pollutant which may cause or contribute to an increase in mortality or serious illness, or which may pose a present or potential hazard to human health. (Rule 1401 – New Source Review of Toxic Air Contaminants, SCAQMD, September 2010)

SUBJECT: **NOTICE OF EXEMPTION FROM THE CALIFORNIA ENVIRONMENTAL QUALITY ACT**

PROJECT TITLE: **2010 CLEAN COMMUNITIES PLAN**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, the South Coast Air Quality Management District (SCAQMD) is the Lead Agency and will prepare a Notice of Exemption for the project identified above.

The SCAQMD has reviewed the proposed project pursuant to the CEQA Guidelines §15002(k)(1), the first step of a three-step process for deciding which document to prepare for a project subject to CEQA. This review indicates that the plan is not a project under CEQA. The basis for this conclusion is as follows. The SCAQMD Board has made a preliminary decision to accept the draft proposal. That preliminary decision does not commit the agency to a definite course of action and, therefore, does not constitute an approval under CEQA. As a result, the acceptance of this plan will not have a legally binding effect on later activities.

Even if the acceptance of the plan may be considered a project, review of the proposed project indicates it is also statutorily exempt from CEQA pursuant to state CEQA Guidelines §15262. The project involves a planning study for possible future actions, which the agency or Board has not approved, adopted or funded. The intent of the plan is to provide guidance for potential future actions anticipated to result in environmental benefits by reducing toxic emissions and improving human health. Possible future actions proposed in the plan, if determined to be feasible and within the authority of the SCAQMD, will be brought back to the Board for approval and will be assessed for potential environmental impacts at that time.

A Notice of Exemption has been prepared pursuant to CEQA Guidelines §15062 – Notice of Exemption. The Notice of Exemption will be filed with the county clerks of Los Angeles, Orange, Riverside and San Bernardino counties immediately following adoption.

Any questions regarding this Notice of Exemption should be sent to Jeff Inabinet (c/o Planning, Rule Development & Area Sources) at the above address. Mr. Inabinet can also be reached at (909) 396-2453.

Date: November 5, 2010 **Signature**:

Steve Smith, Ph.D.
Program Supervisor
CEQA Unit
Planning, Rule Development &
Area Sources

Reference: California Code of Regulations, Title 14

NOTICE OF EXEMPTION

To:	County Clerks of Los Angeles, Orange, Riverside, San Bernardino	**From:**	South Coast Air Quality Management District 21865 Copley Drive Diamond Bar, CA 91765

Project Title:

2010 Clean Communities Plan (CCP, formerly the Air Toxics Control Plan)

Project Location:

South Coast Air Quality Management District (SCAQMD) area of jurisdiction consisting of the four-county South Coast Air Basin (Orange County and the non-desert portions of Los Angeles, Riverside and San Bernardino counties), and the Riverside County portions of the Salton Sea Air Basin and the Mojave Desert Air Basin.

Description of Nature, Purpose, and Beneficiaries of Project:

The 2010 CCP is a planning document that outlines the overall control strategy for the SCAQMD's Air Toxics Control Program (ATCP). The CCP is the continuing effort to update the ATCP developed in 2000 and the subsequent addendum in 2004. The objective of the 2010 CCP is to reduce exposure to toxic air contaminants beyond that which would be accomplished through the implementation of current programs including local, state and federal efforts. The 2010 CCP utilizes a variety of implementation approaches and tools to address exposure to air toxics at the community level and develop solutions. The CCP is an action plan which identifies activities for the public, community representatives, agencies, elected officials and regulated industries to help identify air quality issues in their neighborhoods and work together to develop solutions.

Public Agency Approving Project:	**Agency Carrying Out Project:**
South Coast Air Quality Management District	South Coast Air Quality Management District

Exempt Status:

Three Step Process [CEQA Guidelines §15002(k)(1)]

Statutory Exemption – Feasibility and Planning Studies [CEQA Guidelines §15262]

Reasons why project is exempt:

The CCP contains air toxic control strategies that are not required by law or any other public agencies. The action taken by the Governing Board will be to accept the plan, which does not constitute adoption, approval or funding. Consequently, the plan will not have a legally binding effect on later activities. Therefore, the plan does not constitute a "project" and thus, no CEQA analysis is required. Further, the control strategies in the plan are, in effect, planning studies for possible future actions. As a result, the 2010 CCP is statutorily exempt from CEQA pursuant to CEQA Guidelines §15262. Individual CEQA analyses would be required for individual measures at the time of their development.

Certification Date:

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 36

PROPOSAL: Adopt Proposed Rule 1714 - Prevention of Significant Deterioration for Greenhouse Gases, and Amend Regulation XXX –Title V Permits

SYNOPSIS: On June 3, 2010, U.S. EPA promulgated a "tailoring rule" establishing BACT and permitting requirements for greenhouse gas (GHG) emissions under Prevention of Significant Deterioration (PSD), and Title V programs. U.S. EPA proposed a phased approach to the regulation and permitting of GHG sources. Staff is proposing a new rule for PSD for GHGs (PR 1714), and amendments to Title V (Regulation XXX) programs to implement the federal provisions.

COMMITTEE: Stationary Source, September 24, 2010, and October 15, 2010, Reviewed

RECOMMENDED ACTION:
Adopt the attached resolution:

1) Certifying the Notice of Exemption for Proposed Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, and Proposed Amended Regulation XXX – Title V Permits; and
2) Adopting Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, and Amending Regulation XXX – Title V Permits.

Barry R. Wallerstein, D.Env.
Executive Officer

LT:JW:RP:PP

Background

The District staff is proposing to amend Regulations XVII – Prevention of Significant Deterioration (PSD), and XXX – Title V Permits, to implement federally mandated requirements for greenhouse gases (GHG) for the PSD and Title V programs. These

federal programs are implemented by the District through the enforcement of these two regulations. Regulation XVII amendments will incorporate federal requirements for GHGs by reference into a new rule, Rule 1714 – PSD for GHGs. Regulation XXX amendments would add federal GHG requirements into the current District rules.

U.S. EPA promulgated regulations regarding stationary source permitting and BACT requirements for GHGs which was necessary because of EPA's action in response to *Massachusetts vs. EPA 549 U.S. 497 (2007).* On April 2, 2007, the U.S. Supreme Court found that GHGs are air pollutants under CAA section 302(g). As a result, the Supreme Court found that EPA was required to determine, under CAA section 202(a) whether (1) GHGs from new motor vehicles cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare, or (2) the science is too uncertain to make a reasoned decision. After issuing a proposal and receiving public comment, the EPA Administrator signed two distinct findings regarding GHGs under CAA section 202(a) on December 7, 2009: Endangerment Finding and Cause or Contribute Findings. Because these findings were made under the Clean Air Act, stationary sources are then subject to regulation for GHGs as air pollutants. U.S. EPA published a GHG tailoring rule on June 3, 2010 (75 FR31514) to establish reasonable thresholds for Title V and PSD for GHGs.

The PSD program is a federal preconstruction review and permitting program (40 CFR Part 52) for attainment and unclassified air contaminants applicable to major stationary sources and major modifications. The District currently has partial delegation to implement this program through Regulation XVII – PSD.
Title V is a federal operating permit program, 40 CFR Part 70, implemented by state and local agencies. The District implements federal Title V requirements through Regulation XXX – Title V Permits, which has been approved by U.S. EPA but is not in the SIP.

Regulation Proposal
The proposed adoption of PR 1714 – PSD for GHGs, and amendments to XXX - Title V Permits, are necessary to implement federal changes published June 3, 2010 and effective August 2, 2010. The first phase-in date for implementation of requirements is January 2, 2011, followed by a second step implementation date of July 1, 2011. The proposed amended rules reflect these time-frames.

Regulation XVII – Prevention of Significant Deterioration
There is one new rule proposed for adoption in Regulation XVII - PSD, PR 1714 – PSD for GHGs. This rule adopts by reference 40 CFR Part 52.21, the federal requirements for the PSD program, and specifically exempts those sections of the federal regulation that are not applicable to GHGs. Thus, PSD will include BACT for GHGs, once it is developed by the U.S. EPA, or as determined by AQMD on a case-by-case basis, and public notification and participation.

The thresholds are as follows:

Step 1, as of January 2, 2011 – source already subject to the PSD regulation for new construction or a modification for any attainment pollutant, and having an increase in GHG emissions on a carbon dioxide equivalent (CO_2e) basis (Global Warming Potential [GWP] applied) $\geq$75,000 tpy CO_2e **and** with a net emission increase greater than zero of GHG emissions on a mass basis (no GWP applied), will be required to undergo assessment of BACT for GHG emissions.

Step 2, as of July 1, 2011 - all sources subject to the regulation through Step 1 will continue to be subject to the rules and additionally, sources with a potential to emit (PTE) GHGs $\geq$100,000 tpy CO_2e and emitting GHGs or an NSR pollutant above the 100/250 tpy (mass based) statutory thresholds, will be subject to the regulation. Furthermore, on or after the July 1, 2011 date, modifications of a "major source", including those determined to be a major source solely on the basis of GHG emissions, with a net emissions increase of GHGs of $\geq$75,000 CO_2e (GWP applied), and a net increase in GHGs calculated on a mass basis (no GWP applied) equal to or exceeding 0 tpy, will be subject to the regulation. These facilities will be subject to BACT for GHGs. The U.S. EPA regulation also states that sources emitting <50,000 tpy CO_2e would not be subject to the regulation until at least April 30, 2016. Additional federal rulemaking would be necessary to regulate such sources.

Regulation XXX – Title V Permits

Amendments to Regulation XXX are proposed for seven of the nine rules in the regulation. PAR 3000 – General, is proposed for amendment by adding three definitions. PAR 3001 – Applicability, is proposed to be amended by adding the January 2, 2011 and July 1, 2011 dates for including GHGs in Title V permits. PAR 3002 – Requirements, is proposed to be amended by adding the phase-in dates and threshold levels. PAR 3003 – Applications, PAR3005 – Permit Revisions, and PAR3006 – Public Participation, are proposed for amendment only due to references in those rules to definitions in PAR 3000 – General, and the proposed changes in the numbering sequence in that rule. Proposed Amended Rule 3008 – Potential to Emit Limitations, authorizes sources to cap their PTE to avoid applicability of Title V based solely on GHG emissions.

Currently, the District has issued approximately 500 active Title V permits. Staff has identified 55 existing facilities which may potentially be impacted by the Title V federal regulations. These facilities are primarily classified in the following industries: cement, cogeneration units, electric power generation, hydrogen plant, inorganic chemical manufacturing, and petroleum refineries. This information is based on GHG emissions reported to CARB for 2008. Staff is not able to estimate the number of facilities that may be subject to PSD.

Public Process
A public workshop was held on September 9, 2010. Comments received through the close of comments September 17, 2010 are addressed in the draft Staff Report (See Response to Comments). A public consultation meeting was held October 12, 2010. EPA and ARB staff reviewed the draft rules and provided informal comments.

CEQA and Socioeconomic Impacts
SCAQMD staff has reviewed the Proposed Rule 1714 – PSD for Greenhouse Gases, and the proposed amendments to Regulation XXX – Title V Permits, and determined them to be exempt from CEQA requirements pursuant to State CEQA Guidelines §15268 – Ministerial Projects. A Notice of Exemption will be filed with the county clerks immediately following adoption of the proposed project.

AQMP and Legal Mandates
The District is adopting PR 1714 – PSD for GHGs, and amending PAReg XXX – Title V Permits, to implement the federal requirements for GHGs. These federal requirements are not included in the AQMP, but are federal requirements under the Clean Air Act, and upon adoption will be forwarded to CARB and U.S. EPA for approval, and in the case of Rule 1714, for inclusion in the SIP.

Implementation Plan
The proposed amendments do not materially affect the structure or function of existing programs associated with the implementation of Regulations XVII – Prevention of Significant Deterioration, and XXX – Title V Permits, or any other AQMD rules. Staff is available to assist facilities covered by the proposed amendments.

Resource Impacts
Current AQMD resources are expected to be sufficient to implement and enforce Proposed Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, and Proposed Amended Regulation XXX – Title V Permits.

SUMMARY OF PROPOSAL

Proposed Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases; and Proposed Amended Regulation XXX – Title V Permits

- PR 1714 – adopts by reference 40 CFR Part 52.21 (PSD) and excludes those portions not applicable to GHGs.

- PAR 3000 – General – Adds GHGs to the regulation's purpose; adds definitions for carbon dioxide equivalent, global warming potential, and greenhouse gas; amends definition of minor permit revision to include sources with $\leq$ 75,000 tpy CO_2e.

- PAR 3001 – Applicability – Adds applicability of GHG requirements to the Title V program.

- PAR 3002 – Requirements – Adds compliance dates and thresholds for GHGs for Title V program.

- PAR 3003 – Applications; PAR 3005 – Permit Revisions; PAR 3006 – Public Participation – Updates numbering due to changes in other rules.

- PAR 3008 – Potential to Emit Limitations – Adds applicability for PTE limitations; adds de minimis facility threshold for GHG; adds emission limitation threshold for GHGs.

ATTACHMENT B

KEY ISSUES AND RESPONSES

Proposed Rule 1714 –PSD for GHGs, and Proposed Amended Regulation XXX – Title V Permits	
These amendments and adoption of a proposed rule will implement Federal requirements for GHGs for the Federal Prevention of Significant Deterioration, and Title V programs.	
• BACT for GHGs not well defined	Only BACT and public notice/participation will be required; no modeling will be required. Federal BACT currently being developed and will be applied to sources of GHG emissions; where AQMD must make case-by-case BACT determinations staff will work closely with affected facilties.
• CEQA and Socioeconomic Analyses should be done	Adopting federal requirements; these analyses are not required. The project is exempt from CEQA because implementation is ministerial. A socioeconomic assessment is not required because sources must comply, whether through AQMD's program or U.S. EPA's program.

RESOLUTION NO. 2010-

A Resolution of the South Coast Air Quality Management District Board certifying the Notice of Exemption for Proposed Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, and the proposed amendments to Regulation XXX – Title V Permits.

A Resolution of the South Coast Air Quality Management District Board adopting PR 1714 - Prevention of Significant Deterioration for Greenhouse Gases, and amending Regulation XXX – Title V Permits.

WHEREAS, the AQMD has reviewed the proposed project pursuant to California Environmental Quality Act (CEQA) Guidelines Section 15002(k)(1) and has determined that the project is exempt from the requirements of CEQA as a ministerial project pursuant to state CEQA Guidelines Section 15268; and

WHEREAS, the proposed amendments are categorically exempt pursuant to CEQA Guidelines Section 15308 – Class 8 Categorical Exemption because the adoption by reference of 40 CFR Part 52.21 and implementation of federal requirements through amendments to Regulation XXX, are considered an action by a regulatory agency to enhance and protect the environment; and

WHEREAS, the AQMD staff has prepared, pursuant to CEQA Guidelines Section 15062, a Notice of Exemption for Proposed Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases and Proposed Amended Regulation XXX – Title V Permits; and

WHEREAS, the South Coast Air Quality Management District Board obtains its authority to adopt, amend, or repeal rules and regulations from Sections 40000, 40001, 40440, 40725-40728, 42300 *et seq*., of the California Health and Safety Code; and

WHEREAS, the South Coast Air Quality Management District Board has determined that a need exists to adopt Proposed Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, and amend Regulation XXX –

Title V Permits, to provide for the local enforcement of these federal standards and as required under EPA regulations; and

WHEREAS, the South Coast Air Quality Management District Board has determined that Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, as proposed, and Regulation XXX – Title V Permits, as proposed to be amended, are written or displayed so that their meaning can be easily understood by the persons directly affected by them; and

WHEREAS, the South Coast Air Quality Management District Board has determined that, Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, as proposed, and Regulation XXX – Title V Permits as proposed to be amended, are in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, or state or federal regulations; and

WHEREAS, the Health and Safety Code Section 40727.2 requires that the South Coast Air Quality Management District prepare a written analysis of existing federal air pollution control requirements whenever it adopts or amends a rule imposing new control requirements. However, if the rule is a verbatim adoption or incorporation by reference of a federal standard, the District may comply with this requirement by making a finding that the proposed rule falls within subsection Health and Safety Code 40727.2(g). The District finds that this rule is an adoption by reference of the federal GHG requirements, and that this rule falls within Health and Safety Code Section 40727.2(g); and

WHEREAS, a public hearing has been properly noticed in accordance with the provisions of Health and Safety Code Section 40725; and

WHEREAS, the South Coast Air Quality Management District Board has held a public hearing in accordance with all provisions of law; and

WHEREAS, the South Coast Air Quality Management District Board, in amending and adopting these regulations, references the following statutes which the District hereby implements, interprets, or makes specific: Clean Air Act §§160 *et seq.* (42 U.S.C. §7470 *et seq.*), (Prevention of Significant Deterioration), §§ 501 *et seq.* (42 U.S.C. §7661 *et seq.* (Permits);

WHEREAS, the South Coast Air Quality Management District Board finds that Proposed Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, and the proposed amendments to Regulation XXX – Title V Permits, do not impose the same requirements as an existing state or federal

regulations, and are necessary and proper to execute the powers and duties granted to, and imposed upon, the district; and

WHEREAS, the Governing Board of the South Coast Air Quality Management District finds that Proposed Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, and the proposed amendments to Regulation XXX – Title V Permits , are proposed to implement and enforce federally adopted regulations, which protect the environment; and

WHEREAS, the Governing Board of the South Coast Air Quality Management District has determined that the U.S. EPA has already amended 40 CFR Parts 52 and 70 so that these federal regulations are currently in effect and that the adoption of the proposed amendments would merely update District Regulations to reflect current U.S. EPA requirements, and therefore will not affect air quality or emission limitations; and

WHEREAS, the AQMD Governing Board specifies the Director for Proposed Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, and Proposed Amended Regulation XXX – Title V Permits, as the custodian of the documents or other materials which constitute the record of proceedings upon which the adoption of this proposed amendment is based, which are located at the South Coast Air Quality Management District, 21865 Copley Drive, Diamond Bar, California; and

NOW, THEREFORE, BE IT RESOLVED, that the South Coast Air Quality Management District Board does hereby certify the Notice of Exemption for Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, as proposed, and Regulation XXX – Title V Permits, as proposed to be amended, completed in compliance with CEQA Guidelines Sections 15002(k)(1) - Three Step Process, 15268 - Ministerial Projects and §15308 - Class 8 Categorical Exemption. This information was presented to the Governing Board, whose members reviewed, considered, and approved the information therein prior to acting on Proposed Rule 1714 and Proposed Amended Regulation XXX; and

BE IT FURTHER RESOLVED, that the South Coast Air Quality Management District Board finds that Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, as proposed, incorporates by reference federal requirements for including GHG emissions in PSD program and Regulation XXX – Title V Permits, as proposed to be amended, incorporates federal requirements for GHGs into rule language for the Title V program; and

BE IT FURTHER RESOLVED, that the South Coast Air Quality Management District Board does hereby amend and adopt, pursuant to the authority granted by law, Rule 1714 – Prevention of Significant Deterioration for Greenhouse Gases, and Regulation XXX – Title V Permits, as set forth in the attached.

DATE:_____

_____
CLERK OF THE BOARDS

PROPOSED RULE 1714 Prevention of Significant Deterioration for Greenhouse Gases

(a) Purpose

This rule sets forth preconstruction review requirements for greenhouse gases (GHG). The provisions of this rule apply only to GHGs as defined by EPA to mean the air pollutant as an aggregate group of six GHGs: carbon dioxide, nitrous oxide, methane, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. All other attainment air contaminants, as defined in Rule 1702 subdivision (a), shall be regulated for the purpose of Prevention of Significant Deterioration (PSD) requirements pursuant to Regulation XVII, excluding Rule 1714.

(b) Applicability

The provisions of this rule shall apply to any source and the owner or operator of any source subject to any GHG requirements under 40 Code of Federal Regulations Part 52.21 as incorporated into this rule.

(c) Incorporation by Reference

Except as provided below, the provisions of Title 40 of the Code of Federal Regulations (CFR) Part 52.21, are incorporated herein by reference and made part of the Rules and Regulations of the South Coast Air Quality Management District.

(1) The following subsections of 40 CFR Part 52.21 are excluded: (a)(1), (b)(13), (b)(14), (b)(15), (b)(55-58), (c), (d), (e), (f), (g), (h), (i)(1)((i-v) and (ix-xi), (i)(6-8), (k), (l), (m), (o), (p), (q), (s), (t), (u), (v), (w), (x), (y), (z), (aa), and (cc).

(2) The following term found in 40 CFR Part 52.21(b) is revised as follows:

(A) The term "administrator" means:

(i) "federal administrator" in 40 C.F.R. 52.21(b)(17), (b)(37)(i), (b)(43), (b)(48)(ii)(c), (b)(50)(i), and (b)(51); and

(ii) Executive Officer elsewhere, as defined in Rule 102.

(d) Requirements

(1) An owner or operator must obtain a PSD permit pursuant to this rule before beginning actual construction, as defined in 40 CFR 52.21 (b)(11), of a new major stationary source or major modification to an existing major source as defined in 40 CFR 52.21 (b)(1) and (b)(2), respectively.

(2) Not withstanding the provisions of any other District Rule or Regulation, the Executive Officer shall require compliance with this rule, if applicable, prior to issuing a PSD permit for GHG emissions as required by CAA Section 165.

(e) Public Participation

For major stationary sources subject to Rule 1714, after receipt of a complete application, the Executive Officer shall:

(1) Make a preliminary determination whether construction shall be approved, approved with conditions, or disapproved;

(2) Make available for public review a copy of materials the applicant submitted, a copy of the preliminary determination, a copy of the proposed permit, and a copy or summary of other materials, if any, considered in making the preliminary determination. The confidentiality of trade secrets shall be considered in accordance with Section 6254.7 of the Government Code;

(3) Notify the public, by advertisement in a newspaper of general circulation in the District, of the application, the preliminary determination, the degree of increment consumption that is expected from the source or modification, whether an alternative to an EPA approved model was used, and of the opportunity for written public comment. The applicant shall be responsible for the distribution of the public notice to each address within a 1/4-mile radius of the project or such other greater area as determined appropriate by the Executive Officer. The applicant shall provide verification to the Executive Officer that the public notice has been distributed as required by this Section. The notice shall provide 30 days from date of publication for the public to submit written comments;

(4) Send a copy of the notice of public comment to the applicant, the EPA Administrator, and to officials and agencies having cognizance over the location where the proposed construction would occur as follows: any other state or local air pollution control agencies, the chief executives of the city and county where the source would be located, any comprehensive regional land use planning agency, and any State or Federal Land Manager, or Indian Governing body whose lands may be affected by emissions from the source or modification;

(5) Provide opportunity for a public hearing for interested persons to appear and submit written or oral comments on the air quality impact of the source, alternatives to it, the control technology required, and other appropriate considerations;

(6) Consider all written comments submitted within a time specified in the notice of public comment and all comments received at any public hearing(s) in making a final decision on the approvability of the application. The Executive Officer shall make all comments available for public inspection in the same locations where the Executive Officer made available preconstruction information relating to the proposed source or modification.

(7) Make a final determination whether construction should be approved, approved with conditions, or disapproved; and

(8) Notify the applicant in writing of the final determination and make such notification available for public inspection at the same location where the Executive Officer made available preconstruction information and public comments relating to the source.

PROPOSED AMENDED RULE 3000 GENERAL

(a) Purpose

The Title V Permit system is the air pollution control permit system required to implement the federal Operating Permit Program as required by Title V of the federal Clean Air Act as amended in 1990 and to implement requirements for greenhouse gases pursuant to 40 CFR Parts 70. This regulation defines permit application and issuance procedures as well as compliance requirements associated with the program.

(b) Definitions

(1) ADMINISTRATIVE PERMIT REVISION means any Title V permit revision to:

(A) correct typographical errors;

(B) record facility ownership and information changes which:

(i) identify changes in the name, address, or phone number of any person identified in the permit, or provide a similar minor administrative change at the source; or,

(ii) change ownership or operational control of a source where the District determines that no other change in the permit is necessary, provided that a written agreement containing a specific date for transfer of permit responsibility, coverage, and liability between the current and new holder of the Title V permit has been submitted to the District;

(C) impose requirements for more frequent monitoring, recordkeeping, or reporting by the permittee;

(D) issue a final permit to operate for equipment previously issued a Title V permit to construct, with no change in permit terms and conditions except for the:

(i) removal of permit to construct terms or conditions which are no longer applicable; or,

(ii) inclusion of changes consistent with subparagraphs (b)(1)(A), (b)(1)(B), (b)(1)(C), (b)(1)(E), (b)(1)(F), and (b)(1)(G) of this rule;

(E) annually record revised annual Allocations for each remaining year of the permit term for facilities subject to RECLAIM as a result of the trade, sale, or purchase of RECLAIM Trading Credits (RTC) in compliance with Rule 2007 - Trading Requirements, provided New Source Review is not triggered pursuant to Rule 2005 - RECLAIM New Source Review;

(F) remove equipment, provided that equipment removal does not result in an increase in emissions; or,

(G) move equipment within a facility provided that there is no change to permit conditions and that such a move does not require an evaluation of regulatory requirements.

(2) AFFECTED SOURCE means a facility as defined under the acid rain provisions of Title IV of the federal Clean Air Act and Title 40, Part 70 of the Code of Federal Regulations (40 CFR Part 70), Section 70.2.

(3) AFFECTED STATES means all States:

(A) whose air quality may be affected and that are contiguous to the State in which a Title V permit, permit revision or permit renewal is being proposed; or

(B) that are within 50 miles of the permitted facility.

(4) APPLICABLE REQUIREMENTS means all requirements as defined in 40 CFR Part 70, Section 70.2.

(5) CARBON DIOXIDE EQUIVALENT (CO_2e) means the amount of carbon dioxide (CO_2) that would have the same global warming potential (see Table 2 of this rule) as a given amount of another greenhouse gas.

(~~5~~6) COMPLIANCE DOCUMENTS means all permits, compliance plans, schedules of compliance, approved variances, alternative operating conditions, orders for abatement, and all monitoring and compliance reports required by the Title V permit, except for information entitled to confidential treatment pursuant to Section 114(c) of the federal Clean Air Act. The contents of a facility permit shall not be entitled to confidential treatment.

(~~6~~7) DE MINIMIS SIGNIFICANT PERMIT REVISION means any Title V permit revision where the cumulative emission increases of non-RECLAIM pollutants or hazardous air pollutants (HAP) from these permit revisions during the term of the permit are not greater than any of the emission threshold levels in Table 1.

Table 1
De Minimis Emission Threshold Level

Air Contaminant	Daily Maximum in Pounds Per Day
HAP	30
VOC	30
NO_x	40
PM-10	30
SO_x	60
CO	220

For the purposes of this paragraph, the de minimis levels for HAP and volatile organic compounds (VOC) are not additive if the HAP is a VOC. The de minimis levels for HAP and particulate matter with an aerodynamic diameter smaller than or equal to 10 microns (PM-10)are not additive if the HAP is a PM-10. The HAP de minimis level in this section shall be superseded by any lower HAP de minimis level promulgated by the United States Environmental Protection Agency (EPA) Administrator. De minimis significant permit revisions shall also meet the requirements of clauses (b)(~~12~~15)(A)(i), (ii), (iii), (iv), (vii), (viii) and (ix) of this rule.

(~~7~~8) EFFECTIVE DATE means the date upon which the EPA Administrator deems the District Title V program approved on a full, partial or interim basis, whichever is earlier.

(~~8~~9) EMERGENCY means any situation arising from sudden and reasonably unforeseeable events beyond the control of the facility, including acts of God, which:

(A) requires immediate corrective action to restore normal operation; and

(B) causes the facility to exceed a technology-based emission limitation under the permit, due to unavoidable increases in emissions attributable to the emergency; and

(C) is not caused by improperly designed equipment, lack of preventative maintenance, careless or improper operation, or operator error.

(~~9~~10) FACILITY means any permit unit or source, or grouping of permit units or sources, or other air contaminant-emitting activities which are located on

one or more contiguous properties within the District, in actual physical contact or separated solely by a public roadway or other public right-of-way, and are owned or operated by the same person (or by persons under common control) or an outer continental shelf (OCS) source as defined in 40 CFR Part 55, Section 55.2. Such above-described groupings, if on noncontiguous properties, but connected only by land carrying a pipeline, shall not be considered one facility. Equipment or installations involved in crude oil and gas production in Southern California coastal or OCS waters, and transport of such crude oil and gas in Southern California coastal or OCS waters, shall be included in the same facility which is under the same ownership or use entitlement as the crude oil and gas facility on-shore.

(~~10~~11) FUGITIVE EMISSIONS means those emissions which cannot reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.

(12) GLOBAL WARMING POTENTIAL means the capacity to heat the atmosphere, calculated as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram (kg) of a substance relative to that of 1 kg of CO_2. Global warming potential shall be calculated according to the factors for a 100-year time horizon, as listed in Table 2 of this rule.

(13) GREENHOUSE GAS (GHG) means carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), or perfluorocarbons (PFCs).

(~~11~~14) HAZARDOUS AIR POLLUTANT (HAP) means any pollutant on a list maintained by EPA pursuant to Section 112(b) of the federal Clean Air Act.

(~~12~~15) MINOR PERMIT REVISION means any Title V permit revision that:

(A) (i) does not require or change a case-by-case evaluation of: reasonably available control technology (RACT) pursuant to Title I of the federal Clean Air Act; or maximum achievable control technology (MACT) pursuant to 40 CFR Part 63, Subpart B;

(ii) does not violate a regulatory requirement;

(iii) does not require any significant change in monitoring terms or conditions in the permit;

(iv) does not require relaxation of any recordkeeping, or reporting requirement, or term, or condition in the permit;

(v) does not result in an emission increase of RECLAIM pollutants over the facility starting Allocation plus nontradeable Allocations, or higher Allocation amount which has previously undergone a significant permit revision process;

(vi) does not result in an increase in emissions of a pollutant subject to Regulation XIII - New Source Review or a hazardous air pollutant;

(vii) does not result in an increase in GHG emissions of >75,000 tpy CO_2e;

(viii) does not establish or change a permit condition that the facility has assumed to avoid an applicable requirement;

(~~viii~~ix) is not an installation of a new permit unit subject to a New Source Performance Standard (NSPS) pursuant to 40 CFR Part 60, or a National Emission Standard for Hazardous Air Pollutants (NESHAP) pursuant to 40 CFR Part 61 or 40 CFR Part 63; and,

(~~i~~x) is not a modification or reconstruction of an existing permit unit, resulting in new or additional NSPS requirements pursuant to 40 CFR Part 60, or new or additional NESHAP requirements pursuant to 40 CFR Part 61 or 40 CFR Part 63; or,

(B) incorporates an existing general permit, as defined in subdivision (e) of Rule 3004, and its associated requirements, into another Title V permit.

(~~13~~16) MOJAVE DESERT AIR BASIN means the region as defined in Section 60109 of Title 17 of the California Code of Regulations.

(~~14~~17) MODIFICATION means any physical change or change in the method of operation of any equipment. The following shall not be considered a modification:

(A) routine maintenance and repair;

(B) any change in operator or ownership of the facility;

(C) use of an alternative fuel as required by District rule or federal or State statute, regulation or law;

(D) an increase in the hours of operation or in the production rate, unless a unit specific permit condition limiting hours of operation, throughput or mass emissions would be exceeded; and

(E) for RECLAIM facilities, changes in material selection or formulation, if allowed without a permit revision under Regulation XX - RECLAIM.

(~~15~~18) MONITORING means any of the following: emission testing, continuous emissions monitoring, material testing, and instrumental and non-instrumental monitoring of process conditions.

(~~16~~19) OFF-ROAD MOBILE SOURCES means non-stationary devices powered by an internal combustion engine or motor rated at 50 horsepower or greater, used off public roads and solely at the facility to propel, move, or draw persons or property. Such devices include, but are not limited to: forklifts, motor graders, backhoes, excavators, dozers, trenchers, and tractors.

(~~17~~20) POTENTIAL TO EMIT means the maximum capacity of a facility to emit any air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of a facility to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation is enforceable by the EPA Administrator. The potential to emit limit for the equipment or emission types described by subparagraphs (b)(~~25~~28)(A) through (b)(~~25~~28)(E) of this rule shall not be included in a facility's potential to emit.

(~~18~~21) PROPOSED PERMIT means a permit prepared after evaluation by the District staff, for review by the EPA Administrator, the public, or affected States for an initial permit, permit renewal or permit revision.

(~~19~~22) RECLAIM FACILITY means any facility that is subject to the requirements of Regulation XX - Regional Clean Air Incentives Market (RECLAIM).

(~~20~~23) RECLAIM POLLUTANT means any pollutant that is subject to the requirements of Regulation XX - Regional Clean Air Incentives Market (RECLAIM), and that is emitted from a facility subject to RECLAIM for that pollutant.

(~~21~~24) REGULATED AIR POLLUTANT means any air pollutant as defined in 40 CFR Part 70, Section 70.2.

(~~22~~25) REGULATORY REQUIREMENTS means all applicable requirements, District Rules and Regulations, and all State requirements pertaining to the regulation of air contaminants.

(~~23~~26) RELOCATION means the removal of an existing equipment or source from one parcel of land in the South Coast Air Quality Management District and installation on another parcel of land where the two parcels are not in actual physical contact and are not separated solely by a public roadway or public right-of-way.

(~~24~~27) RENEWAL means the required updating of an existing Title V permit at the end of its term pursuant to Rule 3003 and subdivision (f) of Rule 3004 for the purpose of assuring that the issuance of such updated permit contains current regulatory requirements. Upon approval, a renewed permit will be granted for an additional permit term and may contain new regulatory requirements.

(~~25~~28) REPORTED EMISSIONS, for the purpose of applicability pursuant to Rule 3001 - Applicability, means the emissions data provided by the facility representative, pursuant to Rule 301 - Permit Fees, to the District and validated by the Executive Officer. The following types of reported emissions shall not be considered in determining whether a facility is required to obtain a Title V permit:

(A) Fugitive emissions of VOC, oxides of nitrogen (NO_x), oxides of sulfur (SO_x), carbon monoxide (CO) or PM-10 unless the source belongs to one of the categories listed in paragraph 2 of the definition of major source in 40 CFR Part 70, Section 70.2. Fugitive emissions of HAPs shall not be excluded from reported HAP emissions.

(B) Emissions from on-road and off-road mobile equipment, as defined in Rule 219 - Equipment Not Requiring A Written Permit Pursuant to Regulation II.

(C) Off-site emissions from portable equipment permitted to operate at various locations.

(D) Emissions from non-road engines, as defined by 40 CFR Part 89, Section 89.2, manufactured on or after November 15, 1990 or another date subsequently determined by EPA.

(E) Emissions from military tactical support equipment registered to operate state-wide pursuant to Article 5 - Portable Engine and Equipment Registration, Title 13 of the California Code of Regulations.

(~~26~~29) RESPONSIBLE OFFICIAL means:

(A) for a corporation: a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or a person who performs similar policy-making functions for the corporation, or a duly authorized representative provided the representative is responsible for the overall operational control of the facility, and either:

(i) the Executive Officer has approved a petition from the original responsible official to delegate this authority; or,

(ii) the facility employs more than 250 persons or has a gross annual sales or expenditures exceeding $25 million in second quarter 1980 dollars.

(B) for a partnership or sole proprietorship: general partner or proprietor, respectively.

(C) for a municipality, State, federal, or other public agency: a principal executive officer or ranking elected official.

(D) for Phase II Acid Rain facilities that do not meet the criteria in subparagraphs (b)(~~26~~29)(A) or (C) of this rule: the designated representative responsible pursuant to Title IV of the federal Clean Air Act.

(~~27~~30) SALTON SEA AIR BASIN means the region as defined in Section 60114 of Title 17 of the California Code of Regulations.

(~~28~~31) SIGNIFICANT PERMIT REVISION means any facility permit revision that is not eligible for administrative permit revision, minor permit revision, or de minimis significant permit revision procedures. Such revisions include any of the following:

(A) relaxation of any monitoring, recordkeeping, or reporting requirement, term, or condition in the Title V permit;

(B) the addition of equipment or modification to existing equipment or processes that result in an emission increase of non-RECLAIM pollutants or hazardous air pollutants (HAP) in excess of any of the emission threshold levels in Table 1 of paragraph (b)(~~6~~7) of this rule;

(C) cumulative emission increases of non-RECLAIM pollutants or hazardous air pollutants from de minimis significant permit revisions during the term of the permit, in excess of any of the emission threshold levels in Table 1 of paragraph (b)(~~6~~7) of this rule.

For the purposes of this subparagraph, the de minimis levels for HAP and VOC are not additive if the HAP is a VOC. The de minimis levels for HAP and PM-10 are not additive if the HAP is a PM-10. The HAP de minimis level in this section shall be superseded by any lower HAP de minimis level promulgated by the EPA Administrator, or;

(D) any modification at a RECLAIM facility that results in an emission increase of RECLAIM pollutants over the facility's starting Allocation plus the nontradeable Allocations;

(E) requests for a permit shield when such requests are made outside applications for initial permit or permit renewal issuance;

(F) any revision that requires or changes a case-by-case evaluation of: reasonably available control technology (RACT) pursuant to Title I of the federal Clean Air Act; or maximum achievable control technology (MACT) pursuant to 40 CFR Part 63, Subpart B;

(G) any revision that results in a violation of regulatory requirements;

(H) any revision that establishes or changes a permit condition that the facility assumes to avoid an applicable requirement;

(I) installation of new equipment subject to a New Source Performance Standard (NSPS) pursuant to 40 CFR Part 60, or a National Emission Standard for Hazardous Air Pollutants (NESHAP) pursuant to 40 CFR Part 61 or 40 CFR Part 63; or,

(J) modification or reconstruction of existing equipment, resulting in an emission increase subject to new or additional NSPS requirements pursuant to 40 CFR Part 60, or to new or additional NESHAP requirements pursuant to 40 CFR Part 61 or 40 CFR Part 63.

(~~29~~32) SOUTH COAST AIR BASIN means the region as defined in Section 60104 of Title 17 of the California Code of Regulations.

(~~30~~33) TEMPORARY SOURCE means equipment or a facility that operates at multiple temporary locations.

(~~31~~34) TITLE V means Title V of the federal Clean Air Act as amended in 1990 and the 40 CFR Part 70 EPA regulations promulgated to implement the Act.

(~~32~~35) TITLE V PERMIT means a facility operating permit issued pursuant to Regulation XXX.

(~~33~~36) TITLE V FACILITY means any facility that meets the criteria set forth in Rule 3001 - Applicability.

Global Warming Potentials (Federal Register/Vol. 74, No. 209 (October 30, 2009)

(Adopted October 8, 1993)(Amended August 11, 1995)
(Amended November 14, 1997)
PAR 3001E
November 5, 2010

PROPOSED AMENDED RULE 3001 APPLICABILITY

(a) Phase One Title V Permits

Operators of facilities that have, in 1992 or later, reported annual emissions equal to or greater than any of the threshold amounts shown in Table 1 shall submit initial Title V applications to the Executive Officer and obtain Title V permits in accordance with the timelines specified in Rule 3003 - Applications.

TABLE 1

Emission Threshold Levels for Facilities During Phase One

Based on Actual Reported Emissions in tons per year (tpy) per Facility Location

Pollutant	Actual Reported Emission Threshold Levels Per Facility Location		
	South Coast Air Basin(SOCAB) (tpy)	Riverside County Portion of Salton Sea Air Basin (SSAB) and Los Angeles County Portion of Mojave Desert Air Basin (MDAB) (tpy)	Riverside County Portion of Mojave Desert Air Basin (MDAB) (tpy)
VOC	8	20	80
NO_x	8	20	80
SO_x	80	80	80
CO	40	80	80
PM-10	56	56	80
Single HAP	8	8	8
Combination of HAPs	20	20	20

(b) Phase Two Title V Permits

(1) Operators of facilities, not subject to the provisions of subdivision (a) of this rule, with the potential to emit any regulated air pollutant at, or greater than, any of the threshold amounts shown in Table 2 shall submit to the Executive Officer applications for initial Title V permits in accordance with the timelines specified in Rule 3003 - Applications, and obtain Title

V permits within five years after the effective date, as defined in paragraph (b)(~~7~~8) of Rule 3000.

(2) For the purpose of this subdivision, the potential to emit for a RECLAIM pollutant from a RECLAIM facility is the higher of:

(A) the starting allocation plus nontradeable credits; or

(B) RECLAIM Trading Credits (RTC) held in the allocation account after any trading.

RTCs held in the certificate account are not part of the allocation.

TABLE 2

Emission Threshold Levels for Facilities During Phase Two

Based on Potential to Emit in tons per year (tpy) per Facility Location

Pollutant	Potential to Emit Emission Threshold Levels Per Facility Location		
	South Coast Air Basin(SOCAB) (tpy)	Riverside County Portion of Salton Sea Air Basin (SSAB) and Los Angeles County Portion of Mojave Desert Air Basin (MDAB) (tpy)	Riverside County Portion of Mojave Desert Air Basin (MDAB) (tpy)
VOC	10	25	100
NO_x	10	25	100
SO_x	100	100	100
CO	50	100	100
PM-10	70	70	100
Single HAP	10	10	10
Combination of HAPs	25	25	25

(c) Additional Facilities Requiring Title V Permits

In addition to subdivisions (a) and (b) of this rule, operators of the following facilities shall submit applications to the Executive Officer to obtain Title V permits in accordance with the timelines specified in Rule 3003 - Applications, or with federal regulations:

(1) All new facilities that have a potential to emit any regulated air pollutant at, or greater than, any of the levels specified in Table 2 of subdivision (b)

of this rule, and for which applications for permits to construct and permits to operate are deemed complete after March 31, 2000;

(2) All facilities initially not subject to Title V requirements, that after installation or modification of equipment would have a potential to emit any regulated air pollutant at, or greater than, any of the levels specified in Table 2 of subdivision (b) of this rule, and for which applications for permits to construct or permits to operate are deemed complete after March 31, 2000;

(3) All "affected sources" as defined under the acid rain provisions of Title IV of the federal Clean Air Act and 40 CFR Part 70, Section 70.2;

(4) Solid waste incineration units required to obtain a permit pursuant to Section 129(e) of the federal Clean Air Act;

(5) All facilities subject to a standard, limitation, or other requirement of the New Source Performance Standards in 40 CFR Part 60 or National Emission Standards for Hazardous Air Pollutants in 40 CFR Part 61 or Part 63 that are specifically required by federal regulation to obtain a Title V permit; and,

(6) All other facilities so designated by the EPA by future amendments to 40 CFR Part 70, Section 70.3.

(7) All facilities that have obtained a District facility permit with a condition limiting facility emissions for the purpose of being exempt from Title V permit requirements pursuant to paragraph (d)(2) of this rule, and that have reported annual emissions, calculated in accordance with permit terms and conditions under normal operating conditions, equal to or greater than any of the threshold amounts specified in Table 2 of subdivision (b) of this rule.

(8) On and after January 2, 2011, applicable requirements for greenhouse gases shall be included in Title V permits for any facility that is otherwise required, after that date, to obtain a new, renewed, or revised Title V permit pursuant to subdivision (a) of this rule.

(9) On and after July 1, 2011, any facility with a potential to emit ≥ 100,000 tpy CO_2e, on a CO_2e basis (Global Warming Potential applied) and a Potential to Emit GHGs > 100 tpy GHGs on a mass basis (no Global Warming Potential applied) shall apply for a Title V permit within 180 days after July 1, 2011, unless a Title V permit has already been applied for.

(d) Exemptions

(1) Notwithstanding subdivision (c) of this rule, facilities that would be required to obtain a Title V permit solely because they are subject to one or more of the following regulations are exempt from Title V permit requirements:

(A) 40 CFR Part 60, subpart AAA - Standards of Performance for New Residential Wood Heaters;

(B) 40 CFR Part 61, subpart M - National Emission Standard for Hazardous Air Pollutants for Asbestos, Section 61.145 - Standard for Demolition and Renovation.

(2) Facilities subject to the requirements of subdivision (a) ~~or~~ (b) or (c) of this rule, that demonstrate to the satisfaction of the Executive Officer that the facility's potential to emit has been reduced, either through a facility modification or by accepting an enforceable condition in the District facility permit, to less than the levels for all air contaminants specified in Table 2 of subdivision (b) of this rule, and the PTE is less than 100,000 tpy CO_2e GHGs, are exempt from Title V permit requirements.

(e) Phase One Exclusions

(1) Except in the case of an affected source under the acid rain program, an applicant may request, and the Executive Officer may grant an exclusion from subdivision (a) of this rule, Phase One Title V Permits, provided that the facility can demonstrate to the satisfaction of the Executive Officer that:

(A) the most recent, validated, reported emissions are less than the thresholds in subdivision (a); and

(B) a permanent change has occurred at the facility to explain the reduction in reported emissions.

(2) All requests for exclusion shall be in a form specified by the Executive Officer, shall include copies of reported emissions data and are subject to approval by the Executive Officer.

(Adopted October 8, 1993)(Amended August 11, 1995)
(Amended November 14, 1997)
PAR 3002D
November 5, 2010

PROPOSED AMENDED RULE 3002 REQUIREMENTS

(a) Requirement for Title V Permit

(1) A person shall not construct, modify, relocate, or operate a Title V facility, or equipment located at a Title V facility, without first obtaining a Title V permit or permit revision that allows such construction, modification, relocation or operation, except for:

(~~1~~A) Equipment exempted from permitting requirements pursuant to Rule 219 - Equipment Not Requiring a Written Permit Pursuant to Regulation II;

(~~2~~B) Operation of equipment or a facility pursuant to the application shield provisions of subdivision (b) of this rule; and,

(~~3~~C) Construction, modification, relocation and operation of equipment or a facility authorized by a non-Title V permit issued by the Executive Officer. The Executive Officer may issue a non-Title V permit to existing Phase One or Phase Two facilities that apply for a non-Title V permit prior to the issuance of their initial Title V permit.

(2) On and after January 2, 2011, applicable requirements for greenhouse gases shall be included in Title V permits for any facility that is otherwise required, after that date, to obtain a new, renewed, or revised Title V permit pursuant to paragraph (a)(1) of this rule.

(3) On and after July 1, 2011, any facility with a potential to emit ≥ 100,000 tpy CO_2e, on a CO_2e basis (Global Warming Potential applied) and a Potential to Emit GHGs > 100 tpy GHGs on a mass basis (no Global Warming Potential applied) shall apply for a Title V permit within 180 days after July 1, 2011, unless a Title V permit has already been applied for, and all GHG requirements that are applicable requirements (as defined in Rule 3000 (b)(4)) shall be included in the permit.

(4) On and after July 1, 2011, any new or modified facility with a Potential to Emit increase of > 100,000 tpy CO_2e shall be subject to the requirements specified in paragraph (a)(1) of this rule.

(b) Application Shield

Notwithstanding subdivision (a) of this rule, it is not a violation of this rule to operate a Title V facility or equipment located at a Title V facility without a Title V permit, provided that:

(1) A timely and complete application for initial Title V permit issuance or Title V permit renewal for such facility or equipment has been filed with the Executive Officer; and,

(2) The Executive Officer has not taken final action on the application.

For the purpose of an application shield, a timely and complete application is one that has been submitted in accordance with subdivisions (a) and (c) of Rule 3003. The application shield shall not apply if the permit applicant has failed to submit information required pursuant to subdivision (d) of this rule.

(c) Duty to Comply

(1) A person shall construct and operate a Title V facility and all equipment located at a Title V facility in compliance with all terms, requirements, and conditions specified in the Title V permit at all times.

(2) Any non-compliance with a Title V facility permit term, requirement, or condition is a violation of Regulation XXX and is a violation of the federal Clean Air Act if the permit term, requirement or condition is federally enforceable. Each day during any portion of which a violation occurs is a separate offense. Any non-compliance shall be grounds for:

(A) enforcement action (under the California Health & Safety Code and the federal Clean Air Act);

(B) permit termination;

(C) permit revocation and reissuance;

(D) permit revision; and

(E) denial of a permit renewal or revision application.

(3) It shall not be a defense for a person in any of the actions listed in paragraph (c)(2) of this rule that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of the permit, except as provided for in subdivision (g) of Rule 3002.

(4) A permit may be revised, revoked, reopened and reissued, or terminated for cause as provided in Rule 3004 - Permit Types and Content, and Rule 3005 - Permit Revisions. The filing of a request by the holder of a Title V

permit, for a permit revision, revocation and reissuance, or termination, or of a notification of planned changes or anticipated non-compliance does not stay any permit condition.

(d) Duty to Provide Timely Information

An applicant for, or holder of, a Title V permit shall furnish to the Executive Officer within a reasonable time, as specified by the Executive Officer in writing, any information that the Executive Officer requests in writing to process a permit application or to determine whether cause exists for revising, revoking and reissuing, or terminating the permit, or to determine compliance with the permit.

(e) Duty to Provide Records

A holder of a Title V permit shall furnish to the Executive Officer within a reasonable time, as specified by the Executive Officer in writing, copies of records that are required, by the permit, to be kept. Copies of information claimed to be confidential shall be submitted in a form segregated from other information, conspicuously marked "confidential" on each page, with a concise identification of the basis for the claim.

(f) Duty to Pay Fees

(1) The applicant for, or holder of, a Title V permit shall pay all required fees as specified in Regulation III - Permit Fees.

(2) Failure to pay fees in compliance with paragraph (f)(1) of this rule shall be grounds for permit expiration or revocation of the subject permit(s).

(g) Emergency Provisions

An emergency shall constitute an affirmative defense to an action brought for non-compliance with a technology-based limitation if all of the following conditions are met:

(1) Properly signed, contemporaneous operating logs or other credible evidence that demonstrates compliance with this subdivision are kept at the facility;

(2) The owner/operator of a Title V facility demonstrates that an emergency occurred and that the permit holder can identify the cause(s) of the emergency;

(3) During the period of the emergency, the facility permit holder took all reasonable steps to minimize levels of emissions that exceeded the emission standards, or other requirements in the permit;

(4) The owner/operator of a Title V facility submitted a written notice of the emergency to the District within two working days of the time when emission limitations were exceeded due to the emergency. This notice shall contain a description of the emergency, any steps taken to mitigate emissions, and corrective actions taken;

(5) The permitted facility was being operated properly (i.e., operated and maintained in accordance with the manufacturer's specifications, and in compliance with all regulatory requirements or a compliance plan) before the emergency; and

(6) The facility complies with the breakdown provision of Rule 430 - Breakdown Provisions, or subdivision (i) of Rule 2004 - Requirements, whichever is applicable.

In any enforcement proceeding, the facility permit holder seeking to establish the occurrence of an emergency shall have the burden of proof.

(Adopted October 8, 1993)(Amended August 11, 1995)
(Amended November 14, 1997)(Amended March 16, 2001)
PAR 3003A
November 5, 2010

PROPOSED AMENDED RULE 3003. APPLICATIONS

(a) Application Requirements

The operator of a Title V facility shall submit a timely and complete Title V permit application in accordance with this rule.

(1) Facilities Applying for Initial Title V Permits During Phase One

(A) For facilities required to obtain initial Title V permits pursuant to subdivision (a) of Rule 3001 and that are specifically identified by the District on or before the effective date as defined in paragraph (b)(~~7~~8) of Rule 3000, a timely initial permit application is one submitted to the Executive Officer within 90 days of receipt of the District's notice to the facility with facility-specific application materials, or within one year from the effective date, whichever comes first.

(B) For all other facilities required to obtain initial Title V permits pursuant to subdivision (a) of Rule 3001, a timely initial permit application is one that is submitted within 180 days after the facility becomes subject to the Title V permit program.

(2) Facilities Applying for Initial Title V Permits During Phase Two

(A) For existing facilities required to obtain initial Title V permits pursuant to subdivision (b) of Rule 3001, a timely initial permit application is one submitted to the Executive Officer within 90 days of receipt of the District's notice to the facility with facility-specific application materials, or no later than June 30, 2001, whichever occurs first.

(B) For all other facilities required to obtain initial Title V permits pursuant to subdivision (b) of Rule 3001, a timely initial permit application is one that is submitted within 180 days after the facility becomes subject to the Title V permit program.

(3) Additional Facilities Applying for Initial Title V Permits

Except as set forth elsewhere in this subdivision or in subdivision (c) of this rule, a timely initial permit application is one that is submitted within 180 days after the facility becomes subject to the Title V permit program.

(4) A person who has filed a timely and complete application for an initial Title V permit with the Executive Officer shall be allowed to amend the initial Title V facility permit application if non-Title V Permits to Construct pursuant to Rule 201 or Permits to Operate pursuant to Rule 203 were issued 30 days or more prior to the scheduled issuance of the initial proposed permit for public review.

(5) A person electing to apply for a non-Title V permit, as allowed by paragraph (a)(3) of Rule 3002, that is issued too late to be incorporated into the initial permit application in accordance with paragraph (a)(4) of this rule, shall file an application for a Title V permit revision within 90 days of the issuance of a facility's initial Title V permit.

(6) For purposes of permit renewal, a timely application is one that is submitted at least 180 days, but no more than 545 days, prior to the date of permit expiration.

(7) For facilities which are, or include, major sources (as defined in Section 70.2 of 40 CFR Part 70) in categories or subcategories for which EPA has failed to promulgate a maximum achievable control technology emissions standard by the date established pursuant to subsections (e)(1) and (e)(3) of Section 112 of the federal Clean Air Act, a timely application for a facility permit or permit revision, as appropriate, is one which is submitted within 18 months of such failure, and which complies with Section 112 of the federal Clean Air Act.

(b) Application Content

(1) Initial Permit and Permit Renewal Applications

An applicant shall submit, on forms specified by the Executive Officer and approved by EPA, all information necessary to evaluate the subject facility and the application, to determine the applicability of and to impose all regulatory requirements, and to determine the fee amounts required pursuant to Regulation III - Permit Fees.

(2) Permit Revision Applications

The applicant shall submit the same information as specified in paragraph (b)(1) of this rule, but only to the extent that such information is related to the permit revision. If applicable, information required by paragraphs (c)(2), (d)(2), and (e)(2) of Rule 3005 shall also be provided.

(c) Complete Application

(1) The Executive Officer shall, upon receipt of any application, promptly determine whether the application is complete pursuant to the criteria set forth in the Technical Guidance Document.

(2) Unless the Executive Officer determines that an application is not complete within 60 days of receipt of the application for initial permit issuance or permit renewal, or within 30 days of receipt for permit revisions, such application shall be deemed to be complete.

(3) If the application is determined to be incomplete, the Executive Officer shall notify the applicant in writing what additional information is necessary to make the application complete and shall specify in writing a reasonable deadline for providing such information.

(4) If the applicant does not provide all requested information on or before the deadline specified, the Executive Officer may deny the application. The Executive Officer may extend the initial deadline if requested by the applicant.

(5) To be deemed complete, an application must provide all information required pursuant to subdivision (b) of this rule.

(6) An applicant shall provide application statements and information that are true, accurate, and complete, based on information and belief formed after reasonable inquiry.

(7) The responsible official shall certify all information provided as part of a permit application, a supplement or correction pursuant to subdivision (d) of this rule, or in response to a request for information from the Executive Officer. The certification shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

(d) Duty to Supplement or Correct Application

(1) Any applicant for, or holder of, a Title V permit who fails to submit any relevant information or who has submitted incorrect information in an application for a permit or permit revision shall, upon becoming aware of such failure or incorrect submittal, promptly submit such supplementary facts or corrected information.

(2) An applicant shall provide such additional information as necessary to determine compliance with any requirements that became applicable to the

facility after the date a complete application was filed but prior to release of a proposed permit.

(e) Requests for Additional Information

(1) Even after an application is deemed complete, an applicant shall provide such additional information as has been requested in writing by the Executive Officer as necessary to evaluate or take final action on the application, on or before the reasonable deadline specified in the request.

(2) The facility's ability to operate without a permit, as set forth in subdivision (b) of Rule 3002 shall terminate at 5:00 p.m. on the date specified by the Executive Officer unless the applicant has, on or before that time provided all information requested by the Executive Officer pursuant to either paragraph (e)(1) of this rule, or subdivision (d) of Rule 3002.

(f) Confidential Information

Whenever an applicant for, or holder of, a Title V permit submits information to the Executive Officer in connection with a Title V permit application under a claim of confidentiality, such applicant or permit holder may be required, by the Executive Officer, to submit a copy of such information directly to the EPA Administrator, along with a concise statement of the basis of such claim of confidentiality.

(g) Sharing of Information

(1) Except as provided in paragraph (g)(2) of this rule, any information obtained from a facility or used in the administration of the Title V permit program shall be made available without restriction to EPA upon request.

(2) Where the Executive Officer submits information to the EPA under a claim of confidentiality, the Executive Officer shall provide a copy of such claim if made by a third party, or a concise statement of the basis of such claim, if made by the Executive Officer.

(h) Preservation of New Source Review

The submittal of a complete Title V permit application, or application for revision of such permit, shall not relieve any person of the requirements for a pre-construction permit under Title I of the federal Clean Air Act, District Regulation XIII - New Source Review, or District Rule 2005 - New Source Review For RECLAIM.

(i) Action on Applications

(1) The Executive Officer shall deny an application for initial permit, permit revision, or permit renewal if the applicant cannot show that operation under the permit will comply with all regulatory requirements, unless:

(A) the District Hearing Board has issued a valid variance granted pursuant to Rule 515 or Rule 517, order for abatement which has the effect of a variance pursuant to Regulation VIII, or federal alternative operating condition established pursuant to Rule 518.2 for those regulatory requirements for which the facility is not in compliance; and

(B) the facility operator has submitted with the Title V permit application an acceptable compliance plan.

(2) Except during the 3-year, Phase One period for initial permit issuance, following the effective date, and for applications identified in paragraph (i)(3) of this rule, the Executive Officer shall issue a permit or deny a permit application according to the following schedule:

(A) Applications for initial permits, significant permit revisions and permit renewals: within 18 months after receipt of a complete application pursuant to subdivision (c) of this rule;

(B) Applications for administrative permit revisions: within 60 days after receipt of a complete application pursuant to subdivision (c) of this rule; and,

(C) Applications for minor permit revisions: within 90 days after the receipt of a complete application pursuant to subdivision (c) of this rule or within 15 days after the end of EPA's 45-day review period, whichever is later.

(D) Applications for group processing of multiple minor permit revisions: within 180 days after the receipt of the first complete application, in a group of multiple minor permit revision applications, pursuant to subdivision (c) of this rule or within 15 days after the end of EPA's 45-day review period, whichever is later.

(E) Applications for de minimis significant permit revisions: within 180 days after the receipt of a complete application pursuant to subdivision (c) of this rule or within 15 days after the end of EPA's 45-day review period, whichever is later.

(3) For an application for an initial permit for a new facility or a significant permit revision, that includes a request for a Permit to Construct, the Executive Officer shall issue a permit or deny a permit application according to the following schedule:

(A) Applications for which an Environmental Impact Report is not required and where EPA does not object to the proposed Title V permit or revision within the 45-day review period: within 265 days after the application is deemed complete;

(B) Applications containing a demonstration of an early toxic reduction to comply with Section 112(i)(5) of the federal Clean Air Act, for which an Environmental Impact Report is not required and where EPA does not object to the proposed Title V permit or revision within the 45-day review period: within 265 days after the application is deemed complete;

(C) Applications for which an Environmental Impact Report is not required and EPA objects to the proposed permit or revision: within 355 days after the application is deemed complete;

(D) Applications for which an Environmental Impact Report is required: within the timeframes defined in subparagraphs (i)(3)(A) or (B) or (C) of this rule plus 180 days.

(4) A permit, permit revision, or renewal may be issued only if all the following conditions have been met:

(A) The Executive Officer has received a complete application for a permit, permit revision, or, permit renewal.

(B) Except for administrative permit revisions, minor permit revisions, and de minimis significant permit revisions, the Executive Officer and the facility have complied with the requirements for public participation under Rule 3006.

(C) Except for administrative permit revisions the Executive Officer has complied with the requirements for notifying and responding to affected states under subdivision (m) of this rule.

(D) The conditions of the permit provide for compliance with all regulatory requirements.

(E) The EPA Administrator has received a copy of the proposed permit, any notices required under Rules 3003, 3005, and 3006, and any revisions to the proposed permit in response to public or

affected State comments and has not objected to issuance of the permit under 40 CFR Part 70, Section 70.8(c) within the time period specified therein.

(5) If the Executive Officer fails to act within the time required by this rule on an application for permit renewal, the EPA may invoke its authority under Section 505(e) of the federal Clean Air Act to terminate or revoke and reissue the permit.

(6) Initial Phase One Title V permits, which are required to be issued within three years after the effective date, shall be classified by the Executive Officer into Groups A, B, and C, such that each group contains one-third of the Title V sources identified by the District for Phase One, as far as practicable.

(A) The Executive Officer shall issue Title V permits to the groups according to the following schedule, measured from the effective date: Group A within one year; Group B within two years; and Group C within three years, as far as practicable.

(B) A facility assigned to any group may not petition the Executive Officer or the Hearing Board to change their group designation.

(7) The Executive Officer shall, to the extent possible, simultaneously commence any required noticing and review by the public, EPA and affected States.

(j) EPA Review

(1) The Executive Officer shall submit to the EPA Administrator:

(A) each application for initial permit, permit renewal, minor permit revision, de minimis significant permit revision and significant permit revision;

(B) each proposed permit for initial permit, renewal permit, or permit revision, excluding administrative permit revisions;

(C) any revisions to the proposed permit in response to public or affected State comments;

(D) a copy of any notices required by Rules 3003, 3005, or 3006; and,

(E) each final Title V permit, within 5 working days of permit issuance.

(2) To the extent practicable, the information required by paragraph (j)(1) of this rule shall be provided in a computer-readable format compatible with EPA's national database management system.

(3) The Executive Officer shall keep the information required by paragraph (j)(1) of this rule for 5 years following the issuance of a final Title V permit so that the EPA Administrator may ascertain whether the Title V program complies with the requirement of Part 70 and the federal Clean Air Act. Such information shall be made available to EPA within a reasonable time of the request.

(4) At least 10 days prior to the end of EPA's review period of a proposed permit, the Executive Officer shall notify the applicant, the EPA Administrator and any affected State, in writing, of any refusal to accept all recommendations for the proposed permit that any affected State submitted during the public or affected State review periods. The notice shall include the Executive Officer's reasons for not accepting any such recommendations.

(k) EPA Objection

(1) No permit or permit revision for which an application must be transmitted to EPA pursuant to subdivision (j) of this rule may be issued if the EPA objects to its issuance in writing within 45 days of receipt of the proposed permit and all necessary supporting information, or within 90 days if the EPA provides a written request to delay the permit issuance on the basis that an additional 45 days is necessary to review the public and affected State comments made to the proposed permit. The objection shall include a statement of the reasons for the objection and a description of the terms and conditions that the permit must include to respond to the objections.

(2) Within 14 days of receipt of EPA's objection to a proposed permit, the District shall notify the applicant of EPA's objection.

(3) Within 90 days after receipt of timely objection from EPA that meets the requirements of paragraph (k)(1) of this rule, the Executive Officer shall evaluate EPA's objection, negotiate with EPA over any disagreements, and do one of the following:

(A) deny the proposed permit; or

(B) revise and submit to EPA a new proposed permit in response to EPA's objection.

(4) If the Executive Officer fails, within the time specified in paragraph (k)(3) of this rule, to either deny the proposed permit or revise and submit a new proposed permit in response to the objection, EPA may issue or deny the permit in accordance with 40 CFR Part 70, Section 70.8(c).

(l) Public Petitions to the EPA Administrator

(1) If the EPA Administrator does not object in writing pursuant to subdivision (k) of this rule, any person may petition the EPA Administrator within 60 days after the expiration of the EPA Administrator's 45-day review period to make such objection, as provided for in 40 CFR Part 70, Section 70.8(d).

(2) Any petition under this subdivision shall be based only on objections to the proposed permit that were raised with reasonable specificity during the public comment period provided for in Rule 3006, unless the petitioner demonstrates, to the EPA Administrator, that it was impracticable to raise such objections within such period, or unless the grounds for objection arose after such period.

(3) If the EPA Administrator objects to the proposed permit as a result of a petition filed under this subdivision, the Executive Officer shall not issue the permit until EPA's objection has been resolved. If the permit was issued after the end of EPA's 45-day review period and prior to receipt of EPA's objections, a petition under this rule section does not stay the effectiveness of a permit or its requirements.

(4) If the permit has been issued prior to receipt of an EPA objection under this rule, EPA may revise, terminate, or revoke such permit.

(m) Review by Affected States

(1) Except for administrative permit revisions, the Executive Officer shall give notice of each proposed permit to any affected State on or before the notice is provided to the EPA.

(2) Any affected State may provide recommendations in writing, based upon applicable requirements or requirements of 40 CFR Part 70, with respect to the proposed permit, within 30 days of receipt of the notice.

(3) The Executive Officer shall respond to affected State recommendations in accordance with paragraph (j)(4) of this rule.

(n) Prohibition of Default Issuance

(1) Except for administrative permit revisions, no Title V permit may be issued until after EPA and affected States have had an opportunity to review the proposed permit in accordance with this rule, unless EPA has waived such review for EPA and the affected States.

(2) Except for administrative permit revisions, minor permit revisions, and de minimis significant permit revisions, no Title V permit may be issued until after the public has had an opportunity to review the proposed permit in accordance with Rule 3006.

(3) No provision of these rules shall be construed to require that a Title V permit or renewal be issued after a certain time if the Executive Officer fails to take action on the application.

(4) Failure of the Executive Officer to take action on an application within the time specified by these rules shall not constitute final permit action except for purposes of a judicial or authorized administrative proceeding seeking to compel the Executive Officer to take final action on the application.

PROPOSED AMENDED RULE 3005. PERMIT REVISIONS

(a) General Requirements

(1) Procedures

Applications for permit revisions shall be submitted and processed in accordance with Rule 3003, Rule 3006, and the additional requirements of this rule.

(2) Ability of Facilities to Make Changes

Only changes that qualify as an administrative permit revision may be implemented immediately by the facility.

(3) Application Shield

The application shield under subdivision (b) of Rule 3002 shall not apply to permit revisions.

(4) Permit Shield

The permit shield under subdivision (c) of Rule 3004 shall be processed as a significant permit revision.

(b) Administrative Permit Revisions

(1) Applicability

Administrative permit revision procedures may be used only for those permit revisions described in paragraph (b)(1) of Rule 3000.

(2) Procedures

Administrative permit revisions shall be processed in accordance with Rule 3003 and shall include the following:

(A) A description of the change; and,

(B) Certification by a responsible official, consistent with paragraph (c)(7) of Rule 3003, that the requested revision meets the criteria for use of administrative permit revision procedures and a request that such procedures be used.

(c) Minor Permit Revisions

(1) Applicability

Minor permit revision procedures may be used only for those permit revisions described in paragraph (b)(1215) of Rule 3000.

(2) Procedures

(A) An application requesting the use of minor permit revision procedures shall meet the requirements of, and be processed in accordance with Rule 3003 and shall include the following:

(i) A description of the change, the emissions resulting from the change, and any new regulatory requirements that will apply if the change occurs; and

(ii) Certification by a responsible official, consistent with paragraph (c)(7) of Rule 3003, that the requested revision meets the criteria for use of minor permit revision procedures and a request that such procedures be used.

(B) Within 45 days of receipt of a complete application under minor permit revision procedures, the Executive Officer shall:

(i) determine that the requested revision does not meet the minor permit revision criteria and should be reviewed under another revision procedure; or,

(ii) submit a copy of the proposed permit to the EPA Administrator for a 45-day review and submit a notice of the proposed permit to any affected State.

(d) Group Processing Procedures for Multiple Minor Permit Revisions

(1) An applicant may request group processing procedures for multiple, minor permit revision applications provided that the requested revisions meet the following criteria:

(A) All such requested permit revisions qualify as a minor permit revision pursuant to paragraph (c)(1) of this rule;

(B) Emissions resulting from all such requested revisions are collectively below 5 tons per year (tpy) of VOC, 5 tpy of NO_X, 5 tpy of SO_X, 5 tpy of CO, and 5 tpy of PM_{10}; and,

(C) Within 90 days of receipt of the first complete application, all remaining complete applications in the group are also submitted.

(2) Each application requesting group processing shall meet the requirements of, and be processed in accordance with, Rule 3003 and subparagraph (c)(2)(A) of Rule 3005 and shall also include the following:

(A) Certification by a responsible official, consistent with paragraph (c)(7) of Rule 3003, demonstrating the following:

(i) The proposed revision meets the criteria for use of group processing procedures and a request that such procedures be used; and,

(ii) The applicant has notified EPA of the requested revision. Such notification need only contain a brief description of the requested revision.

(B) A list of the facility's other pending applications awaiting group processing, and a determination of whether the requested revisions, equals or exceeds the applicable threshold pursuant to subparagraph (d)(1)(B) of this rule and whether these emissions when aggregated with the emissions from the other applications, equals or exceeds the applicable threshold pursuant to paragraph (b)(67) of Rule 3000; and,

(3) Within 135 days of receipt of the first complete application in a group of applications requesting that group processing procedures be used, the Executive Officer shall:

(A) submit a copy of the proposed permit for all of the applications in the group to the EPA Administrator for a 45-day review period and submit a notice of the proposed permit to any affected State; or

(B) determine that the requested revisions do not meet the criteria for group processing and should be reviewed under another revision procedure.

(e) De Minimis Significant Permit Revisions

(1) Applicability

De minimis significant permit revision procedures may be used only for those permit revisions described in paragraph (b)(67) of Rule 3000.

(2) Procedures

(A) An application requesting the use of de minimis significant permit revision procedures shall meet the requirements of, and be processed in accordance with, Rule 3003 and shall include the following:

(i) A description of the change, the emissions resulting from the change, and any new regulatory requirements that will apply if the change occurs; and,

(ii) Certification by a responsible official, consistent with paragraph (c)(7) of Rule 3003, that the requested revision meets the criteria for use of de minimis significant permit revision procedures and a request that such procedures be used.

(B) Within 135 days of receipt of a complete application under de minimis significant permit revision procedures, the Executive Officer shall determine if the requested revision does not meet the de minimis significant permit revision criteria and should be reviewed under another revision procedure.

(f) Significant Permit Revisions

(1) Applicability

Significant permit revision procedures shall be used for applications requesting permit revisions as described in paragraph (b)(2831) of Rule 3000 and that do not otherwise qualify as de minimis significant permit revisions under paragraph (b)(67) of Rule 3000, minor permit revisions under paragraph (b)(1215) of Rule 3000 or as administrative permit revisions under paragraph (b)(1) of Rule 3000.

(2) Procedures

Significant permit revisions shall meet all the requirements of this regulation, including those requirements pursuant to Rule 3003 and Rule 3006, as they apply to initial permit issuance and permit renewal.

(g) Reopening for Cause

(1) The Executive Officer shall reopen and revise a permit if any of the following circumstances occur:

(A) Additional regulatory requirements become applicable to a Title V facility with a remaining permit term of three or more years. However, no reopening is required if the effective date of the requirement is later than the date on which the permit is due to expire, unless the original permit or any of its terms and conditions has been extended pursuant to paragraph (f)(4) of Rule 3004;

(B) The Executive Officer or EPA determines that the permit contains a material mistake or that inaccurate statements were made in establishing the emissions standards or other terms or conditions of the permit; or,

(C) The Executive Officer or EPA determines that the permit shall be revised or revoked to assure compliance with the applicable requirements.

(2) Permit reopening and reissuance shall follow the same procedures as apply to initial permit issuance, shall affect only those parts of the permit for which cause to reopen exists and shall be made as soon as possible.

(3) Nothing in this rule limits the authority of the Executive Officer to seek revocation and termination of a permit pursuant to the Health and Safety Code Sections 42307 - 42309 and Health and Safety Code Section 40800 et seq.

(4) Proceedings to reopen a permit shall not be initiated, unless the holder of the Title V permit, the public, and EPA have been notified of the Executive Officer's intent to reopen such permit, at least 30 days in advance of the date the permit is to be reopened.

(5) Notwithstanding paragraph (g)(4) of this rule, the Executive Officer may specify a shorter period of notice upon making a written finding that immediate reopening and revision is necessary to prevent the occurrence of a public nuisance or violation of National Ambient Air Quality Standards due to emissions from the Title V facility, in which case the reopening and revision is effective immediately upon service of the revised permit on the holder of the Title V permit, subject to the permit holder's right to appeal to the Hearing Board pursuant to Health and Safety Code Section 42302.

(6) Permit revocation shall be governed by the procedures set forth in the Health and Safety Code Sections 42307 - 42309 and Health and Safety Code Section 40800 et seq.

(h) Reopenings for Cause by EPA

(1) Within 90 days of receipt of written notice from EPA to reopen a permit for cause, the Executive Officer shall submit a proposed determination, including any proposed new permit, to EPA to terminate, revise, or revoke and reissue a permit, for a 90-day EPA review period. The Executive

Officer may request a 90 day extension of this limit if it is necessary to request a new or revised permit application or additional information from the applicant for, or holder of, a Title V permit.

(2) The Executive Officer shall terminate, revise, or revoke and reissue the permit within 15 days of either the end of EPA's 90-day review period without receiving an EPA objection, or the date EPA notifies the District of agreement with the proposed determination, whichever is sooner.

(3) If the EPA objects to the proposed determination, the Executive Officer shall, within 90 days of receipt of the objection from EPA, attempt to resolve any EPA objection to the proposed determination and terminate, revise or revoke and reissue the permit in accordance with EPA's objection.

(i) Operational Flexibility

An owner/operator of a Title V facility may make certain changes within a permitted facility without a permit revision. This subdivision shall apply to:

(1) Changes that violate an express permit term or condition, provided all of the following conditions are met:

(A) The District and EPA have received a written notice from the owner/operator of the Title V facility at least 7 calendar days before making such change;

(B) The written notice is clearly marked as a request for operational flexibility under this subdivision and includes the following information:

(i) a description of each change within the permitted facility;

(ii) the date on which the change will occur;

(iii) any change in emissions; and

(iv) any permit term or condition that is no longer applicable as a result of the change;

(C) The change is not:

(i) a violation of regulatory requirements or federally enforceable permit terms and conditions that are monitoring (including test methods), recordkeeping, reporting, or compliance certification requirements;

(ii) construction, modification, or relocation under Regulation XIII - New Source Review, Rule 1401 - New Source

Review of Carcinogenic Air Contaminants, or Regulation XVII - Prevention of Significant Deterioration;

(iii) preconstruction or modification under Rule 2005 - RECLAIM New Source Review;

(iv) subject to decision by the Hearing Board;

(v) resulting in an exceedance of the emissions allowable under the permit, whether expressed therein as a rate of emissions or in terms of total emissions;

(vi) an installation of new equipment, or a modification or reconstruction of existing equipment, subject to a New Source Performance Standard (NSPS) pursuant to 40 CFR Part 60, or a National Emission Standard for Hazardous Air Pollutants (NESHAP) pursuant to 40 CFR Part 61 or 40 CFR Part 63; or,

(vii) subject to any requirement under Title IV of the federal Clean Air Act.

(D) The District and the facility have attached the written notice to their copy of the relevant permit.

(2) Trading of emission increases and decreases within the permitted facility solely for the purpose of complying with a federally enforceable emissions cap that is established in the permit independent of otherwise applicable requirements, if all of the following conditions are met:

(A) The facility complies with all regulatory requirements;

(B) For non-RECLAIM pollutants, trading of emissions within the facility shall comply with all of the following requirements:

(i) Prior to the initiation of trading, the facility permit includes, or has been revised to include, terms and conditions authorizing the trading, including all terms required under Rule 3004(a)(4) and (a)(10) to determine compliance, and replicable procedures and permit terms that ensure that the emissions trades are quantifiable and enforceable;

(ii) The trading includes only equipment for which emissions are quantifiable and for which there are replicable procedures to enforce such trading;

(iii) The District and EPA have received written notice from the holder of the Title V permit at least 30 days before trading is initiated;

(iv) The written notice is clearly marked as a request to initiate trading under this subdivision and includes the date the trading will begin, and a description of the changes in emissions that will result and how these changes will comply with the terms and conditions of the permit; and

(v) The District does not provide the owner or operator a written denial of the request for authorization of trading within 30 days of receipt of the request.

(j) Alternative Operating Scenario

The Executive Officer shall allow the owner/operator of a Title V facility to change from one alternative operating scenario to another without requiring a permit revision, provided that the terms and use of the alternative operating scenario are:

(1) identified by the owner/operator in the permit application

(2) approved by the District;

(3) specified in the permit conditions pursuant to paragraph (a)(8) of Rule 3004; and

(4) in compliance with all regulatory requirements.

(k) Prohibition on Changes Not Specifically Allowed by Permit

A Title V facility shall not, without a permit revision, make any change that is not addressed or prohibited by the Title V permit, if such change is subject to minor permit revision, de minimis significant permit revision, or significant permit revision procedures, except in accordance with subdivision (i) of this rule.

(Adopted October 8, 1993)(Amended August 11, 1995)
(Amended November 14, 1997)
PAR 3006A
November 5, 2010

PROPOSED AMENDED RULE 3006. PUBLIC PARTICIPATION

(a) Public Participation Requirements for Permit Actions

(1) All permit actions for initial permit issuance, significant permit revisions, establishment of general permits and permit renewals shall include the following public participation procedures:

(A) The District shall give notice by publication in a newspaper of general circulation in the county where the source is located, by mail to those who request in writing to be on a list to receive all such notices, and by any other means determined by the Executive Officer to be necessary to assure adequate notice to the affected public.

(B) The notice shall include:

(i) The identity and location of the affected facility;

(ii) The name and mailing address of the facility's contact person;

(iii) The identity and address of the South Coast Air Quality Management District as the permitting authority processing the permit;

(iv) The activity or activities involved in the permit action;

(v) The emissions change involved in any permit revision;

(vi) The name, address, and telephone number of a person who interested persons may contact to review additional information including copies of the proposed permit, the application, all relevant supporting materials, including compliance documents as defined in paragraph (b)(~~5~~6) of Rule 3000, and all other materials available to the Executive Officer that are relevant to the permit decision;

(vii) A brief description of the public comment procedures provided; and,

(viii) The time and place of any proposed permit hearing that may be held or a statement of the procedures to request a

proposed permit hearing if one has not already been requested.

(C) Costs of such notice and public participation process shall be paid, as specified in Regulation III, by the applicant.

(D) The notice shall provide at least 30 days for public comment, and shall give at least 30 days of notice if any proposed permit hearing is scheduled.

(E) The Executive Officer shall keep a record of the commenters and also of the issues raised during the public participation process, for 5 years, so that the EPA Administrator may fulfill the obligation under Section 505(b)(2) of the federal Clean Air Act to determine whether a citizen petition may be granted. Such records shall be available to the public as provided in the California Public Records Act.

(F) Any person may request a proposed permit hearing on an application for initial permit, permit renewal, or significant permit revision, or for establishment of a general permit, by filing with the Executive Officer a complete request for a proposed permit hearing within 15 days of the date of publication of notice. On or before the date the request is filed, the person requesting a proposed permit hearing must also mail by first class mail a copy of the request to the contact person of the Title V facility at the address listed in the notice. A complete request for a proposed permit hearing shall include all of the following information:

(i) Identification of the permit action on which a proposed permit hearing is requested;

(ii) Name, address, and telephone number of the person requesting the proposed permit hearing and of the person to whom further notices should be sent, if different;

(iii) Specific identification of the portion or portions of the proposed permit or revision to which objection is made;

(iv) Specific identification of the regulatory requirement or requirements, or provisions of these rules, with which the proposed permit or revision is inconsistent, and the reasons the inconsistency is believed to exist;

(v) Identification of proposed permit terms or conditions, if any, which would eliminate the inconsistency; and,

(vi) A statement of the reason or reasons the requester believes a public hearing would clarify one or more issues involved in the permit decision.

(G) If a valid request for a proposed permit hearing is received in accordance with subparagraph (a)(1)(F) of this rule, the Executive Officer shall hold a proposed permit hearing noticed at least 30 days prior to the hearing and shall deny or approve the proposed permit, or continue the hearing to a specific announced date on which a revised proposed permit would be available for further public review and comment.

(H) Unless there is an objection made by an affected facility, the Executive Officer may conduct a group permit hearing for facilities identified in the public's requests for permit hearings.

(b) Exemptions

Permit revision applications eligible for processing using administrative permit revision, minor permit revision, or de minimis significant permit revision procedures shall be exempt from the public participation requirements of subdivision (a) of this rule.

PROPOSED AMENDED RULE 3008. POTENTIAL TO EMIT LIMITATIONS

(a) Purpose

The purpose of this rule is to exempt low-emitting facilities with actual emissions below a specific threshold from federal Title V permit requirements by limiting the facility's potential to emit.

(b) Applicability

This rule shall apply to any facility which would, if it did not comply with the limitations set forth in either paragraphs (d)(1) or (d)(2) of this rule, have the potential to emit air contaminants equal to or in excess of the thresholds specified in Table 2, subdivision (b) of Rule 3001 – Applicability, or for GHGs 100,000 or more tpy CO_2e.

(c) Definitions

All terms shall retain the definitions in Rule 3000 - General, unless otherwise defined herein.

(1) 12-MONTH PERIOD means a period of twelve (12) consecutive months determined on a rolling basis with a new 12-month period beginning on the first day of each calendar month.

(2) ACTUAL EMISSIONS means the emissions of regulated air pollutants from a facility on a~~n annual~~ 12-month basis. Valid continuous emission monitoring data or source test data shall be preferentially used to determine actual emissions. In the absence of valid continuous emissions monitoring data or source test data, the basis for determining actual emissions shall be: throughputs of process materials; throughputs of materials stored; usage of materials; data provided in manufacturer's product specifications; material volatile organic compound (VOC) content reports or laboratory analyses; other information required by this rule and applicable District, state, and federal regulations; or information requested by or available to the District. All calculations of actual emissions shall use United States Environmental Protection Agency (EPA), California Air

Resources Board (CARB) or District approved methods, including emission factors and assumptions.

(3) ALTERNATIVE OPERATIONAL LIMIT means a limit on a measurable parameter, such as hours of operation, throughput of materials, use of materials, or quantity of product, as specified in paragraph (d)(2).

(4) DE MINIMIS FACILITY means any facility that emits in every 12-month period quantities of actual emissions as specified in either subparagraph (A) or (B) below:

(A) The facility emits ~~less than or equal to all of the following~~:

(i) less than or equal to ~~F~~four (4) tons per year of each regulated air pollutant (excluding hazardous air pollutants (HAPs)); and

(ii) less than or equal to ~~F~~four (4) tons per year of any single HAP, or twenty (20) percent of any newly adopted major source threshold for a single HAP that EPA may establish by rule, whichever is less; and

(iii) less than or equal to ~~F~~five (5) tons per year of any combination of HAPs~~.~~; and

(iv) less than 25,000 tons per year CO_2e for GHG emission.

(B) At least 90 percent of the facility's emissions are associated with an operation for which the throughput is less than or equal to any of the following quantities specified:

(i) 1,120 gallons of any combination of solvent-containing materials but no more than 440 gallons of any one solvent-containing material, provided that the materials do not contain the following: methyl chloroform (1,1,1-trichloroethane), methylene chloride (dichloromethane), tetrachloroethylene (perchloroethylene), or trichloroethylene;

(ii) 600 gallons of the combination of all solvent-containing materials where the materials contain the following: methyl chloroform (1,1,1-trichloroethane), methylene chloride (dichloromethane), tetrachloroethylene (perchloroethylene), or trichloroethylene, but not more than 240 gallons of any one solvent-containing material;

(iii) 960 gallons of solvent-containing (or VOC containing) material, used at a paint spray unit(s);

(iv) 5,722,667 gallons of gasoline dispensed from equipment with Phase I and II vapor recovery system as defined in Rule 461;

(v) 972,000 gallons of gasoline dispensed from equipment with only Phase I vapor recovery system as defined in Rule 461.

(vi) 376,000 gallons of gasoline dispensed from equipment without Phase I and II vapor recovery system as defined in Rule 461;

(vii) 1,120 gallons of gasoline combusted;

(viii) 13,280 gallons of diesel fuel combusted;

(ix) 56,800,000 cubic feet of natural gas combusted

(x) 19,184 gallons of ultraviolet/electron beam materials not to exceed 50 grams/liter

(5) EMISSION UNIT means any article, machine, equipment, operation, contrivance, or related groupings of such that may produce and/or emit any regulated air pollutant or HAP.

(6) MAJOR SOURCE means any facility with a potential to emit, measured in tons per year per facility location, exceeding the emission threshold levels in Table 2, subdivision (b) of Rule 3001.

(7) POTENTIAL TO EMIT means the maximum capacity of a facility to emit an air pollutant based on its physical and operational design. Any physical or operational limitation on the capacity of the facility to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design only if the limitation is legally and practically enforceable by the EPA and citizens or by the District.

(8) PROCESS STATEMENT means a Declaration of Total Emissions filed pursuant to Rule 301(e)(7) or a~~n annual~~ 12-month report on permitted emission units from an operator of a facility certifying under penalty of perjury the following: throughputs of process materials; throughputs of materials stored; usage of materials; fuel usage; any available continuous emissions monitoring data; hours of operation; and any other information required by this rule or requested by the District.

(d) Requirements

Any facility subject to this rule shall comply with either one of the following requirements:

(1) Emission Limitations

A facility subject to this rule has the following limits on emissions in every 12-month period:

(A) 50 percent of the major source thresholds for regulated air pollutants (excluding HAPs and GHGs);

(B) 5 tons per year of any single HAP, or fifty (50) percent of any newly adopted major source threshold for a single HAP that EPA may establish by rule, whichever is less;

(C) 12.5 tons per year of any combination of HAPs; and

(D) less than 50,000 tons per year CO_2e for GHG emissions.

(2) Alternative Operational Limits

Any facility for which 90 percent of the facility's emissions from the permitted emission units in every 12-month period are associated with one of the operations identified in Table 1 shall comply with the corresponding operational limits in Table 1.

(e) Recordkeeping

(1) The recordkeeping provisions below shall not apply to De Minimis facilities.

(2) On and after May 15, 2001, the operator operating a facility subject to this rule under any one alternative operational limit, shall operate the facility in compliance with the alternative operational limit and comply with the following recordkeeping requirements as applicable:

(A) The operator shall maintain all purchase orders, invoices, and other documents to support information required to be maintained in a monthly log. Records required under this section shall be maintained on site for five years and be made available to the District, CARB, or the EPA upon request.

(B) The operator of a Gasoline Dispensing Facility equipped with Phase I and Phase II Vapor Recovery Systems shall maintain on site a monthly log of gallons of gasoline dispensed in the preceding month with a calculation of the total gallons dispensed in the previous 12 months.

(C) The operator of a Degreasing or Solvent-Using unit shall maintain on site a monthly log of amount and type of solvent used in the preceding month with a calculation of the total gallons used in the previous 12 months.

(D) The operator of a Paint-Spraying Unit shall maintain on site a monthly log of the gallons of VOC-containing materials used in the preceding 12 months with a calculation of the gallons of volatile organic compound-containing materials that also contain hazardous air pollutants used in the previous 12 months, and a calculation of the total gallons of volatile organic compound-containing materials used in the previous 12 months.

(E) The operator of an Emergency Standby Engine with output less than 1,000 brake horsepower shall maintain on site a monthly log of hours of operation, amount of fuel used, and a calculation of the total hours operated and amount of fuel used in the previous 12 months shall be kept on site.

(3) On and after May 15, 2001, the operator of a facility not operating under any alternative operational limit, shall comply with the following applicable recordkeeping requirements. The recordkeeping requirements of this rule shall not replace any recordkeeping requirement contained in an operating permit or in a District, State, or Federal rule or regulation.

(A) The operator of a facility subject to this rule shall keep and maintain records for each permitted emission unit or groups of permitted emission units sufficient to determine actual emissions. Such information shall be summarized in a monthly log, maintained on site for five years and shall be made available to the District, CARB, or EPA staff upon request.

(B) Coating/Solvent Emission unit

The operator of a facility subject to this rule that operates a coating/solvent emission unit or uses a coating, solvent, ink, or adhesive shall keep and maintain the records in accordance with Rule 109.

(C) Organic Liquid Storage Unit

The operator of a facility subject to this rule that contains an organic liquid storage unit shall keep and maintain the following records:

(i) A monthly log identifying the liquid stored and monthly throughput; and

(ii) Information on the tank design and specifications including control equipment.

(D) Combustion Emission Unit

The operator of a facility subject to this rule that contains a combustion emission unit shall keep and maintain the following records:

(i) Information on equipment type, make and model, maximum design process rate or maximum power input/output, minimum operating temperature (for thermal oxidizers) and capacity, control device(s) type and description (if any) and all source test information; and

(ii) A monthly log of hours of operation, fuel type, fuel usage, and fuel heating value.

(E) Emission Control Unit

The operator of a facility subject to this rule that contains an emission control unit shall keep and maintain the following records:

(i) Information on equipment type and description, make and model, and emission units served by the control unit;

(ii) Information on equipment design including where applicable: pollutant(s) controlled; control effectiveness; maximum design or rated capacity; inlet and outlet temperatures, and concentrations for each pollutant controlled; catalyst data (type, material, life, volume, space velocity, ammonia injection rate and temperature); baghouse data (design, cleaning method, fabric material, flow rate, air/cloth ratio); electrostatic precipitator data (number of fields, cleaning method, and power input); scrubber data (type, design, sorbent type, pressure drop); other design data as appropriate; all source test information; and

(iii) A monthly log of hours of operation including notation of any control equipment breakdowns, upsets, repairs,

maintenance and any other deviations from design parameters.

(F) General Emission Unit

The operator of a facility subject to this rule that contains an emission unit not included in subdivision (e) of this rule shall keep and maintain the following records:

(i) Information on the process and equipment including the following: equipment type, description, make and model, maximum design process rate or throughput; control device(s) type and description (if any);

(ii) Any additional information requested in writing by the Executive Officer;

(iii) A monthly log of operating hours, each raw material used and its amount, each product produced and its production rate; and

(iv) Purchase orders, invoices, and other documents to support information in the monthly log.

(f) Reporting

(1) The reporting provisions below shall not apply to De Minimis facilities.

(2) Not withstanding the provisions in paragraph (f)(1), within 30 days of a written request by the District or the EPA, the operator of a facility not maintaining records pursuant to subdivision (e) shall demonstrate that the facility's emissions or throughput are not in excess of the applicable quantities set forth in the definition of De Minimis facility.

(3) The operator of a facility subject to this rule shall provide to the District a process statement or monthly log at the time of ~~annual~~ 12-month renewal for the previous 12 months of operation. The operator shall certify that the monthly log is true, accurate and complete.

(4) Any additional information requested by the Executive Officer shall be submitted to the Executive Officer within 30 days of the date of request.

(5) The operator shall notify the Executive Officer within 7 days of any exceedance of the alternative operational limit.

(6) Notwithstanding the provisions in paragraph (f)(3), a current Declaration of Total Emissions submitted in accordance with paragraph (e)(7)(A) of

Rule 301 - Permitting and Associated Fees shall be deemed to meet the reporting requirements of this rule.

(g) Violations

(1) Failure to comply with any of the applicable provisions of this rule shall constitute a violation of this rule. Each day during which a violation of this rule occurs is a separate offense.

(2) A facility subject to this rule shall be subject to applicable federal requirements for a major source, including all other applicable rules of Regulation XXX, when the conditions specified in either subparagraph (g)(2)(A) or (g)(2)(B) below, occur;

(A) Commencing on the first day following every ~~annual~~ 12-month period in which the facility exceeds a limit specified in paragraph (d)(1) and any applicable alternative operational limit specified in paragraph (d)(2), or

(B) Commencing on the first day following every ~~annual~~ 12-month period in which the operator cannot demonstrate that the facility is in compliance with the limits in paragraph (d)(1) or any applicable alternative operational limit specified in paragraph (d)(2).

(h) Exemptions

This rule shall not apply to the following facilities:

(1) Any facility, whose emissions, throughput, or operation, at any time after March 16, 2001 are greater than the quantities specified in paragraphs (d)(1) and (d)(2) and which meets both of the following conditions:

(A) The operator has notified the District at least 30 days prior to any exceedance that the operator intends to submit an application for a Title V permit, or otherwise obtain permit limits that are legally and practically enforceable by the EPA and citizens or by the District; and

(B) A complete Title V permit application is received by the District, or the permit action to otherwise obtain limits that are legally and practically enforceable by the EPA and citizens, or by the District is completed, within 12 months of the date of notification.

(2) Any facility that has applied for a Title V permit in a timely manner and in conformance with Rule 3003 - Applications, and is awaiting final action by the District and EPA.

(3) Any facility required to obtain an operating permit under Rule 3001 - Applicability for any reason other than being a major source.

(4) Any facility with a valid Title V permit.

(5) Notwithstanding paragraphs (h)(2) and (h)(4) of this rule, nothing in this subdivision shall prevent any facility which has applied for or had a Title V permit from qualifying to comply with this rule in the future in lieu of maintaining an application for a Title V permit, or upon rescission of a Title V permit provided ~~if~~ the operator demonstrates to the satisfaction of the Executive Officer that the facility's emissions have been permanently reduced by accepting an enforceable permit change and is in compliance with the emission limitations in paragraph (d)(1) or an applicable alternative operational limit in paragraph (d)(2).

(6) Any facility which has a valid operating permit with conditions limiting facility emissions that are legally and practically enforceable by the EPA and citizens or the District to below the applicable threshold(s) for a major source as defined in paragraph (c)(6).

Table 1
Alternative Operational Limits

Type of Operation	Usage Limit in Every 12-Month Period
Printing, Publishing, and Packaging	In addition to the individual equipment usage limits listed, all Printing, Publishing, and Packaging operations have usage limits of 1,333 gallons of materials containing any one HAP, and 3,333 gallons of materials containing combination HAPs.
Flexography and Rotogravure (using water-based or UV-cured inks, coatings, and adhesives)	40,000 pounds inks, coatings, adhesives, dilution solvents, & cleaning solvents
Flexography and Rotogravure (using solvent-based inks)	10,000 pounds (before controls) of inks, coatings, adhesives, dilution solvents & cleaning solvents
Heatset Offset Lithography	10,000 pounds (before controls) of ink, cleaning solvent, & fountain solution additives
Non-Heatset Offset Lithography (web- or sheet-fed)	1,425 gallons of cleaning solvent & fountain solution additives
Screen Printers	1,425 gallons of solvent-based inks, cleaning solvents, adhesives, & coatings
Boilers (≤ 100,000,000 Btu/hr)	71,000,000 cubic feet of natural gas consumed
Bulk Gasoline Plants (equipped with vapor-balance system)	20,000 gallons per day of gasoline loaded & unloaded
Degreasers & Other Units if the solvents do not include: 1,1,1-trichloroethane, dichloromethane, tetrachloroethylene, or trichloroethylene	5,400 gallons of any combination of solvent-containing materials 2,200 gallons of any one solvent-containing material
Degreasers & Other Units if the solvents include: 1,1,1-trichloroethane, dichloromethane, tetrachloroethylene, or trichloroethylene	2,900 gallons of any combination of VOC-containing materials 1,200 gallons of any one solvent-containing material
Emergency Standby Engines (< 1,000 brake horsepower)	< 200 hours of operation
Gasoline Dispensing Facilities (Equipped with Phase I and Phase II vapor recovery systems)	7,150,000 gallons of gasoline dispensed
Hot Mix Asphalt Plants	125,000 tons of hot mix asphalt produced
Spray Booths	1,100 gallons of all VOC-containing materials, with no more than 110 gallons of VOC- & HAP-containing materials and the VOC content ≤ 1000 gram/liter, less water and exempt compounds
Ultraviolet/Electron Beam Cured Operations	21,582 gallons of ultraviolet/electron beam materials not to exceed 50 grams/liter.

EXECUTIVE SUMMARY

The District staff is proposing to amend Regulations XVII – Prevention of Significant Deterioration (PSD), and XXX – Title V Permits, to implement federally mandated requirements for greenhouse gases (GHG) for the PSD and Title V programs. These federal programs are implemented by the District through the enforcement of these two regulations. Regulation XVII amendments will incorporate federal requirements for GHGs by reference into a new rule, Rule 1714 – PSD for GHGs. Regulation XXX amendments would add federal GHG requirements into the current District rules.

REGULATORY BACKGROUND

On June 3, 2010, U.S. EPA promulgated a "tailoring rule" to describe the applicability criteria that determine which existing or new stationary sources and which modification projects become subject to permitting requirements for GHG emissions under the PSD and Title V programs of the CAA. The District is presently implementing the PSD program under a Partial Delegation from U.S. EPA Region IX. The District implements its Regulation XVII – PSD to address attainment air pollutants. The District's Regulation XVII is presently not approved by U.S. EPA into the SIP. Staff intends to incorporate the GHG provisions for the PSD program by reference by adopting a new rule. The District received approval of Title V as a permitting program for major sources November 21, 2003 (68 FR 65637) and it is implemented through Regulation XXX. The District staff's proposed amendments for Title V (Regulation XXX) retain the basic approach of the regulations and add GHGs to the structure.

Regulation XVII – PSD implements a federally mandated program that provides a pre-construction review and permitting authority for new major stationary sources and major modifications at existing major stationary sources for areas that are designated "attainment" or "unclassifiable" for a National Ambient Air Quality Standard (NAAQS). It works in tandem with "nonattainment" New Source Review (District Regulation XIII) for areas that are not in attainment for a NAAQS.

The South Coast Air Basin is classified "attainment" for carbon monoxide, nitrogen dioxide and sulfur dioxide. It is "nonattainment" for ozone, particulate matter $(PM)_{2.5}$ and PM_{10}. The Salton Sea Air Basin is "unclassified" for carbon monoxide, nitrogen dioxide, sulfur dioxide, and $PM_{2.5}$ and nonattainment for ozone and PM_{10}. Both Basins have requested U.S. EPA to re-designate them as "attainment" for PM_{10} based on recent monitoring.

Title V is a federally enforceable program for permitting large sources in an inclusive format to assist in their compliance with provisions of the CAA.

U.S. EPA has defined GHGs as the following: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydroflurocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). This is consistent with the six gases included in state programs, such as AB 32, and the District's Regulation XXVII – Climate Change. These gases are compared using a term called "Carbon Dioxide Equivalent" (CO_2e), which means the amount of carbon dioxide (CO_2) that would have the same global warming potential as a given amount of another greenhouse gas. Global Warming Potential (GWP) means the capacity to heat the atmosphere, calculated as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram (kg) of a substance relative to that of 1 kg of CO_2. GWPs are calculated according to the factors for a 100-year time horizon.

The U.S. EPA determined that without their rulemaking, PSD and Title V requirements would, as of January 2, 2011, apply to sources of GHGs with emissions of 100 tons per year (tpy), and PSD requirements would apply at levels of 100 tons per year or 250 ton per year, depending on the source category, the threshold levels for criteria attainment pollutants under the CAA. This level of emissions for GHGs is considered extremely low and would greatly increase the number of sources requiring permits, impose undue costs on small sources, overwhelm the resources of permitting authorities, and severely impair the functioning of the PSD and Title V programs. For example, without the GHG tailoring provisions, there would be an estimated six million new Title V permits nationwide, of which, the AQMD's proportionate share could be 300,000 new permits (based on population size). This compares to approximately 500 current Title V permits.

The current U.S. EPA tailoring rule creates a phase-in process starting with the largest GHG emitters covered beginning January 2, 2011, and smaller emitters delayed entry into the programs until at least April 30, 2016.

PUBLIC PROCESS

A Public Workshop/CEQA Scoping Session was held September 9, 2010. Approximately 60 people attended and five comment letters were submitted after the workshop. A Public Consultation Meeting will be held October 12, 2010

PURPOSE AND APPLICABILITY

The purpose of these rule amendments is to implement the federally promulgated requirements for GHG emissions in the PSD and Title V programs. PSD requirements are presently implemented through Regulation XVII and the GHG requirements will be adopted by reference and incorporated into Proposed Rule 1714. Title V requirements are presently implemented through Regulation XXX and the GHG requirements will be incorporated through amendments to Rules 3000, 3001, 3002, 3003, 3005, 3006, and 3008.

LEGAL AUTHORITY

The AQMD obtains authority to adopt, amend, or repeal rules and regulations which control air pollution from Health and Safety Code §§ 40000, 40001, 40440, 40725-40728, 42300 *et seq*.

AQMP AND LEGAL MANDATES

The District is proposing Rule 1714 and amending rules in Regulation XXX – Title V Permits, to implement the federal requirements for GHGs. These rules are not control measures in the AQMP, but are mandatory requirements under the Clean Air Act. Proposed Rule 1714 – PSD for GHGs, will implement the GHG requirements by an adoption by reference of the federal requirements. The GHG requirements for Title V programs will be included in Regulation XXX by amending Rules 3000, 3001, 3002, 3003, 3005, 3006, and 3008 of that regulation.

AFFECTED INDUSTRY

Staff has identified 55 existing facilities which may potentially be impacted by the Title V federal regulations. These facilities are primarily classified in the following industries: cement, cogeneration units, electric power generation, hydrogen plant, inorganic chemical manufacturing, and petroleum refineries. This information is based on GHG emissions reported to CARB for 2008. Please see the discussion below in "summary of proposed rule amendments" for specifics as to what the effective dates are and the threshold levels triggering inclusion. Staff is not able to estimate the facilities that may be subject to PSD.

SUMMARY OF PROPOSED RULE AMENDMENTS

The amendments to Regulations XVII – Prevention of Significant Deterioration, and XXX - Title V Permits, are proposed to implement federal changes to 40 CFR Parts 52 and 70, published June 3, 2010 and effective August 2, 2010. The first step phase-in date is January 2, 2011, followed by a second step implementation date of July 1, 2011.

Regulation XVII – Prevention of Significant Deterioration

One new rule is proposed for Regulation XVII, Proposed Rule 1714 – PSD for GHGs, to adopt by reference the provisions related to GHGs from the federal PSD rule as delineated in 40 CFR Part 52.21. The rule specifies what portions of 40 CFR, Part 52.21 do not apply to GHG emissions. These exclusions are as follows:

(a)(1) Plan disapproval - the provisions of this section are applicable to any SIP which has been disapproved with respect to PSD of air quality in any portion of any State where the existing air quality is better than the national ambient air quality standards. There is no air standard applicable for GHGs.

(b)(13) Definition of Baseline Concentration – pertains to increment consumption which has to do with criteria pollutants.

(b)(14) Major source baseline date – pertains to criteria attainment pollutants.
(b)(15) Definition of Baseline Area –pertains to criteria attainment pollutants.
(b)(55-58) Equipment Replacement Project (ERP) definitions struck down by the DC Circuit Court but not yet removed from the CFR.
(c) Ambient air increments - pertains to criteria attainment pollutants.
(d) Ambient air ceilings - pertains to criteria attainment pollutants.
(e) Restrictions on area classifications –restricts designation of certain Class I areas – pertains to criteria pollutants.
(f) Reserved
(g) Redesignation – pertains to re-designation of areas, which is not applicable to pollutants with no NAAQS.
(h) Stack heights - this has to do with modeling which does not apply to GHGs.
(i)(1)(i-v) Exemptions dealing with construction commenced in the 1977-1980 range.
(i)(1)(ix-xi) Exemptions dealing with construction commenced in 1987.
(i)(6-8) Exemptions dealing with construction commenced in 1988.
(k) Source impact analysis – pertains to NAAQS thus it does not apply to GHGs.
(l) Air quality modeling – there is no NAAQS for GHGs and thus modeling is not applicable to GHGs.
(m) Air quality analysis - pertains to criteria attainment pollutants.
(o) Additional impact analyses – GHG emissions are not a local impact issue.
(p) Sources impacting Federal Class I Areas - pertains to criteria attainment pollutants.
(q) Public participation – Not needed as District Rule 1714 contains public participation requirements.
(s) Environmental impact statements –This pertains to a federal agency preparing NEPA documents.
(t) Disputed permits or redesignations - pertains to criteria attainment pollutants.
(u) Delegation of authority – this applies to the U.S. EPA Administrator; the District is not delegating authority to anyone.
(v) Innovation control technology - this provision is optional, not a required element of a PSD program. Also, this section refers to 40 CFR Part 124.10, which is not the standard for public notice when the rule is incorporated by reference.
(w) Permit rescission – pertains to rescinding permits
(x) Reserved
(y) Reserved
(z) Reserved
(aa) Actual plantwide applicability limitation (PALs) – the District does not have delegation of authority for PALs which are bubble plans (plantwide) for criteria pollutants, not applicable to GHGs. Not adopting this provision for GHGs makes the District's program more stringent than the federal program because bubbles (PALs) add compliance flexibility.

(cc) ERP provisions struck down by DC Circuit Court but not yet removed from the CFR.

In general, the federal rules establish the dates for a phased-in multi-step process. Specifically, beginning January 2, 2011 (Step 1) any source already subject to the PSD regulation for new construction or a modification for any attainment pollutant, and having an increase in GHG emissions on a carbon dioxide equivalent (CO_2e) basis (Global Warming Potential [GWP] applied) $\geq$75,000 tpy CO_2e **and** with a net emission increase greater than zero of GHG emissions on a mass basis (no GWP applied), will be required to undergo assessment of BACT for GHG emissions. To clarify, GHG emissions calculated on a CO_2e basis takes the sum of the six GHG specified above and weights them according to their GWP by multiplying each component by its GWP factor before summing them to make the total GHG emissions. If the calculation is done on a mass basis, no weighting is done and thus no GWP factor is applied. The emissions are the simple summation of all the GHG emissions. As a result, AQMD would begin requiring BACT, as applicable, for GHGs for these sources.

Step 2 of the phased-in implementation for GHG sources has an effective date of July 1, 2011. At this point, all sources subject to the regulation through Step 1 will continue to be subject to the rule and additionally, sources with a potential to emit (PTE) GHGs $\geq$100,000 tpy CO_2e and emitting GHGs or an NSR pollutant above the 100/250 tpy (mass based) statutory thresholds, will be subject to the regulation. Furthermore, on or after the July 1, 2011 date, modifications of a "major source", including those determined to be a major source solely on the basis of GHG emissions, with a net emissions increase of GHGs of $\geq$75,000 CO_2e (GWP applied), and a net increase in GHGs calculated on a mass basis (no GWP applied) equal to or exceeding 0 tpy, will be subject to the regulation. These facilities will be subject to BACT for GHGs. The U.S. EPA regulation also states that sources emitting <50,000 tpy CO_2e would not be subject to the regulation until at least April 30, 2016. Additional federal rulemaking would be necessary to regulate such sources.

The federal rule defines GHGs as the following: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydroflurocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). These gases are compared using a term called "Carbon Dioxide Equivalent" (CO_2e), which means the amount of carbon dioxide (CO_2) that would have the same global warming potential as a given amount of another greenhouse gas. Global Warming Potential (GWP) means the capacity to heat the atmosphere, calculated as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram (kg) of a substance relative to that of 1 kg of CO_2. GWPs are calculated according to the factors for a 100-year time horizon.

The regulation grants relief to sources emitting GHG, because the major source definition as it applies to attainment pollutants is either 100 or 250 tpy, depending on the source category. As stated above, if this threshold level was used for GHGs, it would greatly increase the number of sources requiring permits, impose undue costs on small sources, overwhelm the resources of permitting authorities, and severely impair the functioning to

the PSD and Title V programs. To be considered a "major source" based solely on GHG emissions, a GHG source must have the potential to emit GHGs in amounts of, or exceeding, 100 tpy for sources in any of the 28 major emitting facility source categories listed under PSD CFR 40 Part 52; or 250 tpy for any other stationary source, calculated on a GHG mass basis (no GWP applied); **and** with the potential to emit GHGs of 100,000 or more tpy CO_2e.

PR 1714 also contains the same public participation requirements as the District enforces for all other sources regulated under Regulation XVII – PSD by Rule 1710 - Analysis, Notice and Reporting.

Regulation XXX – Title V Permits

Amendments to Regulation XXX are proposed for seven of the nine rules in the regulation. PAR 3000 – General, is proposed for amendment by adding three definitions: carbon dioxide equivalent (CO_2e); global warming potential (GWP); and greenhouse gas (GHG). One definition, Minor Permit Revision is proposed to be amended by adding a threshold value for GHGs. A table is also added listing the GHGs and their GWPs.

PAR 3001 – Applicability, contains language similar to that found in PAR 3002 regarding the inclusion of sources with GHG emissions into the program. The proposal adds an exemption for sources with PTE GHGs less than 100,000 tpy CO_2e and PTE less than the thresholds in Table 2 of this rule for all other air contaminants if the facility takes an enforceable condition in a permit or modifies the facility to such a level.

PAR 3002 – Requirements, is proposed to be amended by adding the January 2, 2011 and July 1, 2011, dates for including GHGs in Title V permits. The first date (Step 1) requires GHGs to be added to any permit that is being obtained or modified under Title V due to an attainment air contaminant. In other words, if a Title V permit is required for any attainment air contaminant, then applicable requirements for GHG emissions must be included in the permit. The July 1, 2011 date (Step 2) includes any source with a potential to emit (PTE) $\geq$ 100,000 tpy CO_2e (on a CO_2e basis with GWPs applied) and a PTE GHGs $\geq$ 100 tpy on a mass basis (no GWP applied). Language was presented in two options in paragraph (a)(3) regarding the GHG requirements to be presented in the Title V permit and whether they are "applicable" requirements and thus only those requirements under the federal CAA and the SIP; or "regulatory" requirements and thus in addition to applicable federal requirements would also include "state only" requirements, meaning requirements promulgated by state action only. Staff sought input on these two options through the public workshop process and after receiving several comments in support of Option 1, the proposed rule language reflects that only the federal or "applicable" requirements are to be included in the Title V permits. At present, there are no federal regulations that constitute "applicable requirements" for GHGs unless the source is subject to BACT for GHGs under PSD. Also, the proposed rule clarifies that on and after July 1, 2011, new or modified facilities with a PTE increase of $\geq$ 100,000 tpy CO_2e will be subject to Title V.

PAR 3003 – Applications, PAR 3005 – Permit Revisions, and PAR 3006 – Public Participation, are proposed for amendment only due to references in those rules to definitions in PAR 3000 – General, and the proposed changes in the numbering sequence in that proposed amended rule.

PAR 3008 – Potential to Emit Limitations, authorizes sources to cap their PTE to avoid applicability of Title V based on GHG emissions. The proposed amended rule reflects a clarification in the use of the term "annual" to reflect the current process of using 12-month rolling basis for determining actual emissions. Also, the definition of De Minimis Facility is proposed for amendment by adding sources emitting less than 25,000 tpy CO_2e of GHGs. This level is chosen to reflect sources at the GHG emission level of 25,000 tpy CO_2E needing to comply with mandatory reporting requirements. Also, PAR 3008 subdivision (d) adds sources with the PTE GHGs less than 50,000 tpy CO_2e level for PTE limitations.

Rule 3008 includes alternative recordkeeping provisions and operational limits for certain types of equipment. Staff believes equipment subject to the alternative limits would not trigger any of the current GHG thresholds. An emergency standby engine with output less than 1,000 brake horsepower (PAR 3008 (e)(2)(E)), and alternative operational limits for boilers ($\leq$100,000,000 Btu/hr) using $\leq$ 71,000,000 cubic feet of natural gas consumed in a 12-month period (PAR 3008, Table 1) would have GHG emissions far below the 50,000 tpy threshold level. For the engines, the amount of diesel combusted would be 1,000 bhp x 0.05gal/bhp-hr x 200 hrs./yr (max operational time) = 10,000 gals/year and with a value of 10.21 kg CO_2/gallon this yields 102 MT CO_2e. For the boilers the 71,000,000 square cubic feet natural gas equivalent is 3,834 MT CO_2e.

EMISSION REDUCTIONS

While requiring BACT for GHGs may result in either smaller future increases or future reductions of GHGs (and/or possibly criteria pollutants) compared to the status quo, it is impossible to quantify such benefits at the present time. In fact, Federal BACT for GHGs has not currently been finalized. There is an U.S. EPA Climate Change Work Group developing recommendations for U.S. EPA regarding guidelines for GHG BACT. It is likely that BACT for GHG will include energy efficiency and combustion fuel efficiency, but the actual measures, as well as the attendant efficacy, is, at this time, speculative.

Further, the District's CEQA process currently considers GHG emissions. This review requires owner and operators to quantify and address GHG emissions. The addition of these amendments to the CEQA process may not yield additional emission reductions.

COMPARATIVE ANALYSIS

Health and Safety Code Section 40727.2 requires a written analysis comparing the proposed amended rule with existing federal, State and District regulations. This analysis must include averaging provisions, operating parameters, work practice requirements,

and recordkeeping, monitoring, and reporting requirements associated with existing applicable rules and proposed regulations.

These rules encompass all sources and thus the statute should not be interpreted to require this agency to list all federal and state rules and regulations affecting these sources.

CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

SCAQMD staff has reviewed Proposed Rule 1714 and the proposed amendments to Regulation XXX – Title V Permits, and determined them to be exempt from CEQA requirements pursuant to State CEQA Guidelines §15268 – Ministerial Projects. The proposed project is considered to be ministerially exempt because the proposed project is implementing federal requirements and the SCAQMD has not exercised discretion in adopting the proposed project. Upon adoption of the proposed amendments, a Notice of Exemption will be prepared pursuant to CEQA Guidelines §15062 and filed with the county clerks in each county within the SCAQMD's jurisdiction and will be available at AQMD Headquarters, by calling the AQMD Public Information Center at (909) 396-2039, or by accessing AQMD's CEQA website at: www.aqmd.gov/ceqa.

SOCIOECONOMIC ANALYSIS

PARegs XXVII and XXX represent an adoption of the federal Tailoring Rule for PSD by reference and Title V by incorporation of federal requirements in Regulation XXX rules. Since the proposed amendments do not impose requirements beyond the federal rules, Title V and PSD permit holders are not expected to face additional costs or other socioeconomic impacts as a result of the proposed amendments. As such, a socioeconomic assessment is not required.

REFERENCES

1. U.S. EPA 75FR 31514, Prevention of Significant Deterioration and Title V Greenhouse Gas Tailoring Rule, June 3, 2010.

RESPONSE TO COMMENTS

The following comments were received during the public workshop held September 9, 2010 and the comment period, which ended September 17, 2010. Unless noted, the comments and responses deal with PSD.

U.S. EPA and CARB

1. Comment: U.S. EPA and CARB both commented that there needs to be consistent definitions of CO_2e, GHGs, and GWP for all Districts, EPA, and CARB.

   Response: Comment noted. The District looks forward to receiving further input on this issue. At the time of the publication of this report, this work was not yet completed.

Delegation/Applicability

2. Comment: Currently, the AQMD has delegation for PSD on new sources. After January, will AQMD implement GHG provisions?

   Response: Yes, under the proposed rules, if adopted.

3. Comment: It would be helpful for staff to develop a chart to indicate who has authority (federal vs. District) for what parts of PSD.

   Response: Please see response to comment # 4.

4. Comment: What areas of PSD does the District have delegation over?

   Response: The District currently has delegation for new major sources and for modified major sources if they go through the Regulation XVII calculation procedure and it is determined that PSD applies. The District does not have delegation for modified sources that use the method for calculating emissions increase set forth in the federal PSD regulation. The District does not have delegation for plantwide applicability limitation (PALs) or other modifications using NSR Reform calculation methodology.

5. Comment: Does SB 288 impact the GHG requirements?

   Response: The state requirement, SB 288, prohibits backsliding on NSR programs that were adopted prior to 2002. This amendment will not be impacted by SB 288, as the current program does not apply to GHGs, so adding requirements for GHGs does not make the NSR program less stringent.

6. Comment: The adoption of 40 CFR Part 52.21 Subpart A in total is confusing in that so many paragraphs are not available to District permittees by action of SB 288. It would be helpful for staff to create a table delineating which sections of

Part 52.21 are not applicable to the District by action of SB 288, irrespective of GHGs. In the same table, please delineate which of the remaining sections of Part 52.21 apply to GHGs.

Response: Please see response to comment # 5. SB 288 does not apply to this amendment. Staff has listed the sections of Part 52.21 that do not apply to GHGs in PR 1714 and also in the staff report.

7. Comment: How will the District address Clean Units, PALs, Pollution Control Projects (PCP), and calculation procedures? At the Public Workshop, staff noted that PALs are a current option for some PSD permit applicants. However this option is only available if EPA issues the PSD permit. If a PSD permit applicant wants to use PAL, can the applicant do so if Regulation XVII is made part of the SIP? What about if it is delegated? Or again, is the intention of the amendment to have no effect on pollutants other than GHG?

   Response: The commentor is correct that the intention of the amendments is to have no effect on pollutants other than GHGs. PALs and PCPs will remain an option only if U.S. EPA issues the PSD permit.

8. Comment: There are unintentional consequences of adopting all of Part 52.21, perhaps limiting flexibility down the road. For instance, under section 52.21 (m), the absence of a national ambient air quality standard could cause the Administrator to require air quality monitoring data collected during the year prior to a permit application. This could potentially impact many projects with unclear delays.

   Response: Section 52.21 (m) is excluded for GHG requirements in PR 1714.

9. Comment: Please provide a list of all the GHG applicable requirements known at this time in the staff report.

   Response: Staff has drafted the rule to require 40 CFR Part 52.21 and listed the non-applicable portions. All portions excluded for GHGs are also listed in the staff report.

10. Comment: The language in PR 1714 is confusing. Subdivision (a) says all provisions of Rule XVII still apply to other attainment pollutants and that proposed rule applies only to GHGs. Then subdivision (b) says, "Adopt by reference the Code of Federal Regulations Part 52, Subpart A, section 52.21." The definition of "attainment air contaminant" and "major source" in Rule 1702 effectively require regulation of any new source with GHG emissions greater than either 250 or 100 tpy. The rule is silent as to applicability of modification permitting requirements to unlisted "regulated pollutants" including GHGs. We assume that the District intends to bring its rule into conformity with the applicability thresholds in the EPA Tailoring Rule. However, the language in PR

1714 (b) does not refer to the amended GHG thresholds adopted in the Tailoring Rule but adopts Rule 52.21 in its entirety. This is confusing since section 52.21 covers criteria pollutants and other regulated pollutants besides GHGs. We would appreciate clarification of the action and regulatory language proposed by the District to allow for the application of the EPA Tailoring Rule GHG threshold provisions in PSD permits issued by the District.

Response: Subdivisions (a) and (b) referenced by the commentor are both parts of PR 1714 and thus apply to GHGs and only GHGs. PR 1714 states: "This rule sets forth preconstruction review requirements for greenhouse gases (GHG)." The provisions of this rule apply only to GHGs as defined by U.S. EPA to mean the air pollutant as an aggregate group of six GHGs: carbon dioxide, nitrous oxide, methane, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. All other attainment air contaminants, as defined in Rule 1702 subdivision (a), shall be regulated for the purpose of PSD requirements pursuant to Regulation XVII, excluding Rule 1714." Staff believes this language clearly delineates between GHGs which will be regulated under Proposed Rule 1714 and the other pollutants regulated in all other rules in Regulation XVII. PR 1714 does not refer to the GHG threshold because it adopts those by reference in 40 CFR, Part 52.21 which contains the GHG thresholds. As specified in PR 1714, the adoption by reference of the federal language only applies to GHGs. Definitions in Rule 1702 are not applicable to GHGs, as no rule in Regulation XVII other than PR 1714 is applicable to GHGs.

11. Comment: EPA has recently solicited information on biogenic GHG emissions and whether or not a distinction should be made in the Tailoring Rule. Can the door be left open to include these provisions automatically in Regulation XVII (as opposed to undergoing new rulemaking) if EPA chooses to uphold the distinction between anthropogenic and biogenic emissions? This is particularly important with respect to Rule 3008.

    Response: The District is adopting Part 52.21 by reference (excluding sections not pertaining to GHG emissions), so if U.S. EPA makes amendments to 40 CFR Part 52.21 they would automatically be included in Rule 1714 – PSD for GHGs.

12. Comment: GHG emissions from bio-energy facilities should be excluded for purposes of evaluating PSD and Title V emission thresholds. The scientific and policy debate currently occurring over net carbon impact of biomass facilities largely stems from the wide variation in the types of feedstock utilized by such facilities. Urban green waste should be given a default assumption of carbon neutrality and the AQMD rulemaking should specifically incorporate this concept.

    Response: The District is adopting the federal requirements as promulgated. The federal decision to handle bio-energy facilities or biomass differently has not been made at this time.

13. Comment: Outside of relief from the Environmental Appeals Board process, is there any other benefit of having Regulation XVII approved into the SIP? Are there any downsides like losing potential flexibility that comes with a delegated program?

    Response: By adopting the federal requirements, the District becomes the permitting authority, instead of U.S. EPA. This reduces permit review time and improves communication. The commentor is correct that by approving these rules into the SIP the appeals to the Environmental Appeals Board would be avoided.

14. Comment: What options are available to the AQMD to apply the GHG thresholds under EPA's Tailoring Rule to PSD permits? What are the benefits and drawbacks of obtaining full "SIP" approval versus EPA "Delegation"? If the District does not seek a SIP approved PSD program for GHGs, how would that affect PSD permitting for other pollutant.

    Response: If the District does not adopt the federal requirements, permitting reverts to the U.S. EPA and the District may be subject to a SIP call or may apply to administer the U.S. EPA program under a delegation of authority from U.S. EPA. (Please also see response to comment # 13). The decision to incorporate GHGs into Regulation XVII should not impact PSD permitting for criteria pollutants.

15. Comment: Will EPA changes in the referenced CFR section automatically become effective, or will the changes require formal AQMD Board adoption and then EPA approval? Are there other issues associated with SIP approval?

    Response: If the Board approves PR 1714 as proposed, the rule adopts the federal requirements by reference and thus subsequent changes will be implemented.

BACT and LAER

16. Comment: Current District PSD is more stringent than federal requirements with a 1 lb threshold and LAER in place of BACT. Will this impact GHG requirements?

    Response: No, the District's LAER requirement for criteria pollutants will not impact requirements for GHG BACT which will follow the federal definition of BACT and include consideration of cost and energy.

17. Comment: Regulation XVII will now deal with two different BACTs, one being California BACT or LAER, for criteria pollutants, while the other will be

traditional federal BACT for GHGs. This distinction should be made clear in the staff report.

Response: PR 1714 clearly states that rule is for GHGs and the other Regulation XVII rules are for other air contaminants. By adopting GHG provisions by referencing the Code of Federal Regulation, that definition of BACT is incorporated in PR 1714 for GHGs, while BACT is defined for other air contaminants in Rule 1702 – Definitions.

18. Comment: Please describe the difference between BACT and LAER.

    Response: Under federal NSR for attainment and non-attainment air contaminants, Federal BACT or best available control technology generally applies to attainment pollutants and includes the consideration of such factors as energy and cost. LAER or lowest achievable emission rate generally applies to non-attainment air contaminants and is more stringent than BACT, and generally does not consider cost for emission limits that are achieved in practice.

19. Comment: How will federal BACT be determined?

    Response: The District will follow federal guidelines on BACT for GHGs. There is a Climate Change Work Group currently developing recommendations to U.S. EPA regarding guidance on GHG BACT. Staff will closely follow this committee's actions.

20. Comment: Are there any federal BACT requirements for GHGs?

    Response: Currently, no. Please see response to comment # 19. Staff will follow this process and conduct working groups or consultation meeting to brief stakeholders, as appropriate.

21. Comment: With no BACT, LAER, or other method of GHG emission limitation or means of reduction, inclusion of GHGs in a Title V permit might mean virtually nothing except some kind of political statement

    Response: After January 2, 2011, Title V permits may include BACT for GHGs, if applicable, under PSD actions, and may have PTE limitations to keep a facility out of PSD.

22. Comment: We understand that EPA may propose to use a "Top Down" BACT analysis, as currently required in the EPA-District PSD delegation agreement. What will be the role of energy efficiency in the new federal BACT for GHG and how will it be determined? Will a "Top Down" BACT analysis be used to ensure cost-effectiveness and technical feasibility including the assurance that control technologies have been demonstrated in practice are properly evaluated?

Response: The U.S. EPA is currently developing guidelines for BACT determination for GHG. Energy efficiency is one of the topics being considered. (Please see response to comment # 19.) For GHGs, staff has not altered the federal definition of BACT which currently considers cost and technical feasibility.

23. Comment: Traditional federal BACT for GHGs might focus on GHG reductions only and not be sensitive to the possibility of tension between criteria pollutants and GHGs. An example would be tightening up on boiler NO_X emissions which has the effect of lowering boiler efficiency (increasing CO_2) if a combustion modification route is chosen. This is the reason the SCAQMD Board adopted the policy that if a health-based, criteria pollutant measure conflicts with GHG goals, the health-based standard will always trump the latter.

    Response: Both the District and U.S. EPA are aware of this potential conflict and steps will be taken to minimize any impacts.

24. Comments: We have a concern regarding BACT which flows from discussions at the CAAAC BACT subgroup meetings where it was suggested that BACT determinations include a review of an *entire* facility, not just the subject permit unit, to determine efficiency improvements, energy conservation measures, etc. Please state clearly in the staff report, as staff stated at the recent workshop, that the BACT analysis will focus on the permit unit in question only and not the associated facility. Also clarify in the staff report and with EPA that any EPA BACT determinations will be filtered by the SCAQMD to make sure that they are consistent with the Board's policy paraphrased above.

    Response: Federal BACT, as applied in PSD permits, is a case-by-case evaluation based on the new or modified permit unit(s) under consideration. There is a national clearing house for federal BACT.

25. Comment: Will federal BACT include fuel switching?

    Response: The District will follow federal guidelines on BACT for GHGs and this has yet to be determined. Please see response to comments # 19 and # 20.

26. Comment: BACT should be solar energy. The Federal 30% investment tax credit expires in 2016 and along with the Federal Accelerated Cost Recovery System (depreciation in 5 years) makes solar renewable as BACT/LAER cost-effective on a life cycle cost effective basis.

    Response: Federal BACT has yet to be determined for GHGs. U.S. EPA has established a Climate Change Work Group to advise them on developing BACT guidelines for GHGs. The commentor has been given information on how to contact this entity regarding the determination of BACT and using solar energy as a solution.

27. Comment: The District should require LAER and solar conversion for new and retrofit technology.

    Response: The District is adopting the federal requirements for GHGs for PSD and Title V as promulgated in the Federal Register June 3, 2010. The regulation requires BACT assessment for GHG sources, not LAER, which is more stringent (please see response to comment # 18). The District staff believes LAER is not appropriate for GHG emissions in part because of the potential conflict with LAER requirements for criteria pollutants.

28. Comment: How do we (you) ensure that we are not locked into BACT as the means to reduce GHG emissions when down the road Congress may take a different tact or EPA may choose another course? We have concerns with issues of backsliding.

    Response: This is the current regulatory landscape. If requirements change in the future, SCAQMD would evaluate any new approaches.

Requirements

29. Comment: Please clarify your Option 1 and Option 2 in PAR 3001.

    Response: Staff work-shopped the rules with two options, and asked for comments. Option 1 would place only federal and SIP requirements in the Title V permit ("applicable requirements"), and Option 2 would also include "state only" requirements or those implemented by state or local statute, so that all GHG requirements are in one permit.

30. Comment: Option 2 represents more work on the permitting staff than is warranted at this time. The AB 32 Scoping Plan at one time identified 76 potential GHG – related control measures that could be developed by various state agencies. We recommend you revisit this issue in 2-3 years after the impacts of GHGs on PSD and Title V are fully appreciated.

    Response: Option 1 is currently reflected in the proposed amended rules.

31. Comment: Multiple comments were received expressing preference for Option 1. No comments were received in support of Option 2.

    Response: Please see response to comment # 30.

32. Comment: If the District is adopting the rules by reference and then sending them to the state and the state sending them to EPA, what is the projected timing and what happens if you fall short of the January 2, 2011 start date?

Response: The rule will go to the AQMD Governing Board in November and be submitted to the state right away. U.S. EPA should be able to respond quickly, as the proposals are straight forward. The District will enforce the adopted rules regardless of the status of federal approval or work out another arrangement with U. S. EPA to be able to issue permits until U.S, EPA approves the rules into the SIP.

33. Comment: If a source triggers PSD on the basis of GHGs, will that trigger an analysis for criteria pollutants?

    Response: Whether the facility triggers a criteria pollutant analysis when it triggers PSD for GHGs will depend on whether the facility exceeds the threshold for increase in criteria pollutants listed in Regulation XVII, not the entry threshold level of 100 tpy. The significant modification threshold for NO_x, for example is an increase of $\geq$40 tpy. Thus, criteria pollutant analysis may occur where the source is not "major" for that pollutant.

34. Comment: Will other PSD requirements, such as modeling, be required for GHGs?

    Response: The District does not envision implementing any additional requirements for GHG sources other than federal BACT and public notice. As explained in the staff report, many provisions of the PSD rule are inapplicable for GHGs.

35. Comment: The AQMD rulemaking should make clear that the only PSD requirement relevant in the context of GHGs is the BACT requirement.

    Response: Please see response to comment # 34

36. Comment: There are memos regarding PTE for limiting criteria pollutants, are they applicable to GHG emissions?

    Response: There is nothing official at this time, but the GHG thresholds are on the basis of PTE.

37. Comment: Basing requirements on PTE could bring in many facilities.

    Response: PAR 3008 allows a source to take a cap on emissions that will fall below the threshold triggers for inclusion in Title V.

38. Comment: Taking a limit (cap) that would trigger a permit action to include the limit and then the source would incur monitoring/enforcement limits on the open permit.

Response: If a source takes a cap that means it was previously subject to the regulation. There may be monitoring and recordkeeping requirements if a cap is taken.

39. Comment: The GWP number the District uses for methane is 21. I have seen CARB use 25, this is also used by the United Nations group in their second and third assessments, and James Hansen uses 33.

    Response: The GWP number the District uses in the rule (21) comes from the U.S. EPA and is found to be cited in PAR 3000 Table 1 as coming from the Federal Register, Volume 74, No. 209, October 31, 2009.

40. Comment: Is EPA going to open all Title V permits? If the District is considering opening permits with greater than 3-years renewal time, is that 3 years from January 2, July 1, or permit issuance date?

    Response: Beginning January 2nd, staff is required to reopen to add GHG "applicable requirements" to any Title V permit which has more than 3 years left if the life of the permit (since our Title V permits have a life of 5 years, which is usually counted from the date of issuance), based on the expiration date noted in each permit (usually 5 years from the date of issuance). At the Public Workshop staff pointed out that since the only federal requirement for existing GHG sources is the federal Mandatory Reporting Requirements and U.S. EPA has already declared that these are not considered "applicable" requirements, the District does not intend to reopen any Title V permits after January 2nd unless and until some future time when there are applicable requirements for existing GHG sources. However, PSD BACT requirements for GHGs will need to be included in a Title V permit, if applicable.

41. Comment: Where will GHG requirements be placed on the Title V permit?

    Response: This has yet to be determined, but it will generally apply to emission units or devices listed in sections H and D of Title V permits.

42. Comment: Will you re-open Title V permits to incorporate GHG requirements and would it be for the whole facility or only the affect piece of equipment?

    Response: Title V permits will only be revised or issued when PSD is triggered, unless and until U.S. EPA adopts further GHG "applicable requirements". The GHG requirements would be only for the equipment subject to PSD due to a modification, not the entire facility. Please see responses to comments # 24 and #40.

43. Comment: If a permit is currently in the pipeline, but is issued after January 1, 2011, would the new rules apply?

Response: Yes, if the permit is not issued until after January 1, 2011 (for Step 1) and June 30, 2011 (for Step 2), the implementation dates, the new applicable GHG provisions would apply.

44. Comment: PAR 3000 (b)(15)(vi) is not clear. Does it mean that any increase in GHG emissions would disqualify the facility from minor permit revision opportunities?

    Response: No. The language has been re-phrased and re-structured to clarify that only sources emitting greater than 75,000 tpy CO_2e would be disqualified from the minor permit revisions opportunity on the basis of GHG emissions.

45. Comment: PAR 3000 (b)(20) defines Potential to Emit and for GHGs there is no reliable information and data on different GHG emission factors prepared by different organizations. Based on definitions for Compliance Documents and De Minimis Significant Permit Revision, any facility has potential to emit GHG in the amounts exceeding the threshold numbers. Also, the reference to (b)(28) does not apply to GHGs.

    Response: GHG emissions are currently being quantified and reported. Staff does not envision the proposed amendments affecting many sources. Paragraph (b)(28) is a definition regarding coal-fired power plants. GHGs are emitted from such sources.

46. Comment: PAR 3000 (b)(29)(c) definition of "responsible official" should add "or a designee" in the case of a public agency.

    Response: Comment noted. This is existing rule language, so no change was made.

47. Comment: Please explain whether the requirements in PAR 3001 (c)(8) and (9) are applicable to facilities with existing Title V permits or to facilities that would apply for such permits. Who, and based on what data, determines whether the facility should be subject to GHGs triggering Title V? Will the facility be notified by AQMD or should it apply to such permit voluntarily?

    Response: Applicants are responsible to obtain the appropriate permits. PAR 3001 applies to both new and existing faculties.

48. Comment: What would a deviation report be? Would a deviation report be triggered for state requirements if they are listed on a Title V permit?

    Response: Rule 3004 (a)(5) requires the operator to report any non-compliance situation. After considering input, staff is proposing that for GHGs, only "applicable" requirements (federal only) would be listed on Title V permits, so violations of state GHG requirements would not trigger a deviation report.

49. Comment: The uniform emission limitation of 100,000 tpy CO_2e in PAR 3008(d)(1)(D) for emission limitations does not make sense.

    Response: The level has been revised to < 50,000 tpy CO_2e for GHG emissions for the emissions limitation threshold.

50. Comment: The District should do more than the minimum federal requirements.

    Response: The District's proposal to implement the federal requirements for such a new area is a good place to start. Because federal BACT has not yet been determined it would be difficult to go beyond the federal requirements.

51. Comment: Delaying small sources until April 2016 is not acceptable.

    Response: This decision was made by U.S. EPA and the District staff believes this decision is reasonable given the workload associated with lower thresholds compared to the benefits.

52. Comment: The lower level of GHGs that require PSD BACT analysis should be 100 tpy.

    Response: U.S. EPA determined that lowering the GHG threshold to such a level would greatly increase the number of sources requiring permits, impose undue costs on small sources, overwhelm the resources of permitting authorities, and severely impair the functioning to the PSD and Title V programs. For example, based on PTE, an emergency diesel generator, of which there are approximately 9,000 in the Basin, could be a 100 tpy GHG emission source. The U.S. EPA has estimated that at the 100 ton threshold, there would be 6 million new Title V permits, nationwide, of which the AQMD could have to implement 300,000 new permits.

53. Comment: The District is required to do an AQMP every 3 years. The District should have a solar conversion plan by the end of the year.

    Response: The District is in the process of updating the AQMP due to be released in 2011/2012. A solar conversion plan is beyond the scope of this project, but this comment will be referred to the planning staff.

54. Comment: The proposal to regulate GHG emissions under existing PSD and Title V programs is highly controversial and uncertain. The federal proposal is the subject of pending litigation, and the possibility of Congressional intervention in the matter is not at all remote. If the AQMD moves forward with rulemaking in light of the uncertainty, it must make accommodation for future changes to the regulatory landscape. If approved, the proposed revisions to Regulations XVII

and XXX should be automatically and immediately suspended in the event they are no longer federally mandated.

Response: The litigation of the federal actions is speculative and as such the District will move forward with the proposal to adopt the federal requirements as the required implementation date for Step 1 is January 2, 2011. If there is a change, staff will address the issue when it arises.

55. Comment: We understand the severe time constrains you are meeting. Still, the one week time for digesting the material and commenting on such a serious matter is not enough. If you cannot extend the comment period, perhaps you could divide the proposed rules into those subject to January 2, 2011 compliance date and others.

Response: The draft rules and staff report for Regulation XXX were available one week before the Public Workshop. Staff realizes the comment period after the PWS was limited and is one of the reasons why staff has scheduled a Public Consultation Meeting for October 12, 2010. The idea of splitting amendments in not practical since the rule development process takes at least six months and this is the time period between the compliance dates.

CEQA and Socio-economic

56. Comment: It is assumed that the federal government did an NEPA analysis and socio-economic analysis since the District is not.

Response: The District is adopting federal requirements and thus will publish an NOE determining them to be exempt from CEQA requirements pursuant to State CEQA Guidelines §15268 – Ministerial Projects. NEPA does not apply to actions under the Clean Air Act. U.S. EPA conducted a regulatory impact analysis and determined that absent the tailoring rule, small sources would be impacted and that by raising the threshold this rule would result in a cost savings.

57. Comment: The District should do a CEQA document with a socioeconomic impact analysis or a separate socioeconomic analysis document.

Response: The District performs CEQA and socioeconomic analyses separately. The CEQA document to be prepared after the Public Hearing will be a Notice of Exemption. Please see response to comment # 56.

PARegs XXVII and XXX represent an adoption of the federal Tailoring Rule for PSD by reference and Title V by incorporation of federal requirements in the Regulation XXX rules. Since the proposed amendments do not impose requirements beyond the federal rule, Title V and PSD permit holders are not expected to face additional costs or other socioeconomic impacts as a result of the proposed amendments. As such, a socioeconomic assessment is not required.

The following comments were received following the close of comments (September 17, 2010) for the public workshop held September 9, 2010.

58. Comment: The proposed language in PAR 3001 (c)(9) states such facilities "shall apply for a Title V permit within 180 days after July 1, 2011, unless a Title V permit has already been applied for and all requirements that are applicable requirements (as defined in Rule 3000 (b)(4)) shall be included in the permit." The proposed language that discusses how GHG requirements shall be included in the permit should be moved to Rule 3004.

    Response: The language the commentor is referring to has been removed.

59. Comment: The proposed amendments to Rule 3000 continue to rely on the term "regulatory requirements" set forth in existing paragraph (b)(25); however this definition is ambiguous. The Title V permitting scheme is intended to ensure compliance with all "applicable requirements".

    Response: The language pertaining to GHGs specifically calls out "applicable requirements", in PAR 3001 (c)(8) and PAR 3002 (a)(2) and (a)(3). Also, please see response to comment # 30.

South Coast
Air Quality Management District
21865 Copley Drive, Diamond Bar, CA 91765-4182
(909) 396-2000 • www.aqmd.gov

SUBJECT: **NOTICE OF EXEMPTION FROM THE CALIFORNIA ENVIRONMENTAL QUALITY ACT**

PROJECT TITLE: **PROPOSED RULE 1714 – PREVENTION OF SIGNIFICANT DETERIORATION (PSD) FOR GREEHHOUSE GASSES (GHGS) AND PROPOSED AMENDED REGULATION XXX – TITLE V PERMITS**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, the South Coast Air Quality Management District (SCAQMD) is the Lead Agency and will prepare a Notice of Exemption for the project identified above.

Proposed Rule 1714 and Proposed Amended Regulation XXX would implement the federal tailoring rule, which includes requirements for GHGs for the PSD and Title V programs. Proposed Rule 1714 would incorporate federal requirements for GHGs by reference. Proposed amendments to Regulation XXX would add federal GHG requirements into existing SCAQMD regulations. Since the proposed project is implementing federal requirements and the SCAQMD is not exercising discretion with regard to implementing the federal requirements, it is exempt from CEQA pursuant to state CEQA Guidelines §15268 – Ministerial Projects. A Notice of Exemption has been prepared pursuant to CEQA Guidelines §15062 - Notice of Exemption. The Notice of Exemption will be filed with the county clerks of Los Angeles, Orange, Riverside and San Bernardino counties immediately following the adoption of the proposed project.

Any questions regarding this Notice of Exemption should be sent to Jeff Inabinet (c/o Planning, Rule Development & Area Sources) at the above address. Mr. Inabinet can also be reached at (909) 396-2453.

Date: November 5, 2010 **Signature:** Steve Smith

Program Supervisor
Planning, Rule Development &
Area Sources

Reference: California Code of Regulations, Title 14

NOTICE OF EXEMPTION

To:	County Clerks of Los Angeles, Orange, Riverside, San Bernardino	**From:**	South Coast Air Quality Management District 21865 Copley Drive Diamond Bar, CA 91765

Project Title:

Proposed Rule 1714 – Prevention of Significant Deterioration (PSD) for Greenhouse Gasses (GHGs) and Proposed Amended Regulation XXX – Title V Permits

Project Location:

South Coast Air Quality Management District (SCAQMD) area of jurisdiction consisting of the four-county South Coast Air Basin (Orange County and the non-desert portions of Los Angeles, Riverside and San Bernardino counties), and the Riverside County portions of the Salton Sea Air Basin and the Mojave Desert Air Basin.

Description of Nature, Purpose, and Beneficiaries of Project:

Proposed Rule 1714 – Prevention of Significant Deterioration for GHGs, and Proposed Amended Regulation XXX – Title V Permits, are proposed to implement federal changes to 40 CFR Parts 52 and 70, published June 3, 2010 and effective August 2, 2010. Proposed Rule 1714 (proposed for Regulation XVII) adopts by reference the provisions promulgated by EPA in the June 3, 2010 Federal Register. In general, the federal rules establish dates for a phased-in multi-step process for Proposed Rule 1714. Beginning January 2, 2011, any source already subject to the PSD regulation for new construction or a modification for any attainment pollutant, and having an increase in GHG emissions on a carbon dioxide equivalent (CO_2e) basis (Global Warming Potential [GWP] applied) greater than or equal to 75,000 tons per year (tpy) CO_2e and with a net emission increase of GHG emissions greater than zero on a mass basis (no GWP applied), will be required to include Best Available Control Technology (BACT) for GHG emissions (Step 1). Step 2 of the phased-in implementation for GHG sources has an effective date of July 1, 2011. At this point, all sources subject to the regulation through Step 1 will continue to be subject to the rule, and additionally, sources with a potential to emit (PTE) GHGs greater than or equal to 100,000 tpy CO_2e and emitting a New Source Review (NSR) or GHG pollutant above the 100/250 tpy (mass based) statutory thresholds, will be subject to the regulation. Amendments to Regulation XXX are proposed for the following rules: PAR 3000 – General, is proposed to be amended by adding three definitions: carbon dioxide equivalent (CO_2E), global warming potential (GWP) and greenhouse gas (GHG), and the definition for minor permit revision is amended by adding a GHG threshold; PAR 3001 – Applicability and PAR 3002 – Requirements, are proposed to be amended by adding the January 2, 2011 and July 1, 2011 dates for including GHGs in Title V permits; PAR 3003 – Applications, PAR 3005 – Permit Revisions, and PAR 3006 – Public Participation, are proposed for amendment only due to references in those rules to definitions in PAR 3000 – General; and PAR 3008 – PTE Limitations, authorizes sources to cap their PTE to avoid applicability of Title V based on GHG emissions.

Public Agency Approving Project:	**Agency Carrying Out Project:**
South Coast Air Quality Management District	South Coast Air Quality Management District

Exempt Status:

Ministerial Projects [CEQA Guidelines §15268]

Reasons why project is exempt:

Proposed Rule 1714 and Proposed Amended Regulation XXX would implement the federal tailoring rule, which includes requirements for GHGs for the PSD and Title V programs. Proposed Rule 1714 would incorporate federal requirements for GHGs by reference. Proposed amendments to Regulation XXX would add federal GHG requirements into existing SCAQMD regulations. Since the proposed project is implementing federal requirements and the SCAQMD is not exercising discretion with regard to implementing the federal requirements, it is exempt from CEQA pursuant to state CEQA Guidelines §15268 – Ministerial Projects.

Back to Agenda

BOARD MEETING DATE: November 5, 2010 AGENDA NO. 37

PROPOSAL: Proposed Amendments to SOx RECLAIM Program (Regulation XX)

SYNOPSIS: Proposed Amendments to Regulation XX RECLAIM will achieve additional SOx reductions pursuant to the 2007 AQMP Control Measure #2007CMB-02. The proposed amendments also address requirements for demonstrating Best Available Retrofit Control Technology equivalency in accordance with California Health and Safety Code §40440.

COMMITTEE: Stationary Source Committee, June 20, 2008, June 19, 2009, November 20, 2009, May 21, 2010, July 23, 2010, and September 24, 2010, Reviewed. Refinery Committee, December 11, 2009, August 18, 2010 and September 22, 2010, October 14, 2010, Reviewed.

RECOMMENDED ACTIONS:
Adopt the attached resolution:
1. Certifying the Final Program Environmental Assessment (PEA) for Proposed Amended Regulation XX – Regional Clean Air Incentives Market (RECLAIM); and
2. Amending Proposed Rule 2002 – Allocations for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx).

Barry R. Wallerstein, D.Env.
Executive Officer

LTT:JC:GQ:MHP

Introduction
The AQMD Board adopted the Regional Clean Air Incentives Market (RECLAIM) program in October 1993. The purpose of the RECLAIM program is to reduce NOx and SOx emissions through a market-based program. The program replaced a series of

existing and future command-and-control rules and was designed to provide facilities with the flexibility to seek the most cost-effective solution to reduce their emissions. AQMD staff is proposing amendments to Regulation XX – RECLAIM to achieve additional SOx reductions pursuant to the 2007 AQMP Control Measure CMB-02 and state law. Specifically, the proposed amendments address requirements for 1) Best Available Retrofit Control Technology (BARCT) in accordance with California Health and Safety (H&S) Code §40440, and 2) a demonstration of equivalency to command-and-control regulations, as required under H&S Code § 39616(c)(1). Reductions in SOx will help the Basin attain the federal annual average PM2.5 standard by 2015, and the federal 24-hour average standard by 2020. Other proposed rule amendments include clarifications and changes to the protocols.

Public Process

In a three-year rule development process for the proposed amendments from 2008-2010, staff conducted a Public Workshop on June 23, 2009; an Informational Governing Board Hearing on January 8, 2010, and a Public Consultation Meeting on September 8, 2010. Staff held numerous Working Group meetings with the stakeholders, as well as individual meetings with WSPA and the refineries to discuss issues related to the proposed amended rule. Staff presented its proposal at six Stationary Source Committee meetings and four Refinery Committee meetings for review. Staff released the first Preliminary Draft Staff Report in April 2008. At the June 23, 2009 Public Workshop, staff released the Draft Staff Report, the Notice of Preparation of the Draft Environmental Assessment, and the Draft Rule 2002. On August 18, 2010, staff released its Draft Program Environmental Assessment for a 45-day public review. On October 1, 2010, staff released its revised Draft Staff Report and the Socioeconomic Analysis for a 30-day public review. Regarding feasibility and cost analyses, in 2008-2009, staff contracted two consultants, ETS, Inc. and NEXIDEA to conduct independent feasibility and cost analyses. In 2010, staff contracted a third consultant - Norton Engineering Inc. (NEC) - to review the first two consultants' analyses. The consultants' non-confidential reports are posted on the AQMD web page.

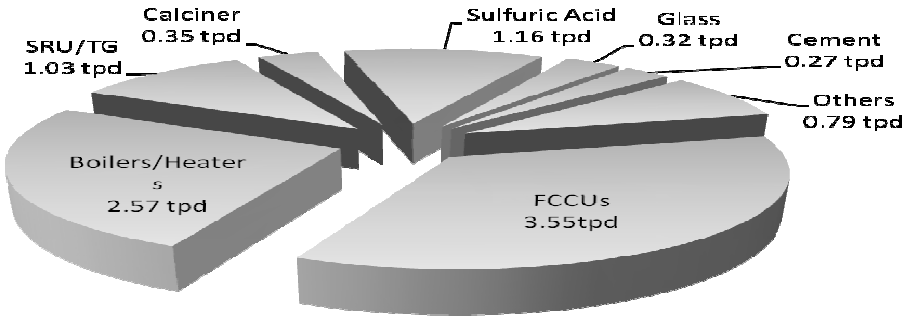
Affected Facilities

The proposed amendments will affect eleven major facilities: six refineries, a coke calciner, two sulfuric acid plants, a container glass manufacturing plant, and a cement plant. These eleven major facilities emitted 9.31 tons per day (93% of the total emissions from the SOx RECLAIM universe.) These eleven facilities hold 10.21 tons per day RTCs (87% of the total RTC holdings for the SOx RECLAIM universe.) The refinery sector accounted for 76 % of the total emissions and 73 % of the total available RTCs. [1] Figure 1 shows the emission distribution at these eleven facilities. The majority

[1] The 2005 audited emissions for the entire SOx RECLAIM universe were 10.04 tons per day. The total RTC Holdings for the universe are 11.77 tons per day.

of the emissions was generated from seven categories of sources: 1) fluid catalytic cracking units; 2) sulfur recovery and tail gas treatment units; 3) refinery boilers and heaters; 4) sulfuric acid manufacturing plants; 5) container glass melting furnace; 6) coke calciner; and 7) cement kilns and a coal fired steam boiler at a cement manufacturing facility.

FIGURE 1
2005 Emission Distribution



Total 32 active facilities = 10.04 tons per day audited emissions.
Top 11 facilities. Top 7 sources.

Staff Proposal

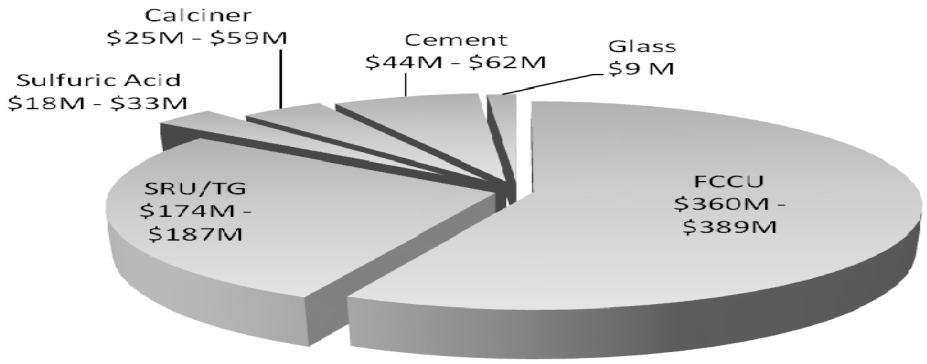
BARCT Levels

Table 1 shows staff's proposed new BARCT levels, emission reductions estimated from 2005 baseline, and the average cost-effectiveness values estimated based on ETS/AEC's and NEXIDEA's recommendations (the first figure in the cost-effectiveness range), and Norton Engineering's recommendations (the second figure in the cost effectiveness range.) Figure 2 shows the present worth values for the 25-year equipment life, estimated using the consultants' input. The total investments were estimated to be approximately $630 millions to $750 millions dollars. The weighted average cost effectiveness spans between $16,000 per ton to $19,000 per ton SOx reduced for this project. The cost effectiveness for individual source categories ranges from $2,000 per ton to $50,000 per ton. It should be noted that WSPA strongly disagrees with the analyses performed by staff and the consultants.

TABLE 1
Staff's Proposed New BARCT Levels

	New BARCT	Emission Reductions (tons per day)	Cost Effectiveness ($/ton)
FCCUs	5 ppmv	2.88	20K - 21K
SRU/TGs	5 ppmv	0.73	31K - 45K
Sulfuric Acid	10 ppmv	1.03	2K – 3K
Coke Calciner	10 ppmv	0.28	10K - 23K
Container Glass	5 ppmv	0.19	5K
Cement Kilns	5 ppmv	0.25	19K - 27K
Coal Fired Boiler	95% reduction	0.00	4 K

FIGURE 3
Present Worth Values (for 25 years) Based on Consultants' Input
(Excluding Cost-Ineffective Controls of >$50 K per Ton)



RTC Reductions

To implement the proposed BARCT levels, staff is recommending that RTC holdings be reduced by 5.7 tons per day or by 51.4 percent beginning 2012 through 2019. When fully implemented, these RTC reductions are expected to result in 5.4 tons per day actual emission reductions. This proposal differs slightly than the staff proposal released on October 1, 2010 and was crafted based on the latest available data and fully complies with all legal requirements.

The 5.7 tons per day RTC reductions will be distributed among the 11 major facilities, investors, and 3 facilities that have more RTCs holdings than originally allocated as of

August 29, 2009. Staff proposes not to shave the RTC holdings of the 18 remaining facilities. Any RTCs traded after August 29, 2009 and prior to the Governing Board hearing date will be subject to the proposed shave levels to ensure that no RTC holdings are inappropriately traded or sheltered.

The 5.7 tons per day RTC reductions will be implemented in four (4) phases over eight (8) years. Staff will submit the first 4 tons per day of RTC reductions to EPA to satisfy the SIP commitment and help the Basin meet the standard in 2015, and will submit the remaining 1.7 tons per day at a later phase.

Phase 1: 3.0 tons per day of reductions in compliance year 2013
Phase 2: 4.0 tons per day of reductions in compliance year 2014
Phase 3: 5.0 tons per day of reductions in compliance year 2017
Phase 4: 5.7 tons per day of reductions in compliance year 2019

In an effort to ensure early reductions for the RECLAIM Program, facilities will be required to use SOx reducing catalysts in the FCCUs no later than July 1, 2011 to achieve a limit of 25 ppmv. The use of alternative controls is also allowed.

Safety Valves

To safeguard the successful implementation of the SOx RECLAIM program, several necessary "safety valves" are built in the proposed rule language: Staff is proposing set-aside RTC accounts (i.e. non-tradable/non-usable) equivalent to the RTC reductions called for by the specific compliance years that can potentially be made available to the impacted facilities in the event RTC prices exceed the $50,000 per ton threshold (discrete credit). Staff commits to monitor the 12-month rolling average RTC price and in the event the SOx RTC price exceeds $50,000 per ton, staff will report to the Governing Board at a public hearing to be held no more than 60 days from staff determination. At the public hearing, the Governing Board will decide whether or not to convert any portion of the non-tradable/non-usable RTCs to tradable/usable RTCs and give that portion back to the facilities so that it can be used for compliance with the facility cap. In addition, staff will not submit any of the post-2015 emission reductions for inclusion into the State Implementation Plan until the reductions have been in effect for one full compliance year.

Key Issues

Although staff resolved most of the outstanding issues relative to the staff proposal the following discussion summarizes the key issues raised during the rule development phase by the stakeholders: 1) costs for compliance and BARCT determination, 2) BARCT determination for Owens-Brockway glass container manufacturing facility in Vernon; 3) water and wastewater, 4) market viability, and 5) shaving methodology for

facilities that are not subject to new BARCT, and for facilities that are subject to new BARCT. Staff's responses to these key issues are summarized below:

1) Costs for Compliance& BARCT Determination

As part of its proposal included in the Set Hearing Board Package released on October 1, 2010, staff proposed to reduce RTC by 6.1 tons per day (55% shave) representing 5.4 tons per day actual emission reductions by 2019. WSPA commented that staff should not pursue the 6.1 tons per day RTC reductions because WSPA estimated the cost of compliance with this shave to be $1.637 billion dollars, of which $836 million dollars would be for emission reductions under WSPA's main strategy to comply with the "programmatic" BARCT, and $801 million dollars would be for "other" investments that must be implemented to achieve additional reductions within WSPA member facilities to comply with the 55% shave.

Staff's Response:

Staff has reviewed WSPA's analysis and concluded that WSPA's main strategy to meet the "programmatic" BARCT is reasonable. However, staff also concluded that WSPA's assumption for an additional $801 million investment to implement "other" measures to meet the 55% shave would not be reasonable or necessary. Staff has identified cost-effective off-site reductions which could be used to substitute for cost-ineffective on-site controls as provided under a market-based cap-and-trade program such as RECLAIM. However, to provide additional margin of safety, staff is proposing to increase the compliance margin to 18.5% and reduce the shave from 55% to 51.4%. Summary of staff's analysis is provided below.

WSPA's Main Strategy. Even though WSPA's main strategy[2] is different than staff's main strategy on an equipment-per-equipment basis, WSPA's strategy would result in 3.81 tons per day actual emission reductions at a cost of $836 million and a cost-effectiveness of $24K per ton. In comparison, staff's proposed main strategy would result in 3.92 tons per day actual emission reductions at a cost of between $561 million - $638 million and a cost-effectiveness of $16K - $18K per ton. On this basis, staff believes that the "programmatic" BARCT strategy proposed by WSPA is similar to staff's proposal since it will achieve similar reduction levels through cost-effective measures.

WSPA's "Other" Strategies. In its analysis presented to the Refinery Committee on October 14, 2010, staff concluded that the two "other" control strategies for a SRU/TG and fuel gas treatment proposed by WSPA at a cost-effectiveness of $213,000 per ton

[2] WSPA's main strategy includes 1) FCCUs would use 2 WGSs and SOx reducing additives to meet 5 ppmv – 35 ppmv; 2) SRU/TGs would use 2 WGSs and have process modifications to meet 5 ppmv - 25 ppmv; 3) 1 WGS and other process modification at other units.

and $100,000 per ton would not be reasonable strategies to implement. However, two "other" strategies proposed by WSPA related to CEMS improvements and RTC holdings surrendered are very cost-effective at $1,686 - $6,805 per ton. The two "other" cost-effective strategies amounted to $81 million dollars. With the main strategy and the two "other" cost-effective strategies in combination, WSPA members could achieve 5.31 tons per day reductions at $917 million and at an average cost-effectiveness of $18,925 per ton. However, WSPA members would only need 5.17 tons per day reduction to meet a 55% shave. Therefore, it is only reasonable to conclude that an investment of $917 million, not $1.637 billion estimated by WSPA, would be more than adequate to meet the proposed 55% shave and would generate 0.14 tons per day surplus RTCs. Nevertheless, to address concerns relative to safety margin, staff has modified its proposal to increase the compliance margin to 18.5% and reduce the shave from 55% to 51.4% which will provide facilities with additional flexibility and the ability to meet the proposed reduction target at less costs than those estimated above. In addition, staff estimated that there would be approximately 1.45 tons per day potentially available surplus RTCs[3] in the market from other sources after the 51.4% shave, which would raise the pool of surplus credits to 1.6 tons per day.

2) BARCT Determination for Owens-Brockway Container Glass Facility in Vernon

Owens-Brockway commented that staff incorrectly determined the BARCT for glass melting furnaces. BARCT for glass melting furnaces should be at 80% not 95% (or 5 ppmv). Owens-Brockway commented that the packed bed scrubbers recommended would not work; the pressure drop introduced by the wet gas scrubbers was not considered; the costs of $225,000 to handle waste water stream were inadequate; other costs (e.g. CEMS, stack, permitting costs) were not included; and other analyses (e.g. NSR for other pollutants, Rule 1401 requirements) were not analyzed.

[3] The 1.47 tpd potentially available RTCs post-shave in the market comprised of:

- 0.21 tpd post-shave remaining unused RTCs (which is calculated as follows: The surplus RTCs estimated from the 2005 baseline are 1.73 tpd (11.77 – 10.04 = 1.73 tpd). WSPS already accounted for 1.30 tpd surplus RTC in their strategy, therefore the remaining unused RTCs are 1.73 – 1.30 = 0.43 tpd pre-shave and (0.43 tpd)(0.486) = 0.21 tpd post shave)
- 0.0009 tpd post shave hold by non-RECLAIM investors. (As of October 14, 2010, there are only two remaining investors that are non-RECLAIM facilities, and these two investors hold approximately 1,306 lbs of RTCs pre-shave or 0.002 tpd pre-shave or 0.0009 tpd post-shave.)
- 0. 60 tpd from non-refinery sector. (Assuming that the non-refineries would install control technologies proposed by either WSPA to meet the 51.4% shave; and would have surplus RTCs to sell in the market.)
- 0.66 tpd from refinery sector. (Assuming that the refineries would install control technologies proposed by either WSPA to meet the 51.4% shave; and would have surplus RTCs to sell in the market.)

Staff's Response:

Staff disagrees with the commenter. Staff's feasibility analysis concludes that today's BARCT is 5 ppmv (95% control efficiency or more). The proposed BARCT for glass facility has been achieved in practice at a container glass manufacturing facility in Seattle Washington. Relative to the control equipment configuration for the Owens-Brockway facility in the South Coast basin, the consultant (ETS) recommended the removal of the two dry scrubbers located upstream of the ESPs, and their replacement with two wet scrubbers (packed bed) positioned downstream of the ESPs. The ESPs located upstream of the packed bed scrubbers will be highly efficient in controlling particulate matter, and thus would provide protection for the packed bed scrubbers from clogging. In the consultant's analysis, a fan was provided to overcome the pressure drop across the wet scrubbers and costs for a new stack were included. The cost effectiveness of this project is about $5,198 per ton SOx removed, and therefore other marginal additional costs such as adding new CEMS and permitting costs would not alter the project's cost-effectiveness significantly. The consultant (ETS) estimated the equipment costs ($225,000) and annual operating costs for a waste water treatment based on information provided by Manufacturer D who cited from their relevant experience with a glass container facility in Seattle, Washington. Nevertheless, to address concerns expressed by Owens-Brockway and other facilities relative to additional margin for safety, staff has modified its proposal to increase the compliance margin to 18.5% and reduce the proposed shave from 55% to 51.4%. Relative to the issues such as NSR, staff recommends that they should be handled at the permitting phase not at the rule development phase of this project. Staff commits to help this and all other impacted facilities during permitting to ensure the successful implementation of this very important program. Staff would further like to remind the commenter that the District's NSR Program (Regulation XIII) includes provisions that shields installation of pollution control equipment from the applicability of certain other NSR requirements.

3) Water & Wastewater Impacts

Stakeholders commented that the water and wastewater impacts of the project would be significant.

Staff's Response: Industry argued that staff proposal will result in significant increases on water demand and wastewater impacts due to the use of wet gas scrubbers. If wet gas scrubbers are used to comply with the proposed rule, staff estimated that the total water demand will increase by approximately 1 million gallons per day or 3 acre feet per day, but increased water demand over current water usage at affected facilities is well below the SCAQMD's significance threshold of 5 million gallons per day of total increased water demand (i.e. potable water, recycled water, and groundwater). The information that staff received to date from the water purveyors and their 2005 Urban Water Management Plans is that there are adequate supplies to meet the total water demand, and use of recycled water is highly recommended if available. Relative to the

wastewater impact, staff's analysis indicates that the overall wastewater increase will be less than 2% and that the facilities have adequate wastewater treatment capacity to treat the increase, and no modifications to any existing wastewater discharge permits are anticipated. WSPA continues to strongly disagree with staff's analyses.

3) Market Viability

Stakeholders commented that there were not enough trading partners, the SOx market was very competitive and reserved, and there was an uneven distribution of RTC holdings.

Staff's Response: For a market based incentive program, staff is required by the H&S codes to conduct periodic BARCT reassessment and demonstrate equivalency with command-and-control rules which would otherwise be developed as a result of BARCT reassessment. To ease the issues identified by the stakeholders, staff is proposing to return a portion of the reductions to the facilities as a compliance margin (18.5%). Similar approach was also utilized as part of the 2005 NOx RECLAIM amendments. Accounting for the fact that the SOx RECLAIM market is a lot less robust than the NOx RECLAIM market, staff is proposing a compliance margin of 18.5%. In addition, staff is proposing to establish a set-aside, non-tradable reserve that could be tapped in when RTC value in the open market reach a certain level. Staff believes that compliance with a facility cap still provides the facilities more operational flexibility than being subject to stringent requirements in command-and-control rules and regulations.

4) Shaving Methodology

Facilities with no equipment subject to new BARCT commented that the uniform shave was not equitable, would create significant difficulties for them to stay in compliance, and indicated that they had limited ability to buy RTCs from large facilities. While WSPA and the refineries that are subject to new BARCT argued strongly during the rule development process in 2008-2009 for the use of a shave methodology that was consistent with that used during the 2005 NOx RECLAIM amendment. During the later phase of the rule development process, they commented that staff should use the 2005 as baseline for the shave, not shave the 1.98 tpd RTCs converted from ERCs and portion reserved for Clean Fuel projects, and not set new BARCT for SRU/TGs and cement kilns.

Staff's Response: Because of the non-uniform emissions and RTC distributions in the SOx RECLAIM market (11 major facilities hold almost 90% of the RTCs and contribute more than 90% of emissions, and the remaining 21 facilities hold only 6% of the RTCs and contribute about 6% of emissions), a uniform percent shave cross the board is not the ultimate solution. The 21 facilities that have no equipment subject to the new BARCT cannot reduce their emissions further, cannot sustain operation since they had limited ability to buy RTCs from large facilities, and therefore cannot remain in

compliance after the shave. To keep the 21 facilities active in the SOx market, staff is proposing to not shave the RTC holdings for these facilities if the RTC holdings are below their initial allocations provided to them at the start of the RECLAIM program. However, the amount of RTC holdings above their initial allocation will be shaved at the same rate as other 11 facilities and investors. With this approach, staff estimated that the 11 facilities will have a shave of 51.4%, 18 of the 21 facilities will be exempt totally from the shave, and 3 of the 21 facilities that have RTC holdings above their initial allocations will be shaved accordingly. Any trading from August 29, 2009 to the Governing Board hearing date will also be subject to the shave to ensure that RTC holdings are not inappropriately traded to or sheltered by a third party to avoid the shave.

California Environmental Quality Act (CEQA) Analysis

Pursuant to California Environmental Quality Act (CEQA) Guidelines §15252 and §15168 and AQMD Rule 110, the SCAQMD has prepared a Program Environmental Assessment (PEA) for proposed amended Regulation XX. Only the topics of air quality and hydrology (water demand) were identified in the Draft PEA as exceeding the SCAQMD's significance thresholds. The Draft PEA was released for a 45-day public review and comment period from August 18, 2010 to October 1, 2010. Three comment letters were received from the public relative to the Draft PEA.

Since the release of the Draft PEA, responses to the comments have been prepared and included in the document. Also, minor modifications have been made to the document. None of the modifications alter any conclusions reached in the Draft PEA, nor provide new information of substantial importance relative to the draft document. Further, the modifications do not constitute significant new information that would require recirculation of the Draft PEA pursuant to CEQA Guidelines §15088.5. Therefore, the document is a now a Final PEA and is included as an attachment to this Governing Board package.

Socioeconomic Analysis

The socioeconomic analysis of the proposed amended SOx RECLAIM was based on the 55 percent shave of SOx RTC holdings. Eleven facilities would be affected, the majority of which are located in Los Angeles County. The average annual compliance cost of the 55 percent shave ranged from $32 to $42 million with few job impacts on the local economy. The new proposed 51.4 percent shave would lower the compliance cost. The job impact of the new proposal would be within the noise of the economic model used for the SOx RECLAIM analysis. WSPA prepared its own socioeconomic analysis, including a scenario where a mid-size refiner closes. Staff reviewed this issue and pointed out a number of mitigating factors relative to any potential job impacts.

Implementation and Resources

It is expected that there will be a temporary workload increase due to applications submitted for installing new control equipment or retrofitting/modifying existing processes and there might be an increase in RTC trading activities. However, current AQMD resources are adequate to implement the proposed rule.

ATTACHMENT A
SUMMARY OF PROPOSAL

New Proposed BARCT Levels for Tier III

— 5 ppmv for FCCUs, SRU/TGs, glass melting furnaces, cement kilns and coal fired boiler
— 10 ppmv for sulfuric acid plants and petroleum coke calciner
— 15 ppmv for diesel combustion[1], and
— 40 ppmv for refinery boilers/heaters

Proposed RTC Reductions

— The total RTC reductions are 5.7 tons per day (51.4% shave) cumulatively distributed as follows: 3.0 tons per day by 2013, 4.0 tons per day by 2014, 5.0 tons per day by 2017, and 5.7 tons per day by 2019.

— The shave will be applied to RTCs held by the 11 major facilities, to those RTC holdings that exceed initial allocations at 3 facilities, and RTCs held by investors, including any RTCs traded between August 29, 2009 and the Governing Board meeting date to prevent inappropriate sheltering of RTCs.

— In addition, by no later than July 1, 2012, SOx emissions from the fluidized catalytic cracking units (FCCUs) must meet an emission limit of 25 ppmv dry @ 0% O2 on a 365-day rolling average. For the purpose of demonstrating compliance with this limit, the refinery shall commence the use of SOx reducing additives in the FCCUs no later than July 1, 2011, unless the operator can demonstrate that the FCCU will achieve this limit by using other control methods.

RTC Adjustment Factors & Backstop

To address market viability concerns, for Phase 3 and 4 (post 2015) of the SOx RECLAIM, staff is proposing set-aside RTC accounts (i.e. non-tradable/non-usable) equivalent to the RTC reductions called for by the specific compliance years that can potentially be made available to the impacted facilities in the event RTC prices exceed the $50,000 per ton threshold (discrete credit).

The AQMD RECLAIM Administrative team shall calculate the 12-month rolling average SOx RTC price for all "discrete" trades. In the event the price exceeds $50 K per ton, the Executive Officer will report to the Governing Board, and at a duly scheduled Public Hearing, the Governing Board will decide whether or not to convert any portion of the non-tradable/non-usable RTCs to tradable/usable, and how much to convert.

[1] As required under AQMD Rule 431.2 – Sulfur Content of Liquid Fuels

The AQMD RECLAIM Administrative team shall determine the tradable/usable SOx RTC adjustment factors for Phase 1 to Phase 4 (2012-2019 and after). The non-tradable/non-usable RTC adjustments factors for Phase 3 and Phase 4 (post-2015) shall also be determined. The adjustment factors will be published and posted on the AQMD website within 30 days after rule adoption date.

ATTACHMENT B - RULE DEVELOPMENT PROCESS

Calendar Year 2008	
January 02, 2008	RECLAIM Working Group was formed
February 07, 2008	Public Consultation Meeting was conducted
April 03, 2008 April 30, 2008	Preliminary Draft Staff Report was released. Two Working Group Meetings were conducted.
May 1, May 15, May 28, June 20, July 02, 2008	Request for Proposal to seek expert consultants was drafted and discussed with the RECLAIM Working Groups on three Working Group Meetings from May to July. A Stationary Committee Meeting was also conducted on June 20.
July 11, 2008 July 16, 2008	RFP was presented to the Governing Board, and received Governing Board's approval to release on July 11. A Bidder Conference was conducted on July 16
August 1, 2008 August 30, 2008	Staff formed a task force to evaluate the six proposals received & make recommendation to the Governing Board
September 5, 2008	Staff presented the recommendation of consultants to the Governing Board and received an approval to hire ETS, Inc. and NEXIDEA
September 15, 2008 October 15, 2008	The consultants visited the facilities and conducted their feasibility and cost analyses, and the draft analyses were released to the facilities for comments.
December 16, 2008	NEXIDEA finalized the analyses for coke calciner and sulfuric acid plants. ETS Inc. finalized the analyses for glass and cement facilities.
Calendar Year 2009	
January – April 20, 2009	ETS Inc., their subcontractors, and staff conducted a second visit to all refineries. ETS, Inc. released their draft analyses three additional times to the refineries for comments and finalized their analyses on April 20, 2009.
June 23, 2009 (Public Workshop and CEQA Scoping Meeting)	Staff conducted a Public Workshop and CEQA Scoping Meeting. At this stage, staff proposed about 7 tpd RTC reduction from 2012-2017 with a total costs (present worth value for 25 years) estimated to be $883 - $944 million dollars and a weighted average cost effectiveness of about $16 K per ton SOx reduced. Staff released the draft staff report, Notice of Preparation for Environmental Assessment, and draft rule.
June 19, 2009 November 20, 2009	Two Stationary Committee Meetings were conducted in 2009. In addition, from March – December, staff conducted several

	meetings with WSPA and the refineries to discuss issues related to costs, baseline and RTC shave methodologies.
December 11, 2009 December 15, 2009	The Governing Board established a Refinery Committee Group and conducted the first Refinery Committee Meeting on December 11 and a WGM on December 15. At this stage, staff's estimates were 6.2 tpd emission reductions from 2005 baseline, 7.5 tpd RTC reduction, 64% - 67.5% RTC shave, total estimated costs of $745 million, and cost effectiveness of about $13 K per ton SOx reduced.
Calendar Year 2010	
January 08, 2010 (Informational Hearing)	Staff conducted an "Informational Hearing" to inform the Governing Board and the public about the development of PAR XX, the main issues associated with PAR XX, and a proposed Work Plan for 2010.
March 10, 2010 – June 15, 2010	As called for under the Work Plan and approved by the Governing Board, staff hired a Norton Engineering Inc. (NEC) to review ETS, Inc. and NEXIDEA's feasibility and costs analyses. NEC and staff visited the refineries in March/April, and NEC completed its review and issued a final report on June 15. In April – June, staff also met with WSPA and the refineries numerous times to discuss RTC shave methodologies and costs, costs and cost-effectiveness analyses. In addition, staff contacted the California Department of Water Resources and other water purveyors to discuss about the water impacts of the proposal, current and potential future regulations related to water usage in California.
August 18, 2010	Draft CEQA document was released and staff conducted a second Refinery Committee Meeting. Staff's revised estimates were 5.4 tpd emission reductions from 2005 baseline, 6.1 tpd RTC reduction from 2012 - 2019, 55% RTC shave, total estimated costs of $630 - 745 million, and cost effectiveness of about $16 K - $19 K/ton. Staff excluded the emission reductions of 0.85 tpd estimated from boilers/heaters, used audited emissions in the analysis for RTC shave, extended the compliance period to 2019 and accounted for growth.
September 8, 22 and 24, 2010	Staff reconvened the WGM & conducted a Public Consultation Meeting on September 8, a RCM on September 22, and a SSC Meeting on September 24, 2010.
October 1, 2010	Set Hearing for PAR XX was conducted on October 1st, 2010-

October 14, 2010	Revised Draft Staff Report and Socioeconomic Analysis were released for 30-day public review. A RCM was conducted on October 14, 2010. On October 26, staff revised its proposal to 5.7 tpd RTC reduction (51.4% shave) in 4 phases: 3 tpd in CY 2013, 4 tpd in CY 2014, 5 tpd in CY 2017, and 5.7 tpd in CY 2019.
November 5, 2010	A Governing Board Hearing is planned for November 5, 2010.

ATTACHMENT D – RESOLUTION

A Resolution of the South Coast Air Quality Management District (AQMD) Governing Board Certifying the Final Program Environmental Assessment for Proposed Amended Regulation (PAR) XX – Regional Incentive Market Program (RECLAIM).

A Resolution of the Governing Board Amending Proposed Amended Regulation XX (Proposed Amended Rule (PAR) 2002 – Allocations for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx))

WHEREAS, the 2007 AQMP was adopted by the AQMD Governing Board in June 2007 and subsequently approved by the California Air Resources Board and submitted to the U.S. Environmental Protection Agency for inclusion into the State Implementation Plan; and

WHEREAS, the Governing Board finds and determines with certainty that the PAR XX (PAR 2002 – Allocations for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx)) is considered a "project" pursuant to the California Environmental Quality Act (CEQA); and

WHEREAS, the AQMD has had its regulatory program certified pursuant to Public Resources Code §21080.5 and has conducted CEQA review and analysis pursuant to such program (AQMD Rule 110); and

WHEREAS, AQMD staff has prepared a Draft Program Environmental Assessment (PEA) pursuant to its certified regulatory program and CEQA Guidelines §15252 and §15168 setting forth the potential environmental consequences of PAR XX (PAR 2002 – Allocations for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx)); and

WHEREAS, the Draft PEA was released for public review, all comments received were responded to, and the Draft PEA has been revised such that it is now a Final PEA; and

WHEREAS, it is necessary that the adequacy of the Final PEA, including responses to comments be determined by the Governing Board prior to its certification; and

WHEREAS, it is necessary that the AQMD prepare a Statement of Findings and Statement of Overriding Considerations pursuant to CEQA Guidelines §15091 and §15093, respectively, regarding potentially significant adverse environmental impacts that cannot be mitigated to insignificance; and a Mitigation Monitoring Plan pursuant to Public Resources Code §21081.6, regarding the mitigation included in the Final PEA; and

WHEREAS, the Governing Board prior to voting on PAR XX (PAR 2002), has reviewed and considered the Final PEA including responses to comments, prior to its certification; and

WHEREAS, the Governing Board finds and determines, taking into consideration the factors in §(d)(4)(D) of the Governing Board Procedures, that the modifications adopted which have been made to PAR XX (PAR 2002), since notice of public hearing was published do not significantly change the meaning of the proposed project within the meaning of Health and Safety Code §40726 and would not constitute significant new information requiring recirculation of the Draft PEA (CEQA document) pursuant to CEQA Guidelines §15088.5; and

WHEREAS, the Governing Board has determined that the socioeconomic impact assessment of the PAR 2002 is consistent with the Governing Board March 17, 1989 and October 14, 1994 resolutions and the provisions of Health and Safety Code §§40440.8, 40728.5 and 40920.6; and

WHEREAS, the Governing Board has reviewed and considered the staff's findings related to cost and employment impacts of the PAR Regulation XX (PAR 2002) set forth in the socioeconomic impact assessment made public with the agenda package for this meeting, and hereby find and determines that cost and employment impacts are as set forth in that assessment; and

WHEREAS, the Governing Board has determined that PAR XX (Rule 2002) are cost-effective per ton of SOx reduced; and

WHEREAS, the Governing Board has actively considered the socioeconomic impact assessment and has made a good faith effort to minimize such impacts; and

WHEREAS, the Governing Board of the South Coast Air Quality Management District by adopting this regulation is implementing, interpreting, or making specific the provisions of Health and Safety Code §39616(c)(1) (equivalent or less cost under RECLAIM compared with command-and-control regulations) and §39616(c)(4) (no significant shift from high- to low-skilled jobs); and

WHEREAS, the Governing Board has determined that a need exists to adopt the PAR XX (Rule 2002) to implement Control Measure CMB-02 of the 2007 AQMP and to reduce SOx and implement BARCT for refinery fluid catalytic cracking units, sulfur recovery units/tail gas, sulfuric acid plants, container glass manufacturing plants, cement kilns and coal fired boiler at cement manufacturing plants, and coke calciner; and

WHEREAS, the Governing Board of the South Coast Air Quality Management District obtains its authority to adopt this proposed amended rule from Sections 39002, 39616, 39650, 40000, 40001, 40440, 40440.1, 40702, 41508 and 41700 of the California Health and Safety Code; and

WHEREAS, the Governing Board has determined that PAR XX (Rule 2002) as proposed is written or displayed so that its meaning can be easily understood by the persons directly affected by it; and

WHEREAS, the Governing Board has determined that PAR XX (PAR 2002) as proposed is in harmony with, and not in conflict with or contradictory to, existing federal or state statutes, court decisions, or regulations; and

WHEREAS, the Governing Board has determined that PAR XX (PAR 2002) as proposed does not impose the same requirements as any existing state or federal regulation and the proposed rule is necessary and proper to execute the powers and duties granted to, and imposed upon, the District; and

WHEREAS, the Governing Board has determined that PAR XX (PAR 2002) as proposed references the following statutes which the AQMD hereby implements, interprets or makes specific: Health and Safety Code §40001(a) and (b) (air quality standards and air pollution episodes); 40702 (adoption of rules and regulations), §40440(a) (rules to carry out plan); §40440(b) (best available retrofit control technology); and Federal Clean Air Act Section 172(c)(1) (reasonably available control technology); and

WHEREAS, the AQMD Governing Board has determined that there is a problem that the proposed amendments to Regulation XX will alleviate (Health and Safety Code §40001(c)). Specifically, the amendments will reduce SOx credits in the market to reflect BARCT; and

WHEREAS, the AQMD Governing Board finds, pursuant to Health and Safety Code §39616(c)(1), that the proposed amendments to RECLAIM are designed to achieve the emissions levels projected to result from implementation of the rules and control measures subsumed by RECLAIM and any future air quality measures that would otherwise have been adopted as part of the District's plan for attainment at equal or less cost; and

WHEREAS, the AQMD Governing Board finds, pursuant to Health and Safety Code §39616(c)(2), that the proposed amendments to RECLAIM do not change the previous findings that RECLAIM provides a level of enforcement and monitoring comparable to more stringent than command and control air quality measures by requiring more frequent and more accurate monitoring, more frequent and more complete emissions reports, electronic emissions reporting, maintenance of on-site records of their emissions

reports and underlying data for three years, annual or more frequent facility inspections, and annual emissions audits; and

WHEREAS, the AQMD Governing Board finds, pursuant to Health and Safety Code §39616(c)(4), that the proposed amendment to RECLAIM will not result in a greater loss of jobs or more significant shifts from higher to lower skilled jobs, on an overall District-wide basis, than would exist under command and control air quality measures; and

WHEREAS, the Governing Board has determined that there is a problem that PAR XX (PAR 2002) will help alleviate, that is the basin does not meet the ambient quality standards for $PM_{2.5}$, and the proposed rule will promote the attainment of these standards; and

WHEREAS, a public hearing has been properly noticed in accordance with the provisions of Health and Safety Code Section 40725; and

WHEREAS, the Governing Board has held a public hearing in accordance with all provisions of law; and

WHEREAS, the Governing Board specifies the manager of PAR XX (PAR 2002) as the custodian of the documents or other materials which constitute the record of proceeding upon which the adoption of this proposed amended rule is based, which are located at the South Coast Air Quality Management District, 21865 Copley Drive, Diamond Bar, California; and

NOW, THEREFORE, BE IT RESOLVED, that the Governing Board does hereby certify that the Final PEA for PAR XX (PAR 2002) was completed in compliance with CEQA and Rule 110 provisions; and finds that the Final PEA was presented to the Governing Board, whose members reviewed, considered and approved the information therein prior to acting on PAR XX (PAR 2002); and

BE IT FURTHER RESOLVED, that the Governing Board adopts a Statement of Findings and a Statement of Overriding Considerations pursuant to CEQA Guidelines §15091 and §15093, respectively, and a Mitigation Monitoring Plan pursuant to Public Resources Code §21081.6 regarding potentially significant adverse environmental impacts that cannot be mitigated to insignificance, as required by CEQA, and which are included as Attachment 1 and incorporated herein by reference; and

BE IT FURTHER RESOLVED, that the Governing Board does hereby adopt, pursuant to the authority granted by law, PAR XX (PAR 2002) as set forth in the attached and incorporated herein by reference.

Mitigation Monitoring Plan

INTRODUCTION

The proposed amendments to Regulation XX - Regional Clean Air Incentives Market (RECLAIM) are considered a "project" as defined by the California Environmental Quality Act (CEQA) (California Public Resources Code §§21000 et seq.). The SCAQMD as Lead Agency for the proposed project, prepared a Notice of Preparation/Initial Study (NOP/IS) which identified environmental topics to be analyzed in a Draft Environmental Assessment (EA). The NOP/IS provided information about the proposed project to other public agencies and interested parties prior to the intended release of the Draft EA. The NOP/IS was distributed to responsible agencies and interested parties for a 30-day review and comment period from June 19, 2009, to July 21, 2009. The initial evaluation in the NOP/IS identified the topics of aesthetics, air quality, energy, hydrology and water quality, hazards and hazardous materials, and transportation and traffic as potentially being adversely affected by the proposed project. During that public comment period, the SCAQMD received three comment letters.

Of the comment letters received relative to the NOP/IS, in particular, Comment 2-4 from Comment Letter #2 suggested that a Program Environmental Assessment (PEA), in lieu of an EA, be prepared for the proposed project. In response to this comment, and in accordance with CEQA Guidelines §15168, SCAQMD has prepared a Final PEA to evaluate potential adverse impacts from the proposed project. The decision to prepare a PEA is appropriate because the proposed project consists of a series of actions that can be characterized as one large project and are related: 1) in connection with the issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program (CEQA Guidelines §15168 (a)(3)); and, 2) as individual activities that would be carried out under the same authorizing regulatory authority and having similar environmental effects which can be mitigated in similar ways (CEQA Guidelines §15168 (a)(4)).

The Draft PEA, which included the NOP/IS and comment letters with responses to comments in Appendices C and D, respectively, was released for a 45-day public review and comment period from August 18, 2010 to October 1, 2010. Based on the conclusions in the NOP/IS prepared for the proposed project, the Draft PEA further analyzed whether or not the aesthetics, air quality, energy, hydrology and water quality, hazards and hazardous materials, and transportation and traffic impacts are significant. The Draft PEA concluded that only the topics of air quality and hydrology (water demand) would have significant adverse impacts.

Three comment letters were received during the public comment period on the analysis presented in the Draft PEA. Responses to these comment letters have been prepared and are included in Appendix E of the Final PEA The Final PEA, prepared pursuant to CEQA Guidelines §15132, identifies air quality and hydrology (water demand) as areas that may be adversely affected by the proposed project. No comment letters were received that identified other potentially significant adverse impacts from the proposed project.

Note that some minor modifications have been made to the Draft PEA to make it into a Final PEA. These modifications were evaluated by staff and it was concluded that none of the modifications alter any conclusions reached in the Draft PEA, nor do they constitute "significant

new information"[1] and, therefore, do not require recirculation of the document pursuant to CEQA Guidelines §15088.5. The Final PEA will be presented to the Governing Board prior to its November 5, 2010 public hearing.

SUMMARY OF THE PROPOSED PROJECT

SCAQMD staff is proposing amendments to Regulation XX – Regional Clean Air Incentives Market (RECLAIM), Rule 2002 – Allocations for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx) to achieve additional SOx emission reductions as outlined in the 2007 AQMP in Control Measure (CM) CMB-02: Further SOx Reduction for RECLAIM (CM #2007CMB-02). The proposed changes to Rule 2002 would reduce the allowable SOx emission limits based on current Best Available Retrofit Control Technology (BARCT) for the following industrial equipment and processes: 1) petroleum coke calciners; 2) cement kilns; 3) coal-fired boiler (cogeneration); 4) container glass melting furnace; 5) diesel combustion; 6) fluid catalytic cracking units; 7) refinery boilers/heaters; 8) sulfur recovery units/tail gas treatment units; and, 9) sulfuric acid manufacturing. Additional amendments are proposed to establish procedures and criteria for reducing RECLAIM Trading Credits (RTCs) and RTC adjustment factors for year 2013 and later. Other minor changes are proposed for clarity and consistency throughout the regulation. The proposed project is expected to result in anticipated reductions of up to 5.7 tons per day of SOx emissions by 2019 from 11 facilities.

POTENTIAL SIGNIFICANT ADVERSE IMPACTS THAT CANNOT BE REDUCED BELOW A SIGNIFICANT LEVEL

The Final PEA identified the topics of air quality and water demand as the only areas that may be significantly adversely affected by the proposed project.

<u>Project-Specific and Cumulative Construction Air Quality Impacts</u>

Relative to construction emissions, the "worst-case" scenario are that the construction phases overlap due to concurrent construction activities at a single facility or at more than one facility. Specifically, the scenario analyzed in the Final PEA is the simultaneous activities of demolishing existing equipment, site preparation, and constructing new air pollution control equipment, which could occur at a single facility or at more than one facility. The analysis further assumes that the "worst-case" day is that in which each construction project is operating construction equipment that generates the greatest emissions.

Based on these assumptions for overlapping construction phases, the "worst-case" emissions were calculated to be 89 pounds of VOC per day, 464 pounds per day of NOx, and 159 pounds

[1] Pursuant to CEQA Guidelines §15088.5, "Significant new information" requiring recirculation include, for example, a disclosure showing that:

(a) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.

(b) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.

(c) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.

(d) The draft EA was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

per day of PM10. The significance threshold for construction-related emissions is 75 pounds of VOC per day, 100 pounds of NOx per day, and 150 pounds of PM10 per day. Estimated construction emissions did not exceed the significance thresholds for CO, SOx and PM2.5.

Greenhouse Gas Impacts

With regard to greenhouse gas (GHG) emissions, the proposed project involves combustion processes during both construction and operation, which could generate GHG emissions such as carbon dioxide (CO2), methane (CH4), and nitrous oxide (N2O). However, the proposed project does not affect equipment or operations that have the potential to emit non-combustion GHGs such as sulfur hexafluoride (SF6), hydrofluorocarbons (HFCs) or perfluorocarbons (PFCs).

Installation of SOx control equipment as part of implementing the proposed project is expected to generate construction-related CO2 emissions. In addition, based on the type and size of equipment affected by the proposed project, CO2 emissions from the operation of the SOx control equipment are likely to increase from current levels due to electricity, fuel and water use. The proposed project will also result in an increase of GHG operational emissions produced from additional truck hauling and deliveries necessary to accommodate the additional solid waste generation and increased use of supplies such as catalyst and caustic.

For the purposes of addressing the GHG impacts of the proposed project, the overall impacts of CO2 equivalent (CO2eq) emissions from the project were estimated and evaluated from the earliest possible initial implementation of the proposed project with construction beginning in 2012. Once the proposed project is fully implemented, the potential SOx emission reductions would continue through the end of the useful life of the equipment. The analysis estimated CO2eq emissions from all sources subject to the proposed project (construction and operation) from the beginning of the proposed project (2012) to the end of the project construction (2019). The beginning of the proposed project was assumed to be no sooner than 2012, since installing SOx control equipment such as a wet gas scrubber (WGS) takes considerable advance planning and engineering. Full implementation of the proposed project is expected to occur by the end of 2018 since all the affected facilities would be required to comply with the proposed project by January 1, 2019, such that any installed or modified SOx controls would be constructed and operational by the final compliance date. Thus, once construction is complete and the equipment is operational, no further changes in CO2eq emissions are anticipated.

Implementing the proposed project is expected to increase GHG emissions that exceed the SCAQMD's GHG significance threshold for industrial sources and this potentially significant adverse impact cannot be mitigated below significance. The SCAQMD's GHG significance threshold for industrial sources is 10,000 metric tons of CO2eq emissions per year (MTCO2eq/yr). While none of the affected facilities individually exceed the GHG industrial significance threshold of 10,000 MTCO2eq/yr, the "worst-case" GHG emissions from the proposed project as a whole were calculated to be 39,020 MTCO2eq/yr which exceeds the SCAQMD's GHG significance threshold.

Recycled water projects and the utilization of recycled water are among the most direct ways to reduce GHG from combustion activities associated with conveying water to the affected facilities if water-intensive scrubbers are installed as a result of the proposed project. Specifically, the

energy it would take to treat and convey reclaimed water to a facility (e.g., 1,200 kilowatt-hours per million gallons (kWh/MMgallons)[2]) is approximately 10 times less than the amount of energy it would take for potable water (e.g., 12,700 kWh/MMgallons[3]) to be supplied, conveyed and distributed. Thus, for each facility that will have future access to recycled water and uses reclaimed wastewater to satisfy the water demands for the proposed project and in turn, mitigate CO2eq emissions, less GHG emissions would be generated for the operational water use/conveyance and operational wastewater generation portions of the proposed project. While the GHG mitigation measures identified in the Mitigation Monitoring Plan section of this document may reduce GHG emissions associated with water conveyance to the maximum extent feasible, none are mitigation measures that will avoid the significant impact or reduce the GHG impact to less than significant. Also, no other feasible mitigation measures have been identified to reduce GHG emissions to a level of insignificance. Therefore, the proposed project is considered to have significant adverse unavoidable cumulative GHG impacts.

Water Demand

Implementation of the proposed project may cause water demand impacts associated with the existing facilities affected by the proposed project. Specifically, the installation of WGSs and dry gas scrubbers (DGSs), the installation of new or modification of existing fuel gas treatment (FGT) systems, and upgrading existing sulfuric acid plant controls all involve an increased demand for water. However, for any facility that installs a SOx control equipment that utilizes water, SCAQMD staff requires that the facility operators utilize both current supplies and future supplies of recycled water if available, pursuant to the Harbor Refineries Recycled Water Pipeline Project (HRRWPP), for operation of the equipment. The HRRWPP is an ongoing construction project to conserve potable water and instead produce and convey recycled water to multiple industrial and irrigation customers in the Los Angeles Harbor area[4]. Several facilities that may be affected by the proposed project will be served by the HRRWPP.

The analysis in the Final PEA shows that the increased potential demand for total water (i.e., 883,368 gallons per day) that may result from implementing the proposed project is not expected to exceed the SCAQMD's significance threshold of five million gallons of total water demand per day. Further, based on discussions with the local water suppliers, the existing water supply is expected to have the capacity to meet the increased demands of the proposed project. While the total water demand for the proposed project will not exceed the SCAQMD's significance threshold for total water demand, based on the definition of "water demand project" in CEQA Guidelines §15155, the potential increase in potable water demand was estimated to be 201,587

[2] California's Water – Energy Relationship, Table 1-2, Page 9, California Energy Commission, Final Staff Report, CEC-700-2005-011-SF, November 2005. http://www.energy.ca.gov/2005publications/CEC-700-2005-011/CEC-700-2005-011-SF.PDF

[3] California's Water – Energy Relationship, Table 1-3, Page 11, California Energy Commission, Final Staff Report, CEC-700-2005-011-SF, November 2005. http://www.energy.ca.gov/2005publications/CEC-700-2005-011/CEC-700-2005-011-SF.PDF

[4] Future access to recycled water for these five facilities is dependent upon the completion of the Harbor Refineries Recycled Water Pipeline Project (HRRWPP) by Summer 2013 (SCH No. 2008121093, certified on October 20, 2009). The HRRWPP will conserve potable water and instead produce and convey recycled water to multiple industrial and irrigation customers in the Los Angeles Harbor area (http://www.ladwp.com/ladwp/cms/ladwp011486.jsp). Proponents of the HRRWPP are working with each of the affected facilities to negotiate construction of a new water conveyance at their site in order to tie-into the recycled water pipeline.

gallons per day and may be considered a substantial use of potable water. For the purposes of the CEQA analysis prepared for the proposed project, a substantial amount of potable water is defined as the amount of water necessary to supply 500 dwelling units or approximately 133,911 to 223,186 gallons of potable water per day.

While the use of recycled water may reduce potable water demand to the maximum extent feasible, the use of recycled water will not avoid the significant impact or reduce the potable water demand impact to less than significant. Also, no other feasible mitigation measures have been identified to reduce potable water demand to a level of insignificance. Therefore, the proposed project may cause significant potable water demand impacts.

STATEMENT OF FINDINGS

Public Resources Code §21081 and CEQA Guidelines §15091(a) state that no public agency shall approve or carry out a project for which a CEQA document has been completed which identifies one or more significant adverse environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. Additionally, the findings must be supported by substantial evidence in the record (CEQA Guidelines §15091(b)). As identified in the Final PEA and summarized above, the proposed project has the potential to create significant adverse air quality and water demand impacts. The SCAQMD Governing Board, therefore, makes the following findings regarding the proposed project. The findings are supported by substantial evidence in the record as explained in each finding. This Statement of Findings will be included in the record of project approval and will also be noted in the Notice of Decision. The Findings made by the SCAQMD Governing Board are based on the following significant adverse impacts identified in the Final PEA.

1. **Potential project-specific and cumulative VOC, NOx, and PM10 emissions during construction exceed the SCAQMD's applicable significance air quality thresholds and cannot be mitigated to insignificance.**

   Finding and Explanation:

   The implementation of the proposed project is anticipated to trigger construction activities associated with the installation of new SOx control equipment, (i.e., WGSs). Construction activities associated with the proposed project would result in emissions of VOC, NOx, SOx, CO PM10, and PM2.5, but only the estimated emissions for VOC, NOx and PM10 are expected to exceed the SCAQMD's applicable significance air quality thresholds for construction. As a result, the proposed project is expected to have significant adverse construction air quality impacts. However, the temporary construction emissions would cease upon completion of the installation of new or modification of existing air pollutant control equipment, as applicable. Once all the modified or new equipment are in place, the proposed project is expected to result in a reduction of SOx emissions up to 5.7 tons per day.

   The Governing Board finds that mitigation measures have been identified, but they would not reduce to insignificance the significant adverse project-specific or cumulative impacts to air quality associated with construction. No other feasible mitigation measures have

been identified. CEQA Guidelines §15364 defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors."

The Governing Board further finds that the Final PEA considered alternatives pursuant to CEQA Guidelines §15126.6, but no project alternative, other than the No Project Alternative, would reduce to insignificant levels the significant project-specific or cumulative construction air quality impacts identified for the proposed project.

2. Potential GHG emissions exceed the SCAQMD's applicable significance GHG threshold and cannot be mitigated to insignificance.

Finding and Explanation:
While none of the affected facilities individually exceed the SCAQMD's industrial GHG significance threshold of 10,000 MTCO2eq/yr, if the proposed project is implemented, the analysis indicates that there would be a significant increase in GHG emissions for the project as a whole. Because there are significant adverse GHG impacts from the proposed project, the PEA must describe feasible measures that could minimize significant adverse impacts.

The Governing Board finds that mitigation measures have been identified, but they would not reduce to insignificance the significant adverse GHG emission impacts. No other feasible mitigation measures have been identified. CEQA Guidelines §15364 defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors."

The Governing Board further finds that aside from the No Project Alternative, the Final PEA considered alternatives pursuant to CEQA Guidelines §15126.6, Alternative B was found to be the environmentally superior alternative. Alternative B can reduce to insignificant levels the significant GHG impacts identified for the proposed project. However, Alternative B, with a potential SOx emissions reduction of 1.50 tons per day, only partially achieves the SOx emission reductions identified in the AQMP, which are necessary to demonstrate attainment with state and federal air quality standards. When compared to the proposed project, while Alternative B creates fewer environmental impacts, it also provides fewer benefits to air quality and public health and does not satisfy project objectives.

3. Potential potable water demand would use a substantial amount of potable water and cannot be mitigated to insignificance.

Finding and Explanation:
The PEA concluded that the proposed project may cause significant adverse potable water demand impacts. Because there are significant adverse potable water demand impacts from the proposed project, the PEA must describe feasible measures that could minimize significant adverse impacts. While these mitigation measures may reduce the

amount of potable water needed, they would not avoid or reduce the adverse potable water demand impact to less than significant.

The Governing Board further finds that aside from the No Project Alternative, the Final PEA considered alternatives pursuant to CEQA Guidelines §15126.6, Alternative B was found to be the environmentally superior alternative. Alternative B can reduce to insignificant levels the significant water demand impacts identified for the proposed project. However, Alternative B, with a potential SOx emissions reduction of 1.50 tons per day, only partially achieves the SOx emission reductions identified in the AQMP, which are necessary to demonstrate attainment with state and federal air quality standards. When compared to the proposed project, while Alternative B creates fewer environmental impacts, it also provides fewer benefits to air quality and public health and does not satisfy project objectives.

Conclusion

The Governing Board finds that feasible mitigation measures have been identified to help minimize the potentially significant adverse impacts to air quality and water demand. CEQA defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors" (Public Resources Code §21061.1).

The Governing Board further finds that aside from the No Project Alternative, the Final PEA considered alternatives pursuant to CEQA Guidelines §15126.6. While Alternative B would reduce to insignificant levels the significant GHG and water demand impacts identified for the proposed project, Alternative B will not reduce to insignificant levels the significant air quality construction impacts and will not achieve the objectives of the proposed project.

The Governing Board further finds that a Mitigation Monitoring Plan (pursuant to Public Resources Code § 21081.6) needs to be prepared since feasible mitigation measures were identified.

The Governing Board further finds that the findings required by CEQA Guidelines §15091(a) are supported by substantial evidence in the record. The record of approval for this project may be found in the SCAQMD's Clerk of the Board's Office located at SCAQMD headquarters in Diamond Bar, California.

STATEMENT OF OVERRIDING CONSIDERATIONS

If significant adverse impacts of a proposed project remain after incorporating mitigation measures, or no measures or alternatives to mitigate the adverse impacts are identified, the lead agency must make a determination that the benefits of the project outweigh the unavoidable adverse environmental effects if it is to approve the project. CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits of a proposed project against its unavoidable environmental risks when determining whether to approve the project [CEQA Guidelines §15093(a)]. If the specific economic, legal, social, technological, or other benefits of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable"

[CEQA Guidelines §15093(a)]. Accordingly, a Statement of Overriding Considerations regarding potentially significant adverse air quality and water demand impacts that may result from the proposed project has been prepared. This Statement of Overriding Considerations is included as part of the record of the project approval for the proposed project. Pursuant to CEQA Guidelines §15093(c), the Statement of Overriding Considerations will also be noted in the Notice of Decision for the proposed project.

Despite the inability to incorporate changes into the proposed project that will mitigate potentially significant adverse air quality and water demand impacts to a level of insignificance, the SCAQMD's Governing Board finds that the following benefits and considerations outweigh the significant unavoidable adverse environmental impacts:

1. The analysis of potential adverse environmental impacts incorporates a "worst-case" approach. This entails the premise that whenever the analysis requires that assumptions be made, those assumptions that result in the greatest adverse impacts are typically chosen. This method likely overestimates the actual environmental impacts from the proposed project.

2. Each of the alternatives was crafted to show the various possibilities or permutations of how operators of SOx RECLAIM facilities could achieve actual SOx reductions, but ultimately, there is no way to predict what each facility operator will do. Further, because of the compliance flexibility inherent in the RECLAIM program, affected operators may choose to reduce SOx emissions using compliance options that minimize or eliminate significant environmental impacts at their facilities.

3. The 2007 AQMP identifies ambient air pollutant levels relative to federal and state ambient air quality standards (AAQS), establishes baseline and future emissions, and develops control measures to ensure attainment of the AAQS. Construction is a continuous activity in the district and is accounted for in the AQMP. Thus, any changes in air quality as a result of construction emissions from the proposed project are accounted for in the AQMP and would not be expected to interfere with the attainment demonstrations.

4. The proposed project implements 2007 AQMP Control Measure CMB-02: Further SOx Reductions for RECLAIM (CM #2007CMB-02) and obtains 2.9 tons per day of SOx emission reductions as called for in the 2007 AQMP. The proposed project may actually achieve additional SOx emission reductions beyond 2.9 tons per day (up to 5.7 tons per day) depending on the actual BARCT SOx emission controls employed.

5. The reduction of SOx emissions that may occur from implementing the proposed project will also reduce the secondary formation of PM2.5, which will provide additional health benefits from reducing exposure to PM2.5 concentrations.

6. Since the Basin is in non-attainment for PM2.5, for which SOx is a major precursor and since 17 million residents of the South Coast Air Basin are experiencing the worst PM2.5 exposure in the nation, the proposed project achieves the largest amount of overall SOx reductions by relying on currently available SOx control technologies.

7. SCAQMD staff has calculated that the air quality benefit of reducing one ton of SOx is equivalent to the air quality benefit achieved by reducing 15 tons of NOx in progressing towards attainment of the PM2.5 standard. Thus, the SOx reductions that may be achieved by the proposed project will help substantially reduce PM2.5 concentrations.

8. Although the proposed project also has the largest amount of adverse environmental impacts overall when compared to the alternatives, it achieves the maximum level of SOx reductions and corresponding health benefits.

9. Considering the PM2.5 exposure levels of the residents in the South Coast Air Basin and the need for expeditious improvement in PM2.5 air quality, the proposed project is preferred over Alternatives A, B, and C because it provides the most flexibility in the methods for reducing SOx emissions while maximizing the amount of potential SOx reductions and health benefits if the methods are implemented.

10. Implementing the control measures in the 2007 AQMP will result in an overall net reduction in criteria pollutant emissions. Therefore, cumulative air quality impacts from the proposed project and all other AQMP control measures when considered together, are not expected to be significant because implementation of all AQMP control measures is expected to result in net emission reductions and overall air quality improvement.

The SCAQMD's Governing Board finds that the above-described considerations outweigh the unavoidable significant effects to the environment as a result of the proposed project.

MITIGATION MONITORING PLAN

When making findings as required by Public Resources Code §21081 and CEQA Guidelines §15091, the lead agency must adopt a reporting or monitoring program for the changes to the project which it has adopted or made a condition of project approval in order to mitigate or avoid significant effects on the environment (Public Resources Code §21081.6 and CEQA Guidelines §15097[a]). To fulfill the requirements of Public Resources Code §21081.6 and CEQA Guidelines §15097, the SCAQMD has developed this mitigation monitoring plan for anticipated impacts resulting from implementing the proposed project.

AIR QUALITY IMPACTS

IMPACT SUMMARY OF MITIGATION MEASURES AQ-1 to AQ-8: Project-specific and cumulative construction-related emissions of VOC, NOx, and PM10 emissions, based on a "worst-case" analysis, would exceed the SCAQMD's regional mass daily significance thresholds for these pollutants. Emission sources include worker vehicles and heavy construction equipment. The following mitigation measures are intended to minimize the emissions associated with these sources during construction activities. No feasible mitigation measures have been identified to reduce emissions to a level of insignificance.

MITIGATION MEASURES: The following construction mitigation measures are required for each of the affected facilities.

On-Road Mobile Sources

AQ-1 Develop a Construction Emission Management Plan for each affected facility to minimize emissions from vehicles including, but not limited to: consolidating truck deliveries; scheduling deliveries to avoid peak hour traffic conditions; describing truck routing; describing deliveries including logging delivery times; describing entry/exit points; identifying locations of parking; identifying construction schedule; and prohibiting truck idling in excess of five consecutive minutes or another time-frame as allowed by the California Code of Regulations, Title 13 §2485 - CARB's Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling.

Off-Road Mobile Sources

AQ-2 Suspend all construction activities that generate air pollutant emissions during first stage smog alerts.

AQ-3 Prohibit construction equipment from idling longer than five minutes.

AQ-4 Use electricity or alternate fuels for on-site mobile equipment instead of diesel equipment to the extent feasible.

AQ-5 Tune-up construction equipment and maintain a two- to four-degree retard diesel engine timing, to the extent feasible.

AQ-6 Use electric welders to avoid emissions from gasoline or diesel welders in portions of the project sites where electricity is available.

AQ-7 Use on-site electricity rather than temporary power generators in portions of the project sites where electricity is available.

AQ-8 Prior to use in construction, each project applicant will evaluate the feasibility of retrofitting the large off-road construction equipment that will be operating for substantial periods. Retrofit technologies such as particulate traps, selective catalytic reduction, oxidation catalysts, air enhancement technologies, etc., will be included in the evaluation. These technologies will be required if they are certified by CARB and/or USEPA and are commercially available and can feasibly be retrofitted onto construction equipment.

Other mitigation measures were considered but were rejected because they would not further mitigate the potential significant impacts of the proposed project. These mitigation measures included: 1) provide temporary traffic control during all phases of construction activities (traffic safety hazards have not been identified); 2) implement a

shuttle service to and from retail services during lunch hours (most workers eat lunch onsite and lunch trucks visit the construction site); 3) use methanol, natural gas, propane or butane-powered construction equipment (equipment is not CARB-certified or commercially available); 4) pave unpaved roads (most facility roads are paved).

IMPLEMENTING PARTIES: The SCAQMD's Governing Board finds that implementing the mitigation measures AQ-1 through AQ-8 is the responsibility of the owner, operator, or agent of each affected facility who submits a permit application to comply with the proposed project.

MONITORING AGENCY: The SCAQMD's Governing Board finds that through its discretionary authority to issue and enforce permits for this project, the SCAQMD will ensure compliance with mitigation measures AQ-1 through AQ-8. Mitigation monitoring and reporting will be accomplished as follows:

MMAQ-1: CONSTRUCTION EMISSION MANAGEMENT PLAN

Each facility operator shall develop and submit a Construction Emission Management Plan to the SCAQMD for approval prior to starting construction activities. Upon approval, each facility operator shall train all personnel subject to the requirements set forth in the Construction Emission Management Plan on how to comply with the requirements in the plan, and document that training. The SCAQMD may conduct routine inspections of the site to verify compliance. The Construction Emission Management Plan shall include all of the following: description of construction traffic control methods such as flag persons, contractor entry/exit gates, et cetera; construction schedule including hours of operation; description of truck routing; and, description of deliveries including hours of delivery.

<u>Traffic Control</u>

Traffic requiring entrance onto each facility's property will be directed toward the entry gate or gates, if there are multiple entrances, so that congestion, as well as associated air pollution, will be minimized.

Points of entry will be selected to maximize facility security and reduce traffic-associated emissions. Each facility operator will direct their Receiving Department to consider delivery items, time of delivery, in-plant congested areas, surrounding area traffic, and gate security issues when assigning a gate entry location.

On-site parking will be used to the maximum extent available. In the event that off-site parking is required, construction workers may be requested to park at a designated off-site property. Buses or some other type of shuttle may transfer multiple workers at one time to and from the project site. No on-street parking (i.e., off of each facility's site) will be allowed.

Construction Schedule

In an effort to reduce traffic by construction workers, operators of the each facility may request its contractors to follow a compressed workweek. An example of a compressed workweek would be a four-day work week and a 10-hour work day with most work scheduled to begin by 7:00 a.m. and end after 5:30 p.m., Monday through Friday, to further minimize traffic congestion and related emissions. In addition, some work may need to be scheduled during the night shift, which will begin after 6:00 p.m. and end around 4:30 a.m. Critical path work may require a deviation from the aforementioned workweek and start- and stop-times; however, deviations will be minimized.

During process unit shutdowns, extended work shifts and night shifts, scheduled six to seven days per week, may be necessary. Each facility operator will establish in their Construction Emission Management Plan the details of the construction schedule, including operating hours, days, and number of shifts per day. This construction work schedule will need to be designed to minimize the travel time during peak travel periods.

Trip Reduction Plan

No feasible mitigation has been identified for the emissions from on-road vehicle trips. CEQA Guidelines §15364 defines feasible as "...capable of being accomplished in a successful manner." No feasible mitigation measures for offsite motor vehicles have been identified. Health and Safety Code §40929 prohibits the air districts and other public agencies from requiring an employee trip reduction program making such mitigation infeasible.

Delivery of Equipment and Materials

Each facility operator will coordinate the delivery of equipment and materials to avoid peak hour traffic, whenever possible. That is, delivery of construction materials to the site will be scheduled to occur during off-peak periods which are typically from 8:30 a.m. until 4:00 p.m. Monday through Friday. Each facility operator will request that equipment and material deliveries be minimized between the hours of 7:00 a.m. to 8:00 a.m. and 4:30 p.m. to 5:30 p.m. to reduce traffic in and out of each facility during high traffic peak times. Exceptions will be made for trucks carrying time-critical materials, e.g., concrete delivery and soil hauling (which eliminates the double handling or on-site stock-piling of soil, preventing it from being moved from place-to-place due to lack of adequate staging area, and subsequent removal at a later time via trucks). Delivery routes and schedules will be developed pursuant to the California Department of Transportation regulations.

It may be necessary to handle a limited amount of equipment as wide or special loads. These deliveries are subject to California Department of Transportation regulations and will be coordinated with local police departments. These trips will be scheduled to avoid peak hour traffic.

MMAQ-2: SUSPEND ALL CONSTRUCTION ACTIVITIES THAT GENERATE AIR EMISSIONS DURING FIRST STAGE SMOG ALERTS.

If and when any first stage smog alert or greater occurs, each facility operator will record the date and time of each alert, will suspend all construction activities that generate emissions, and will record the date and time when the use of construction equipment and construction activities are suspended. This log shall be maintained on-site for a period of at least two years from completion of construction.

MMAQ-3: PROHIBIT TRUCKS FROM IDLING LONGER THAN FIVE MINUTES

Each facility operator will notify all vendors that during deliveries, truck idling time will be limited to no longer than five minutes. For any delivery that is expected to take longer than five minutes, each facility operator will require the truck's operator to shut off the engine. Each facility operator will notify the vendors of these delivery requirements at the time that the purchase order is issued and again when trucks enter the gates of the facility. To further ensure that drivers understand the truck idling requirement, signs will be posted at each facility entry gates stating idling longer than five minutes is not permitted.

MMAQ-4: USE ELECTRICITY OR ALTERNATE FUELS FOR ON-SITE MOBILE EQUIPMENT INSTEAD OF DIESEL EQUIPMENT TO THE EXTENT FEASIBLE

Each facility operator shall evaluate the use of electricity and alternate fuels for on-site mobile construction equipment prior to the commencement of construction activities, provided that suitable equipment is available for the activity. Equipment vendors will be contacted to determine the commercial availability of electric or alternate-fueled construction equipment. Equipment that will use electricity or alternate fuels will be included in the Construction Emission Management Plan.

The potential equipment that may be considered includes, but is not limited to:

- Electric scissor lifts
- Electric golf carts
- Bicycles
- Boom lifts

Each facility operator will limit the number of personal and company vehicles allowed to enter each facility beyond the parking lots. This restriction helps minimize onsite emissions and promotes the use of ride sharing and alternate fueled transportation such as bicycles and electric golf carts.

In addition to the other alternative fueled equipment, each facility operators and the construction contractors will use electric boom lifts or bi-powered boom lifts, when available.

MMAQ-5: MAINTAIN CONSTRUCTION EQUIPMENT, TUNED UP AND WITH TWO TO FOUR DEGREE RETARD DIESEL ENGINE TIMING

Each facility operator, in cooperation with the construction contractors, will maintain vehicle and equipment maintenance records for the construction portion of the proposed project. All construction vehicles must be maintained in compliance with the manufacturer's recommended maintenance schedule. Each facility operator will maintain their construction equipment and the construction contractor will be responsible for maintaining their equipment and maintenance records. All maintenance records for each facility and their construction contractor(s) will remain on-site for a period of at least two years from completion of construction. Each facility operator, in cooperation and coordination with each construction contractor and equipment vendor, will evaluate the practicality of retarding diesel engine timing on off-road construction equipment for the purpose of reducing emissions.

MMAQ-6: USE ELECTRIC WELDERS INSTEAD OF GAS OR DIESEL WELDERS IN PORTIONS OF THE FACILITY WHERE ELECTRICITY IS AVAILABLE.

Each facility operator and their construction contractor will conduct a survey of the proposed project area to assess whether the existing infrastructure can provide access to electricity, as available, within the facility. Construction areas within the facility where electricity is not available will be identified on a site plan as part of the Construction Emission Management Plan. The use of gas or diesel welders shall be prohibited in areas of the facility that are shown to have access to electricity. Each facility operator will assess the number of electrical welding receptacles available, and will indicate whether diesel generators or welders are required for the proposed project. Each facility operator shall include in all construction contracts the requirement that diesel welders are only allowed to operate in the portions of the facility as identified on the site plan as not being accessible to electric power. If gas or diesel welders are actually used, each facility operator shall maintain welder records that indicate the location where welders are operated for a period of at least two years from completion of construction.

MMAQ-7: USE ON-SITE ELECTRICITY RATHER THAN TEMPORARY POWER GENERATORS IN PORTIONS OF THE FACILITY WHERE ELECTRICITY IS AVAILABLE.

The use of temporary power generators shall be prohibited in areas of the facility that have existing infrastructure to provide access to electricity. Construction areas within the facility where electricity is not available will be identified on a site plan as part of the Construction Emission Management Plan. The use of temporary power generators within these identified areas of the facility will be allowed. The use of temporary power generators outside of these identified areas shall be prohibited. Each facility operator shall include in all construction contracts the requirement that the use of temporary power generators is prohibited in certain portions of the facility as identified on the site plan. Each facility operator shall maintain records that indicate the location where the generators are operated, if at all, for a period of at least two years from completion of construction.

MMAQ-8: PRIOR TO USE IN CONSTRUCTION, EACH FACILITY OPERATOR WILL EVALUATE THE FEASIBILITY OF RETROFITTING THE LARGE OFF-ROAD CONSTRUCTION EQUIPMENT THAT WILL BE OPERATING FOR SIGNIFICANT PERIODS. RETROFIT TECHNOLOGIES SUCH AS SELECTIVE CATALYTIC REDUCTION, OXIDATION CATALYSTS, AIR ENHANCEMENT TECHNOLOGIES, ETC., WILL BE EVALUATED. SUCH TECHNOLOGIES WILL BE REQUIRED IF THEY ARE COMMERICALLY AVAILABLE AND CAN FEASIBLY BE RETROFITTED ONTO CONSTRUCTION EQUIPMENT.

All construction equipment diesel engines rated at 50 hp or greater shall meet the highest tier of California Emission Standards for Off-Road Compression-Ignition Engines as specified in California Code of Regulations, Title 13, §2423(b)(1) unless such engine is not available for a particular item of equipment within the southern California area for use for the needed construction equipment for the proposed project.

At a minimum, construction equipment engines will be required to meet Tier 1 California standards if equipment with engines that meet Tier 2 standards are not available, unless such engine is not available for a particular item of equipment.

In the event that an engine is not available that meet any tier (e.g., Tier 1 up to Tier 4) for any off-road engine rated at 50 hp or greater, that engine shall be equipped with a diesel particulate filter, unless certified by engine manufacturers that the use of such devices is not practical for specific engine types. Each facility operator shall submit to the SCAQMD, prior to initiation of construction, information in writing on why particulate filters are not practical. For purposes of this condition, the use of such devices is "not practical" if, among other reasons:

(1) There is no available particulate filter that has been certified by either the California Air Resources Board or U.S. Environmental Protection Agency for the engine in question; or,
(2) The construction equipment is intended to be on-site for 30 days or less.

The use of a particulate filter may be terminated immediately if one of the following conditions exists:

(1) The use of the particulate filter is excessively reducing normal availability of the construction equipment due to increased downtime for maintenance, and/or reduced power output due to an excessive increase in backpressure;
(2) The particulate filter is causing or is reasonably expected to cause significant engine damage; or,
(3) The particulate filter is causing or is reasonably expected to cause a significant risk to workers or the public.

During construction of the proposed project and for two years following completion of construction, each facility operator shall keep records onsite of applicable compliance activities to demonstrate the steps taken to assure compliance with Mitigation Measure AQ-8 as specified in Tables 1 and 2.

GHG IMPACTS

IMPACT SUMMARY OF MITIGATION MEASURES GHG-1 to GHG-2: Based on a "worst-case" analysis, none of the affected facilities individually exceed the industrial GHG significance threshold. However, if the proposed project gets implemented, the analysis indicates that there will be a significant increase in GHG emissions for the project as a whole. Because there are significant adverse GHG impacts from the proposed project, the PEA must describe feasible measures which could minimize the significant adverse impacts. The following mitigation measures are intended to minimize the GHG emissions associated with water conveyance. No feasible mitigation measures have been identified to reduce GHG emissions to a level of insignificance.

MITIGATION MEASURES: The following GHG mitigation measures are required for each of the affected facilities.

GHG-1 When SOx control equipment is installed and water is required for its operation, the facility operator is required to use recycled water, if available, to satisfy the water demand for the SOx control equipment.

GHG-2 In the event that recycled water cannot be delivered to the affected facility, the facility operator is required to use their best efforts to submit a written declaration with the application for a Permit to Construct for the

SOx control equipment, to be signed by an official of the water purveyor indicating the reason(s) why recycled water cannot be supplied to the project.

IMPLEMENTING PARTIES: The SCAQMD's Governing Board finds that implementing mitigation measures GHG-1 through GHG-2 is the responsibility of the owner, operator, or agent of each affected facility who submits a permit application to comply with the proposed project.

MONITORING AGENCY: The SCAQMD's Governing Board finds that through its discretionary authority to issue and enforce permits for this project, the SCAQMD will ensure compliance with mitigation measures GHG-1 through GHG-2. Mitigation monitoring and reporting will be accomplished as follows:

MMGHG-1: USE RECYCLED WATER, IF AVAILABLE, FOR SOX CONTROL EQUIPMENT THAT REQUIRES WATER FOR ITS OPERATION

At the time of submitting an application for a Permit to Construct for SOx control equipment that requires water for its operation, each facility operator shall submit a copy of a Memorandum of Understanding agreement reached between the facility operator and the recycled water supplier or purveyor that indicates recycled water will be used to supply water to the SOx control equipment. Once the SOx control equipment becomes operational, on a monthly basis, each facility operator will record the amount of recycled water supplied to the SOx control equipment from the recycled water bill. This log shall be maintained on-site for a period of at least two years from initiating operation.

MMGHG-2: SUBMIT WRITTEN DECLARATION IF RECYCLED WATER IS NOT AVAILABLE

The facility operator is required to use their best efforts submit a written declaration with the application for a Permit to Construct for the SOx control equipment, to be signed by an official of the water purveyor indicating the reason(s) why recycled water cannot be supplied to the project.

WATER DEMAND IMPACTS

IMPACT SUMMARY OF MITIGATION MEASURES HWQ-1 to HWQ-2: Because some SOx control equipment can utilize a substantial amount of water, significant adverse impacts associated with water demand are expected from the proposed project during operation. Because there are significant adverse potable water demand impacts from the proposed project, the PEA must describe feasible measures which could minimize the significant adverse impacts. The following mitigation measures are intended to minimize the amount of potable water demand. No feasible mitigation measures have been identified to reduce the potable water demand to a level of insignificance.

MITIGATION MEASURES: The following water demand mitigation measures are required for each of the affected facilities.

HWQ-1 When SOx control equipment is installed and water is required for its operation, the facility operator is required to use recycled water, if available, to satisfy the water demand for the SOx control equipment.

HWQ-2 In the event that recycled water cannot be delivered to the affected facility, the facility operator is required to submit a written declaration with the application for a Permit to Construct for the SOx control equipment, to be signed by an official of the water purveyor indicating the reason(s) why recycled water cannot be supplied to the project.

IMPLEMENTING PARTIES: The SCAQMD's Governing Board finds that implementing the mitigation measures HWQ-1 through HWQ-2 is the responsibility of the owner, operator, or agent of each affected facility who submits a permit application to comply with the proposed project.

MONITORING AGENCY: The SCAQMD's Governing Board finds that through its discretionary authority to issue and enforce permits for this project, the SCAQMD will ensure compliance with mitigation measures HWQ-1 through HWQ-2. Mitigation monitoring and reporting will be accomplished as follows:

MMHWQ-1: USE RECYCLED WATER, IF AVAILABLE, FOR SOX CONTROL EQUIPMENT THAT REQUIRES WATER FOR ITS OPERATION

At the time of submitting an application for a Permit to Construct for SOx control equipment that requires water for its operation, each facility operator shall submit a copy of a Memorandum of Understanding agreement reached between the facility operator and the recycled water supplier or purveyor that indicates recycled water will be used to supply water to the SOx control equipment. Once the SOx control equipment becomes operational, on a monthly basis, each facility operator will record the amount of recycled water supplied to the SOx control equipment from the recycled water bill. This log shall be maintained on-site for a period of at least two years from initiating operation.

MMHWQ-2: SUBMIT WRITTEN DECLARATION IF RECYCLED WATER IS NOT AVAILABLE

The facility operator is required to submit a written declaration with the application for a Permit to Construct for the SOx control equipment, to be signed by an official of the water purveyor indicating the reason(s) why recycled water cannot be supplied to the project.

CONCLUSION

Based on a "worst-case" analysis, the potential adverse construction air quality impacts, GHG impacts, and water demand impacts from the adoption and implementation of the proposed project are considered significant and unavoidable. Although feasible mitigation measures have been identified that would reduce these impacts associated with the proposed project, they are not sufficient to reduce the impacts to insignificance. Further, although implementing Alternative B would reduce GHG and potable water demand impacts to less than significant, Alternative B does not achieve the project objectives as well as the proposed project. As a result, no other feasible mitigation measures or project alternatives have been identified that would further reduce these impacts while still achieving the overall objectives of the proposed project.

Table 1
Mitigation, Monitoring and Reporting Plan for Each Affected Facility Operator

Mitigation Measure/Implementation Requirement	Party Responsible for Implementing Mitigation	Monitoring Action	1. Enforcement Agency 2. Monitoring Agency 3. Monitoring Phase
AQ-1/ Schedule truck deliveries of over-sized equipment and materials for non-peak a.m. and p.m. periods (i.e., avoid deliveries between 7:00 a.m. – 8:00 a.m. and 4:30 p.m. – 5:30 p.m. periods), except for time-sensitive materials during construction activities.	Each Affected Facility Operator	Maintain records of the date and time of each delivery of over-sized equipment and materials during construction activities.	1. SCAQMD 2. SCAQMD 3. Daily during all construction phases
AQ-1/ Limit access to and from the construction site.	Each Affected Facility Operator	Submit plot plan to SCAQMD that indicates access points to and from the construction site. Maintain records documenting that all construction contractors and subcontractors have been directed to use only specified access points.	1. SCAQMD 2. SCAQMD 3. Prior to the start of construction
AQ-1/ Provide sufficient parking on the facility site or other local site to accommodate all the construction employees, and do not permit on-street parking.	Each Affected Facility Operator	Submit plot plan to SCAQMD that indicates location(s) of construction employee parking and number of parking spaces available. Maintain records that all construction contractors and subcontractors have been directed to park only in designated areas and are not permitted to use on-street parking.	1. SCAQMD 2. SCAQMD 3. Prior to the start of construction

Mitigation, Monitoring and Reporting Plan for Each Affected Facility Operator

Mitigation Measure/Implementation Requirement	Party Responsible for Implementing Mitigation	Monitoring Action	1. Enforcement Agency 2. Monitoring Agency 3. Monitoring Phase
AQ-1/ Schedule construction delivery materials to occur during off-peak periods (i.e. from 8:30 a.m. until 4:00 p.m.) and/or after 5:30 p.m. and before 7:00 a.m., except for time-sensitive materials.	Each Affected Facility Operator	Maintain records of the date and time of each construction material delivery.	1. SCAQMD 2. SCAQMD 3. Daily during all construction phases
AQ-1/ Record number of construction personnel on-site.	Each Affected Facility Operator	Maintain records of number of construction personnel on-site.	1. SCAQMD 2. SCAQMD 3. Daily during all construction phases
AQ-1/ Record number of construction delivery trucks and haul trucks.	Each Affected Facility Operator	Maintain records of number of construction delivery trucks and haul trucks entering the facility site.	1. SCAQMD 2. SCAQMD 3. Daily during all construction phases
AQ-2/ Suspend use of construction equipment during first stage smog alert or greater.	Each Affected Facility Operator	Maintain records of date and time of each first stage smog alert or greater.	1. SCAQMD 2. SCAQMD 3. Per first stage smog alert or greater
AQ-3/ Notify vendors and contractors that truck and equipment operators are prohibited from idling longer than five minutes.	Each Affected Facility Operator	Prepare standard notification letter that explains idling limitation during deliveries and provide copy to all vendors. Post signs on-site.	1. SCAQMD 2. SCAQMD 3. At time purchase order is issued or contract is signed

Table 1 (continued)
Mitigation, Monitoring and Reporting Plan for Each Affected Facility Operator

Mitigation Measure/Implementation Requirement	Party Responsible for Implementing Mitigation	Monitoring Action	1. Enforcement Agency 2. Monitoring Agency 3. Monitoring Phase
AQ-4/ Identify on-site mobile construction equipment that will use electricity or alternate fuels.	Each Affected Facility Operator	Maintain on-site mobile construction equipment records as follows: 1. equipment ID; 2. equipment type; 3. equipment manufacturer/ model; 4. engine horsepower rating; and, 5. power source/fuel type.	1. SCAQMD 2. SCAQMD 3. Daily during all construction phases
AQ-4/ Restrict the number of personal and company vehicles entering the facility site beyond the parking lots.	Each Affected Facility Operator	Maintain records of number of personal and facility-owned or operated vehicles entering the facility site. Each affected facility operator will restrict drive in authorization for contractors, to only those with specific permission.	1. SCAQMD 2. SCAQMD 3. Daily during all construction phases
AQ-5/ Identify construction equipment that will undergo retarding of diesel engine timing for the purpose of reducing emissions.	Each Affected Facility Operator	Submit to SCAQMD a letter that identifies the construction equipment that will undergo retarding of diesel engine timing as follows: 1. equipment ID; 2. equipment type; 3. equipment; 4. manufacturer/model; 5. engine horse-power rating; and, 6. power source/fuel type.	1. SCAQMD 2. SCAQMD 3. Submit letter to SCAQMD prior to scheduled use in the field and quarterly thereafter during all construction phases

Table 1 (continued)
Mitigation, Monitoring and Reporting Plan for Each Affected Facility Operator

Mitigation Measure/Implementation Requirement	Party Responsible for Implementing Mitigation	Monitoring Action	1. Enforcement Agency 2. Monitoring Agency 3. Monitoring Phase
AQ-5/ Schedule periodic maintenance activities for all vehicle and construction equipment, including regular tune-ups and retard diesel engine timing.	Each Affected Facility Operator	Maintain records of maintenance activities for all vehicle and construction equipment.	1. SCAQMD 2. SCAQMD 3. Daily during all construction phases
AQ-6/ Use electric welders during construction activities where existing infrastructure to provide access to electricity is available.	Each Affected Facility Operator	Submit to SCAQMD a site plan that identifies the construction areas within the facility site where electricity is not available.	1. SCAQMD 2. SCAQMD 3. Prior to scheduled use in the field
AQ-6/ Identify diesel and gasoline welders used during construction.	Each Affected Facility Operator	Maintain records of diesel and gasoline welders used during construction that specify the following: 1. equipment ID; 2. welder type; 3. manufacturer and model number; 4. date, time and duration of operation; 5. location within the facility site where operated; and, 6. amount and type of fuel used (applies to non-electric welders).	1. SCAQMD 2. SCAQMD 3. Daily during all construction phases

Table 1 (continued)

Off-Road Construction Equipment List

Equipment ID	Type	Manufacturer	Model	Engine Rating (hp)	To What Tier Is Equipment Certified?	Modifications Made	Date(s) and Hour(s) Operated

(Adopted October 15, 1993)(Amended March 10, 1995)(Amended December 7, 1995)
(Amended July 12, 1996)(Amended February 14, 1997)
(Amended May 11, 2001)(Amended January 7, 2005)
(Draft October 28, 2010)

PROPOSED AMENDED RULE 2002. ALLOCATIONS FOR OXIDES OF NITROGEN (NO_X) AND OXIDES OF SULFUR (SO_X)

(a) Purpose

The purpose of this rule is to establish the methodology for calculating facility Allocations and adjustments to RTC holdings for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx).

(b) RECLAIM Allocations

(1) RECLAIM Allocations will begin in 1994.

(2) An annual Allocation will be assigned to each facility for each compliance year starting from 1994.

(3) Allocations and RTC holdings for each year after 2011 are equal to the 2011 Allocation and RTC holdings, as determined pursuant to subdivision (f) unless, as part of the AQMP process, and pursuant to Rule 2015 (b)(1), (b)(3), (b)(4), or (c), the District Governing Board determines that additional reductions are necessary to meet air quality standards, taking into consideration the current and projected state of technology available and cost-effectiveness to achieve further emission reductions.

(4) The Facility Permit or relevant sections thereof shall be re-issued at the beginning of each compliance year to include allocations determined pursuant to subdivisions (c), (d), (e), and (f) and any RECLAIM Trading Credits (RTC) obtained pursuant to Rule 2007 - Trading Requirements for the next fifteen years thereafter and any other modifications approved or required by the Executive Officer.

(c) Establishment of Starting Allocations

(1) The starting Allocation for RECLAIM NO_X and SO_X facilities initially permitted by the District prior to October 15, 1993, shall be determined by the Executive Officer utilizing the following methodology:

Starting Allocation=$\Sigma[A \times B_1]$+ERCs+External Offsets

where

A = the throughput for each NO_X and SO_X source or process unit in the facility for the maximum throughput year from 1989 to 1992 inclusive; and

B_1 = the applicable starting emission factor for the subject source or process unit as specified in Table 1 or Table 2

(2) (A) Use of 1992 data is subject to verification and revision by the Executive Officer or designee to assure validity and accuracy.

(B) The maximum throughput year will be determined by the Executive Officer or designee from throughput data reported through annual emissions reports submitted pursuant to Rule 301 - Permit Fees, or may be designated by the permit holder prior to issuance of the Facility Permit.

(C) To determine the applicable starting emission factor in Table 1 or Table 2, the Executive Officer or designee will categorize the equipment at each facility based on information relative to hours of operation, equipment size, heating capacity, and permit information submitted pursuant to Rule 201 - Permit to Construct, and other relevant parameters as determined by the Executive Officer or designee. No information used for purposes of this subparagraph may be inconsistent with any information or statement previously submitted on behalf of the facility to the District, including but not limited to information and statements previously submitted pursuant to Rule 301 - Permit Fees, unless the facility can demonstrate, by clear and convincing documentation, that such information or statement was inaccurate.

(D) Throughput associated with each piece of equipment or NO_X or SO_X source will be multiplied by the starting emission factors specified in Table 1 or Table 2. If a lower emission factor was utilized for a given piece of equipment or NO_X or SO_X source pursuant to Rule 301 - Permit Fees, than the factor in Table 1 or Table 2, the lower factor will be used for determining that portion of the Allocation.

(E) Fuel heating values may be used to convert throughput records into the appropriate units for determining Allocations based on the emission factors in Table 1 or Table 2. If a different unit basis than set forth in Tables 1 and 2 is needed for emissions calculations, the Executive Officer shall use a default heating value to determine source emissions, unless the Facility Permit holder can demonstrate with substantial evidence to the Executive Officer that a different value should be used to determine emissions from that source.

(3) All NO_X and SO_X ERCs generated at the facility and held by a RECLAIM Facility Permit holder shall be reissued as RTCs. RECLAIM facilities will have these RTCs added to their starting Allocations. RTCs generated from the conversion of ERCs shall have a zero rate of reduction for the year 1994 through the year 2000. Such RTCs shall have a cumulative rate of reduction for the years 2001, 2002, and 2003, equal to the percentage inventory adjustment factor applied to 2003 Allocations pursuant to paragraph (e)(1) of this rule and shall have a rate of reduction for compliance year 2004 and subsequent years determined pursuant to paragraph (f)(1) of this rule.

(4) Non-RECLAIM facilities may elect to have their ERCs converted to RTCs and listed on the RTC Listing maintained by the Executive Officer or designee pursuant to Rule 2007 - Trading Requirements, so long as the written request is filed before July 1, 1994. Such RTCs will be assigned to the trading zone in which the generating facility is located. RTCs generated from the conversion of ERCs shall have a zero rate of reduction for the year 1994 through the year 2000. Such RTCs shall have a cumulative rate of reduction for the years, 2001, 2002, and 2003, equal to the percentage inventory adjustment factor applied to 2003 Allocations pursuant to paragraph (e)(1) of this rule.

(5) External offsets provided pursuant to Regulation XIII - New Source Review, not including any offsets in excess of a 1 to 1 ratio, will be added to the starting Allocation pursuant to paragraph (c)(1) provided:

(A) The offsets were not received from either the Community Bank or the Priority Reserve.

(B) External offsets will only be added to the starting Allocation to the extent that the Facility Permit holder demonstrates that they have not already been included in the starting Allocation or as an

ERC. RTCs issued for external offsets shall not include any offsets in excess of a 1 to 1 ratio required under Regulation XIII - New Source Review.

(C) RTCs generated from the conversion of external offsets shall have a zero rate of reduction for the year 1994 through the year 2000. These RTCs shall have a cumulative rate of reduction for the years 2001, 2002, and 2003, equal to the percentage inventory adjustment factor applied to 2003 Allocations pursuant to paragraph (e)(1) of this rule, and for compliance year 2004 and subsequent years allocations shall be determined pursuant to paragraph (f)(1) of this rule. The rate of reduction for the year 2001 through year 2003 shall not be applied to new facilities initially totally permitted on or after January 7, 2005.

(D) Existing facilities with units that have Permits to Construct issued pursuant to Regulation II - Permits, dated on or after January 1, 1992, or existing facilities which have, between January 1, 1992 and October 15, 1993, installed air pollution control equipment that was exempt from offset requirements pursuant to Rule 1304 (a)(5), shall have their starting Allocations increased by the total external offsets provided, or the amount that would have been offset if the exemption had not applied.

(E) Existing facilities with units whose reported emissions are below capacity due to phased construction, and/or where the Permit to Operate issued pursuant to Regulation II - Permits, was issued after January 1, 1992, shall have their starting Allocations increased by the total external offsets provided.

(6) If a Facility Permit holder can demonstrate that its 1994 Allocation is less than the 1992 emissions reported pursuant to Rule 301 - Permit Fees, and that the facility was, in 1992, operating in compliance with all applicable District rules in effect as of December 31, 1993, the facility's starting Allocation will be equal to the 1992 reported emissions.

(7) For new facilities initially totally permitted on or after January 1, 1993 but prior to October 15, 1993, the starting Allocation shall be equal to the external offsets provided by the facility to offset emission increases at the facility pursuant to Regulation XIII - New Source Review, not including any offsets in excess of a 1 to 1 ratio.

(8) The Allocation for new facilities initially totally permitted on and after

October 15, 1993, shall be equal to the total RTCs provided by the facility to offset emission increases at the facility pursuant to Rule 2005-New Source Review for RECLAIM.

(9) The starting Allocation for existing facilities which enter the RECLAIM program pursuant to Rule 2001 - Applicability, shall be determined by the methodology in paragraph (c)(1) of this rule. The most recent two years reported emission fee data filed pursuant to Rule 301 - Permit Fees, may be used if 1989 through 1992 emission fee data is not available. For facilities lacking reported emission fee data, the Allocation shall be equal to the external offsets provided pursuant to Regulation XIII - New Source Review, not including any offsets in excess of a 1 to 1 ratio. The Allocation shall not include any emission offsets received from either the Community Bank or the Priority Reserve.

(10) A facility may not receive more than one set of Allocations.

(11) A facility that is no longer holding a valid District permit on January 1, 1994 will not receive an Allocation, but may, if authorized by Regulation XIII, apply for ERCs.

(12) Clean Fuel Adjustment to Starting Allocation

Any refiner who is required to make modifications to comply with CARB Phase II reformulated gasoline production (California Code of Regulations, Title 13, Sections 2250, 2251.5, 2252, 2260, 2261, 2262, 2262.2, 2262.3, 2262.4, 2262.5, 2262.6, 2262.7, 2263, 2264, 2266, 2267, 2268, 2269, 2270, and 2271) or federal requirements (Federal Clean Air Act, Title II, Part A, Section 211; 42 U.S.C. Section 7545) may receive (an) increase(s) in his Allocations except to the extent that there is an increase in maximum rating of the new or modified equipment. Each facility requesting an increase to Allocations shall submit an application for permit amendment specifying the necessary modifications and tentative schedule for completion. The Facility Permit holder shall establish the amount of emission increases resulting from the reformulated gasoline modifications for each year in which the increase in Allocations is requested. The increase to its Allocations will be issued contemporaneously with the modification according to a schedule approved by the Executive Officer or designee (i.e., 1994 through 1997 depending on the refinery). Each increase to the Allocations shall be equal to the increased emissions resulting from the modifications solely to comply with the state or federal reformulated gasoline requirements at

the refinery or facility producing hydrogen for reformulated gasoline production, and shall be established according to present and future compliance limits in current District rules or permits. Allocation increases for each refiner pursuant to this paragraph, shall not exceed 5 percent of the refiner's total starting Allocation, unless any refiner emits less than 0.0135 tons of NO_X per thousand barrels of crude processed, in which case the Allocation increases for such refiner shall not exceed 20 percent of that refiner's starting Allocation. The emissions per amount of crude processed will be determined on the basis of information reported to the District pursuant to Rule 301 - Permit Fees, for the same calendar year as the facility's peak activity year for their NO_X starting Allocation.

(d) Establishment of Year 2000 Allocations

(1) (A) The year 2000 Allocations for RECLAIM NO_X and SO_X facilities will be determined by the Executive Officer or designee utilizing the following methodology:

$$\text{Year 2000 Allocation} = \Sigma [A \times B_2] + \text{RTCs created from ERCs} + \text{External Offsets},$$

where

A = the throughput for each NO_X or SO_X source or process unit in the facility for the maximum throughput year from 1987 to 1992, inclusive, as reported pursuant to Rule 301 - Permit Fees; and

B_2 = the applicable Tier I year Allocation emission factor for the subject source or process unit, as specified in Table 1 or Table 2.

(B) The maximum throughput year will be determined by the Executive Officer or designee from throughput data reported through annual emissions reports pursuant to Rule 301 - Permit Fees, or may be designated by the permit holder prior to issuance of the Facility Permit.

(C) To determine the applicable emission factor in Table 1 or Table 2, the Executive Officer or designee will categorize the equipment at each facility based on information on hours of operation, equipment size, heating capacity, and permit information submitted pursuant to Rule 201 - Permit to Construct, and other parameters as determined by the Executive Officer or designee. No information used for purposes of this

subparagraph may be inconsistent with any information or statement previously submitted on behalf of the facility to the District including but not limited to information and statements previously submitted pursuant to Rule 301 - Permit Fees, unless the facility can demonstrate, by clear and convincing documentation, that such information or statement was inaccurate.

(D) Throughput associated with each piece of equipment or NO_X or SO_X source will be multiplied by the Tier I emission factor specified in Table 1 or Table 2. If a factor lower than the factor in Table 1 or Table 2 was utilized for a given piece of equipment or NO_X or SO_X source pursuant to Rule 301, the lower factor will be used for determining that portion of the Allocation.

(E) The fuel heating value may be considered in determining Allocations and will be set to 1.0 unless the Facility Permit holder demonstrates that it should receive a different value.

(F) The year 2000 Allocation is the sum of the resulting products for each piece of equipment or NO_X or SO_X source multiplied by any inventory adjustment pursuant to paragraph (d)(4) of this rule.

(2) For facilities existing prior to October 15, 1993 which enter RECLAIM after October 15, 1993, the year 2000 Allocation will be determined according to paragraph (d)(1). The most recent two years reported emission fee data filed pursuant to Rule 301 - Permit Fees, may be used if 1989 through 1992 emission fee data is not available. For facilities lacking reported emission fee data, the Allocation shall be equal to their external offsets provided pursuant to Regulation XIII - New Source Review, not including any offsets in excess of a 1 to 1 ratio.

(3) No facility shall have a year 2000 Allocation [calculated pursuant to subdivision (d)] greater than the starting Allocation [calculated pursuant to subdivision (c)].

(4) If the sum of all RECLAIM facilities' year 2000 Allocations differs from the year 2000 projected inventory for these sources under the 1991 AQMP, the Executive Officer or designee will establish a percentage inventory adjustment factor that will be applied to adjust each facility's year 2000 Allocation. The inventory adjustment will not

apply to RTCs generated from ERCs or external offsets.

(e) Allocations for the Year 2003

(1) The 2003 Allocations will be determined by the Executive Officer or designee applying a percentage inventory adjustment to reduce each facility's unadjusted year 2000 Allocation so that the sum of all RECLAIM facilities' 2003 Allocations will equal the 1991 AQMP projected inventory for RECLAIM sources for the year 2003, corrected based on actual facility data reviewed for purposes of issuing Facility Permits and to reflect the highest year of actual Basin-wide economic activity for RECLAIM sources considered as a whole during the years 1987 through 1992.

(2) No facility shall have a 2003 Allocation (calculated pursuant this subdivision) greater than the year 2000 Allocation [calculated pursuant to subdivision (d)].

(f) Annual Allocations for NO_X and SO_x and Adjustments to ~~NOx~~ RTC Holdings

(1) Allocations for the years between 1994 and 2000, for RECLAIM NO_X and SO_X facilities shall be determined by a straight line rate of reduction between the starting Allocation and the year 2000 Allocation. For the years 2001 and 2002, the Allocations shall be determined by a straight line rate of reduction between the year 2000 and year 2003 Allocations. ~~SOx Allocations for each year after 2003 are equal to the facility's 2003 Allocations, as determined pursuant to subdivision (e).~~ NOx Allocations for 2004, 2005, and 2006 and SOx Allocations for 2004 through 201~~1~~2 are equal to the facility's 2003 Allocation, as determined pursuant to subdivision (e). NOx RTC Allocations and holdings subsequent to the year 2006 and SOx Allocations and holdings subsequent to the year 201~~1~~2 shall be adjusted to the nearest pound as follows:

(A) The Executive Officer will adjust NOx RTC holdings, as of January 7, 2005 for compliance years 2007 and thereafter by multiplying the amount of RTC holdings by the following adjustment factors for the relevant compliance year, to obtain tradable/usable and non-tradable/non-usable holdings:

Compliance	Tradable/Usable NOx RTC Adjustment	Non-t~~T~~radable/ Non-u~~U~~sable NOx

Year	Factor	RTC Adjustment Factor
2007	0.883	0
2008	0.856	0.027
2009	0.829	0.054
2010	0.802	0.081
2011 and after	0.775	0.108

RTCs designated as non-tradable/non-usable pursuant to this subparagraph shall be held, but shall not be used or traded. The adjustment factors in this subparagraph are subject to change pursuant to paragraph (i)(5).

(B) Commencing on January 1, 2008 with NOx RTC prices averaged from January 1, 2007 through December 31, 2007, the Executive Officer will calculate the 12-month rolling average RTC price for all trades for the current compliance year. The Executive Officer will update the 12-month rolling average once per month. The computation of the rolling average prices will not include RTC transactions reported at no price or ~~and~~ RTC swap transactions.

(C) Notwithstanding the requirements of non-tradable/non-usable credits specified in subparagraph (f)(1)(A), in the event that the NOx RTC prices exceed $15,000 per ton based on the 12-month rolling average calculated pursuant to subparagraph (f)(1)(B), the Executive Officer will report to the Governing Board. If the Governing Board finds that the 12-month rolling average RTC price exceeds $15,000 per ton, then the incremental NOx reductions as specified in subparagraph (f)(1)(D) shall be converted to T~~t~~radable/U~~u~~sable NOx RTCs upon Governing Board concurrence. The Executive Officer's report to the Board will be made at a public hearing at the earliest possible regularly scheduled Board Meeting, but no more than 60 days from Executive Officer determination.

(D) The incremental NOx RTCs restored shall be the difference between the N~~n~~on-tradable/N~~n~~on-usable A~~a~~djustment F~~f~~actors, as specified in subparagraph (f)(1)(A), of the current compliance year and the most recent prior year the adjustment factor was implemented.

(E) RTC conversion pursuant to subparagraph (f)(1)(C) shall only

occur in the compliance year in which Cycle 1 facilities are operating.

(F) Notwithstanding the adjustment factors required pursuant to subparagraph (f)(1)(A), beginning with the following December and each year thereafter that the Governing Board finds the $15,000 per ton NOx RTC price is exceeded pursuant to subparagraph (f)(1)(C), the Executive Officer will publish the applicable adjustment factors for the next compliance year beginning January 1. The adjustment factors will be published at a public hearing during a regularly scheduled Board Meeting. The adjustment factors will be determined as follows:

(i) If the 12-month rolling average falls below $15,000 per ton for at least 6 consecutive months, then the emission adjustment factors for the following compliance year shall equal the next more stringent adjustment factors listed in subparagraph (f)(1)(A) than the factors currently in effect; otherwise;

(ii) The next compliance year adjustment factors shall equal the compliance year adjustment factors currently in place.

The Executive Officer need no longer comply with the annual public hearing requirement once the adjustment factors for the 2010 compliance year have been implemented for a 12-month period.

(G) The NOx RTC adjustment factors for compliance years 2008 through 2010 shall not be submitted for inclusion into the State Implementation Plan until the adjustments have been in effect for one full compliance year. The 2011 NOx RTC adjustment factors shall not be submitted for inclusion into the State Implementation Plan until 12-months after the adjustments have been in effect for one full compliance year.

(H) NOx Allocations for facilities that enter RECLAIM after January 7, 2005 for compliance years 2007 and after shall be determined by applying the Tradable/Usable and Non-t~~T~~radable/Non-u~~U~~sable NOx RTC Adjustment Factors under subparagraph (f)(1)(A) to the facility's Compliance Year 2006 Allocation.

(I) SOx RTC Holdings as of (*date of adoption*) for compliance years 2013~~2~~ and after shall be adjusted to achieve an overall reduction in the following amounts:

Compliance Year	Minimum emission reductions (lbs.)
~~2012~~	~~1,095,000~~
2013	2,190,000
2014	2,920,000 ~~3,285,000~~
2015	2,920,000 ~~3,518,600~~
2016	2,920,000 ~~3,752,200~~
2017	3,650,000 ~~3,985,800~~
2018	3,650,000 ~~4,219,400~~
2019 and after	4,161,000 ~~4,453,000~~

(J) The Executive Officer shall determine a Tradable/usable SOx RTC Adjustment Factor~~s~~ for each compliance year~~s~~ after 201~~2~~1~~1~~ as follows:

$$F_{\text{compliance year i}} = 1 - [X_i / (A_i + B_i + C_i)]$$

Where:

$F_{\text{compliance year i}}$ = Tradable/usable SOx RTC Adjustment Factor for compliance year i starting with 2013~~2~~

A_i = Total SOx RTCs for compliance year i held as of (rule adoption date) by all RTC holders, except those listed in Table 5

B_i = Total SOx RTCs for compliance year i credited to any facilities listed in Table 5 between August 29, 2009 and (rule adoption date), and not includes in C_i

C_i = Total SOx RTCs held as of (rule adoption date) by facilities listed in Table 5 for compliance year i in excess of ~~initial~~ allocations as determined pursuant to subdivision (e).

X_i = Amount to be reduced for compliance year i starting with 2013~~2~~ as listed in subparagraph (f)(1)(I).

(K) The Executive Officer shall determine Non-tradable/N~~n~~on-usable SOx RTC Adjustment Factors for ~~each~~ compliance years ~~after 2014~~ 2017 through 2019 as follows:

$$N_{\text{compliance year j}} = F_{\text{compliance year 2016}~~4~~} - F_{\text{compliance year j}}$$

Where:

$N_{\text{compliance year j}}$ = Non-tradable/N~~n~~on-usable SOx RTC Adjustment Factor for compliance year j

$F_{\text{compliance year j}}$ = Tradable/U~~u~~sable SOx RTC Adjustment

Factor for compliance year j as determined pursuant to subparagraph (f)(1)(J~~K~~)

j = 2017~~5~~ through 2019

$F_{\text{compliance year 2016}}$~~4~~ = Tradable/usable SOx RTC Adjustment Factor for compliance year 2016~~4~~ as determined pursuant to subparagraph (f)(1)(J~~K~~)

Non-tradable/N~~n~~on-usable SOx RTC Adjustment Factors for compliance years ~~2012,~~ 2013 through 2016, 2014, 2020, and all years after 2020 shall be 0.0.

(L) The Executive Officer shall adjust the SOx RTC holdings as of (*date of adoption*) for compliance years 2013~~2~~ and after as follows:

(i) Apply the Tradable/U~~u~~sable SOx RTC A~~a~~djustment F~~f~~actor ($F_{\text{compliance year i}}$) and Non-tradable/N~~n~~on-usable SOx RTC Adjustment Factor~~s~~ ($N_{\text{compliance year j}}$) for the corresponding compliance year as published under subparagraph (f)(1)(M) to SOx RTC holdings held by any RTC holder except those listed in Table 5;

(ii) Apply no adjustment to SOx RTC holdings that are held as of August 29~~.~~, 2009 by a facility listed in Table 5, and that are less than or equal to the facility's~~s~~ allocations as determined pursuant to subdivision (e), and that were not credited between August 29, 2009 and (rule adoption date);

(iii) Apply the Tradable/U~~u~~sable SOx RTC A~~a~~djustment F~~f~~actor ($F_{\text{compliance year i}}$) and Non-tradable/N~~n~~on-usable SOx RTC Adjustment Factor~~s~~ ($N_{\text{compliance year j}}$) for the corresponding compliance year as published under subparagraph (f)(1)(M) to any SOx RTC holding as of (rule adoption date), that is held by a facility that is listed in Table 5, and that is over the facility's ~~initial~~ allocation~~s~~ as determined pursuant to subdivision (e); and

(iv) Apply the Tradable/U~~u~~sable SOx RTC A~~a~~djustment F~~f~~actor ($F_{compliance\ year\ i}$) and Non-tradable/non-usable SOx RTC Adjustment Factor~~s~~ ($N_{compliance\ year\ j}$) for the corresponding compliance year as published under subparagraph (f)(1)(M) to any SOx RTC holding that was acquired between August 29, 2009 and (rule adoption date) by a facility that is listed in Table 5.

~~(v)~~ No SOx RTC holding shall be subject to the SOx RTC adjustments as published under subparagraph (f)(1)(M) more than once.

(M) The Executive Officer shall publish the SOx RTC Adjustment Factors determined according to subparagraphs (f)(1)(J) and (f)(1)(K) within 30 days after (*date of adoption*).

(N) Commencing on January 1, 2017~~5~~ and ending on February 1, 2020, the Executive Officer will calculate the 12-month rolling average SOx RTC price for all trades during the preceding 12 months for the current compliance year. The Executive Officer will update the 12-month rolling average once per month. The computation of the rolling average prices will not include RTC transactions reported at no price or ~~and as~~ RTC swap transactions.

(O) In the event that the SOx RTC prices exceed $50,000 per ton based on the 12-month rolling average calculated pursuant to subparagraph (f)(1)(N), the Executive Officer will report to the Governing Board at a duly noticed public hearing to be held no more than 60 days from Executive Officer determination. The Executive Officer will announce that determination on the SCAQMD website. At the public hearing, the Governing Board will decide whether or not to convert any portion of the Non-tradable/N~~n~~on-usable RTCs, as determined pursuant to subparagraphs (f)(1)(K) and (f)(1)(L), and how much to convert if any, to Tradable/U~~u~~sable RTCs. The portion of Non-tradable/N~~n~~on-usable RTCs available for conversion to Tradable/U~~u~~sable RTCs shall not include any portion of Non-tradable/N~~n~~on-usable RTCs that are designated for previous compliance years and has not already been converted by the Governing Board, or that has been otherwise included in the

State Implementation Plan pursuant to subparagraph (f)(1)(P).

(P) The Executive Officer will not submit the emission reductions obtained through subparagraph (f)(1)(I) for ~~commencing with~~ compliance years 2017~~5~~ ~~and~~ through 2019 for inclusion into the State Implementation Plan until the adjustments for the RTC Holdings have been in effect for one full compliance year.

(Q) SOx Allocations for compliance years 2013~~2~~ and after, for facilities that enter RECLAIM after *(date of adoption)* and for basic equipment listed in Table 4 shall be determined according to the BARCT level listed in Table 4 or the permitted emission limits, whichever is lower.

(R) By no later than July 1, 2012, SOx emissions at the exhaust of a Fluidized Catalytic Cracking Unit, as measured at the final stack venting gases originating from the facility's FCC Regenerator, including after the CO Boiler or any additional controls in the system following the regenerator (the final stack shall constitute the only exhaust gas compliance point within the FCCU facility), shall not exceed a concentration of 25 ppmv dry @ 0% oxygen on a 365-day rolling average. The numeric concentration-based limit does not apply during time periods in which SOx data are determined to be incorrect due to analyzer calibration or malfunction. For the purpose of demonstrating compliance with this limit, the operator of a FCCU shall commence the use of SOx reducing additives in the FCCU no later than July 1, 2011, unless the operator has an existing wet gas scrubber in operation at BARCT levels prior to (*date of adoption*) or can demonstrate to the Executive Officer that the FCCU will achieve this limit by using other control methods.

(2) New facilities initially totally permitted, on and after October 15, 1993, but prior to January 7, 2005, and entering the RECLAIM program after January 7, 2005 shall not have a rate of reduction until 2001. Reductions from 2001 to 2003, inclusive, shall be implemented pursuant to subdivision (e). New facilities initially totally permitted on or after January 7, 2005 using external offsets shall have a rate of reduction for such offsets pursuant to subparagraph (c)(5)(C). New facilities initially totally permitted on or after January 7, 2005 using RTCs shall have no rate of reduction for such RTCs, provided that

RTCs obtained have been adjusted according to paragraph (f)(1), as applicable. The Facility Permit for such facilities will require the Facility Permit holder to, at the commencement of each compliance year, hold RTCs equal to the amount of RTCs provided as offsets pursuant to Rule 2005.

(3) Increases to Allocations for permits issued for Clean Fuel adjustments pursuant to paragraph (c)(12), shall be added to each year's Allocation.

(g) High Employment/Low Emissions (HILO) Facility

The Executive Officer or designee will establish a HILO bank funded with the following maximum total annual emission Allocations:

(1) 91 tons per year of NO_X

(2) 91 tons per year of SO_X

(3) After January 1, 1997, new facilities may apply to the HILO bank in order to obtain non-tradable RTCs. Requests will be processed on a first-come, first-served basis, pending qualification.

(4) When credits are available, annual Allocations will be granted for the year of application and all subsequent years.

(5) HILO facilities receiving such Allocations from the HILO bank must verify their HILO status on an annual basis through their APEP report.

(6) Failure to qualify will result in all subsequent years' credits being returned to the HILO bank.

(7) Facilities failing to qualify for the HILO bank Allocations may reapply at any time during the next or subsequent compliance year when credits are available.

(h) Non-Tradable Allocation Credits

(1) Any existing RECLAIM facility with reported emissions pursuant to Rule 301 - Permit Fees, in either 1987, 1988, or 1993, greater than its starting Allocation, shall be assigned non-tradable credits for the first three years of the program which shall be determined according to the following methodology:

Non-tradable credit for NO_X and SO_X:

Year 1 = $(\Sigma [A \times B_1])$ - 1994 Allocation;

Where:

A = the throughput for each NO_X or SO_X source or process unit in the facility from the single maximum throughput year from 1987, 1988, or

1993; and

B_1	=	the applicable starting emission factor, as specified in Table 1 or Table 2.
Year 2	=	Year 1 non-tradable credits X 0.667
Year 3	=	Year 1 non-tradable credits X 0.333
Year 4 and subsequent years	=	Zero non-tradable credit.

(2) The use of non-tradable credits shall be subject to the following requirements:

(A) Non-tradable credits may only be used for an increase in throughput over that used to determine the facility's starting Allocation. Non-tradable credits may not be used for emissions increases associated with equipment modifications, change in feedstock or raw materials, or any other changes except increases in throughput. The Executive Officer or designee may impose Facility Permit conditions necessary to ensure compliance with this subparagraph.

(B) The use of activated non-tradable credits shall be subject to a non-tradable RTC mitigation fee, as specified in Rule 301 subdivision (n).

(C) In order to utilize non-tradable credits, the Facility Permit holder shall submit a request to the Executive Officer or designee in writing, including a demonstration that the use of the non-tradable credits complies with all requirements of this paragraph, pay any fees required pursuant to Rule 301 - Fees, and have received written approval from the Executive Officer or designee for their use. The Executive Officer or designee shall deny the request unless the Facility Permit holder demonstrates compliance with all requirements of this paragraph. The Executive Officer or designee shall, in writing, approve or deny the request within three business days of submittal of a complete request and notify the Facility Permit holder of the decision. If the request is denied, the Executive Officer or designee will refund the mitigation fee.

(D) In the event that a facility transfers any RTCs for the year in which non-tradable credits have been issued, the non-tradable credit Allocation shall be invalid, and is no longer available to the facility.

(i) RTC Reduction Exemption

(1) A facility may file an application for Executive Officer approval to be exempted from all or a portion of the requirements pursuant to subparagraph (f)(1)(A) with the exception of RTC holdings as of January 7, 2005 for compliance year 2007 and thereafter in excess of the initial allocation. For the purposes of this rule, initial allocation refers to the RTCs issued by the District to a facility upon entering the RECLAIM program. The application shall contain sufficient data to demonstrate to the satisfaction of the Executive Officer that the facility meets the following criteria:

(A) the facility has been in the program since the start of RECLAIM, or existed prior to 1994, but subsequently entered RECLAIM pursuant to Rule 2001 because facility emissions exceeded 4 tons per year;

(B) at least 99 percent of the facility's emissions reported for the most recent completed compliance year prior to the date of filing an application is from equipment not listed in Table 3 and the achieved emission rates for each and every piece of equipment at the facility is less than or equal to the 2000 (Tier I) Ending Emission Factor listed in Table 1 or the emission factor listed in Table 3, whichever is lower, for the corresponding equipment type;

(C) RTCs that were part of the total initial allocation for the facility have never been transferred or sold by the facility for year 2007 or later compliance years; and

(D) the cumulative NOx compliance costs incurred by the facility up to the submittal date of the application as specified in paragraph (i)(3) to comply with the RECLAIM Allocation as required under Rule 2004(b) and (d)(1) exceed the compliance costs that otherwise would have occurred to meet and maintain emission limits specified in Table 1 for each and every piece of equipment at the facility. The compliance costs shall be based on the following parameters:

(i) cost of controlling emissions using the parameters and procedures for determining total direct and indirect capital investment and total annual costs as specified in the most recent edition of the Control Cost Manual published by the U.S. EPA Office of Air Quality and Planning Standards, excluding control costs for any equipment listed in Table 3, if any;

(ii) realized and anticipated revenues and expenditures of the Facility Permit holder resulting from buying and selling any RTCs that are or were held by the facility where the contract of sale or purchase was executed prior to the date of application for exemption pursuant to paragraph (i)(1);

(iii) costs associated with compliance with the New Source Review provisions of Rule 2005, Rule 2012(c), or other applicable state or federal requirements shall not be included;

(iv) costs that result only in improving process efficiency or product quality, costs of projects that were initiated before the date the facility was subject to RECLAIM requirements, or legal costs or any other costs that do not directly reduce NOx emissions shall not be included; and

(v) any cost savings that resulted in implementing any NOx emissions strategy, such as fuel savings, increased production or sale; or

(2) A facility may file an application for Executive Officer approval to be exempted from all or a portion of the requirements pursuant to subparagraph (f)(1)(A) for the initial allocations portion of a facility's RTC holdings provided that the facility meets all of the following:

(A) The facility's starting and year 2000 Allocations were calculated using the same emission factors that are equal to or lower than the 2000 (Tier 1) emission factors listed in Table 1;

(B) Emission rate achieved for each source at the facility is less than or equal to the emission factors listed in Table 3 for the corresponding equipment type; and

(C) RTCs for 2007 or later compliance years for the facility have never been transferred or sold.

(3) A facility shall submit the applications specified pursuant to paragraphs

(i)(1) or (i)(2) no later than July 7, 2005 or between January 1 and March 31, 2006, pay the appropriate evaluation fee pursuant to Rule 306, and accept enforceable permit conditions to ensure compliance with the provisions of this subdivision, in order for the Executive Officer to approve the exemption. If approved, the facility's initial RTC allocation shall be designated as non-tradable and additional RTCs purchased above the initial allocation shall be subject to the RTC adjustments specified in subparagraph (f)(1)(A), as appropriate. The Executive Officer shall deny an application that is not filed within the time periods specified in this paragraph, lacks any information specified under paragraph (i)(7), or fails to demonstrate that it meets the requirements in paragraphs (i)(1) or (i)(2).

(4) Upon approval the exemption shall:

(A) be limited to the adjustment factors specified in subparagraph (f)(1)(A);

(B) begin the next compliance year following the exemption approval; and

(C) not apply to reductions resulting from future periodic BARCT review.

(5) RTC adjustments exempted pursuant to this subdivision shall be distributed proportionally among the remainder of the RTC holders and implemented two years from the compliance year of the applicable exemption and are subject to applicable paragraph (f)(1) provisions. Public notification of the distributed reductions shall occur at least one year prior to implementation.

(6) A Facility Permit holder has the right to appeal the denial of the exemption application to the Hearing Board in the same manner as a permit denial as specified in Health and Safety Code Section 42302.

(7) An application submitted to request an exemption from the RTCs reduction pursuant to paragraphs (i)(1) or (i)(2) shall include the following information.

(A) Detailed description of each project and itemized listing of how it relates to meeting the RECLAIM reduction requirements;

(B) Date of start and completion of each project listed in (A);

(C) Detailed calculations or emissions data demonstrating NOx emission reductions resulting from each project or combination of projects directly resulting in reductions. The emission levels achieved shall be based on actual CEMS data or source tests results;

(D) Itemized revenue and expenditures for each RTC trading activity since participation in the RECLAIM program;

(E) Itemized costs for each project and corresponding receipts or other equivalent documentation as approved by the Executive Officer for such expenditures; and

(F) Cost savings resulting from each project(s) (e.g. fuel savings, improved productivity, increased sales, etc.) and documentation of the values of such savings.

(8) A facility qualifying for exemption shall report as part of its Annual Permit Emission Program (APEP) report, submitted pursuant to Rule 2004(b)(4), whether or not emissions from equipment listed in Table 3, if any, remain less than or equal to 1 percent of the total facility emissions on an annual basis for the duration of the exemption. If the emissions exceed 1 percent, the facility shall be in violation of the rule for each and every day of the compliance year and the Executive Officer shall reduce the facility's initial allocation for the next compliance year to the emissions level specified for that year pursuant to subparagraph (f)(1)(A).

(9) A facility applying for exemption shall have 1 percent of its initial allocations subject to the requirements pursuant to subparagraph (f)(1)(A).

(10) Non-tradable RTC allocations designated pursuant to paragraph (i)(3) shall become tradable in the event the facility permanently ceases to operate.

ADDENDUM TO THE FINAL STAFF REPORT
Amend Rule 2002 – Allocations for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx)

Revised Staff Proposal

Subsequent to the completion of the attached staff report and Program Environmental Assessment and in our effort to resolve pending issues, staff is proposing the following minor revisions to its proposal.

Staff recommends that the compliance margin in the shave methodology for the proposed SOx RECLAIM amendment be raised from 10 to 18.5 percent. This change approximates the effective average compliance margin between RTC holdings and actual emissions in 2005 and 2008 and more accurately reflects the challenges facing a relatively smaller and less robust market. As a result of this change, the proposed SOx shave will change from 55 to 51.4 percent and the total SOx RTC reduction will be 5.7 tons per day (4,161,000 lbs/year). Staff is also proposing the consolidation of the eight-year-long implementation into four phases as follows:

	Compliance Year	RTC Reductions (tons/day)
Phase 1	2013	3.0
Phase 2	2014	4.0
Phase 3	2017	5.0
Phase 4	2019 and after	5.7

To ensure that SOx reductions are achieved early at the initial stages of rule implementation, staff is proposing the use of SOx additives beginning July 1, 2011 (alternative controls allowed).

CEQA evaluation of the Revised Staff Proposal

Staff has reviewed the recommended modifications to the proposed project identified above and concluded that the modifications are within the scope of the CEQA analysis for the proposed project and project alternatives in the Final Program Environmental Assessment (PEA). Specifically, the environmental impacts associated with the modifications to the proposed project are within the scope of what was analyzed for the proposed project under both Option 1 and Option 2. In addition, the emission reductions and environmental impacts

associated with the modifications to the proposed project are within the scope of what was analyzed for the proposed project and the alternatives. For these reasons, the modifications to the proposed project do not alter any of the conclusions reached in the Final PEA, nor provide new information of substantial importance relative to the environmental analysis since the release of the Draft PEA for public review and comment. Based on staff's review of the the proposed modifications, recirculation of the CEQA document pursuant to CEQA Guidelines §15088.5 is not required because the modifications do not constitute significant new information, which is defined as follows:

(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.

(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.

(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.

(4) The draft CEQA document was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

William Wong, Principal Deputy District Counsel

Note that on October 26, 2010, staff revised its proposal to 5.7 tons per day RTC reductions (51.4% shave) distributed in four phases in eight years from 2013-2019 and after. Since the actual emission reductions estimated pursuant to BARCT remain unchanged at 5.4 tons per day, there is no need to update this final staff report to include this minor change.

TABLE OF CONTENTS

Table of Contents

Executive Summary

RECLAIM Program & Best Available Retrofit Control Technology

On October 15, 1993, the District's Governing Board adopted Regulation XX - Regional Clean Air Incentives Market (RECLAIM) and established a declining cap and trade mechanism to reduce NOx and SOx emissions from the largest stationary sources in the South Coast Air Basin (Basin). Regulation XX is comprised of 11 rules that specify the rules applicability, NOx and SOx facility allocations, general requirements, as well as monitoring, reporting, and recordkeeping requirements for NOx and SOx sources located at RECLAIM facilities. The RECLAIM program started with 41 SOx facilities and 392 NOx facilities. By the end of 2005 compliance year, the program included 33 SOx facilities and 304 NOx facilities. By the end of 2008, the SOx facilities reduced to 32 facilities.

Under the SOx RECLAIM program, the RECLAIM facilities are issued SOx annual allocations (also known as facility caps), which decline annually from 1993 until 2003 and remain constant after 2003. The annual allocations issued to the RECLAIM facilities reflect the levels of Best Available Retrofit Control Technology (BARCT) envisioned to be in place at the RECLAIM facilities, and were the results of a BARCT analysis in 15 years, conducted in 1993. Since 1993, the District conducted one BARCT reassessment for NOx in 2005, and has not yet conducted a BARCT reassessment for SOx. Under the RECLAIM program, the facilities have the flexibility to install air pollution control equipment, change method of operations, or purchase RECLAIM Trading Credits (RTCs) to meet the BARCT levels.

AQMD staff is proposing amendments to Regulation XX – RECLAIM to achieve additional SOx reductions pursuant to the 2007 AQMP Control Measure CMB-02. The proposed amendments address requirements for BARCT in accordance with California Health and Safety (H&S) Code §40440, which is applicable to market-based incentive programs, as well as equivalency to command-and-control regulations, as required under H&S Code § 39616(c)(1). Reductions in SOx will help the Basin attain the federal annual average PM2.5 standard by 2015, and the federal 24-hour average standard by 2020. Other proposed rule amendments include clarifications and changes to the protocols.

PM2.5 Implementation Rule

In March 2007, the U.S. Environmental Protection Agency (EPA) issued a final rule, known as the *Clean Air Fine Particle Implementation Rule*, which requires non-attainment areas such as the South Coast Air Basin to meet the fine particulate ($PM_{2.5}$) standards by 2010. The *Clean Air Fine Particle Implementation Rule* requires the District to achieve the fine particulate standards as expeditiously as possible, and allows the District a one-time extension up to five years but no later than 2015. The rule requires the District to evaluate and employ all control measures to reduce the direct $PM_{2.5}$ emissions, as well as the emissions from $PM_{2.5}$ precursors, specifically sulfur dioxide (SO_2), and the most potent $PM_{2.5}$ precursors.

2007 Control Measure CMB-02 - Further SOx Reduction for RECLAIM (SOx)

To establish the basis for future compliance with the final U.S. EPA rule, staff has developed the 2007 Air Quality Management Plan (AQMP) Control Measure CMB-02 – Further SOx Reduction for RECLAIM (SOx) adopted by the Governing Board in July 2007. This control measure proposed to further reduce SOx allocations by approximately 3 tons per day in 2011-2014 to help the basin achieve the PM2.5 standards by 2014 and also stated that staff may need to incorporate the concept of facility modernization as described under Control Measure MCS-01 - Facility Modernization to achieve additional reductions beyond 2014 to meet the 2020 24-hour standard.

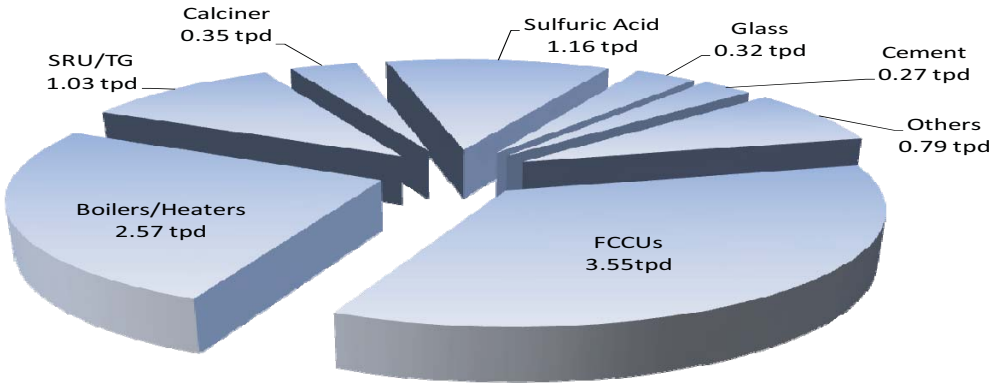
RTC Holdings, 2005 Emissions Distribution & BARCT Area of Focus

In 1993, the District issued a total of 12 tons per day of SOx allocations for the 2003 compliance year and beyond for the facilities in SOx RECLAIM. This is also the 2002 baseline for RECLAIM facilities used in the 2007 Air Quality Management Plan. It should be noted that the SOx RECLAIM emissions and RTC market are not distributed uniformly: In 2005, the SOx RECLAIM facilities emitted a total of 10.04 tons per day emissions.; more than 92% of the emissions was generated by the top 11 facilities; and in these 11 facilities, the top 7 source categories listed below were responsible for 80% of the facility emissions.

- Fluid catalytic cracking units;
- Sulfur recovery and tail gas treatment units;
- Boilers and heaters using refinery gas;
- Sulfuric acid manufacturing plants;
- Container glass melting furnace;
- Coke calciner;
- Cement kilns and a coal steam boiler at a cement manufacturing facility.

These top emitters emitted approximately 7.53 tons per day in 2005 and are the focus for BARCT evaluations in this proposed rule amendment. The remaining facilities either do not have any equipment subject to proposed new BARCT, or their facility emissions are too low to make BARCT cost-effective. Figure EX-1 presents the 2005 emissions distribution, and Figure EX-2 presents a comparison for RTC Holdings and emissions between the top 11 facilities and the remaining 21 active facilities in SOx RECLAIM universe.

FIGURE EX-1
2005 Emissions Distribution



Total 32 active facilities = 10.04 tons per day audited emissions.
Top 11 facilities. Top 7 sources.

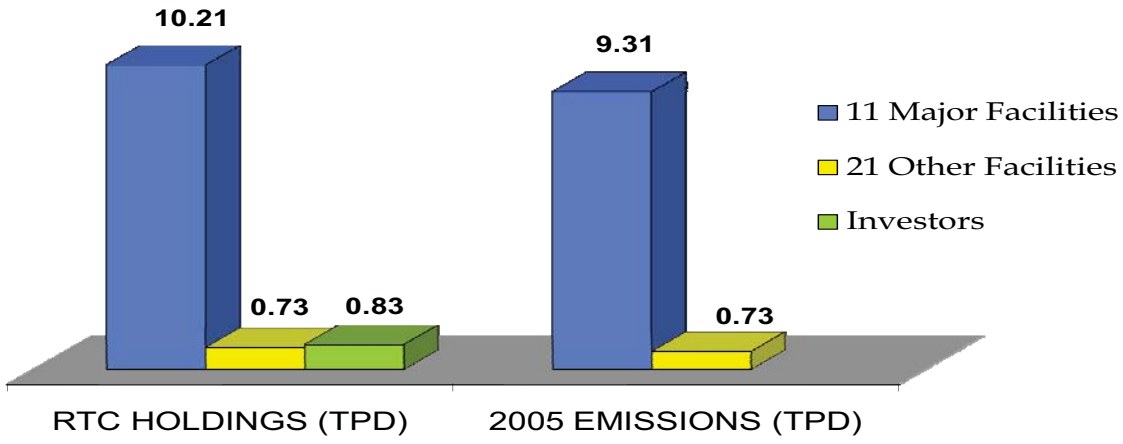
Distributions of RTC Holdings versus 2005 Emissions



1

Public Process

The public process of the PAR XX is summarized in Table EX-1. In 2008, staff formed the RECLAIM Working Group that included members representing SOx RECLAIM facilities, the Western States Petroleum Association (WSPA), the environmental community, as well as CARB and U.S. EPA to discuss and brainstorm the proposed amended SOx RECLAIM. The first meeting was conducted on February 7, 2008.

On April 3, 2008, staff released the first Preliminary Draft Staff Report, and conducted two Working Group meetings on April 3 and April 30, 2008 to discuss staff's initial proposal including allocations, emissions inventory and distribution, and potential BARCT for seven (7) major emitting categories of stationary source equipment located at the eleven (11) major SOx RECLAIM facilities.

In May 2008, staff, WSPA and the refineries worked in collaboration to develop a Request for Proposal (RFP) to solicit expert consultants to conduct independent studies on feasibility and cost effectiveness. Additional working group meetings were held on May 15, May 28, and July 2 to discuss the Request for Proposal. On July 11, 2008, the Governing Board approved the release of the RFP and staff conducted a Bidder's Conference immediately after. A public notice advertising the RFP and inviting bids was published in accordance with AQMD's Procurement Policy and Procedure. The District's procurement office received and accepted a total of six (6) proposals.

Staff formed an evaluation panel in August 2008 to evaluate the potential contractors. The four member evaluation panel consisted of one AQMD Assistant Deputy Executive Officer from Planning, Rule Development, and Area Sources Division; one AQMD Program Supervisor of the Best Available Control Technology team; one AQMD Program Supervisor of the Refinery Team; and one representative from WSPA. Staff invited one representative from the environmental group and two representatives from the U.S. EPA; however, they could not participate in this evaluation process due to schedule conflicts.

The panel was in agreement that the contractors possessed good qualifications, presented good approaches and had workable schedules. After serious consideration, the panel recommended the Governing Board award the contracts to:

— ETS, Inc. in the amount not to exceed $289,360 to conduct analyses for refinery Fluid Catalytic Cracking Units (FCCUs), boilers/heaters, and sulfur recovery units and tail gas treatment units (SRU/TGTUs); and

— NEXIDEA Inc. in the amount not to exceed $45,500 to conduct analyses for sulfuric acid manufacturing facility and a coke calciner facility.

The panel recommendation was approved by the Governing Board in a public meeting on September 5, 2008. The two consulting firms started the projects immediately after receiving the awards. First, the consultants and staff scheduled and conducted site visits at BP, Chevron, ConocoPhillips, Tesoro, Valero, ExxonMobil, California Portland Cement, Owens Brockway, and Rhodia in September and October 2008. During these site visits, the consultants gathered all necessary technical information on equipment and operating conditions, discussed operational characteristics of the equipment with the facilities, observed the physical layout of the

equipment, as well as listened to any concerns or foreseen constraints provided by the refinery technical experts related to future prospective add-on control devices.

After the site visits, the consultants conducted their own independent research, contacted the control manufacturers and vendors, gathered cost information, and performed their own independent engineering analyses on commercially available control technologies and cost effectiveness. In October 2008, the consultants developed the draft reports which were distributed to the affected facilities and AQMD staff for comments. After addressing all comments received from the facilities, as well as AQMD staff, the consultants finalized their analyses and reports for coke calciner, cement kilns, coal fired boiler, glass furnaces, and sulfuric acid plants on December 16, 2008 as planned in the contracts.

Because of the complexity associated with the refinery systems, the analyses related to FCCUs, SRU/tail gas, and fuel gas treatment could not be completed in December 2008. The contractors and staff scheduled another round of extensive site visits at all six refineries in January and February 2009. The consultants' draft analyses were provided to the refineries a total of four times (October 2008, January, February and March 2009) for comments. The primary consultant, ETS, Inc., and the subcontractor, AEC Engineering, addressed substantial amount of comments received from all six refineries, revised their reports appropriately, and finalized their assessment for the refineries in April 2009. The non-confidential reports from NEXIDEA, ETS and AEC Engineering are available for public information.

In 2009, staff reconvened the Working Group meetings. A Public Workshop was conducted on June 23, 2009, and in this workshop, staff released 1) the Draft Staff Report to discuss BARCT, cost effectiveness, RTC reduction methodology, and timing of the proposed rule implementation; 2) Notice of Preparation of the Draft Environmental Assessment; and 3) the Draft PAR XX. In addition, staff conducted numerous meetings with WSPA and WSPA members, and other affected facilities as requested. Two Working Group meetings were held on August 27 and December 15, 2009.

At the January 8, 2010 Governing Board Meeting, staff conducted an Informational Hearing to inform the Governing Board and the public about the development of PAR XX, the main issues associated with the proposed amended rule, and proposed a Work Plan for 2010 which was developed in collaboration with WSPA and provided a roadmap towards resolving pending issues. To address concerns by WSPA relative to the feasibility and cost analyses conducted by ETS/AEC and NEXIDEA in 2008-2009, the Governing Board approved in January 2010 the hiring of a second consultant to provide an independent review of the analyses previously conducted. To fulfill that commitment, staff hired Norton Engineering Inc. (NEC) to review ETS, Inc. and NEXIDEA's feasibility and costs analyses. NEC was the next highest ranked consultants from the six initially reviewed, and the highest ranked by WSPA. NEC and staff visited the refineries in March/April, and NEC completed its review and issued a final report on June 15. Between April to June, staff met with WSPA and the refineries numerous times to discuss RTC shave methodologies, costs, and estimate impacts to the refineries.

On August 18, 2010, staff released its Draft CEQA document concurrently with the second Refinery Committee Meeting addressing SOx RECLAIM. Staff also conducted a Public Working Group Meeting and a Public Consultation Meeting on September 8, 2010. Staff's revised estimates for BARCT reductions at this time were 5.4 tpd emission reductions from 2005 baseline, 6.1 tpd RTC reductions from 2012 – 2019 amounting to a 55% RTC shave. The

estimated total costs are $630 - $745 millions, and cost effectiveness of about $16 K - $19 K per ton SOx reduced.

In staff's current proposal, several significant changes have been made as follows: 1) exclusion of emission reductions of 0.85 tpd estimated from boilers/heaters since the proposed BARCT limit was unchanged from the previous BARCT level of 40 ppmv; 2) use of audited emissions in the analysis for RTC shave, and 3) extension of the compliance period to 2019 instead of 2017 as previously proposed, and 4) accounting for growth in emissions as was done in the 2005 BARCT reassessment under NOx RECLAIM.

The proposed amendments to SOx RECLAIM have been scheduled to be presented to the Governing Board for consideration at the November 5, 2010 Governing Board Meeting.

TABLE EX-1
Summary of the rule development process for Proposed Amended Regulation XX

Calendar Year 2008	
January 02, 2008	RECLAIM Working Group was formed
February 07, 2008	Public Consultation Meeting was conducted
April 03, 2008 April 30, 2008	Preliminary Draft Staff Report was released. Two Working Group Meetings were conducted.
May 1, May 15, May 28, June 20, July 02, 2008	Request for Proposal to seek expert consultants was drafted and discussed with the RECLAIM Working Groups on three Working Group Meetings from May to July. A Stationary Committee Meeting was also conducted on June 20.
July 11, 2008 July 16, 2008	RFP was presented to the Governing Board, and received Governing Board's approval to release on July 11. A Bidder Conference was conducted on July 16
August 1, 2008 August 30, 2008	Staff formed a task force to evaluate the six proposals received & make recommendation to the Governing Board
September 5, 2008	Staff presented the recommendation of consultants to the Governing Board and received an approval to hire ETS, Inc. and NEXIDEA
September 15, 2008 October 15, 2008	The consultants visited the facilities and conducted their feasibility and cost analyses, and the draft analyses were released to the facilities for comments.
December 16, 2008	NEXIDEA finalized the analyses for coke calciner and sulfuric acid plants. ETS Inc. finalized the analyses for glass and cement facilities.
Calendar Year 2009	
January – April 20, 2009	ETS Inc., their subcontractors, and staff conducted a second visit to all refineries. ETS, Inc. released their draft analyses three additional times to the refineries for comments and finalized their analyses on April 20, 2009.

TABLE EX-1 (Cont.)

June 23, 2009 (Public Workshop and CEQA Scoping Meeting)	Staff conducted a Public Workshop and CEQA Scoping Meeting. At this stage, staff proposed about 7 tpd RTC reduction from 2012-2017 with a total costs (present worth value for 25 years) estimated to be $883 - $944 million dollars and a weighted average cost effectiveness of about $16 K per ton SOx reduced. Staff released the draft staff report, Notice of Preparation for Environmental Assessment, and draft rule.
June 19, 2009 November 20, 2009	Two Stationary Committee Meetings were conducted in 2009. In addition, from March – December, staff conducted several meetings with WSPA and the refineries to discuss issues related to costs, baseline and RTC shave methodologies.
December 11, 2009 December 15, 2009	The Governing Board established a Refinery Committee Group and conducted the first Refinery Committee Meeting on December 11 and a WGM on December 15. At this stage, staff's estimates were 6.2 tpd emission reductions from 2005 baseline, 7.5 tpd RTC reduction, 64% - 67.5% RTC shave, total estimated costs of $745 million, and cost effectiveness of about $13 K per ton SOx reduced.
Calendar Year 2010	
January 08, 2010 (Informational Hearing)	Staff conducted an "Informa~~l~~tional Hearing" to inform the Governing Board and the public about the development of PAR XX, the main issues associated with PAR XX, and a proposed Work Plan for 2010.
March 10, 2010 – June 15, 2010	As called for under the Work Plan and approved by the Governing Board, staff hired a Norton Engineering Inc. (NEC) to review ETS, Inc. and NEXIDEA's feasibility and costs analyses. NEC and staff visited the refineries in March/April, and NEC completed its review and issued a final report on June 15. In April – June, staff also met with WSPA and the refineries numerous times to discuss RTC shave methodologies and costs, costs and cost-effectiveness analyses. In addition, staff contacted the California Department of Water Resources and other water purveyors to discuss about the water impacts of the proposal, current and potential future regulations related to water usage in California.
August 18, 2010	Draft CEQA document was released and staff conducted a second Refinery Committee Meeting. Staff's revised estimates were 5.4 tpd emission reductions from 2005 baseline, 6.1 tpd RTC reduction from 2012 - 2019, 55% RTC shave, total estimated costs of $630 - 745 million, and cost effectiveness of about $16 K - $19 K/ton. Staff excluded the emission reductions of 0.85 tpd estimated from boilers/heaters, used audited emissions in the analysis for RTC shave, extended the compliance period to 2019 and accounted for growth.

TABLE EX-1 (Cont.)

September 8, 22, and 24, 2010	Staff reconvened the WGM & conducted a Public Consultation Meeting on September 8, a RCM on September 22, and a SSC Meeting on September 24, 2010.
October 1, 2010 October 14, 2010	Set Hearing for PAR XX was conducted on October 1st, 2010- Revised Draft Staff Report and Socioeconomic Analysis were released for 30-day public review. RCM was conducted on October 14. On October 26, staff revised its proposal to 5.7 tpd RTC reduction (51.4% shave) in 4 phases: 3 tpd in CY 2013, 4 tpd in CY 2014, 5 tpd in CY 2017, and 5.7 tpd in CY 2019.
November 5, 2010	A Governing Board Hearing is planned for November 5, 2010.

Current Staff Proposal for BARCT and SOx RTC Reductions

To estimate SOx RTC reductions, staff used the RTC reduction methodology first developed in the 2005 NOx RECLAIM rule amendment. In this methodology, the base year inventory (i.e., 1997) was selected. Associated growth factors were used to project the 1997 audited emissions to year 2019. BARCT adjustment was then applied to the projected 2019 inventory to calculate the remaining emissions at BARCT levels. Staff then applied a 10% adjustment (increase) to the remaining emissions to account for inaccessible RTCs due to imperfect market conditions and RTCs held by facilities to ensure compliance with annual audits. The proposed project results in 5.4 tons per day emission reductions from the 2005 baseline. This is equivalent to 6.1 tons per day RTC reduction, approximately 55% reductions of RTC's holdings of 11.09 tons per day by 2019.[1]

In staff's current proposal shown in Table EX-2, staff made the following changes:

- Staff removed emission reductions estimated for boilers/heaters. Since the proposed BARCT limit is retained at 40 ppmv for boilers/heaters, any reductions estimated for boilers/heaters from the 2005 baseline are considered as "opportunity reductions" that the facilities may select to implement, but not as reductions due to new BARCT.

- Staff used 1997 audited emissions instead of reported emissions to estimate RTC shave,

- Staff provided additional 2 years for implementing the RTC reductions as requested by several RECLAIM facilities, and extended the implementation period to 2019 and incorporated growth factor adjustments to reflect the extension period.

[1] Based on RTC records as of August 29, 2009

TABLE EX-2
Staff's Proposal

	2014	2017	2019
Original Proposal in January 2010	RTC reduction = 4.5 tpd RTC Shave = 41%	RTC reduction = 7.5 tpd RTC Shave = 67.5%	
Current Proposal	RTC reduction = 4.5 tpd RTC Shave = 41%		RTC reduction = 6.1 tpd RTC Shave = 55%

Note: Percentage shave is calculated using RTC holdings of 11.09 tons per day for major emitters and investors. Current unused RTCs based on 2008 emissions = 11.77-9.22=2.55 tpd (22% of 11.09 tons per day)

Table EX-3 shows the new proposed BARCT levels, Tier I current BARCT levels, the percent reduction from Tier I and the estimated cost effectiveness for each of the seven (7) categories of sources located at the eleven (11) major facilities:

TABLE EX-3
Proposed New BARCT Levels

	Tier I (1993 Projected BARCT for Year 2000)	New BARCT	Emission Reductions from 2005	% Reduction from Tier I	Cost Effectiveness (note 1)
FCCUs	13.7 lbs/Mbarrels	5 ppmv 3.25 lbs/Mbarrels	2.88 tons/day	76%	$20K - $21K per ton
SRU/TGs	Reported Value Avg 9.03 lbs/hour	5 ppmv 5.28 lbs/hour (note 2)	0.73 tons/day	42%	31K - $45K per ton
Boilers & Heaters	6.76 lbs/mmscft	40ppmv 6.76 lbs/mmscft	0.00 tons/day	0%	Not Applicable
Sulfuric Acid	Reported Value Avg 5.08 lbs/hour	10 ppmv 0.14 lbs/hour	1.03 tons/day	97%	$2K - $3K per ton
Coke Calciner	Reported Value Avg 2.47 lbs/ton coke	10 ppmv 0.11 lbs/ton coke	0.28 tons/day	96%	$10K - $23K per ton
Container Glass	Reported Value Avg 2.51 lbs/ton	5 ppmv 0.03 lbs/ton	0.19 tons/day	99%	$5K per ton
Cement Kilns	Reported Value Avg 0.05 lbs/ton	5 ppmv 0.04 lbs/ton	0.25 tons/day	20%	$19K - $27K per ton
Coal Fired Boilers	Reported Value	95% reduction	0 tons/day **	95%	$4 K per ton

Note: 1) The first figure of the range reflects the cost effectiveness estimated based on ETS/AEC/NEXIDEA analyses, and the second figure reflects the cost effectiveness estimated based on input provided by Norton Engineering. ** Equipment not in operation in 2005. 2) 5 ppmv is for combusted tail gas.

The net facility investment for BARCT was estimated to be $630 million - 745 million dollars. The weighted average cost effectiveness was about $16 K - $19K per ton SOx reduced, with a range from $2K to $50K per ton SOx reduced. Figure EX-3 presents the emission reductions estimated from the 2005 baseline. Figure EX-4 presents the estimated costs (the present worth

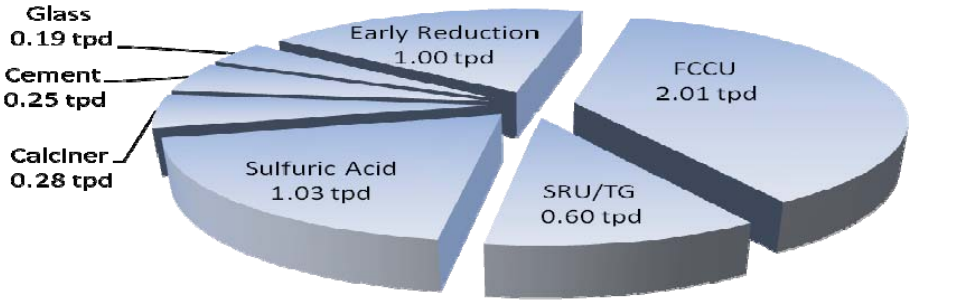
values for 25 years) based on the first set of consultants' (ETS/AEC and NEXIDEA) estimates. The second consultants estimated the costs of about $750 million dollars for the proposed projects.

The revised 6.1 tpd RTC reductions would be implemented over eight (8)years:

- 1.5 tons per day of reductions in compliance year 2012
- 1.5 tons per day of reductions in compliance year 2013
- 1.5 tons per day of reductions in compliance year 2014
- 0.32 tons per day of reductions in compliance year 2015
- 0.32 tons per day of reductions in compliance year 2016
- 0.32 tons per day of reductions in compliance year 2017
- 0.32 tons per day of reductions in compliance year 2018
- 0.32 tons per day of reductions in compliance year 2019

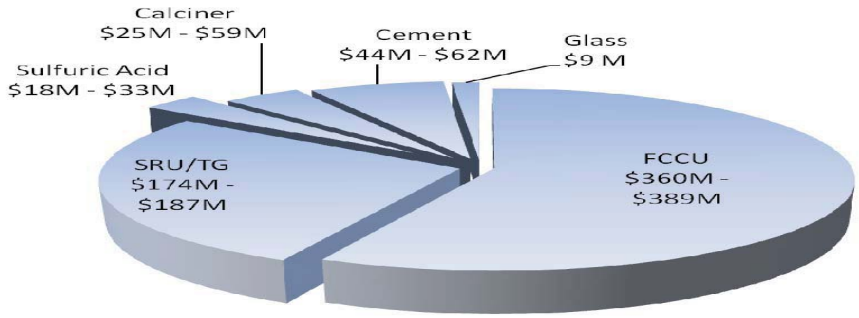
Staff proposed to submit the first 4.5 tons per day RTC reductions to EPA to satisfy the SIP commitment and help the Basin meets the standard in 2015. The remaining reductions would be submitted at a later phase.

FIGURE EX-3
Emission Reduction (Tons per Day) from 2005 Baseline



Total Emission Reductions from 2005 Baseline = 5.36 tons per day

FIGURE EX-4
Present Worth Values for 25 years (Million Dollars) Based on ETS/AEC, NEXIDEA's and Norton Engineering Estimates (Excluding Cost-Ineffective Controls of >$50 K per Ton)

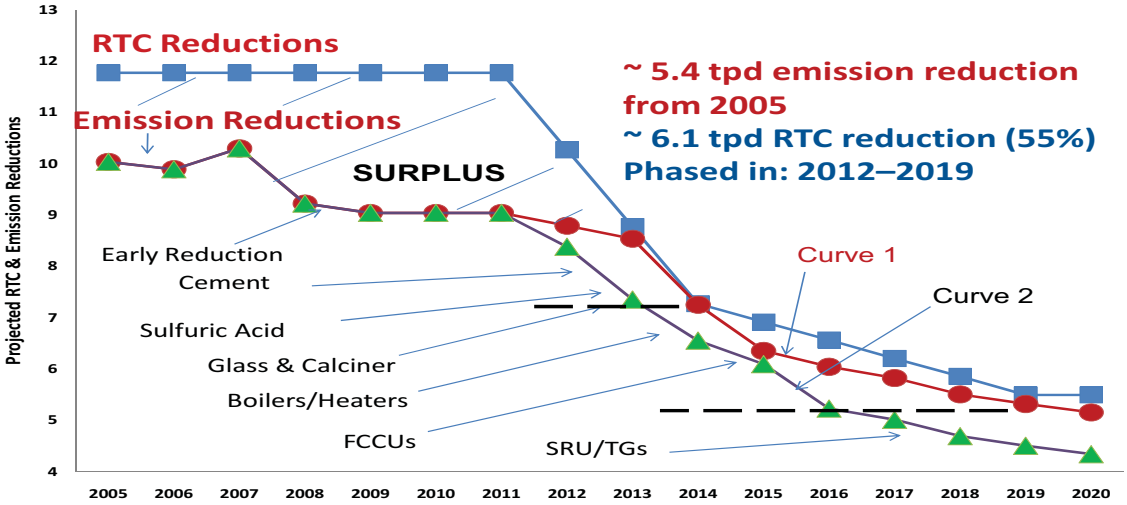


SOx RECLAIM project = $630 M - $738 M, 5.4 tpd emission reductions, cost effectiveness = $16 K - $19K per ton. Refinery sector = $561 M - $638 M, 3.9 tpd emission reductions.

Figure EX-5 shows the RTC reductions as proposed by staff. Figure EX-5 also shows the reported emissions from 2005 – 2008 and the amount of unused RTCs available in the market. In Figure EX-5, Curve 1 and Curve 2 represent two hypothetical but realistic emission reduction scenarios that use cost effectiveness as the key variable to phase-in source category compliance in future years. In Curve 1, it is assumed that BARCT would be implemented for cement, sulfuric acid, glass, and calciner by year 2014, and BARCT for FCCUs and SRU/TGs would be implemented after 2014. In Curve 2, it is assumed that RECLAIM facilities would implement voluntarily the cost-effective control measures identified by the consultants for boilers/heaters to meet the Tier 1 BARCT. The first dashed line in Figure EX-5 shows that because there is ample amount of RTCs currently available in the market comprised of unused RTCs (2.55 tpd) in the market, early reductions achieved at two refineries (1 tpd), and reductions from currently not operative cement kilns (0.25 tpd), the RECLAIM facilities will be in compliance with the proposed shave in 2014 without significant expenditures on BARCT for major equipment such as FCCUs and SRU/TGs. Implementing BARCT for FCCUs and SRU/TGs will likely take place after 2014 to meet the target of 2019. However, careful evaluation of the second dashed line in Figure EX-5 intersects with Curve 2 suggests that in perfectly operating market, many of the estimated expenditures for FCCU's and SRU/TG's controls may not be necessary after all.

The draft CEQA analysis for this proposed rule amendment was released on August 18, 2010. The draft socioeconomic analysis was released with this revised draft staff report. The draft rule language for the proposed Rule 2002 is attached with this revised draft staff report. Rule development is ongoing and staff is committed to working with all stakeholders throughout the process.

FIGURE EX-5 [2]
Staff's Proposal and Potential Compliance Scenarios



Emissions - Curve 1: BARCT for staff proposal. Curve 2: Additional opportunity for reductions from boilers/heaters

[2] The assumptions used in Figure EX-5 are as follows: 1) early implementation occurred in 2008-2009; 2) In late 2009, CPCC announced the shutdown of the cement kilns, which may or may not be permanent, and to the extent that when the economy improves, they plan to bring the cement kiln on-line. An assumption was made that either CPCC would sell their unused RTCs in 2013 or installed control equipment to achieve emission reductions; 3) Controls for sulfuric acid will be implemented in 2013, for glass and calciner in 2014, for FCCUs and SRUs in 2015 – 2020; and 4) any opportunity reduction from boilers/heaters will be implemented in 2012-2015.

Key Issues Raised by WSPA at the Refinery Committee Meeting on October 14, 2010

Staff's original proposal presented to the Governing Board on January 8, 2010 was:

- 4.5 tpd RTC reductions by 2014 (41% shave), and
- 7.5 tpd RTC reductions by 2017 (67.5% shave)

After numerous meetings with WSPA, in August, staff revised its proposal to:

- 4.5 tpd RTC reductions by 2014 (41% shave), and
- 6.1 tpd RTC reductions by 2019 (55% shave)

WSPA indicated that it would cost the refineries $2.85 billion to comply with 60% shave. WSPA hired a consultant firm (ENVIRON) to collect data from the refineries and perform analysis with the results aggregated and de-identified. In the August 18, 2010 Refinery Committee Meeting, the members of the Governing Board directed staff to analyze the costs provided by WSPA. Staff identified three "outliers" in WSPA's estimates that were substantially different from the consultants' estimates. If the costs for these three "outliers" were adjusted, then the costs estimated by WSPA would be in close comparison with the consultants' estimates. The three "outliers" are in the control costs of 1) Refinery 1's FCCU, 2) Refinery 3's FCCU, and 3) Refinery 3's SRU/TG.[3] Staff's analysis was presented at the September 22 Refinery Committee Meeting.

On October 12, 2010, WSPA revised its cost analysis to reflect staff's proposal of 55% shave. The overall costs estimated by WSPA were now $1.637 billion. WSPA indicated that it would cost $836 million to comply with BARCT. WSPA also indicated that complying with BARCT would not be enough; WSPA's members asserted that they would need to invest an additional of $801 million in "other" strategies to achieve additional emission reductions within WSPA-members' facilities to comply with the 55% shave. Table EX-3 and EX-4 show a cost comparison between WSPS's proposal and staff's proposal.

As shown in Table EX-3, staff and the consultants estimated that the refineries would reduce 3.92 tpd by installing 4 WGSs for the FCCUs, 3 WGSs for the SRU/TGs, 1 WGS for coke calciner and implementing other process modification at a cost (present worth value for 25 years) of between $561 million - $638 million and the cost-effectiveness of $16K - $18K per ton.

In comparison, as shown in Table EX-3, WSPA estimated that the refineries would reduce 3.81 tpd by 1) installing 2 WGSs for FCCUs, 2 WGSs for the SRU/TGs, and 1 WGS for coke calciner; 2) using SOx reducing additives in the other FCCUs; and 3) implementing other process modification. The cost (present worth value for 25 years) of these control strategies proposed by WSPA and its members was estimated at $836 million and the cost-effectiveness was estimated at $24K per ton. Even though WSPA's proposed main strategy does not meet BARCT on equipment by equipment basis (e.g. 5 ppmv for FCCUs, 5 ppmv for SRU/TGs), WSPA's proposal comes very close to staff's proposal on the actual emission reductions achieved (i.e. 3.81 tpd from WSPA's proposal versus 3.92 tpd from staff's proposal.)

[3] Detailed explanations are provided in Response #16 to WSPA's comments received from March 2010 – August 2010 in Chapter 14 - Comments & Responses of the Staff Report.

WSPA indicated that they must invest an additional $801 million in "other" strategies shown in Table EX-4 to secure adequate reductions at each member facility rather than relying on RTCs available in the open market to meet staff's proposed shave of 55%. However, the first two of the "other" strategies proposed by WSPA and its members in Table EX-4 are not cost-effective: 1) the strategy for SRU/TG is cost-ineffective at $213,277 per ton; and 2) the strategy for fuel gas treatment is also cost-ineffective at $104,445 per ton. While the first two strategies in Table EX-4 are not cost-effective, the third and fourth strategies are very cost-effective, and therefore would be reasonable to implement.

In addition, as shown in Table EX-5, the 55% shave would require RTC reductions in the amount of 5.17 tpd RTC from the refinery sector. WSPA and the refineries have demonstrated that they can achieve 5.31 tpd reductions with the main strategy and the two "other" (third and fourth) cost-effective strategies negating the need for implementing the cost-ineffective strategies proposed by WSPA and its members. The costs estimated by WSPA to achieve 5.31 tpd reductions are $917 million, which reflects a cost-effectiveness of $18,925 per ton SOx reduced.

Furthermore, in addition to the 5.31 tpd actual reductions that can be obtained through WSPA's strategies, staff estimated that there would be an additional of about 1.47 tpd potentially available RTCs from other sources.[4] As a result, there would be about 6.57 tpd combined RTCs and actual emission reductions to comply with the 55% shave of 5.17 tpd reduction target attributed to WSPA members and subsequently this would result in a surplus of more than 1.5 tpd.

In conclusion, staff has concluded that WSPA's assumption for additional costs of $801 million for an additional of 2.12 tpd reduction would not be reasonable under a market-based program.

[4] The 1.47 tpd potentially available RTCs post-sahve in the market comprised of:

- 0.21 tpd post-shave remaining unused RTCs (which is calculated as follows: The surplus RTCs estimated from the 2005 baseline are 1.73 tpd (11.77 – 10.04 = 1.73 tpd). WSPS already accounted for 1.30 tpd surplus RTC in their strategy, therefore the remaining unused RTCs are 1.73 – 1.30 = 0.43 tpd pre-shave and (0.43 tpd)(0.486) = 0.21 tpd post shave)
- 0.0009 tpd post shave hold by non-RECLAIM investors. (As of October 14, 2010, there are only two remaining investors that are non-RECLAIM facilities, and these two investors hold approximately 1,306 lbs of RTCs pre-shave or 0.002 tpd pre-shave or 0.0009 tpd post-shave.)
- 0.60 tpd from non-refinery sector. (Assuming that the non-refineries would install control technologies proposed by either WSPA to meet the 51.4% shave; and would have surplus RTCs to sell in the market.)
- 0.66 tpd from refinery sector. (Assuming that the non-refineries would install control technologies proposed by either WSPA to meet the 51.4% shave; and would have surplus RTCs to sell in the market.)

TABLE EX-3
Cost Comparison between WSPA's and AQMD's Main Strategies

AQMD's Main Strategy							WSPA's Main Strategy					
		Limit	Reduction (TPD)	Range of Costs ($Million)		CE ($/ton)		Limit	Reduction (TPD)	Costs ($Million)	CE ($/ton)	
FCCU	4 WGS	5 ppmv	2.01	360	389	$20K - $21K	FCCU	2 WGS	5 ppmv	1.60	328	$22K
								3 DeSOx	6-35 ppmv			
SRU	3 WGS	5 ppmv	0.60	174	187	$31K - $44K	SRU	2 WGS and other process modification	5-25 ppmv	0.36	331	$101K
Other Units	1 WGS and other process modification	10 ppmv	0.31	27	62	$9K - $22K	Other Units	1 WGS and other process modification	Not specified	0.98	177	$20K
Early Reductions (FCCU, SRU)	1 WGS and other process modification	5 ppmv	1.00	-	-		Early Reductions (FCCU)	1 WGS	5 ppmv	0.87	-	
Sub Total			3.92	561	638	$16K-$18K	Sub Total			3.81	836	$24K

TABLE EX-4
Costs Information on WSPA "Other" Strategies

Project		Reduction (TPD)	Costs ($Million)	Cost Effectiveness ($/Ton)
SRUs	15 ppmv	0.13	253	213,277
Fuel Gas Treatment	<40 ppmv	0.49	467	104,445
CEMS Improvements	3 projects	0.26	4	1,686
RTCs		1.24	77	6,805
Total for Others		**2.12**	**801**	**41,406**
Total for Others (excluding cost-ineffective projects)		**1.5**	**81**	**5,918**

TABLE EX-5
Likely Refinery Compliance Strategy

WSPA Strategies	Reduction (TPD)	Costs ($Million)
1. WSPA's Main Strategy	3.81	836
2. "Other" Cost-Effective WSPA Strategies	1.5	81
Total Actual Reductions & Costs	**5.31**	**917**
Average Cost Effectiveness = $18,925 Per Ton		

Key Issues Raised Prior to the Informational Hearing on January 8, 2010

There are four (4) key issues raised by the stakeholders: 1) BARCT determination, 2) water and wastewater, 3) market viability, 4) shaving methodology for facilities that are not subject to new BARCT, and for facilities that are subject to new BARCT. Staff's responses to these key issues are summarized below:

1) BARCT Determination

Stakeholders commented that staff should pursue only 3 tons per day reduction as stated in the 2007 AQMP to meet the SIP commitment. The current trend of PM2.5 is declining and does not warrant a SOx shave that is estimated to cost industry over one billion dollars. In addition, the costs and cost effectiveness were under-estimated and environmental impacts (e.g. water, energy) were not appropriately analyzed.

Staff's Response: For a market based incentive program, staff is required by the H&S codes to conduct periodic BARCT reassessment and demonstrate equivalency with command-and-control rules which would otherwise be developed as a result of BARCT reassessment:

> *"…achieve an equivalent or greater level of emission reductions at an equivalent or lower cost as would have been achieved under a command-and-control rule"*

The percent RTC reduction (55%) that staff estimated for the SOx RECLAIM universe is still much less stringent than the percent reduction (90% - 98%) that could be imposed to specific categories of sources such as FCCUs, SRU/TGs, sulfuric acid plant, cement plant, coal fired boiler, and glass melting furnaces under the command-and-control approach.

Furthermore, it should be noted that SOx is a significant building block of PM2.5. Chemical speciation of PM2.5 samples indicated that in the South Coast Air Basin 25% of the ambient PM2.5 is attributed to contribution from sulfates. Furthermore, SOx reductions are highly effective in reducing ambient PM2.5 levels as compared to other primary and secondary contributors to PM2.5 formation (1 tons SOx = 1.5 tons PM2.5 = 15 tons NOx). Therefore, the reductions of SOx are essential for the Basin to meet the federal annual standard of PM2.5 by 2015 and the federal 24-hour average standard of PM2.5 by 2020. As indicated in the 2007 AQMP, the control strategies included in the Plan to meet the annual PM2.5 standard when fully implemented will fall short of meeting the 24-hour standard by approximately 30%. Therefore, additional reductions above and beyond the control strategies committed in the 2007 AQMP for meeting the 2015 annual PM2.5 standard are necessary to meet the 24-hour PM2.5 standard in 2020. For further information, please refer to Chapter 5 of the 2007 AQMP.

In addition, it is worth mentioning that the U.S. EPA is proposing to set a new, more stringent, one-hour standard for SO2 between 50 – 100 parts per billion (ppb) and revoke the current 24-hour of 140 ppb and the current annual standard of 30 ppb to further protect public health. The U.S. EPA and the state are also proposing to tighten the annual average PM2.5 standard.

Regarding the costs and cost effectiveness analyses, after verifying the consultants' analyses, staff formulated its proposal based largely on consultants' recommendations. In response to comments from industry related to costs and in an effort to optimize the effectiveness of its proposal, staff removed the least cost effective control strategies (exceeding $50,000 per ton SOx

reduced) from staff proposal. While these refinements to the staff proposal have reduced anticipated reductions by 5% (0.33 tons per day), they improved the overall cost effectiveness to $16 K- $19K per ton SOx reduced and reduced the total compliance costs by 25%. To further reduce the cost impacts, staff proposes to spread the potential emission reductions over 8 years starting from 2012. Staff also proposes to submit only 3 tons per day reductions to satisfy the SIP commitment in Phase 1 (i.e. 3 tpd reductions by 2014). The remaining reductions will be submitted later.

2) Water & Wastewater Impacts

Stakeholders commented that the water and wastewater impacts of the project would be significant.

Staff's Response: Industry argues that staff proposal will result in significant increases on water demand and wastewater impacts due to the water-intensive operation of wet gas scrubbers. To the extent that wet gas scrubbers are used to comply with the proposed SOx control requirements of the proposed project, staff acknowledges that the total water demand will increase, (by approximately 1 million gallons per day or 3 acre feet per day), but increased water demand over current water usage at affected facilities is well below the SCAQMD's significance threshold of 5 million gallons per day of total increased water demand (i.e. potable water, recycled water, and groundwater). The information that staff received to date from the water purveyors and collected from their 2005 Urban Water Management Plans is that there are adequate supplies to meet the total water demand because the water demand can be largely offset by recycled water and groundwater sources. Availability of water supplies to meet increased water demand is another water demand significance threshold criterion. Even though the potential increase in total water demand is below the SCAQMD's significance threshold of 5 million gallons per day, and because California is in a state of emergency for drought, staff has identified another criterion for what would be considered a substantial use of when determining whether a project, could be considered a "water demand" project as defined by CEQA. Using the more stringent criterion of what constitutes a potable water demand project, the potable water demand of the proposed project would exceed the more stringent criterion if recycled water was not utilized. Currently, recycled water is used at the three refineries in the basin and the water purveyors indicated that, as part of their Urban Water Management Plans, they are in the process of expanding their pipeline service to serve the remaining refineries. Therefore, in the spirit of utilizing abundance of caution, it was determined to classify the water impacts of the proposed project as significant and the impact of the proposed project can be mitigated by the use of recycled water, if available.

Relative to the wastewater impact, staff's analysis based on the Survey [5] conducted among the affected facilities indicates that the overall wastewater increase will be less than 2% and that the facilities have adequate wastewater treatment capacity to treat the increase in wastewater generated. An increase of 25 percent would trigger a permit revision and would be considered a significant adverse wastewater impact. Since all of the affected facilities have been shown to have a potential wastewater increase less than 25 percent, no modifications to any existing wastewater discharge permits are anticipated as a result of the proposed project. Nevertheless,

[5] Staff developed a Survey Questionnaire and sent to the impacted facilities in July 2009 to collect current information related to water usage and wastewater generated at the facilities. The results of the responses from the facilities are summarized in Chapter 11 of this Staff Report.

staff will continue working with water purveyors and the impacted facilities to further refine the water demand analysis and analyze other impacts and alternatives.

3) Market Viability

Stakeholders commented that there were not enough trading partners, the SOx market was very competitive and reserved, and there was an uneven distribution of RTC holdings.

Staff's Response: For a market based incentive program, staff is required by the H&S codes to conduct periodic BARCT reassessment and demonstrate equivalency with command-and-control rules which would otherwise be developed as a result of BARCT reassessment. To ease the issues identified by the stakeholders, staff is proposing to return a portion of the reductions to the facilities as a compliance margin (10%). This approach was also utilized as part of the 2005 NOx RECLAIM amendments. In addition, staff is proposing to establish a set-aside, non-tradable reserve that could be tapped in when RTC value in the open market reach a certain level. Staff is also proposing to submit 4.5 tons per day reductions by December 2014 to meet the minimum AQMP obligation and will submit the remaining at later date no later than December 2019. Staff believes that compliance with a facility cap still provides the facilities more operational flexibilities than being subject to stringent requirements in command-and-control rules and regulations.

4) Shaving Methodology

Facilities with no equipment subject to new BARCT commented that the uniform shave was not equitable, would create significant difficulties for them to stay in compliance, and indicated that they had limited ability to buy RTCs from large facilities. While WSPA and the refineries that are subject to new BARCT argued strongly during the rule development process in 2008-2009 for the use of a shave methodology that was consistent with that used during the 2005 NOx RECLAIM amendment. During the later phase of the rule development process, they commented that staff should use the 2005 as baseline for the shave, not shave the 1.98 tpd RTCs converted from ERCs and portion reserved for Clean Fuel projects, and not set new BARCT for SRU/TGs and cement kilns.

Staff's Response: Because of the non-uniform emissions and RTC distributions in the SOx RECLAIM market (11 major facilities hold 87% RTCs and contribute more than 94% of emissions, and the remaining 21 facilities hold only 6% RTCs and contribute about 6% of emissions), a uniform percent shave of 52% across the board is not the ultimate solution. The 21 facilities that have no equipment subject to the new BARCT cannot reduce their emissions further, cannot sustain operation since they had limited ability to buy RTC from large facilities, and therefore cannot remain in compliance after the shave. To keep the 21 facilities active in the SOx market, staff is proposing to not shave the RTC holdings for these facilities if the RTC holdings are below their initial allocations provided to them at the start of the RECLAIM program. However, the amount of RTC holdings above their initial allocation will be shaved at the same rate as other 11 facilities and investors. With this approach, staff estimated that instead of a 52% shave across the board, the 11 facilities will have a shave of 55%, 18 of the 21 facilities will be exempt totally from the shave, and 3 of the 21 facilities that have RTC holdings above their initial allocations will be shaved up to the initial allocation levels. Any trading from August 29, 2009 to the Governing Board hearing date will also be shaved to ensure that the 14 facilities subject to shave as of August 29, 2009 will not sell their RTC holdings to a third party investor or any of the remaining 18 facilities to avoid the shave.

Staff used the 1997 baseline to be consistent with the approach used in the NOx RECLAIM adopted by the Governing Board in 2005. Using the audited 1997 baseline emissions, grown to 2019 based on assumptions embedded in the 2007 AQMP, would result in 55% shave to the 11 facilities, including the refineries and investors, whereas using the audited 2005 baseline would result in 59% shave. The emission profile changed significantly since 1997. Active facilities have purchased RTCs from shutdown facilities to partially sustain/expand their facility operations. These investments would be wasted if the shave is based strictly on today BARCT and current emission profile. [6] However, the SRU/TGs and cement kilns should not be exempt from BARCT because retrofit control technologies are available for these sources. The 1.98 tons per day RTCs converted from ERCs at the start of the RECLAIM program are not inherently protected from the shave since their values were reduced at approximately 35% in Tier II, and furthermore, even ERCs for non-RECLAIM facilities are often recalled and reduced in values.

~~Draft~~ Staff Report

The attached ~~revised Draft~~ Staff Report includes the following information:

- BARCT determinations;
- Cost-effectiveness;
- Summary of consultants' analyses;
- Method of determining RTC reductions and amount estimated;
- Timing of reductions; and
- Preliminary methods of applying reductions.

Draft Staff Report changes since December 2009

Since the release of the draft Staff Reports in the Public Workshop conducted on June 23, 2009, and the Informational Hearing on January 8, 2010, staff modified the document as follows:

- Removed control technology recommendations with cost effectiveness larger than $50 K per ton (1 for FCCU, 2 for SRU/TGTUs, 1 for Boilers/Heaters) from the cost analysis, emission and RTC reduction analyses,
- Added achieved-in-practice information,
- Added a draft analysis on water and waste, and
- Provided responses to the comments received in the Public Workshop,
- Included analysis by Norton Engineering (NEC) and a cost effectiveness analysis based on NEC's recommendations,
- Used the audited 1997 emissions in the analysis for RTC shave,
- Excluded the emission reductions of 0.85 tpd estimated from boilers/heaters since the proposed BARCT limit is retained at the previous BARCT level of 40 ppmv, and
- Extended the implementation period from 2017 to 2019 and reflected growth embedded in the 2007 AQMP.

~~Staff will continue to revise the draft Staff Report as needed in the future.~~

[6] Total RTCs from shutdown facilities as of today date are 1.42 tons per day of which investors have 0.83 tons per day. The amount of RTCs hold by investors will be shaved at the same rate as the RTCs hold by the 11 facilities that have equipment subject to BARCT.

Chapter 1 - Background

1.1 Legislative Authority

The California Legislature created the Air Quality Management District (AQMD) in 1977 (the Lewis-Presley Air Quality Management Act, Health and Safety Code Section 40400 et seq.) as the agency responsible for developing and enforcing air pollution control rules and regulations in the South Coast Air Basin (Basin). By statute, the AQMD is required to adopt an Air Quality Management Plan (AQMP) demonstrating compliance with all state and federal ambient air quality standards for the Basin (Health and Safety Code (H&SC) §40460(a)). In addition, the AQMD must adopt rules and regulations that implement the AQMP (H&SC §40440(a)).

The California Clean Air Act (CCAA) also requires the AQMD to achieve and maintain state standards by the earliest practicable date and for extreme non-attainment areas and to implement all Best Available Retrofit Control Technologies (BARCT) for existing sources. H&SC §40406 specifically defines BARCT as "…best available retrofit technology means an emission limitation that is based on the maximum degree of reduction achievable taking into account environmental, energy, and economic impacts by each class or category of source."

1.2 Fine Particle Regulation and SOx Control

Scientific studies have found an association between exposure to particulate matter and significant health problems, including: aggravated asthma; chronic bronchitis; reduced lung function; irregular heartbeat; heart attack; and premature death in people with heart or lung disease. Individuals particularly sensitive to fine particle exposure include older adults, people with heart and lung disease, and children.

In July 1997, the U.S. EPA promulgated the National Ambient Air Quality Standards for Fine Particles (PM-2.5). The annual standard is a level of 15 micrograms per cubic meter (μg/m3) based on a 3-year average of annual mean PM2.5 concentrations. The 24-hour standard is a level of 65 μg/m3, based on a 3-year average of the 98th percentile of 24-hour concentrations. In September 2006, EPA significantly strengthened the previous daily fine particle standard from 65 μg/m3 to 35 μg/m3. This standard increases protection of the public from short-term exposure to fine particles.

There are multiple areas across the country exceeding the federal PM2.5 standards. Unfortunately, Southern Californians are burdened with a disproportional share of the PM2.5 exposure estimated to be 52 percent of the nation wide exposure resulting in approximately 5,400 premature deaths annually.

In March 2007, EPA issued a final rule, known as the *Clean Air Fine Particle Implementation Rule*, requires non-attainment areas to meet PM 2.5 standards by 2010. The Basin is classified as a non-attainment area and the District must develop an Air Quality Management Plan by 2008 to address the implementation processes to substantially reduce PM2.5 in order to meet the PM2.5 standards by 2010. The attainment date of 2010 may be extended for up to five years; however the District must achieve PM2.5 standards as expeditiously as possible, no later than 2015. The recently adopted AQMP revision in 2007 serves as the region's attainment demonstration to the federal ozone and PM2.5 standards and includes a formal request to the U.S. EPA to extend the PM2.5 attainment date to 2015.

Five main types of pollutants contribute to ambient PM2.5 concentrations: direct PM2.5 emissions, sulfur dioxide, nitrogen oxides, ammonia and volatile organic compounds. The effect of reducing emissions of each of these pollutants varies by areas depending on the composition, concentrations of these pollutants and other area-specific factors. The EPA's *Clean Air Fine Particle Implementation Rule* requires the District to implement all reasonably available control measures (RACM) and reasonably available control technology (RACT), considering economic and technical feasibility and other factors that are needed to show that the area will attain the fine particle standards as expeditiously as practicable. In this *Clean Air Fine Particle Implementation Rule*, the U.S. EPA specifically requires the non-attainment areas to evaluate all control measures to reduce direct PM2.5 emissions, as well as PM2.5 precursors, especially SOx. While the 2007 AQMP lays out a multi-pollutant control strategy to demonstrate attainment with the federal PM2.5 standards, it identifies NOx and SOx reductions by far as the two most effective tools in reaching attainment with the PM2.5 standards.

1.3 Current RECLAIM Program

On October 15, 1993, the District's Governing Board adopted the RECLAIM program and Regulation XX. Regulation XX includes 11 rules that specify the applicability, NOx and SOx allocations, general requirements, as well as monitoring, reporting, and recordkeeping requirements. The RECLAIM program started with 41 SOx and 392 NOx facilities in 1993. By the end of 2005 compliance year, the program includes 33 SOx and 304 NOx facilities.

Under the RECLAIM program, facilities are issued SOx and NOx annual allocations, or also known as facility caps. The facility caps declined annually to reflect the levels of BARCT that were envisioned to be in place at the RECLAIM facilities. To meet the annual declining allocation, RECLAIM facilities have the flexibility of installing pollution control equipment, changing operations, or purchasing RECLAIM Trading Credits (RTCs). It was envisioned that a BARCT analysis be conducted every three years to capture any advancement in control technology and to assure that the RECLAIM program would achieve emission reductions as expeditiously as possible.

Throughout the years, there have been a number of amendments to the RECLAIM rules. In January 2005, a BARCT analysis was re-conducted for NOx, and as a result of this analysis, the

RECLAIM rules were amended and the NOx annual allocations previously given to the NOX RECLAIM facility were further reduced by approximately 20% to reflect BARCT.

For SOx, the annual allocations given decline annually from 1993 until 2003, and remain constant since 2003. The 2003 SOx allocations reflected the BARCT levels envisioned for SOx in 1993. BARCT analysis for SOx has not been reevaluated since 1993, and is reevaluated with this proposed amendment.

1.4 Control Measure CMB-02

Control Measure CMB-02 estimated that BARCT would be implemented to achieve approximately 3 tons per day SOx emission reductions from 2011 to 2014. The control measure estimated that reducing sulfur content in refinery fuel gas could achieve approximately 1.6 tons per day SOx; and reducing SOx emissions from fluid catalytic cracking units could achieve 1.3 tons per day SOx. It was expected that the control measure implementation may either affect all SOx RECLAIM facilities or only affect the facilities that have highest SOx emissions and that can employ BARCT. During the rulemaking process, it was envisioned that staff will also explore the feasibility to incorporate the control concept of Control Measure MCS-01 - Facility Modernization to achieve reductions beyond 2014.

1.5 Affected Facilities

Currently, there are 32 facilities in the SOx RECLAIM Program. Six of the 32 facilities are refineries with substantial operational capacities compared to 150 refineries in the U.S, and Chevron and BP are the two largest refineries in the state of California based on the operational capacities reported. [7] These 32 RECLAIM facilities have SOx emissions greater than or equal to four tons per year in 1990 or any subsequent year. SOx facilities in the RECLAIM program have a wide range of equipment such as Fluidized Catalytic Cracking Units (FCCU), furnaces, kilns, sulfuric acid plants, tail gas units, boilers, heaters, internal combustion engines, and gas turbines. The emission inventory of these facilities and the top emitters at these facilities is discussed in Chapter 1, Section 1.7.

[7] Operable capacities of six refineries and their ranks compared to 150 refineries in the U.S.

Refinery	Capacity (Barrels per Day)	Rank in the U.S.
Chevron	279,000	17
BP West Coast Products LLC	265,000	18
ExxonMobil	149,500	47
ConocoPhillips	139,000	52
Tesoro	96,860	64
Ultramar Inc.	80,887	71

1.6 2007 Air Quality Management Plan

The 2007 Air Quality Management Plan (AQMP) was based on the 2002 base year inventory. In the 2007 AQMP, RECLAIM facilities were reported to emit a total of 12 tons per day SOx as shown in Table 1-1. In 2002, the SOx emissions from RECLAIM represented more than 50% of the total SOx emissions from stationary sources, and 23% of the total SOx emissions from the entire basin.

TABLE 1-1

Summary of Emissions by Major Source Category (2002 Base Year)
(Tons per Day)

Source Category	NOx	SOx
Stationary Sources		
Fuel Combustion	35	2
Waste Disposal	2	0
Cleaning and Surface Coatings	0	0
Petroleum Production and Marketing	0	7
Industrial Processes	0	0
Solvent Evaporation		
Consumer Products	0	0
Architectural Coatings	0	0
Others	0	0
Misc. Processes	27	0
RECLAIM Sources	**29**	**12**
Total Stationary Sources	**93**	**22**
Total Mobile Sources	**1000**	**31**
TOTAL	**1093**	**53**

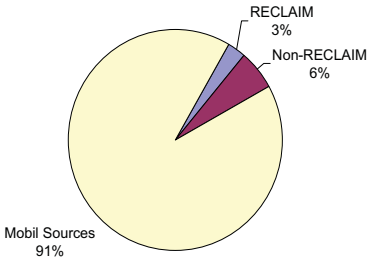
Reference: 2007 AQMP. The actual emissions from RECLAIM facilities of 12 tpd were also reported in the "Annual RECLAIM Audit Report for the 2002 Compliance Year", dated March 5, 2004. Total RTCs (allocations and converted ERCs) were reported to be 13 tpd in the 2002 RECLAIM Audit Report.

Data presented in Table 1-1 and Figure 1-1 present a sharp distinction between the distributions of NOx versus SOx emissions in the basin, and explain the importance of undertaking a BARCT reassessment for RECLAIM facilities in this amendment of Regulation XX. As shown in Table 1-1 and Figure 1-1, the RECLAIM facilities contribute to only about 3% of the NOx emissions in the entire South Coast Air Basin (Basin). A majority of NOx emissions in the Basin comes from mobile sources. In contrast, the RECLAIM facilities contribute to more than 23% of SOx emissions in the Basin and more than 50% of SOx emissions from stationary sources.

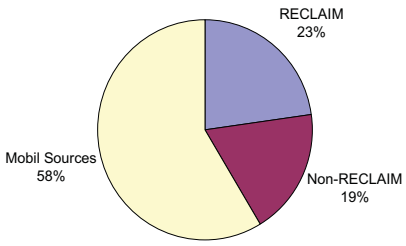
The top 10 ranking sources of SOx emissions in the basin in 2002, 2014 and 2023 are shown in Table 1-2. SOx emissions from RECLAIM facilities are ranked #2, second only to ships and commercial boats. Given the effectiveness of the SOx reduction in improving PM2.5 air quality

and ultimately reaching the federal PM2.5 standards, searching for additional emission reductions in RECLAIM category sources becomes an important effort.

FIGURE 1-1
NOx and SOx Emission Distribution (2002 Baseline)



NOx Emissions



SOx Emissions

TABLE 1-2
Top Ten Ranking of SOx Emissions from Highest to Lowest

	2002 Base Year	2014 Base Year	2023 Base Year
1	Ships & Commercial Boats	Ships & Commercial Boats	Ships & Commercial Boats

3	Non-RECLAIM Sources	Aircraft	Aircraft
4	Heavy-Duty Diesel Trucks	Manufact/Industrial Combustion	Manufact/Industrial Combustion
5	Aircraft	Light-Duty Passenger Cars	Light-Duty Passenger Cars
6	Trains	Light-Duty Trucks	Light-Duty Trucks
7	Off-Road Equipment	Service/Commercial Combustion	Service/Commercial Combustion
8	Light-Duty Passenger Cars	Non-RECLAIM Sources	Non-RECLAIM Sources
9	Manufact/Industrial Combustion	Waste Burning & Disposal	Waste Burning & Disposal
10	Light-Duty Trucks	Residential Fuel Combustion	Residential Fuel Combustion

Reference: 2007 AQMP. Note that Non-RECLAIM sources are sources that are not included in the RECLAIM program such SOX emissions emitted from flares or generated under upset conditions.

The 2007 AQMP calls for significant reductions of SOx from both stationary and mobile sources by 2014. As shown in Table 1-3, a regional modeling in the 2007 AQMP indicates that an overall emission reduction of 24 tons per day SOx is needed to meet the particulate standard in 2014. In that 24 tons per day reduction, mobile source control measures from California Air Resources Board and the District can potentially reduce 21 tons per day. The remaining 3 tons per day reductions comes from the stationary source control measure for RECLAIM facilities. A BARCT reassessment for SOx is therefore essential to identify the potential sources that can generate the 3 tons per day SOx reduction required for 2014.

1.7 2005 Annual Emissions Report

RECLAIM facilities reported a total of 10 tons per day SOx from January to December 2005. As shown in Table 1-4, the top twelve SOx emitting facilities emitted 9.47 tons per day SOx, which are about 95% of total emissions from RECLAIM universe. The top 11 emitting facilities where staff will focus in to find the sources of emission reductions include:

- Six refineries: BP, ConocoPhillips, Chevron, ExxonMobil, Ultramar, and Equilon (Tesoro.)
- Two sulfuric acid plants: Rhodia Inc. and ConocoPhillips
- One coke calciner plant: BP located in Wilmington
- One cement manufacturing plant: California Portland Cement Co.
- One container glass manufacturing plants: Owns Brockway Glass Container Inc.

TABLE 1-4
SOx Emissions at RECLAIM Facilities (Compliance Year 2005)

Facility ID	Facility Name	Cycle	Emissions (tons per year)	Emissions (tons per day)	Cumulative Percentage
131003	BP WEST COAST PROD.LLC BP CARSON REFINERY	2	679.4	1.86	19%
800363	CONOCOPHILLIPS COMPANY	2	421.2	1.15	30%
114801	RHODIA INC.	1	410.7	1.13	42%
800370	EQUILON (Now is TESORO)	1	363.6	1.00	52%
800030	CHEVRON PRODUCTS CO.	2	362.5	0.99	62%

	OTHER RECLAIM FACILITIES	1 and 2	165.0	0.45	100%
	Total		**3621**	**9.92**	

Reference: Based on the 2005 Annual Permit Emissions Report (January 2005 – December 2005), the emissions reported for 2005 were 9.92 tons per day. Please note that the audited 2005 emissions were 3,663 lbs (10.04 tons per day) as shown in the 2010 Annual RECLAIM Audit Report, March 5, 2010.

Table 1-5 shows the distribution of SOx emissions with respect to the equipment/processes at RECLAIM facilities. As shown in Table 1-5, top emitters at RECLAIM facilities include fluid catalytic cracking units, sulfur recovery and tail gas treatment units, refinery boilers and heaters burning refinery gases, coke calciner, cement kilns, sulfuric acid absorption tower and glass melting furnaces. Staff will focus in reassessing BARCT for these top emitters which emit more than 80% of SOx emissions at RECLAIM facilities.

TABLE 1-5
Distribution of SOx Emissions at RECLAIM Facilities

Equipment/Processes	Percentage of Emissions
Fluid Catalytic Cracking Units	33%
Sulfur Recovery & Tail Gas Units	10%
Refinery Process Heaters and Boilers	31%
Cement Kilns – Glass Melting Furnaces	7%
Sulfuric Acid Manufacturing	12%
Other Miscellaneous Processes/Equipment	7%

Reference: 2005 baseline emissions

Table 1-6 shows SOx emissions reported from 2002 to 2007, grouped by compliance year and calendar year (e.g. SOx emissions reported for the 2003 compliance year were the emissions reported from January 1, 2003 – December 31, 2003 for Cycle 1 RECLAIM facilities, and from July 1, 2003 – June 31, 2004 for Cycle 2 facilities. SOx emissions reported for the 2003 calendar year were the emissions reported from January 1, 2003 – December 31, 2003 for both Cycle 1 and Cycle 2 facilities.) The average reported emissions from 2003 – 2007 compliance year were approximately 10 tpd (Staff did not include year 2002, and the years before 2002 in the average, because the Tier II shave started in 2003.) Year 2005 emissions are closest to the average, and thus stand out to be the most representative emissions for the period from 2003 – 2007.

TABLE 1-6
SOx Emissions Reported by RECLAIM Facilities from 2002 – 2007

Year	SOx Emissions by Compliance Year (tpd)	SOx Emissions by Calendar Year (tpd)
2002	11.84	12.17
2003	10.56	11.08
2004	9.85	9.85
2005	**9.92**	**10.13**
2006	9.81	10.24
2007	10.27	
Average (2003 - 2007)	**10.08**	

Chapter 2 – Best Available Retrofit Control Technology

2.1 Definition

Best Available Retrofit Control Technology (BARCT) is defined in California Health and Safety (H&S) Code §40406 as:

> *"… an emission limitation that is based on the maximum degree of reduction achievable, taking into account environmental, energy, & economic impacts by each class or category of source."*

In addition, Section §40440(b) (1) requires the District to adopt rules that requires the use of BARCT for existing sources:

> *"Require the use of best available control technology for new or modified sources and the use of best available retrofit control technology for existing sources."*

The BARCT analysis procedure for RECLAIM is identical to any BARCT analysis procedure used in developing a command-and-control rule. In RECLAIM, however, the BARCT levels are mainly used for assessing programmatic RECLAIM Trading Credit (RTC) reductions. Unlike other facilities that are subject to a command-and-control rule, RECLAIM facilities are not required to meet the BARCT levels at all times. RECLAIM facilities are provided the flexibility to meet the programmatic reductions by various means, such as installing control devices or buying RTCs.

It should be noted that California H&S Code §39616 requires a market incentive program to achieve an equivalent or greater level of emission reductions at an equivalent or lower cost as would have been achieved under a command-and-control rule. Since the adoption of RECLAIM in 1993, staff has not conducted any BARCT analysis for SOx. Starting with the 2003 AQMP, staff committed to conduct a BARCT analysis for RECLAIM facilities every three years to assure that RECLAIM and non-RECLAIM facilities are subject to the same BARCT standards based on state-of-the-art control technologies.

2.2 BARCT Evaluation Process

In order to identify BARCT meeting the definition of California Health and Safety (H&S) Code §40406, staff conducted the following procedure:

2.2.1 Identify Technology That Can Achieve Maximum Degree of Reduction

To identify technology that can achieve maximum degree of reduction for this project, staff conducted a thorough and extensive research of the:

1. Control technology (both existing technology and potential future technology) from literature research, consultations with manufacturers/vendors, and expert consultants;

2. Federal, state, or other air pollution control district or agency rules/regulations; and

3. U.S. EPA RACT/BARCT/LAER Clearinghouse, CARB database, and other state and local district permitting database to search for recent BACT or BARCT implementation.

It should be noted that in the rule making process staff is not obligated or limited to look at fully commercialized available technologies. Sometimes staff is called upon to develop technology forcing rules. In this situation, staff can consider technology that has not been applied to full scale operations, and provide sufficient time in the rule language to assist the technology to reach maturity. In addition, staff can develop alternative compliance provisions to handle situations where the technology cannot be fully developed.

Staff will consider feasible retrofit control technology, which is a technology that has been previously installed and operated successfully at a similar type of source, or has practical potential for application to the source (i.e. has been successfully applied to similar sources with similar gas stream characteristics).

Staff will also consider currently available retrofit control technology, which is a control technology that 1) is being offered commercially by vendors, or 2) is in commercial demonstration or licensing. Technologies that are in development and testing stages are generally classified as not currently available, but if available in the future, will be considered in the BARCT determination as well.

In July 2008, staff awarded two contracts to two individual contractors and a sub-contractor to conduct an independent analysis on feasible/available control technologies and assess costs and cost effectiveness of control technologies. The contractors were required to identify at least two available control technology manufacturers/vendors for each of the seven categories of sources. The contractors were also asked to collect the manufacturers' performance guaranteed letters. The results are of staff's work and consultants' analyses are summarized in Chapter 3 – Chapter 9 of this report.

A summary of staff's review on federal, state or other air pollution control districts' regulatory requirements is shown in Appendix B of this report. [8]

[8] In addition, please also see staff's review of regulatory requirements shown in Appendix VI of the 2007 AQMP – RACM Demonstration.

2.2.2 Evaluate Control Effectiveness

After the technically feasible and available control technologies were identified, staff evaluated the control effectiveness of the control technology using the control efficiency, or the outlet SOx concentration, or the emission factor reported for each control technology. These control effectiveness information was obtained by considering data available through permitting, source testing, engineering estimates, or performance guarantees by the control manufacturers/vendors.

As part of the contracts, the contractors were required to assess the levels of emission reductions that could be achieved from at least two different types of control technology. The results are summarized in Chapter 3 – Chapter 9 of the Staff Report.

2.2.3 Conduct Top-Down Cost Effectiveness Analysis

After the control effectiveness is established, a top-down cost effectiveness analysis starting with the most effective control technology was conducted to provide information on emission reductions and cost effectiveness associated with different control technologies and different levels of control.

The top-down cost effectiveness analysis must consider site-specific, physical limitation, as well as operational characteristics of the equipment at the facilities. Equipment costs, installation costs, annual operating costs, the useful life of the control equipment are all captured in this analysis to generate a cost-effectiveness factor in dollars per ton of pollutants reduced.

Staff did not conduct a cost effectiveness analysis for this project but selected to contract this task to two contractors and a subcontractor. Their extensive and detailed cost analyses are summarized and referenced in Part II of the Staff Report. In most parts, staff was in agreement with the contractors' analyses and used their costs and cost effectiveness in the scenario studies discussed in Chapter 12. However, in some few scenarios, staff adjusted the consultants' estimate to reflect the actual conditions at the facilities.[9]

Establishing a cost-effectiveness factor allows a comparison of control technologies. Using the contractors' costs information, staff estimated the following four types of cost-effectiveness:

1) Individual cost effectiveness for a specific emitting source (e.g. cost effectiveness for each FCCU);
2) Average cost effectiveness for the category of source (e.g. average cost effectiveness for five FCCUs in the Basin);
3) Average cost effectiveness for the entire project; and

[9] For example, for coke calciner, the consultant used maximum operational parameters to design the control system, estimated costs, emission reductions, and cost effectiveness. Staff used the estimated costs from the consultant's analysis but estimated cost effectiveness based on actual emission reductions not emission reductions estimated based on the designed operational parameters.

4) Incremental cost-effectiveness for the entire project.

The individual cost-effectiveness is defined as the present worth value of the control technology divided by the total quantity of pollutants removed during the life time of a control technology. The average cost effectiveness is an average of all control technologies, or an average of all control technologies for all sources in the project. The incremental cost-effectiveness is a comparison of the cost and performance level of a control technology to a next more stringent option.

There is no bright line cut-off of what cost effectiveness in dollars per ton should be considered as cost effective. The cost-effectiveness factor remains a relative measurement factor.

The top down analysis conducted by the contractors and their results are summarized in Part II of the Staff Report.

In addition to the top down analysis conducted by the contractors, staff conducted a scenario analysis presented in Chapter 12 where staff estimated the emission reductions and cost effectiveness for four scenarios of control ranging from the most stringent set of control to the least stringent set of control. From this analysis, staff selected a scenario that best reflected BARCT, "… *maximum degree of reduction achievable, taking into account of ....economic impacts by each class or category of source."*

2.2.4 Select Best Available Retrofit Control Technology (BARCT)

The H&S Code 40406 requires the District to take into account environmental, energy and economic impacts during the BARCT selection process. The energy impact of each evaluated control technology is the energy penalty or benefit resulting from the operation of the control technology at the source. An example of the energy impact includes the increase (or decrease) in energy consumption at the source.

The environmental impacts are evaluated to determine whether a particular control technology has any impacts, either positive or negative, to the environment. An example of the environmental impact is the generation of wastewater discharge and solid waste.

The economic impacts (costs and cost effectiveness) are evaluated to determine the impacts of staff proposal on each affected facility and to the economy of the basin as a whole.

Staff asked the consultants to identify and quantify the environmental effects or impacts (water demand, wastewater treatment, solid waste, energy consumption) and provide information on any hazardous materials and hazardous waste, if known for each SOx reduction technique or technology evaluated. The consultants' results for this analysis are in their final reports. [10]

[10] The consultants' estimates are accurate except for the reported water demand for the SRU/TG's wet gas scrubbers. The figures reported in the final report are not the same as the numbers reported in the draft report. It is an oversight in transferring the numbers, only for the SRU/TGs. Staff contacted the wet gas scrubber

In addition, the consultants were asked to conduct an analysis on concurrent effect on other air pollutants, and made comments and recommendations if there were technologies capable of reducing SOx, and concurrently reducing (or increasing) PM2.5, and/or CO2. The consultants indicated that wet gas scrubbers should have a positive effect on particulate emissions and minimal impact on NOx, ammonia, and volatile organic compound. Fine particulate impact will be lessened by reducing SO2 emissions which is PM2.5 precursor.

After considering environmental, energy, and economic impacts of each category of seven sources identified by staff, the contractors proposed the BARCT levels shown in Table 2-1.

Staff was in agreement with the consultants' recommendation for FCCUs, SRUs/TGs, refinery boilers/heaters, coke calciner, and sulfuric acid manufacturing, however, staff differed in setting the BARCT limits for glass melting furnace and cement kilns/coal-fired boiler, and further removed the scenarios where the cost effectiveness was lower exceeding >$50K per ton. The proposed BARCT levels recommended by staff and the consultants are shown in Table 2-1. Refer to Chapter 3 – Chapter 9 for additional information and BARCT evaluation.

Table 2-1
BARCT Levels Recommended by the Consultants and AQMD

Basic Equipment	Consultants' Recommendation	AQMD's Recommendation
Fluid Catalytic Cracking Units	5 ppmv	5 ppmv
SRUs/TGs	Incinerated tail gas: 5 ppmv; Non incinerated tail gas: 10 ppmv H2S & 300 ppmv non H2S	Incinerated tail gas: 5 ppmv; Non incinerated tail gas: 10 ppmv H2S & 300 ppmv non H2S
Refinery Boilers/Heaters	40 ppmv	40 ppmv
Calciner, Petroleum Coke	10 ppmv	10 ppmv
Sulfuric Acid Mfg	10 ppmv	10 ppmv
Container Glass Melting Furnace	1-2 ppmv (99% control)	5 ppmv
Cement Kiln & Coal-Fired Boiler	1-2 ppmv (95% control)	5 ppmv

Additional CEQA, Socioeconomic, and market analyses are being conducted and staff will continue to readjust the proposed BARCT levels if needed to satisfy the requirement of the H&S Code.

manufacturers and directly gathered the water demand information for SRU/TGs as explained in a footnote in Chapter 11.

Chapter 3 – Fluid Catalytic Cracking Units

3.1 Process Description

There are six refineries that operate six fluid catalytic cracking units (FCCU) in the District: Chevron, BP West Coast, ExxonMobil, ConocoPhillips, Ultramar and Tesoro. The FCCUs are classified as major sources of emissions in RECLAIM, and as such, the emissions from FCCUs are required to be monitored with continuous emission monitoring system (CEMS), and reported on a daily basis electronically to the District. A brief description of the process is presented below. The FCCU capacities in barrels fresh feed per calendar day reported to the U.S. Energy Information Administration are as follows. BP and ExxonMobil operate the two largest FCCUs in the state of California in terms of barrels fresh feed per calendar days processed.

BP	101,500 barrels per calendar day
ExxonMobil	83,500 barrels per calendar day
Chevron	66,500 barrels per calendar day
Valero	52,200 barrels per calendar day
ConocoPhillips	48,700 barrels per calendar day
Tesoro	31,958 barrels per calendar day

The FCCU is the most important and widely used refinery process for converting heavy oils into more valuable gasoline and lighter products. The process uses a very fine catalyst that behaves as a fluid when aerated with a vapor. The fluidized catalyst is circulated continuously between a reactor and a regenerator and acts as a vehicle to transfer heat from the regenerator to the oil feed in the reactor. The cracking reaction is endothermic and the regeneration reaction is exothermic. A schematic of a fluid catalytic cracking unit (FCCU) is shown in Figure 3-1.

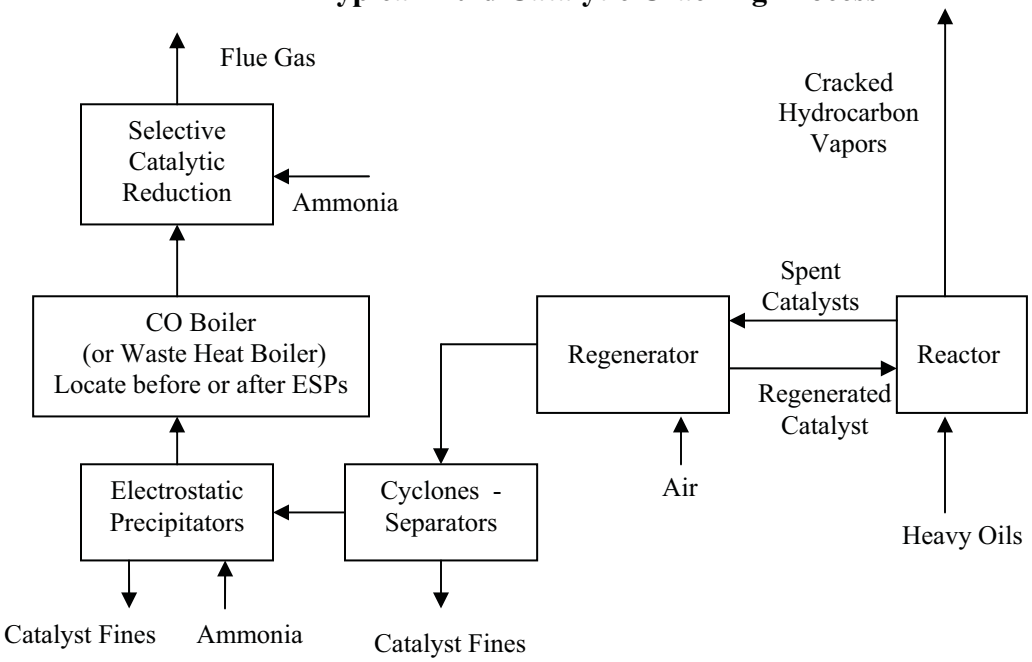
The fresh feed is preheated by heat exchangers to a temperature of 500-800 degree Fahrenheit and enters the FCCU at the base of the feed riser where it is mixed with the hot regenerated catalyst. The heat from the catalyst vaporizes the feed and brings it up to the desired reaction temperature. The mixture of catalyst and hydrocarbon vapor travels up the riser into the reactor. The cracking reaction starts in the feed riser and continues in the reactor. Average reactor temperatures are in the range of 900-1000 degree Fahrenheit. As the cracking reaction progresses, the catalyst surface is gradually coated with carbon (coke), reducing its efficiency. While the cracked hydrocarbon vapors are routed overhead to a distillation column for separation into lighter components, the oil remaining on the catalyst is removed by steam stripping before the spent catalyst is cycled to the regenerator.

In the regenerator, the coke is burned off with air and the spent catalyst is reactivated. The regenerator can be designed and operated to either partially burn the coke on the catalyst to a mixture of carbon monoxide (CO) and carbon dioxide (CO_2), or completely burn the coke to CO_2. The regenerator temperature is carefully controlled to prevent catalyst deactivation by overheating and to provide the desired amount of carbon burn-off. This is done by controlling the air flow to give a desired CO_2/CO ratio in the exit flue gases or the desired temperature in the

regenerator. The flue gas containing a high level of CO is routed to a supplemental-fuel fired CO boiler if needed to completely burn off the CO to CO_2. Generally, FCCUs operate in a completely burn mode; and in this scenario, the CO boiler might be used as a heat recovery device without any supplemental fuel. The regenerated catalyst is generally steam-stripped to remove adsorbed oxygen before being cycled back to the reactor. The regenerator exit temperatures for catalyst are about 1,200-1,450 degree Fahrenheit.

It is during the regeneration cycle that some of the catalyst is lost in the form of catalyst fines. The catalyst fines escape the regenerator in both the flue gas and the hydrocarbon vapor stream going to the fractionation column. The FCCU is a major source of sulfur oxides, nitrogen oxides and particulate matter in the refinery. To control particulate emissions, flue gas from the regenerator is routed through a series of cyclones and electrostatic precipitators. Selective catalytic reduction can be used to reduce nitrogen oxides emissions. The control options for sulfur oxides are discussed in Section 3.3 below.

FIGURE 3-1
Typical Fluid Catalytic Cracking Process



3.2 Current Allocations and Emissions

3.2.1 Allocations

In 1993, the six refineries in the basin were issued emission allocations to their FCCUs based on an emission factor (also known as Tier I emission factor) of 13.7 lbs SOx per thousand barrels refinery feed. The activity of each FCCU used in the allocation determination in 1993, and the emissions allocated to each FCCU are listed in Table 3-1. The total Tier I allocations provided for the six FCCUs are 2.17 tons per day.

3.2.2 Emissions

Since FCCUs are classified as major sources in RECLAIM, the SOx emissions from the FCCUs are monitored with CEMS and reported on a daily basis to the District. The total annual emissions from January 2005 – December 2005 from the FCCUs is about 3.55 tons per day as shown in Table 3-2.

The FCCUs at RECLAIM facilities are not subject to any specific concentration or emission rate standards. RECLAIM facilities are given the flexibility to operate their equipment as long as the total emissions from the facility are at or below the facility emission caps. The allocations provided to the FCCUs since 1993 have not been adjusted even though there are commercially available technologies that can be used to further reduce SOx emissions from the FCCUs. In addition, the capacity of each FCCU may increase since the level reported in 1993, which warrants for a need to upgrade the capacity of the control device.

TABLE 3-1
SOx Allocations for FCCUs

Facility	Peak Year	Emission Factor (lbs/1000 barrels)	Tier I Allocations (lbs/year)	Tier I Allocations (tons/day)
A	1992	13.7	297,345	0.41
B	1990	13.7	414,233	0.57
C	1988	13.7	188,545	0.26

TABLE 3-2
Current SOx Emissions from FCCUs

Facility	2005 SOx Emissions (tons/day)	2006 SOx Emissions (tons/day)	2007 SOx Emissions (tons/day)
A	0.39	0.36	0.33
B	1.03	0.70	0.71
C	0.96	1.00	0.97
D	0.31	0.27	0.20
E	0.25	0.28	0.18
F	0.61	0.89	0.56
	3.55	**3.50**	**2.95**

Note: The 2005 SOx emissions were from SCAQMD database for the period from January 2005 – December 2005. The 2006 and 2007 emissions were reported by the facilities through a Survey Questionnaire distributed by SCAQMD in 2008.

Based on responses from the facilities to the 2008 SCAQMD Survey Questionnaire, staff estimated that the six refineries were operated at the current emission rates listed in Table 3-3.

TABLE 3-3
Current SOx Emission Rates & Concentrations from FCCUs

SOx Outlet Concentrations (ppmv)	Emission Rate (lbs/1000 barrels feed)
Average 18 ppmv	10.99
Average 36 ppmv	21.68
35 ppmv – 95 ppmv	34.91
Average 12 ppmv	6.89
Average 11 ppmv	16.67
Average 58 ppmv	22.18
Average of 6 Refineries	**17.93**

Note: The SOx outlet concentrations at 0% O2 were either data reported by the facilities through the Survey conducted in 2008, or data in the source test results provided by SCAQMD source testing team.

3.3 Control Technology

The potential available control technologies to reduce SOx emissions from a FCCU are:

1. Processing of low sulfur feed stocks,
2. Feed hydro-treating,
3. Flue gas scrubbing,
4. Using SOx reducing additives,
5. Using combination of the above control technologies

Currently, the six refineries in the Basin have processed low sulfur feed stocks and use feed hydrotreating. Five refineries in the District have experimented with SOx reducing additives, and one refinery has chosen to install a wet scrubber to reduce SOx and PM concurrently.

3.3.1 SOx Reducing Catalysts

Type of Catalysts

Developed in the late 1970s, SOx reducing catalysts were initially alumina based. However, the alumina based catalysts were shown to be susceptible to deactivation. In 1980, it was found that the potential pick-up SO3 in the regenerator was substantially increased by replacing the pure alumina-based catalysts with magnesium-aluminate catalysts (1 mole of magnesium per 2 moles of aluminum). In 1990, Akzo Nobel invented hydrotalcite, and hydrotalcite-like, compounds to support up to 3 to 4 moles of magnesium per mole of aluminum. In 1997, Intercat Inc. patented a self-supporting hydrotalcite SOx reducing catalyst, named SOXGETTER®, and Grace-Davidson developed a DESOX® catalyst with significantly improved performance. In 2000,

Intercat Inc. commercialized Super SOXGETTER® which is advertised to be 80% better than SOXGETTER®, and Grace-Davidson commercialized Super DESOX®, 35% better than DESOX® .[11, 12]

Mechanism for SOx Reduction

In general, SOx reducing catalysts remove SOx from the regenerator flue gas and release the sulfur as H_2S in the FCCU reactor through a three step mechanism:

In the regenerator, sulfur bearing coke is burned to SO_2; and in the presence of excess oxygen, a portion of SO_2 is converted to SO_3

$$S + O_2 \rightarrow SO_2$$
$$SO_2 + 1/2O_2 \rightarrow SO_3$$

The magnesium-based reducing catalysts "pick-up" SO_3 in the regenerator and form magnesium sulfate:

$$M_xO + SO_3 \rightarrow M_xSO_4$$

The magnesium sulfate recirculates back to the reactor, and reacts with hydrogen to form either magnesium sulfide and water, or magnesium oxide, and hydrogen sulfide:

$$M_xSO_4 + 4\ H_2 \rightarrow M_xS + 4H_2O$$
$$M_xS + H_2O \rightarrow M_xO + H_2S$$
$$M_xSO_4 + 4\ H_2 \rightarrow M_xO + H_2S + 3H_2O$$

The H_2S then exits the FCCU in the dry gas and must be removed by the sulfur recovery units. This increase in H_2S, 5% - 20%, can typically be managed within a refinery's operations.

Performance of SOx Reducing Catalysts

Control efficiency of SOx reducing additives depends on many factors such as 1) feed type, 2) starting SOx level, 3) catalyst type, 4) amount of catalysts added, and 5) FCCU's operating conditions. Manufacturers of SOx reducing catalysts generally use a proprietary computer model to estimate the performance of their products. Typical control efficiencies are reported to be in a range of 70% - 87% from an uncontrolled level as shown in Table 3-4.

SOx reducing catalysts also reduce PM10. In 2003, during the development of Rule 1105.1 – Reduction of PM10 and Ammonia Emissions from Fluid Catalytic Cracking Units, five refineries in the District experimented with SOx reducing catalysts supplied by Intercat Inc. and Grace-Davidson. Data collected from 2 refineries shown in Table 3-5 shows that with the use of SOx reducing catalysts, SOx and PM_{10} emissions could be reduced by approximately 40% - 60%. [13]

TABLE 3-5
Application of SOx Reducing Catalysts at Two Refineries in the District

Refinery	**#1**	**#1**	**#2**	**#2**
Test Date	Oct-01	Mar-02	Aug-96	Oct-01
SOx Reducing Additives (lbs/day)	0	178	0	1,471
Total PM_{10} (lbs/hr)	11.41	6.50	128.89	48.25
SOx (lbs/day)	2,291	1,352	4,553	1,583
Average Period for SOx (days)	16	23	4	24
Percent Reduction	43% for PM_{10}, 41% for SOx		63% for PM_{10}, 65% for SOx	

Note: The percent reduction in total PM10 with the SOx reducing additives for Refinery #1 was calculated as follows: % reduction = (1-(6.50/11.42))x100 = 43%. Same approach is used to estimate the percent reduction in total PM10 for Refinery # 2, and the percent reductions in SOx emissions for both refineries. SOx emissions from FCCUs are reported on a daily basis and staff has used an average period from 4 days to 24 days to estimate an average of SOx emissions at these 2 refineries. The information here was presented in the final Staff Report of Rule 1105.1, October 2003.

[13] Staff Report of SCAQMD Rule 1105.1 – Reduction of PM10 and Ammonia Emissions from Fluid Catalytic Cracking Unit, October 9, 2003.

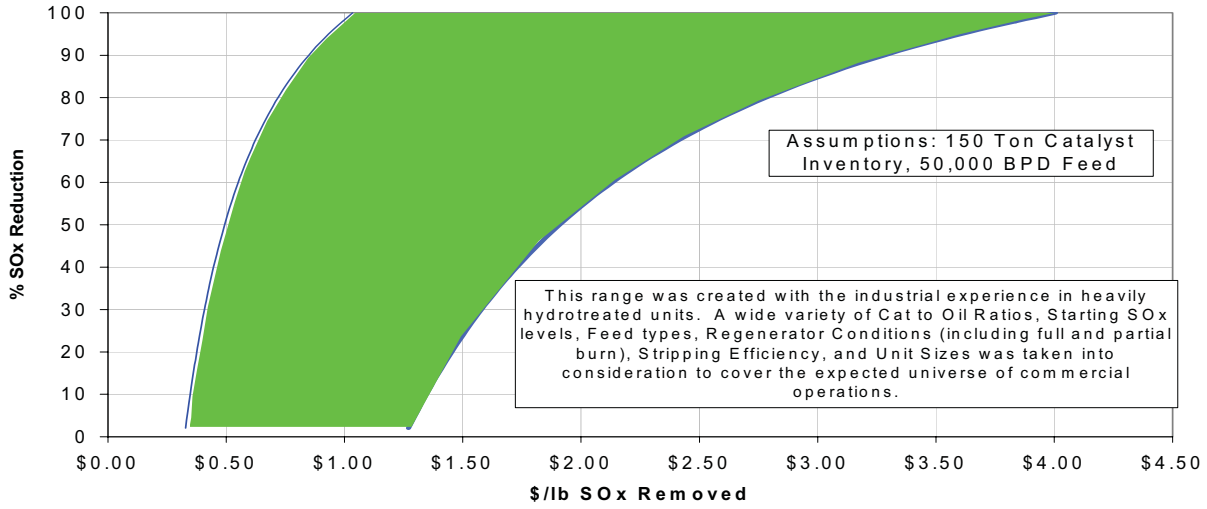
Just recently, a refinery in the District voluntarily conducted a short-term testing with SOx reducing catalysts from September 2008 – December 2008. CEMS was used to continuously measured SOx. Source tests were conducted to measure SOx and PM10. The results indicated that SOx could be reduced to 7 ppmv, 0% O2, without any increase in PM10. A considerable amount of SOx reducing additives was needed throughout this period of time. The short-term testing proceeded without any problems to the FCCU operation. Additional long term testing would be needed however to ensure that a level of 7 ppmv or below was a sustainable level with SOx reducing catalysts.

Costs and Cost Effectiveness for SOx Reducing Catalysts in Literature

Commercial data from Intercat for SOXGETTER® have shown that 85% reduction in SOx, resulting in 50 ppmv emissions, can be achieved with an addition rate of 18 lbs SOx per pound of additive. Decreasing emissions to below 25 ppmv reduced the additive efficiency to below 14 lbs SOx per pound of additive. The concentration of SOXGETTER® required to reduce emissions below 25 ppmv was slightly greater than 5% by weight of the total catalyst inventory. The relative cost increase to reduce emissions from 50 to 25 ppmv was 31%.

Figure 3-2 was built based on a manufacturer's field and laboratory experience with the additives and provided to staff during the development of Rule 1105.1. In this scenario, if 85% reduction is needed to achieve 25 ppmv SOx outlet concentration, the cost effectiveness will be approximately $6,000 per ton SOx removed. [14]

FIGURE 3-2
Efficiency of SOx Reducing Additives



In other references shown in Table 3-6, a range of $500 - $3,000 per ton SOx reduced has been reported in literature.

[14] Staff Report of SCAQMD Rule 1105.1 – Reduction of PM10 and Ammonia Emissions from Fluid Catalytic Cracking Unit, October 9, 2003.

Through the 2008 Survey Questionnaire, the refineries reported that they currently use Intercat SUPER SOXGETTER and Grace Davison SUPERDESOX at a rate of $6 - $8 per pound at an addition rate of 220 lbs/day – 800 lbs/day to the FCCUs.

TABLE 3-6
Cost Effectiveness of SOx Reducing Catalysts

SOx Level	Cost Effectiveness
7 ppmv at 0% O2 (short-term testing)	$18,941 per ton [3]
25 ppmv at 0% O2, 365 day average and 50 ppmv at 0% O2, 7-day rolling average	$500 - $880 per ton [1]
50% reduction from uncontrolled level	$2,000 - $3,000 per ton [2]

3.3.2 Wet Gas Scrubbers

Wet scrubbing is used to control both SOx and particulate. There are two types of wet scrubbing that are typically used for FCCUs, the caustic-based non-regenerative wet scrubbing and the regenerative scrubbing. Both systems can achieve a level of less than 5 ppmv demonstrated at several refineries in the U.S. as shown in Table 3-7.

Non-Regenerative Wet Gas Scrubbers

Non-regenerative wet scrubbing is a proven control technology for many decades and there are many manufacturers in the U.S. Typically, caustic soda (NaOH) is used as the alkaline absorbing reagent for SO2. Other alkaline reagents, such as soda ash and magnesium hydroxide, can also be used. The absorbents capture SO2, and convert SO2 to various types of sulfites and sulfates (NaHSO3, Na2SO3, Na2SO4). Acid mist (H2SO4) is also captured. The sulfites and sulfates are later separated in a purge treatment system and the treated water, free of suspended solids, are either discharged or recycled. One example of the caustic-based non regenerative scrubbing system is the proprietary EDV (Electro Dynamic Venturi) scrubbing system offered by BELCO Technologies Corporation, shown in Figure 3-3.[15, 16]

An EDV scrubbing system consists of three main modules 1) a spray tower module, 2) a filtering module, and 3) a droplet separator module. The flue gas enters the spray tower module, which is an open tower with multiple layers of spray nozzles. The nozzles supply a high density stream of

[15] *Evaluating Wet Scrubbers*, Edwin H. Weaver of BELCO Technologies Corporation, Petroleum Technology Quarterly, Quarter 3, 2006.

[16] *A Logical and Cost Effective Approach for Reducing Refinery FCCU Emissions.* S.T. Eagleson, G. Billemeyer, N. Confuorto, and E. H. Weaver of BELCO, and S. Singhania and N. Singhania of Singhania Technical Services Pvt., India, Presented at PETROTECH 6th International Petroleum Conference in India, January 2005.

caustic water, which travels countercurrent with the gas flow, circles, encompasses, wets, and saturates the flue gas. Multiple stages of liquid/gas absorption occur in the spray tower module. SO2 and acid mist are captured and converted to sulfites and sulfates. Large particles in the flue gas are also removed by impaction with the water droplets.

The flue gas saturated with heavy water droplets continues to move up the wet scrubber to the filtering module. In here, the flue gas reaches super-saturation. Water further condenses and agglomeration of fine particles in the gas stream takes place. The size and mass of the fine particulate in the gas stream continue to increase. The flue gas, super-saturated with heavy water droplets, then enters the droplet separator module. The droplet separator module consists of a bank of parallel spin vanes. The heavy, super-saturated, water droplets impinge on the walls of these spin vanes, and are drained to the bottom of the wet scrubber. The filtering module and the droplet separator modules are important components of the wet scrubber to control fine particulate.

The spent caustic water purged from the wet scrubber is typically processed in a purge treatment shown in Figure 3-4. In the purge treatment unit, a clarifier is used to remove suspended solids which are later disposed. The effluent from the clarifier is oxidized with agitated air. Sulfites are converted to sulfates, and the chemical oxygen demand (COD) is further reduced so that the effluent can be safely discharged to the waste water system.

Regenerative Wet Gas Scrubbers

The regenerative wet gas scrubbing process removes the SO2 from the flue gas with a buffer that can be regenerated. The buffer is sent to a regenerative plant where the SO2 is extracted from the buffer as concentrated SO2. The concentrated SO2 is then sent to a sulfur recovery unit (SRU) to recover sulfur as byproducts, such as liquid SO2, sulfuric acid or elemental sulfur. Where the inlet concentrations of SO2 are high and a significant amount of byproducts can be generated and sold to be used in the fertilizer, chemical, pulp and paper industries, the use of regenerative wet gas scrubber is favored over non-regenerative wet gas scrubber. One example of a regenerative scrubber is the proprietary LABSORB offered by BELCO Technologies Corporation. [17, 18]

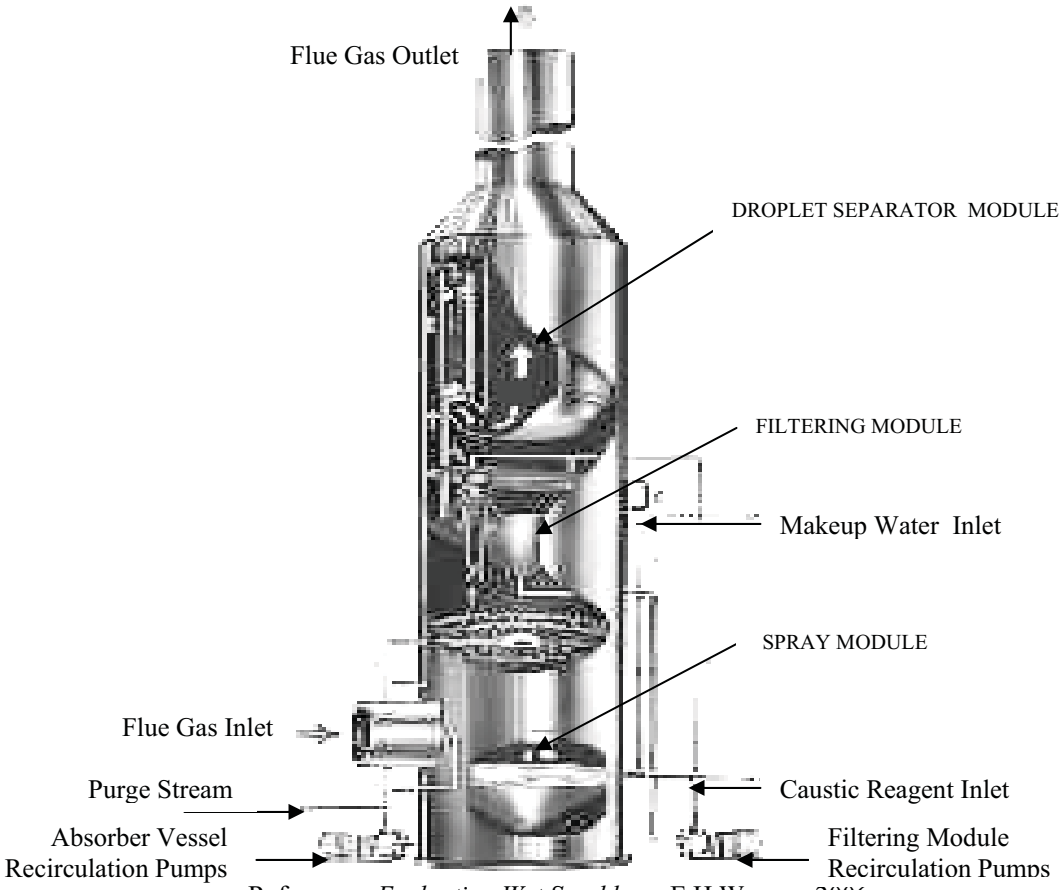
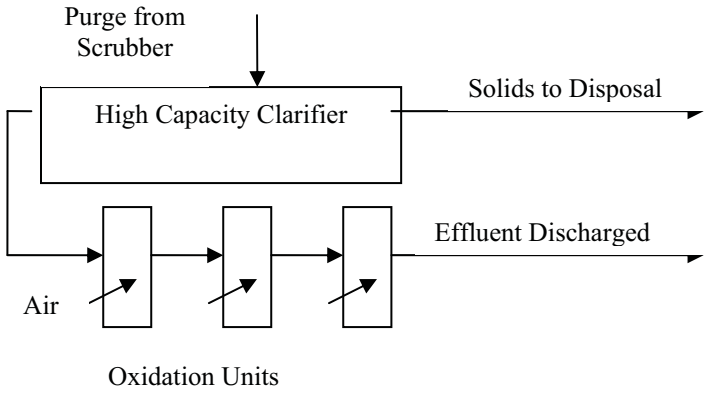
FIGURE 3-3
EDV Non-Regenerative Wet Scrubbing System Developed By BELCO



Reference: *Evaluating Wet Scrubbers*, E.H.Weaver, 2006.

FIGURE 3-4
Purge Treatment System



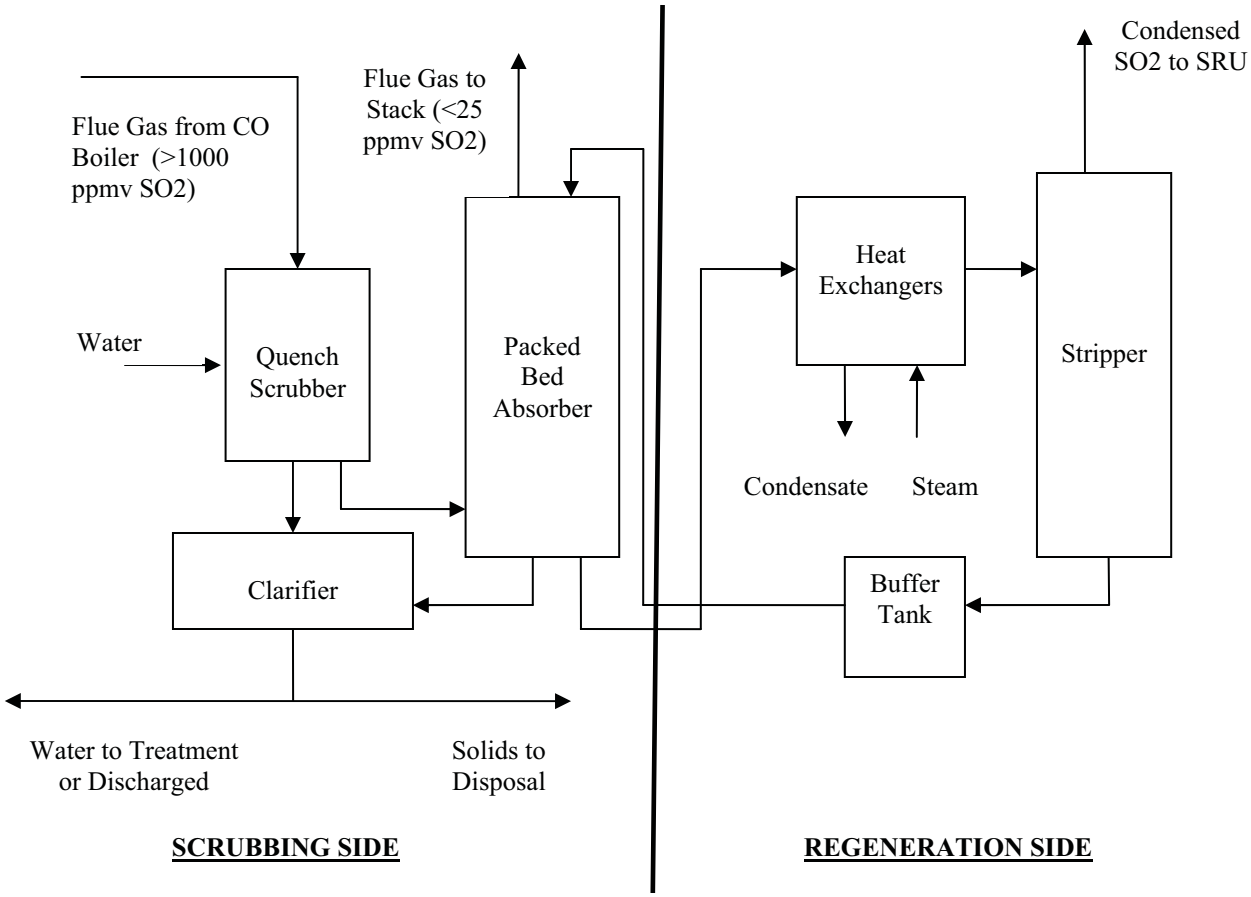
The LABSORB scrubbing process, as shown in Figure 3-5, uses a patented non-organic aqueous solution of sodium phosphate salts as a buffer. This buffer is made from two common available products, caustic and phosphoric acid. The LABSORB scrubbing system is capable of reducing

SOx to 25 ppmv or less. The LABSORP system consists of 1) a quench pre-scrubber, 2) an absorber, and 3) a regeneration section which typically includes a stripper and a heat exchanger.

In the scrubbing side of the regenerative scrubbing system, the quench pre-scrubber is used to wash out the large particles carried over, as well as acid components in the flue gas such as HF, HCl and SO3. The absorption of SO2 is carried out in the absorber. The absorber is typically a single high-efficient packed bed scrubber, packed with high-efficient structural packing materials. In some scenarios, such as when the inlet SO2 concentration is low, a multiple-staged packed bed scrubber, or a spray and plate tower scrubber, is recommended to achieve an outlet concentration of 25 ppmv or less.

In the regenerative side of the regenerative scrubbing system, the SO2-rich buffer stream is first heated by steam to vaporize the water and remove it from the buffer. The buffer stream is then sent to a stripper/condenser to separate the SO2 from the buffer. The buffer free of SO2 is returned to the buffer mixing tank while the condensed-SO2 gas stream is sent back to the SRU for further treatment.

FIGURE 3-5
LABSORB Regenerative Wet Scrubbing System Developed By BELCO



A regenerative wet gas scrubber typically costs more than a non-regenerative unit to install. BELCO Inc. estimated that the capital cost of a regenerative system is about 2.4 times the capital cost of a non-regenerative system, primarily due to the additional complexity of the regenerative wet scrubbing system. However, the regenerative system has a significant advantage in annual operating costs because the alkaline absorbing buffer in the regenerative system can be regenerated, low amount of reagents used in the regenerative system, and the byproducts (e.g. elemental sulfur) can be sold. The annual operating costs of a regenerative system are estimated to be about 35% of the annual operating costs of a non-regenerative system as shown in Table 3-7. Table 3-8 presents an estimate for cost effectiveness of the wet gas scrubber reported in literature, ranging from $500 - $3,000 per ton to achieve 25 ppmv. As shown later, a 5 ppmv and lower level has also been achieved. The consultants and staff's estimated a cost effectiveness of $12,000 - $76,000 per ton to achieve 5 ppmv level as shown in Chapter 12 of this report.

TABLE 3-7
Capital Costs and Annual Operating Costs of Regenerative Wet Gas Scrubbing System

Type of Costs	Percent Of Costs Comparing to Non-Regenerative WGS
Capital Costs:	240% of Non-Regenerative WGS's
Operating Costs:	
Caustic	18%
Power	35%
Make-Up Water	Less than 5%
Water Discharge	Less than 5%
Solids Disposal	Less than 5%
Operating & Maintenance	20%
Steam	10%
Cooling Water	Less than 5%
Phosphoric Acid	5%

TABLE 3-8
Cost Effectiveness for Wet Gas Scrubbers

SOx Achieved Level	Cost Effectiveness
5 ppmv at 0% O2, 365 day average	$12,000 - $76,000 per ton [(2)]
25 ppmv at 0% O2, 365 day average 50 ppmv at 0% O2, 7-day rolling average	$500 - $3,000 per ton [(1)]

Note: 1) *Assessment of Control Options for Petroleum Refineries in the Mid-Atlantic Region – Final Technical Support Document*. Prepared by MACTEC Federal Programs, Inc. for the Mid-Atlantic Regional Air Management Association (MARAMA), January 31, 2007. 2) Refer to the consultants' report for this project. The high end $76,000 per ton was for a refinery that already has the feed extensively hydrotreated to a level slightly above 10 ppmv.

3.4 Achieved-In-Practice Information

As shown in Table 3-9, there is an extensive list of refineries in the U.S. have been installed wet gas scrubbers or use SOx reducing catalysts to meet a typical U.S. EPA current standard of 25 ppmvd SO2 at 0% O2, 365-day rolling average; 50 ppmvd at 0% O2, 7-day rolling average set through various consent decrees since 2001.

TABLE 3-9
SOx Control Technology for FCCUs

Refinery	SOx Limit	Technology	Implementation
Marathon Petroleum Co LLC., Garyville Refinery, Louisiana [1]	25 ppmvd at 0% O2, 365-day rolling average	Wet Gas Scrubber	NA

Equilon, Martinez, CA [3]	25 ppmvd at 0% O2, 365-day rolling average (155,000 barrels per day capacity FCCU)	SOx Reducing Catalysts	2001
Equilon, Anacortes, WA [3]	25 ppmvd at 0% O2, 365-day rolling average (145,000 barrels per day capacity FCCU)	Wet Gas Scrubber	2006
Deer Park Refining, Deer Park, TX [3]	25 ppmvd at 0% O2, 365-day rolling average (340,000 barrels per day capacity FCCU)	Wet Gas Scrubber	2003

Note: 1) The U.S. Environmental Protection Agency RACT/BACT/LAER Clearinghouse; 2) *Assessment of Control Options for Petroleum Refineries in the Mid-Atlantic Region – Final Technical Support Document*. MACTEC Federal Programs, Inc. for Mid-Atlantic Regional Air Management Association (MARAMA), January 31, 2007; 3) *Motiva Enterprises LLC, Equilon Enterprises LLC, and Deer Park Refining Limited Partnership Civil Judicial Settlement,* March 21, 2001; 4) *BP Texas City Site – Texas City, Texas – 2004 Environmental Statement*, June 2005. 5) Valero installed two wet gas scrubbers for the FCCU and fluid coker units continuously achieved 1 ppmv – 2 ppmv SOx, at 0% O2 in the past 2 years.

An extensive study by a refinery in Canada indicates that wet gas scrubbers are commonly used to achieve an emission reduction of 95%, while reducing additives are routinely being used to achieve 85% - 90% reduction. [19] As shown in Table 3-9, it seems that SOx reducing catalysts are typically the choice for FCCUs with average capacity of less than 150,000 barrels feed per day, while wet gas scrubbers are typically the choice for FCCUs with capacity higher than 150,000 barrels per day.

Achieved-In-Practice Information for 5 PPMV Using Wet Gas Scrubbers

In the past several months, District staff contacted many air pollution control agencies throughout the nation to collect the performance information for the FCCU's wet gas scrubbers. Some air pollution control agencies do not require a facility to submit CEMS data, and in this case, the agencies provide staff with source test or RATA information.

To date, staff received the performance data of ten FCCU's wet gas scrubbers. All ten FCCU's wet gas scrubbers achieved a level below 18 ppmv. Six out of the ten FCCUs overly surpassed the performance of a typical wet gas scrubber (i.e., 25 ppmv SO2 ^{at} 0% O2, 365-day rolling average and 50 ppmvd at 0% O2, 7-day rolling average required by the U.S. EPA.) Staff was informed that many facilities choose not to lower the SOx level below the level required by the U.S. EPA. However, lower SOx levels are achievable by scrubbing the flue gases with more caustic solution at a higher pH level. Staff identified six facilities that opted to achieve these lower SOx levels. The resulting emissions from these six outstanding refineries are shown in Table 3-10, which demonstrate that wet gas scrubbers can achieve a level below 5 ppmv at 0% O2 in practice.

[19] *Reducing Refinery SOx Emissions*. E. Butler, K. Groves, J. Hymanyk of Chevron Canada Limited and M. Maholland, P. Clark, and G. Aru of Intercat Inc. Petroleum Technical Quarterly, Quarter 3, 2006.

Lion Oil *El Dorado, AR* (4)	BELCO	2002	2.65 ppmv	Source Test
Placid Refining *Port Allen, LA* (5)	BELCO	2008	< 1 ppmv	Source Test (2/19/09)
Citgo (FCCU-A) *Lake Charles, LA* (5)	BELCO	2005	1.87 ppmv	RATA (9/13 and 9/14/05)

Note:
1) Source test data was conducted in October, 2008. CEMS data was submitted to SCAQMD by the refinery. Concentration was estimated by SCAQMD staff based on the average refinery gas throughputs. CEMS/source test data shown in Appendix C of this report.
2) Telephone conversations and emails between Minh Pham (SCAQMD) and Ravi Rangan of Delaware Department of Natural Resources and Environmental Control (DNREC) between April 2008 and July 2009. Permit for Delaware City Refinery (aka Premcor Refining) is now owned by Valero. Source test and CEMS data provided by DNREC. The unit includes a BELCO pre-scrubber, an amine-based regenerative CANSOLV packed-bed absorber, and a caustic polisher to reduce both SOx and particulate emissions for their FCCU and their fluidized coker unit (FCU). The system for the FCCU is to treat an inlet flow of 442,400 scfm, and 258,200 scfm for FCU. The system is to reduce 97% emissions from FCCU, and 99% emissions from FCU. The systems were in operation since 2006, and continuously achieved levels of 1 ppmv – 2 ppmv SOx, 0% O2. Extensive CEMS data were provided by air quality engineer of Delaware City. The capacity of this refinery FCCU is about twice bigger than the largest refinery FCCU in the District.
3) Telephone conversations and emails between Kevin Orellana (SCAQMD) and Toby Allen of Northwest Clean Air Agency between July and November 2009.
4) Telephone conversations and emails between Kevin Orellana (SCAQMD) and Mary Pettyjohn of Arkansas Department of Environmental Quality in August 2009.
5) Telephone conversations and emails between Kevin Orellana (SCAQMD) and Tim Bergeron of Louisiana Department of Environmental Quality between August and November 2009

3.5 Proposed BARCT Level and Emission Reductions

The consultants (ETS/AEC) recommended a BARCT level of 5 ppmv at 0% O2, 365-day average for all remaining five FCCUs based on the solid achieve-in-practice performance of a wet gas scrubber at the refinery in the District for the past 6 months. The estimated emission reductions and cost effectiveness based on ETS/AEC are shown in Table 3-11

TABLE 3-11
Emission Reductions & Cost Effectiveness Estimates (ETS/AEC)

	Refinery:	1	2	3	4	5	6	Total
Emissions Reduction (tpd)		0.58	0.19	0.28	0.20	0.87	0.94	3.07
	Cost Effectiveness (ETS/AEC)	$14.4k	$76.2k	$36.6k	$42.1k	$11.6k	$12.8k	~~$20.8k~~ $24.6k

Reference: Table EX-1 of ETS/AEC Final Report for Module 3A, April 20, 2009

Since there are at least six refineries in the U.S. successfully operating wet gas scrubbers to achieve a level below 5 ppmv, staff concurred with the consultants' recommendation, and proposed to set BARCT for FCCUs at 5 ppmv, 0% O2, 365-day average. However, because Refinery 2 has heavily treated their FCCU feed to the low 10 ppmv level, installing a wet gas scrubber to get to a level of 5 ppmv is not cost effective ($76 K per ton). Therefore, staff removed the emission reductions and costs associated with this control scenario from its proposal and subsequent analyses. With this refinement, the anticipated emission reductions and weighted average cost effectiveness from this process category are estimated as shown below. Staff hired Norton Engineering Consultants (NEC) to review the cost analyses conducted by ETS/AEC. The cost effectiveness estimated by using NEC recommendations is shown in Table 13-12.

TABLE 3-12
Comparison of Cost Effectiveness
ETS/AEC versus NEC

Refinery:	1	3	4	5	6	Total
Emissions Reduction (tpd)	0.58	0.28	0.20	0.87	0.94	2.88
Cost Effectiveness based on ETS/AEC ($/ton)	$14.4k	$36.6k	$42.1k	$11.6k	$12.8k	$19.6k (Note 3)
Cost Effectiveness based on input from NEC ($/ton)	$15.4k	$41.3-$44.2k (Note 1)	$45.1k	~~$11.6k~~$ 9.4k (Note 2)	$12.8k	$21.2k (Note 3)

Note: 1) The low end of the cost effectiveness reflects the costs of a WGS without additional PM10 control capability and the high end of the cost effectiveness reflects the costs of a WGS with additional PM10 control. 2) In March 2010, Refinery 5 revised the capital cost estimate that they provided to staff from $70 million as shown in their Authority for Expenditures (AFE) to $60 million dollars, and staff revised the cost-effectiveness based on the revised data. 3) The weighted average cost-effectiveness numbers shown here were calculated excluding the costs and emission reductions associated with early reductions, and excluding the costs and emission reductions associated with the cost-ineffective case for Refinery 2.

The proposed BARCT is then equal to approximately 3.25 lbs/thousand barrels feed, ~~77%~~76% reduction from the Tier I level of 13.7 lbs/thousand barrels feed.

Chapter 4 – Refinery Boilers and Heaters

4.1 Process Description

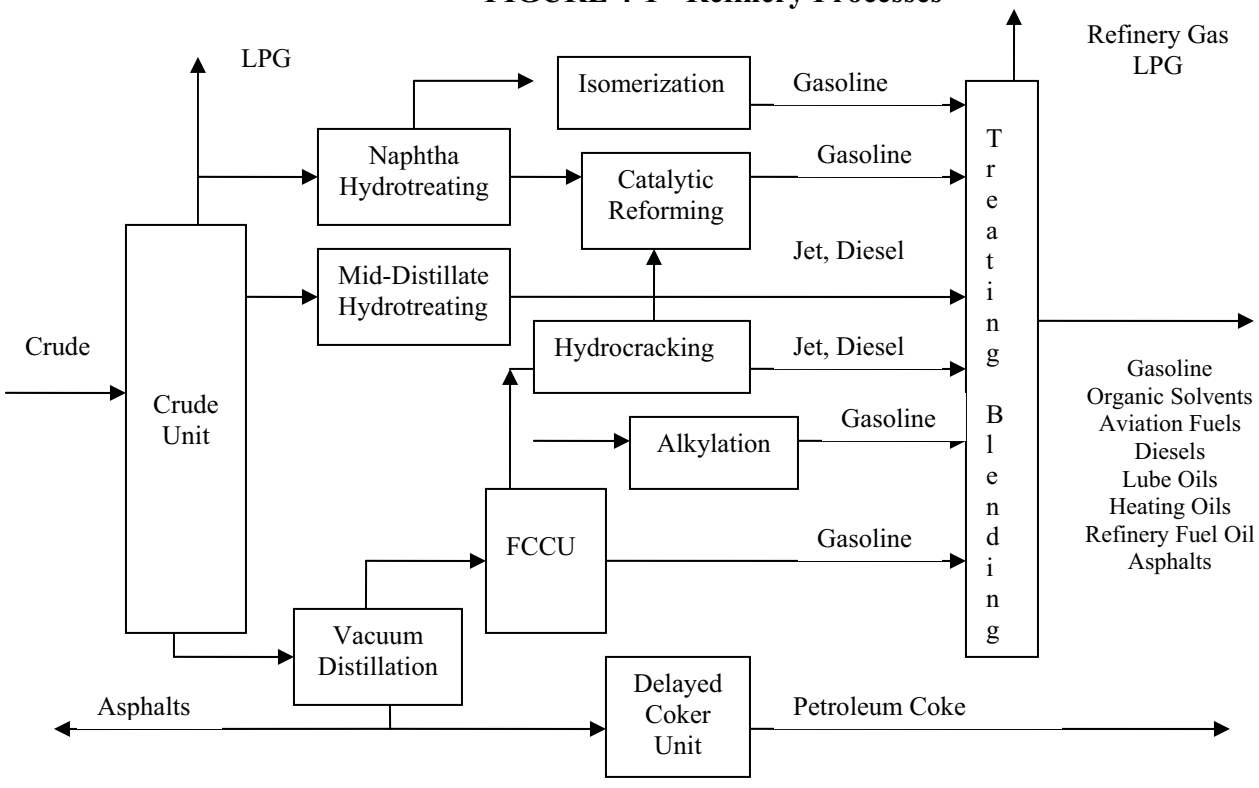
Boilers and heaters are used extensively in almost all of the processes in refinery such as distillation, hydrotreating, fluid catalytic cracking, alkylation, reforming, and delayed coking. Figure 4-1 provides a simplified diagram of the processes where boilers and heaters are used.

The refinery heaters and boilers primarily use refinery gas, one of the products generated at the refinery. As a back-up fuel, most of these boilers and heaters use natural gas. Liquid fuel or solid fuel is rarely used in refinery boilers and heaters. The combustion of sulfur or sulfur compounds in fuel generates sulfur dioxide (SO_2), with a small amount being further oxidized to sulfur trioxide (SO_3):

$$S + O_2 = SO_2$$
$$SO_2 + ½\ O_2 = SO_3$$

There are approximately 300 boilers and heaters in the refineries. The majority (96%) of these boilers and heaters are classified as major SOx sources. Collectively, the boilers and heaters emit about 3 tons per day SOx, ranging from 1 lbs to 498 lbs per day from each source, with SOx outlet concentration ranging from 7 ppmv – 200 ppmv.

FIGURE 4-1 - Refinery Processes



4.2 Current Allocations and Emissions

4.2.1 Allocations

In 1993, all boilers and heaters at the refineries were provided allocations based on the highest reported fuel usage from 1987 to 1992, and an emission factor of 6.76 lbs SOx per million cubic foot of refinery fuel gas. This emission factor was developed based on an assumption that the refinery fuel gas would meet the 40 ppmv standard in Rule 431.1.

TABLE 4-1
SOx Allocations for Refinery Boilers/Heaters

Facility	Emission Factor (lbs/mmcft)	Tier I Allocations (lbs/year)	Tier I Allocations (tons/day)
A	6.76	190,422	0.26
B	6.76	139,918	0.19
C	6.76	73,779	0.10
D	6.76	101,839	0.14
E	6.76	93,315	0.13
F	6.76	49,859	0.07
		Total	**0.89**

4.2.2 Emissions

In calendar year 2005, the refineries reported a total of 3 tons per day SOx emissions from all 300 boilers and heaters currently operated at the refineries. Table 4-2 presents a list of the top 16 emitters in this category which collectively emitted about 1 ton per day of SOx in 2005.

TABLE 4-2
SOx Emissions from Top Emitting Boilers/Heaters

Facility	Device Description	Rating (mmbtu/hr)	2005 Emissions (tons/day)	2006 Emissions (tons/day)	2007 Emissions (tons/day)

Total 16 Heaters (1 Not in Operation)			**0.91**	**0.98**	**1.11**

Note: The 2005 SOx emissions were from SCAQMD database for the period from January 2005 – December 2005. The 2006 and 2007 emissions were reported by the facilities through a Survey Questionnaire distributed by SCAQMD in 2008.

As part of the responses to the 2008 SCAQMD Survey, the refineries reported that the refinery fuel gas is generally hydrotreated with Amine solution to reduce sulfur before being combusted in the refinery heaters and boilers. The sulfur contents in the refinery fuel gas were reported to be in a range of 49 ppmv – 327 ppmv. The SOx concentrations in in the boilers/heaters' stacks vary from 6.5 ppmv – 44 ppmv

4.3 Control Technology

Generally, SOx emissions from boilers and heaters can be further reduced by:

- Using lower sulfur fuels;
- Improving efficiency of fuel gas treating system; and
- Using dry or wet gas scrubbers.

4.3.1 Lower Sulfur Fuels

Currently, many boilers and heaters in the U.S. still use solid fuel or liquid fuel. Solid fuel and liquid fuel typically contain higher sulfur content than refinery fuel gas or natural gas, thus the combustion of solid fuel and liquid fuel generates more NOx and SOx than other types of fuel. Recently, the U.S. EPA has reached various settlement agreements with the refineries to eliminate, or minimize, the use of solid fuel/liquid fuel in all boilers and heaters operated at the refineries.[20, 21] According to these settlement agreements, the use of liquid/solid fuels is only allowed during natural gas curtailment periods.

[20] Motiva Enterprises LLC, Equilon Enterprises LLC, and Deer Park Refining Limited Partnership Civil Judicial Settlement, March 21, 2001.

[21] *BP Exploration & Oil Co., Amoco Oil Comapany, and Atlantic Richfield Company Consent Decree*, Civil No. 2:96CV095RL

In the District, boilers/heaters at the refineries typically use refinery gas as primary fuel, and natural gas as a back-up fuel. Liquid fuel, such as diesel, is typically used in internal combustion engines. Diesel fuel, if used, must contain less than 15 ppmw (0.0015%) of sulfur to comply with the South Coast AQMD Rule 431.2.[22] This requirement is applicable to all non-RECLAIM facilities, as well as RECLAIM facilities, on and after June 1, 2004; however it has not been used to adjust the RECLAIM SOx allocations provided in 1993.

However, it should be noted that the allocations provided for the combustion of diesel/liquid fuel in 1993 were approximately 0.043 tons per day, which was less than 0.5% of the total allocations provided to RECLAIM facilities at that time. In addition, the 2005 emissions from the combustion of diesel/liquid fuel in internal combustion engines are only 729 lbs per year (or 0.001 tons per day) which is only about 0.03% of the total emissions from boilers/heaters that use refinery gas. Because the allocations and the 2005 emissions from the combustion solid/liquid fuel in refineries are negligible compared to those generated from the combustion of refinery gas, staff has chosen not to focus in adjusting the allocations of RECLAIM refineries based on the fact that they are required to comply with low sulfur diesel fuel by 2004 at this time.

4.3.2 Improving Efficiency of Fuel Gas Treating System

At the refinery, refinery fuel gas is treated in various acid gas processing units such as an amine or Merox treating unit for removal of sour components (e.g. hydrogen sulfide, carbonyl sulfide, mercaptan, ammonia). Lean amine is generally used as absorbent. At the end of the process, the lean amine is regenerated to form rich amine, and H2S is evolved as acid gas which is then fed to the SRUs/tail gas treatment as discussed in Chapter 5. By improving the efficiency of the amine treating unit to recover more sulfur from the inlet acid gas stream, the sulfur content of the outlet refinery fuel gas, and subsequently the SOx emissions from boilers and heaters that use these refinery fuel gases can be reduced.

The South Coast AQMD Rule 431.1 limits the sulfur content in the refinery fuel gas to 40 ppmv sulfur.[23] This limit was already incorporated in the RECLAIM allocations and resulted in an emission factor of 6.76 lbs SOx per million cubic feet of refinery gas. However, as shown in Table 4-3, the sulfur content in refinery fuel gas may be further reduced to 25 - 35 ppmv at some refineries in the U.S. The outlet SOx concentrations from boilers/heaters may also be limited to less than 20 ppmv. The costs of modifying an acid gas processing unit may vary widely on a case-by-case basis, therefore staff has chosen not to analyze this control option at this time, and may need to discuss this control option in details with the refineries at a later date.

[22] SCAQMD Rule 431.2 – Sulfur Contents of Liquid Fuels, Amended September 15, 2000.

[23] SCAQMD Rule 431.1 – Sulfur Contents of Gaseous Fuels, Amended June 12, 1998.

TABLE 4-3

4.3.3 Flue Gas Scrubbers

While the first two control options are aiming at reducing the sulfur content of fuel before it is combusted, flue gas scrubbing is aiming at reducing SOx emissions in the flue gas after it exits the boilers and heaters. Literature contains extensive information about these technologies. [24, 25]

[24] *Assessment of Control Options for Petroleum Refineries in the Mid-Atlantic Region – Final Technical Support Document*. Prepared by MACTEC Federal Programs, Inc. for the Mid-Atlantic Regional Air Management Association (MARAMA), January 31, 2007.

[25] Assessment of Control Technology Options for BART-Eligible Sources – Steam Electric Boilers, Industrial Boilers, Cement Plants, and Paper and Pulp Facilities. Northeast States for Coordinated Air Use Management (NESCAUM) in partnership with the Mid-Atlantic Northeast Visibility Union (MANE-VU), March 2005.

4.3.3.1 Dry Scrubbers

Dry scrubbers include 1) spray dryer scrubbers and 2) dry injection scrubbers. In dry scrubbers, a dry calcium and sodium based alkaline powered sorbent is used to absorb SO_2. A spray dryer scrubber refers to a configuration where the reaction between SO_2 and the dry sorbent takes place in a dedicated reactor (or scrubber), whereas in the dry injection scrubber, the sorbent is injected directly into the existing boiler/heater or the ducting system of the boiler/heater.

In the dry scrubbers, high temperatures (1800 – 2000 degree F) are needed to decompose the sorbent into porous solids with high adsorbing surface area. Several injection ports may be required for even distribution of dry sorbent in the boilers/heaters or ductwork. Cyclones and ESPs are typically used downstream of a dry scrubber to remove the particulate formed in the process. Dry injection scrubbers can achieve about 50% - 80% removal efficiency, whereas spray dryer scrubbers can achieve about 80% – 90%. Dry scrubbers are mostly applicable to small and medium size boilers/heaters with low level of inlet SOx.

4.3.3.2 Wet Scrubbers

In wet scrubbers, aqueous slurry of limestone, lime, or other proprietary sorbent is used to absorb SO_2. A wet scrubber includes a spray tower which is generally followed by a mist eliminator. The flue gas enters a spray tower, where it is impacted with aqueous lime or limestone slurry for SO_2 absorption. Particulate formed in the spray tower falls to the bottom of the spray tower, where it is collected and recycled back to the scrubber system or disposed. The scrubbed flue gas is then sent to a mist-eliminator to remove any entrained particulate droplets. Wet scrubbers are about 90% - 98% efficiency in removing SOx depending on the type of sorbent used.

As discussed in Chapter 3, Section 3.3.2, wet scrubbers are used extensively to control SOx and PM from FCCUs at several refineries in the U.S. A wet scrubber designed by BELCO includes a spray module with two additional modules, a filtering module and a droplet separator module, to remove fine particulate. This scrubber has been used to achieve an outlet concentration of 25 ppmv of SOx from FCCUs. Boilers/heaters are expected to achieve a level of 20 ppmv or lower as shown in Table 4-3.

4.3.3.3 Costs and Cost Effectiveness

Cost effectiveness for wet gas scrubbers has been estimated to be $7,700 - $45,400 per ton depending on the size of the scrubbers, inlet SOx, and amount of emissions reduced. [26] Using a wet gas scrubber may allow the refinery to combust higher sulfur fuel; and since higher sulfur

[26] *Assessment of Control Options for Petroleum Refineries in the Mid-Atlantic Region – Final Technical Support Document*. Prepared by MACTEC Federal Programs, Inc. for the Mid-Atlantic Regional Air Management Association (MARAMA), January 2007.

fuel costs less than low sulfur fuel, this can result in a savings in annual operating costs. BELCO estimated that using an EDV® wet gas scrubber with caustic soda (NaOH) as a scrubbing agent for a 198 mmbtu/hr vacuum distillation process heater burning high sulfur fuel of 150 ppmv – 200 ppmv could generate a saving of $1 - $2.8 million dollars per year.[27]

TABLE 4-4
Cost Effectiveness for Wet Scrubbers

Efficiency	Cost Effectiveness
90-99.9%	$7,700 - $45,400 per ton
99%+	$1 - $2.8 million dollars annual savings for a 198 mmbtu/hr heater

4.4 Proposed BARCT Level and Emission Reductions

For refinery boilers/heaters, the consultants studied the technologies for pre-treatment of fuel gas prior to combustion, as well as the technologies for post-treatment of flue gas after combustion. Regarding the pre-treatment of fuel gas prior to combustion, the consultants recommended that the Tier I BARCT of 40 ppmv total sulfur in refinery fuel gas be retained as BARCT. Regarding the post-treatment of flue gas from boilers/heaters after combustion, the consultants found that the wet gas scrubbers were not cost-effective. Nonetheless, the consultants found that the fuel gas at some refineries can be further reduced to the Tier I BARCT which results in about 0.89 tons per day emission reductions from the 2005 baseline. Staff concurred with the consultants' recommendation on keeping BARCT at 40 ppmv.

[27] *Controlling Fired Process Heater Emissions to Reduce Fuel Costs and Improve Air Quality,* S.T. Eagleson and N. Confuorto of BELCO, S.Singhania and N. Singhania of Singhania Technical Services Pvt., and R. John of Lisha Engineering Co., Presented in the Petrotech 7th International Oil & Gas Conference, January 24, 2007

Chapter 5 – Sulfur Recovery – Tail Gas Units

5.1 Process Description

A typical sulfur recovery system at the refineries include a sulfur recovery unit (Claus unit) followed by a tail gas treatment unit (e.g. Amine treating) to maximize the removal of H_2S.

The Claus sulfur recovery unit, as shown in Figure 5-1, consists of a reactor, converters and condensers. The two reactions proceed in the Claus sulfur recovery unit are exothermic. The first reaction occurs in the Claus reactor, where a portion of H_2S reacts with air to form SO_2.

$$2H_2S + 2O_2 \rightarrow SO_2 + S + 2H_20$$

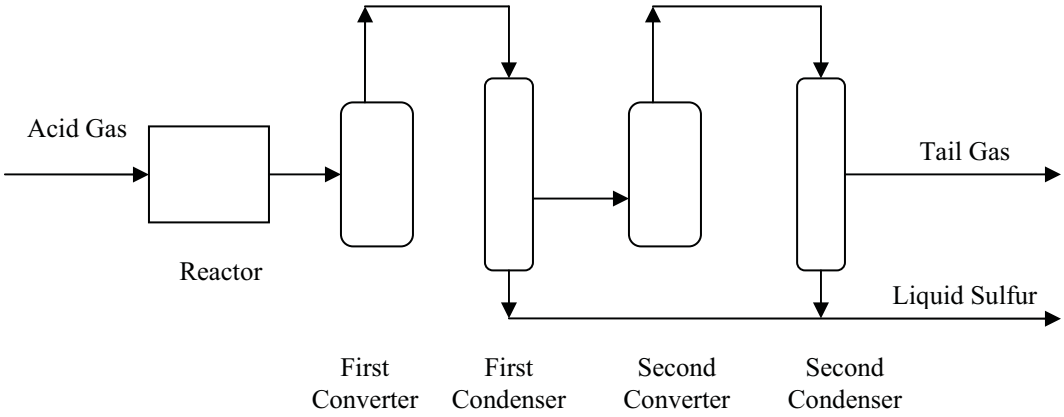
The second reaction takes place in the catalytic converter where SO_2 reacts with H_2S to form liquid elemental sulfur.

$$2H_2S + SO_2 \rightarrow 3S + 2H_20$$

Side reactions also occur which produce carbonyl sulfide (COS) and carbon disulfide (CS_2), which have presented problems in many Claus plant operations due to the fact that they cannot be easily converted to elemental sulfur and carbon dioxide,

Liquid sulfur is recovered after the final condenser. Two converters and two condensers in series generally remove 95% of the sulfur in the incoming acid gas. Some of the newer sulfur recovery units have three to four sets of converters and condensers.

FIGURE 5-1
Two Stage Claus Sulfur Recovery Process



To recover the remaining sulfur compounds in the tail gas, the tail gas is sent to a tail gas treatment process, such as amine, diethanol amine (DEA), SCOT, Wellman-Lord, and FLEXSORB.

Figure 5-2 shows a simplified diagram of SCOT tail gas treatment process. The sulfur compounds in the tail gas are reduced in a catalytic reactor to H_2S. The H_2S is absorbed in the amine (or other absorbent) in the H_2S absorber, steam-stripped from the absorbent solution in the H_2S stripper, concentrated, and recycled back to the front end of the sulfur recovery unit This approach typically increases the overall sulfur recovery efficiency of the Claus unit to 99.8% or higher. However, the fresh acid gas feed rate to the sulfur recovery unit is reduced by the amount of recycled stream, which reduces the capacity of the sulfur recovery unit. The residual H_2S in the treated gas from the absorber is typically vented to a thermal oxidizer where it is oxidized to SO_2 before emitting to the atmosphere.

FIGURE 5-2
Tail Gas Treatment – SCOT Process

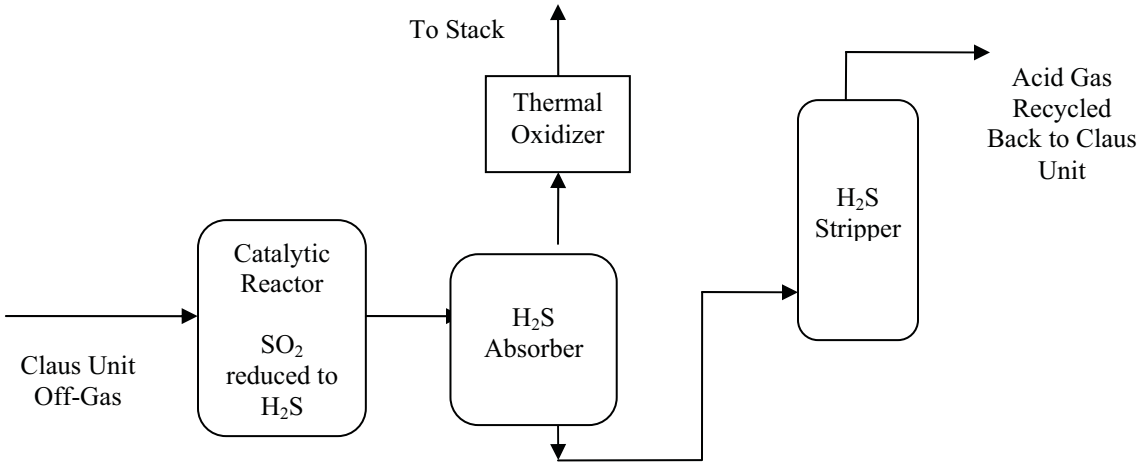


Figure 5-3 shows a simplified diagram of Wellman-Lord tail gas treatment process. The sulfur compounds in the tail gas are first incinerated with air to oxidize to SO_2. After the incinerator, the tail gas enters a SO_2 absorber, where the SO_2 is absorbed in typically sodium sulfite (Na_2SO_3) solution to form sodium bisulfite ($NaHSO_3$) and sodium pyrosulfate ($Na_2S_2O_5$). The absorbent rich in SO_2 is then stripped, and the SO_2 is recycled back to the Claus gas. The residual sulfur compounds in the treated tail gas from the SO_2 absorber is typically vented to a thermal oxidizer where it is oxidized to SO_2 before emitting to the atmosphere.

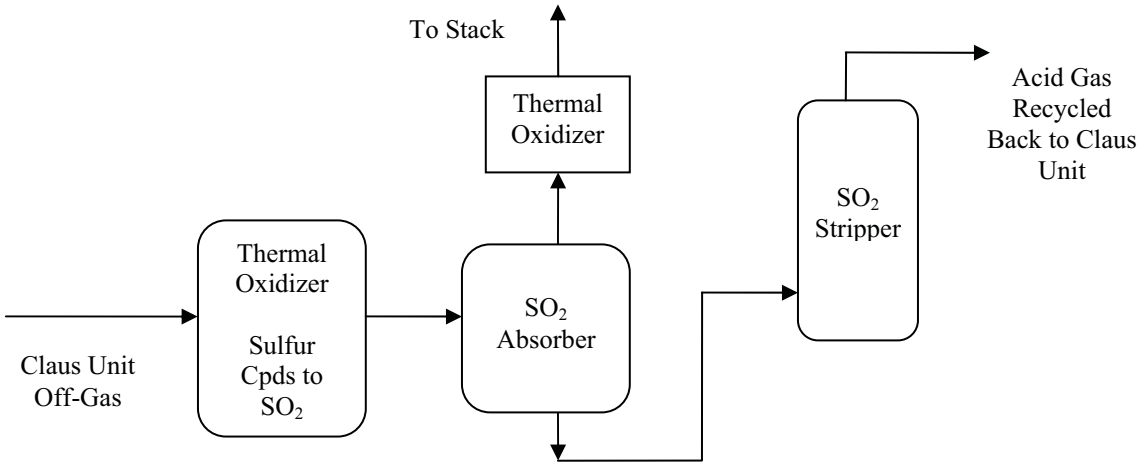
FIGURE 5-3
Tail Gas Treatment - Wellman-Lord Process



5.2 Current Allocations and Emissions

5.2.1 Allocations

In 1993, the facilities were issued emission allocations for their sulfur recovery - tail gas treatment unit based on the highest reported emissions from 1988 – 1992. The emissions allocated to each unit are listed in Table 5-1. The total Tier I allocations provided were 1.61 tons per day.

TABLE 5-1
SOx Allocations for Sulfur Recovery -Tail Gas Treatment Units

Facility	Process	Peak Year	Tier I Allocations (lbs/year)	Tier I Allocations (tons/day)
B	Tail Gas Unit	1990	353,992	0.48
A	Inorganic Chemicals	1992	280,670	0.38
A	Sour Water Oxidizer	1992	2,328	0.00
A	Sulfur Plant	1992	65,341	0.09
A	Tail Gas Unit	1992	31,343	0.04
D	KCR Process	1992	6,904	0.01
D	Merox Process	1992	1,599	0.00

TABLE 5-1 (Continued)
SOx Allocations for Sulfur Recovery -Tail Gas Treatment Units

Facility	Process	Peak Year	Tier I Allocations (lbs/year)	Tier I Allocations (tons/day)
D	Tail Gas Unit	1992	6,008	0.01
D	Tail Gas Unit	1992	50,587	0.07
G	Tail Gas Unit	1991	14,934	0.02

C	Tail Gas Unit	1988	6,500	0.01
E	Mericher Alkyd Feed	1991	250,983	0.34
			Total	**1.61**

5.2.2 Emissions

Since sulfur recovery - tail gas treatment unit with thermal oxidizers are classified as major sources in RECLAIM, the SOx emissions from these units are monitored with CEMS and reported on a daily basis to the District. The total annual emissions for 2005, 2006, and 2007, 0.96 tpd, 1.02 tpd and 0.96 tpd respectively from these units are presented in Table 5-2.

The sulfur recovery - tail gas treatment units at RECLAIM facilities are not subject to any specific concentration or emission rate standards. RECLAIM facilities are given the flexibilities to operate their equipment anyway they want provided that the total emissions from the facility are below facility emission caps. The allocations provided to these units since 1993 have not been adjusted even though there may have emerging technologies that can be used to further reduce SOx emissions from these units. Comparing the allocations provided in 1993 at 1.61 tons per day with the 2005 reported emissions at 0.96 tons per day, it seems that the sulfur recovery - tail gas treatment units at RECLAIM facilities have been slightly improved since 1993 provided that their capacity has not been changed.

Through the 2008 Survey, the refineries reported that their SRUs' capacity ranges from 90 long tons per day – 270 long tons per day. The refineries have been using more than one Claus units with the technologies such as SUPERCLAUS, FLEXSORB, or WELLMAN LORD to recover approximately 95% - 99.99% sulfur in their SRUs and tail gas treatment. All six refineries have thermal oxidizers at the end of their tail gas treatment units. A refinery reported that they would only vent the tail gas to incinerators when needed to meet the requirement of NSPS 40 CFR Part 60, Subpart J. The stack average SOx concentrations at the outlet of the thermal oxidizers vary widely from 20 ppmv at 0% O2 for Refinery E, 26 ppmv for Refinery D, 59 ppmv – 77 ppmv for Refinery A, 98 ppmv – 150 ppmv for Refinery B, and 98 ppmv for Refinery F

TABLE 5-2
SOx Emissions from Sulfur Recovery – Tail Gas Treatment Units

Facility	Device Description	Rating (mmbtu/hr)	2005 Emissions (tons/day)	2006 Emissions (tons/day)	2007 Emissions (tons/day)

			1.03	**1.02**	**0.96**

Note: The 2005 SOx emissions were from SCAQMD database for the period from January 2005 – December 2005. The 2006 and 2007 emissions were reported by the facilities through a Survey Questionnaire distributed by SCAQMD in 2008.

5.3 Control Technology

The main purpose of the Claus sulfur recovery - tail gas treatment units is to recover sulfur. Afterwards, the treated gas is vented to a thermal oxidizer to oxidize the remaining H_2S. The Claus sulfur recovery, tail gas treatment and thermal oxidizer systems in the District generally have recovery efficiency of about 95% - 99.99% to meet NSPS 40 CFR Part 60, Subpart J limit and SCAQMD Rule 468 limit (e.g. 250 ppmv SO_2 with the use of thermal oxidizers, or 10 ppmv H_2S without the use of thermal oxidizers). The three main strategies that can be employed to further reduce SO_2 emissions from these units are 1) to increase the efficiency of the sulfur recovery unit, 2) to improve the efficiency of the tail gas treatment processes, and 3) to use a wet gas scrubber as an alternative for the thermal oxidizer.

5.3.1 Increase Efficiency of the Sulfur Recovery Unit

5.3.1.1 SELECTOX

The SELECTOX catalyst is used in the first stage of the Claus unit to promote the oxidation of H_2S to SO_2 without the use of a flame. SELECTOX catalyst has helped to increase the efficiency of sulfur recovery unit from 90% to 97%. SELECTOX has been used in San Joaquin

Refinery located in Bakersfield, California. [28] Other catalysts such as Criterion catalysts have been used to increase the sulfur recovery efficiency from a typical 96% - 97% to 99.8% - 99.9%. Testing on the tail gas unit at the Motiva Enterprises' Port Arthur refinery demonstrated that the stack SO_2 remained in the 22 ppmv – 28 ppmv range, which was only about 10% of the permitted maximum 250 ppmv required by NSPS, 40 CFR Part J. [29]

5.3.1.2 SUPER-CLAUS®

The SUPERCLAUS sulfur recovery unit is similar to the Claus unit but contains three to four catalytic converters. The first two or three catalytic converters use the Claus catalysts, while the last reactor uses a selective oxidation catalyst that highly selective and oxidize H_2S to sulfur. The efficiency of sulfur recovery is about 99%.

5.3.2 Increase Efficiency of Tail Gas Unit

5.3.2.1 SCOT Tail Gas Unit

SCOT stands for Shell Claus Off-gas Treating, which is the most common tail gas treatment system. Tail gas from the Claus unit is contacted with hydrogen and reduced in the hydrotreating reactor to form H_2S and water in the presence of a cobalt/molybdenum or alumina catalyst. The gas is then cooled and enters an amine absorber where it is contacted with monoethanolamine (MEA) or diethanolamine (DEA), or triethanolamine (TEA) to generate a rich amine stream. The rich amine stream is then desorbed in a stripper, where a lean amine stream is regenerated and recycled to the absorber, while and H_2S gas stream is sent back to the Claus unit. This technology has been used by several refineries in the District as reported through the 2008 Survey.

5.3.2.2 Sulfreen Tail Gas Unit

The Sulfreen process is a catalytic tail gas process that adds two or three Sulfreen reactors to treat the tail gas. Alumina catalyst is used to remove additional sulfur. Activated titanium oxide is used to remove COS and CS_2. Any remaining H_2S leaves the reactors are oxidized in the final stage. The recovering efficiency of the Sulfreen process is 99 – 99.9%.

5.3.2.3 Beaven Process

The Beaven process uses quinine solution to absorb H_2S in the tail gas. The absorbed H_2S is then oxidized to form a mixture of elemental sulfur and hydroquinone. Hydroquinone is

[28] *Sulfur Technology, Capability and Experience.* WorleyParsons.

[29] *Catalysts for Lower Temperature Tail Gas Unit Operation.* S. Massie and C. Wilson of Criterion Catalysts & Technologies, presented at the Brimstone Sulfur Recovery Symposium, Vail, Colorado, September 2005.

converted back to quinone. Before entering the absorber, COS and CS_2 in the tail gas can also be eliminated by the use of cobalt molybdate catalyst in a reactor located prior to the absorber. The recovering efficiency of the Beaven process is 99% – 99.9%.

5.3.2.4 Stretford Process

The Stretford process uses a hydrotreating reactor to convert SO_2 in the tail gas to H_2S, and then contacts H_2S with Stretford solution in a liquid-gas absorber. The Stretford solution contains a mixture of vanadium salt, anthraquinone disulfonic acid (ADA), sodium carbonate, and sodium hydroxide. The vanadium salt acts as a catalyst to convert H_2S into elemental sulfur. The recovering efficiency of the Stretford process is about 99%.

5.3.2.5 FLEXSORB ®

The FLEXSORB process were developed by the ExxonMobil Research and Engineering as alternative to the MDEA amine treatment process. The process uses a number of FLEXSORB solvents include the SE, SE Plus, SE hybrid, and the PS solvents. The solvents are designed to selectively absorb and convert H_2S, organic sulfur to elemental sulfur. The efficiency of FLEXSORB is about 99.9+%. This technology has been used by one refinery in the District as reported through the 2008 SCAQMD Survey.

5.3.2.6 PRO-Claus

The Parsons RedOx Claus (PROClaus) unit is a dry catalytic process that contains three additional stages, a reduction and two oxidation stages. In a reduction stage, a highly selective SO2 reduction catalyst developed by Lawrence Berkeley National Laboratory is used to accelerate the reduction of SO_2 to elemental sulfur. After this stage, the remaining H_2S is oxidized to form elemental sulfur under the presence of a Parsons Hi-Activity selective oxidation catalyst, and then it is sent to a thermal oxidizer to complete the oxidation process. An overall sulfur recovery efficiency of all three stages is 99.5%.

5.3.2.7 LO-CAT

LO-CAT is a liquid redox tail gas treatment capable of recovering 99.9+% with or with the use of a proprietary Mobile Bed Absorber (MBA) where H_2S and SO_2 are absorbed into a circulating solution and converted to elemental sulfur in the presence of a chelated-iron catalyst. The solution leaving the MBA is then oxidized. Exhaust gas from the MBA is vented to the atmosphere and contains less than 10 ppmv H_2S.

Table 5-3 provides a summary of the processes described above.

TABLE 5-3
Control Efficiency of Sulfur Recovery – Tail Gas Treatment Process

Process	Efficiency
Typical Claus with tail gas treatment and incinerators	90% - 95% (<250 ppmv)
Selectox catalyst for Claus Unit	97%
SUPERCLAUS® for Claus Unit	99%
SCOT for Tail Gas Treatment	99%
Sulfreen for Tail Gas Treatment	99% - 99.9+%
Beaven for Tail Gas Treatment	99% - 99.9+%
Stretford Tail Gas Treatment	99%
FLEXSORB Tail Gas Treatment	99.9+%
PRO-Claus Tail Gas Treatment	99.5%
LO-CAT Tail Gas Treatment	99.9+%

5.3.3 Wet Gas Scrubber

As described above, typically in the District, the tail gas from the Claus sulfur recovery unit is sent to an amine treatment process, which absorbs H_2S, produces a concentrated H_2S stream, and recycles the concentrated H_2S stream to the front end of the SRU. The residual H_2S in the treated gas is typically vented to a thermal oxidizer where H2S is oxidized to SO_2 before emitting to the atmosphere. This approach typically increases the overall sulfur recovery efficiency of the Claus sulfur recovery unit; however has the tendency to reduce the amount of fresh acid gas stream that could potentially be treated by the Claus sulfur recovery unit.

As an alternative to this process, the tail gas from the Claus unit is first oxidized to SO_2. The SO_2 is then captured by alkaline agent (e.g. sodium hydroxide caustic solution) in a wet gas scrubber, and the residual SO_2 not captured in the scrubber is discharged to the atmosphere. With this approach, there is no concentrated H_2S stream recycles to the front end of the SRU, and the overall sulfur recovery/removal efficiency is increased to 99.95%, above the efficiency of the current Claus SRU-Tail Gas Treatment systems in the District. [30] Two types of wet gas scrubbers that have been installed and used by the refineries in the U.S. are described in details below.

[30] *Improving Sulfur Recovery Units*, E. Juno of Sinclair Oil Corporation, S.F. Myer and C. Kulczycki of MECS, and N. Watts of CEntry Constructors and Engineers, Petroleum Technical Quarterly, Quarter 3 of 2006.

5.3.3.1 DynaWave Non-Regenerative Scrubber

Wet gas scrubbing technique is currently used at two refineries in Wyoming, the Sinclair Oil refinery, rated 72,000 barrels per day, and the Casper refinery, rated at 22,500 barrels per day. The scrubbers used at these two refineries are manufactured by DynaWave and use caustic (NaOH) as a scrubbing agent.

DynaWave scrubber can utilize other sodium based agents such as soda ash (Na_2CO_3), or calcium based agents such as lime (CaO) or limestone ($CaCO_3$), however Sinclair Oil refinery and Casper refinery have selected caustic (NaOH) because:

- Caustic was available as a 50% solution which could be pumped directly to the scrubber without further dilution or mixing. Soda ash or calcium based agents are only readily available as a powder and they would require an installation of a reagent preparation station.

- The reaction between SO_2 and caustic (NaOH) are relatively fast compared to the reaction of SO_2 with calcium based reagents. The products, sodium sulfite ($NaHSO_3$) or sodium bisulfite salts (Na_2SO_3) accumulated in the waste water stream, are soluble and can be further oxidized to reduce the COD in the waste stream to the level acceptable to the municipal wastewater treatment plant. In contrast, the products calcium sulfite ($CaSO_3$) or calcium sulfate ($CaSO_4$, aka gypsum) of the reaction between SO_2 and calcium based agents are insoluble salts which are not easily removed from the scrubber solution.

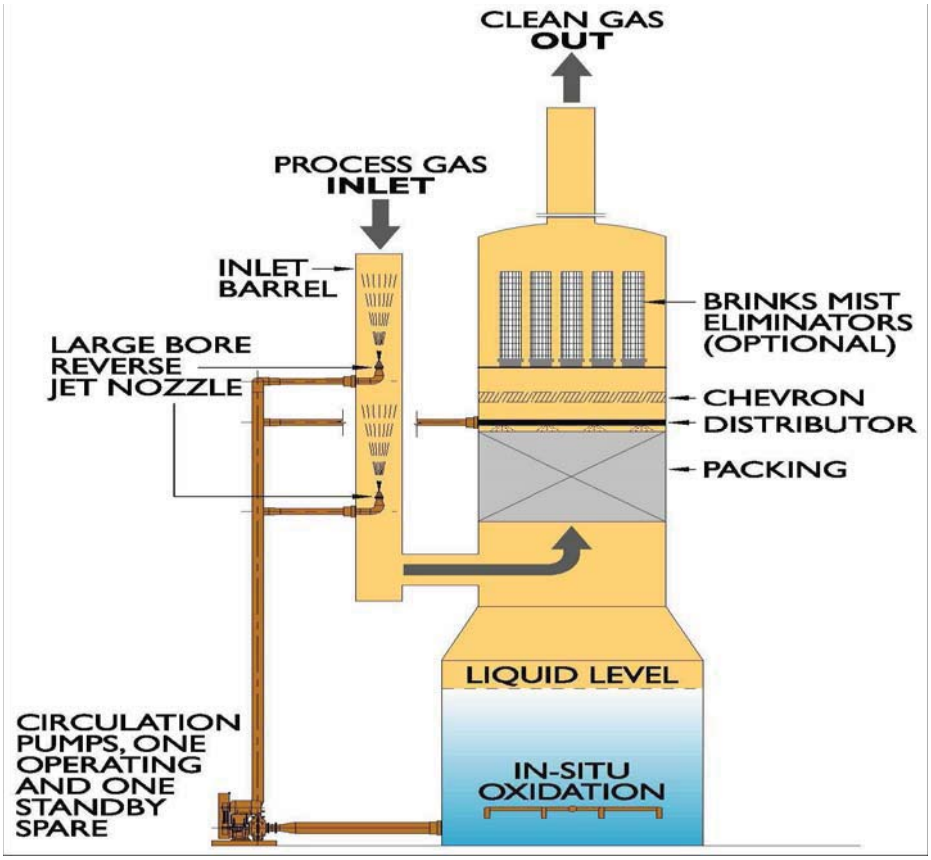
Using caustic solution as a scrubbing agent has helped the refineries to save on capital costs and annual operating costs, and improve the removal efficiency and operability of the system.

Most DynaWave scrubbers contain two stages of scrubbing, or froth zones, in the inlet barrel, as shown in Figure 5-4. In the first scrubbing stage, the inlet process gas is adiabatically saturated or "quenched". The gas exits the first scrubbing stage at 150 – 180 degree F and passes through the second scrubbing stage. In the second stage, caustic liquid agent is again injected upward into the incoming gas. The SO2 is absorbed, and reacts with the caustic agent, forming sodium by products, sodium sulfite and sodium bisulfite salts.

The reverse jet nozzles, located in the inlet barrel and used to inject the caustic reagent, is a proprietary piece of equipment supplied by Monsanto Enviro-Chem System (MECS) which is very critical to the scrubber application. A relatively large volume of scrubbing liquid is injected counter to the gas flow to create a froth zone. The gas collides with the liquid, forcing the liquid toward the wall. A standing wave, created at the point the liquid is reversed by the gas, is an extremely turbulent region. In this turbulent region, the gas absorption and particulate collection is enhanced significantly.

If the SO_2 concentration in the inlet gas stream is high, Dynaware will include a third stage scrubbing consisting of 2-inch diameter metal packing rings added to further increase the gas/liquid absorption. The liquid agent circulated to the third stage scrubbing can be turned off when it is not needed.

FIGURE 5-4
DynaWave Wet Gas Scrubber Used for Sulfur Recovery Tail Gas Treatment Unit



After passing through the third scrubbing stage, the air stream will pass through a set of chevrons which are used to maximize the liquid droplet removal. Liquid droplets disengage from the gas stream and accumulate in the bottom of the vessel. The bottom of the vessel is also used as a reservoir for the scrubber solution which ensures continuous feed to the recirculation pumps. Sulfite salts are also oxidized to sulfates in the reservoir. In addition to DynaWave scrubber, particulate filters, ESPs, or mist eliminators can be used downstream of the wet scrubber to remove fine particulates.

5.3.3.2 Cansolv® Regenerative Scrubber

Development of the Cansolv technology started in 1988 and begun by Union Carbide Canada Ltd.. Since then, it has been used commercially to control SO2 from sulfur recovery units, sulfuric acid plants, cogeneration units, and power plant boilers. In California, the Cansolv technology has also been used to control SOx emitted from a sulfuric acid plant at an oil refinery since September 2002. The Cansolv scrubber also has been installed and operated since July 2006 to control SOx from a sulfur recovery - tail gas application at BP Cherry Point refinery. The project was developed by Marsulex Inc. and is subject to an annual mass limit of 135 tons per year which can be translated to 150 ppmv SOx.[31] Cansolv advertises that their regenerative scrubber can be designed to achieve 10 ppmv SO2. [32, 33, 34]

5.4 Performance Information

The existing performance levels of the sulfur recovery units in the District reported by the facilities through the 2008 Survey are listed in Table 5-4. The SOx concentrations at the stack of the thermal oxidizers vary widely from 17 ppmv – 150 ppmv.

TABLE 5-4
Performance of SRU-Tail Gas Treatment in SCAQMD

Facility	% Sulfur Recovery	SOx Level
A	99.9%-99.99%	59 ppmv – 77 ppmv from thermal oxidizer
B	90%	98 ppmv – 150 ppmv from thermal oxidizer
C	---	17 ppmv – 56 ppmv from thermal oxidizer
D	99.9%	26 ppmv from thermal oxidizer
E	96%	20 ppmv from thermal oxidizer
F	99.5%	98 ppmv from thermal oxidizer
		<3 ppmv H2S outlet of tail gas treatment unit

The performance of several recent sulfur recovery units operated by the refineries located outside of the SCAQMD is shown in Table 5-5. The units were designed to meet 99%-99.9% sulfur recovery efficiency.

[31] According to the *2nd Round of Comments on RECLAIM SOx Shave Staff Report Part I*, dated July 1, 2008, the unit is designed to meet less than 200 ppmv, 12-hour rolling average, which is the limit of NSPS Subpart J/Ja. The unit has a mass limit of 135 tons per year, which can be translated to 150 ppmv SOx. The system was started in July 2006, was in operation for about 4 months, was shutdown due to equipment problems outside of the Cansolv system, and is currently not in operation.

TABLE 5-5
Performance of Sulfur Recovery – Tail Gas Treatment Unit

Company	Source	SOx Standard
Arizona Clean Fuels Yuma LLC, Yuma AZ (1)	SRU - Tail Gas (Amine) Unit - Sour Water Stripper	99.97% sulfur recovery efficiency
BP, Texas City, Texas (2)	SRU	99% sulfur recovery. All refinery fuel gas is scrubbed to remove sulfur. Significant reductions by routing vent streams from the SRU to the front end of the SRU, to recover additional sulfur instead of combusting sulfur to SO2.
Shell Martinez, Contra Costa County, Bay Area (3)	SRU SCOT and tail gas thermal oxidizer	Limit at 50 ppmv at 0% O2. Test showed 13 ppmv SO2 and <0.1 ppmv H2S at 0% O2.
Marathon Petroleum Garyville Refinery, Louisiana (1)	SRU with thermal oxidizers and oxygen enrichment	93 ppmvd SO2 at 0% excess air, 99.9% sulfur recovery, 99.5% thermal oxidizer efficiency

Note: 1) The U.S. Environmental Protection Agency RACT/BACT/LAER Clearinghouse; 2) *BP Texas City Site – Texas City, Texas – 2004 Environmental Statement*, June 2005; 3) CARB BACT Clearinghouse.

Wet gas scrubbing technique is currently used at two refineries in Wyoming, the Sinclair Oil refinery and the Casper refinery since 2004. Results of a full scale testing at Sinclair refinery in November 2005 are shown in Table 5-4. The system was proven to be 99.99% in sulfur removal efficiency and resulted in SO2 outlet concentrations below 0.5 ppmv. In January 2005, Sinclair Oil Corporation decided to install a third DynaWave scrubber at its Tula refinery which has already started up in 2006. The most recent 6-months CEMS data provided to the District by the Wyoming air quality control office confirmed the achieved-in-practice performance for the DynaWave wet gas scrubbers at the level below 5 ppmv.

TABLE 5-6
Full-Scale Performance of DynaWave Non-regenerative Scrubber for Sulfur Recovery Unit at Sinclair Refinery

	Run 1	Run 2	Run 3	Average
SO2 inlet, lbs/hr	276.10	259.13	249.50	261.58
SO2 outlet, lbs/hr	0.01	0.01	0.01	0.01
SO2 outlet, ppmv	0.31	0.31	0.31	0.31
SO2, % Removal	99.99	99.99	99.99	99.99

Note: Based on EPA Source Test Method 6. The 0.31 ppmv is the lowest detection level for stack testing. From *Improving Sulfur Recovery Units*, E. Juno of Sinclair Oil Corporation, S.F. Myer and C. Kulczycki of MECS, and N. Watts of CEntry Constructors and Engineers, Petroleum Technical Quarterly, Quarter 3 of 2006.

5.5 BARCT Level and Emission Reductions

Through the data provided to the consultants, there was one refinery regularly vented the flue gas to the atmosphere, and the remaining refineries treated or incinerated the tail gas from their SRU/TG systems. Because of this distinction in the refinery's operations, the consultants divided their recommendations for SRU/TG into two areas.

— For uncombusted tail gas, the consultants recommended a BARCT level of NSPS Subpart J (Ja), namely 10 ppm H2S and 300 ppm reduced sulfur species (total of H2S, COS, and CS2)

— For the combusted tail gas, the consultants recommended 5 ppmv SOx @ 0% O2 as BARCT. The consultants indicated a level of 10 ppmv would allow a greater number of refineries to meet the overall BARCT level by the gas treatment methods without having to install a wet gas scrubber.

TABLE 5-7
Initial Emission Reductions and Cost Effectiveness Estimated by ETS/AEC for SRU/TGs

Refinery:	1	2	3	4	5	6	Total
Emission Reductions (tpd)	0.13* (note 1)	0.17	0.15	0.04	0.06	0.29	0.83
Cost Effectiveness based on ETS/AEC ($/ton)	$22.4k (note 3)	$39.0k (note 2)	$12.9k (note 3)	$54.7k (note 3)	$123k (note 2)	$36.3k (note 2)	$37.4k (note 4)

*Note: 1) Already met the emission reductions; 2) As shown in Table EX-1 of Module 3A ETS/AEC Final Report; 3) As shown in Table EX-1 of Module 2 ETS/AEC Final Report; 4) As shown in the Summary Table EX-6 of Module 2 and Module 3A of ETS/AEC Final Report.

Staff concurred with the recommendations of the consultants on the level of proposed BARCT, except that staff will not require any BARCT with low cost effectiveness (>$50 K per ton). The emission reductions estimated by staff is as follows:

TABLE 5-8
Staff's Proposed Emission Reductions and Cost Effectiveness for SRU/TGs

Refinery:	2	3	6	Total
Emission Reductions (tpd)	0.17	0.15	0.29	0.73
Cost Effectiveness ($/ton)	$39.0k	$12.9k	$36.3k	$31.5k
Cost Effectiveness based on input from NEC ($/ton)	$49.6k	$55.3k	$41.6k	$44.5k

Chapter 6 – Sulfuric Acid Manufacturing

6.1 Process Description

Sulfuric acid manufacturing process, as shown in Figure 6-1, includes three basic operations. First, sulfur in the feedstock is oxidized and spent sulfuric acid is decomposed to sulfur dioxide (SO_2) in a furnace:

$$S + O_2 = SO_2$$
$$\text{Spent } H_2SO_4 = H_2O + \tfrac{1}{2} O_2 + SO_2$$

The sulfur dioxide is then catalytically oxidized to sulfur trioxide (SO_3) in a multi-staged catalytic reactor (or converter). A typical catalyst used in the reactor is vanadium:

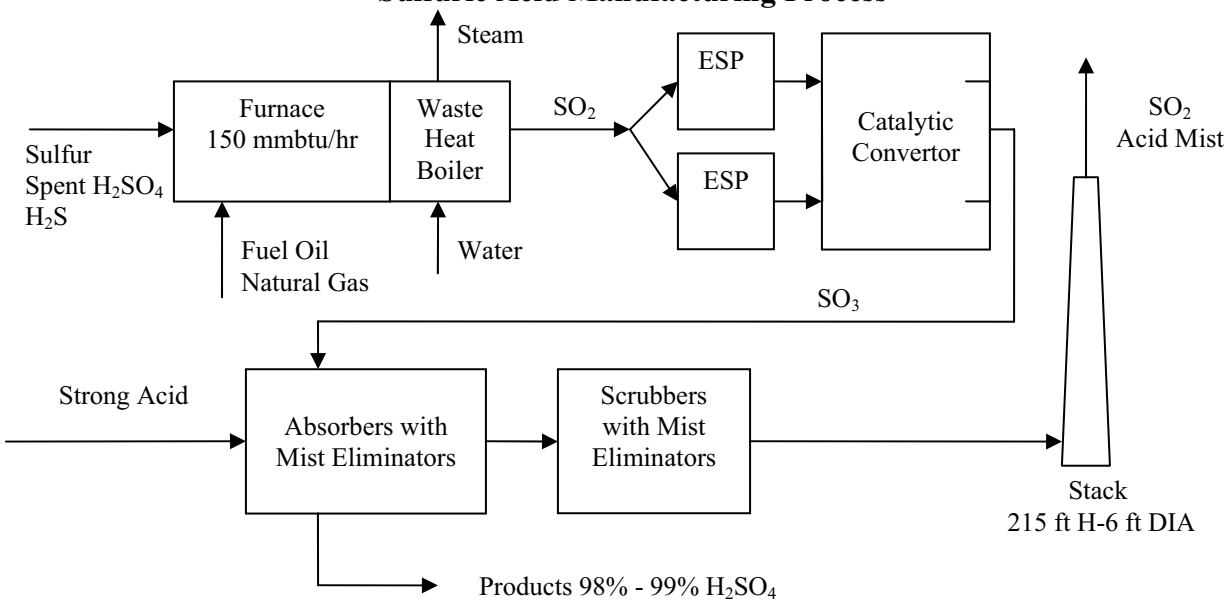
$$2SO_2 + O_2 = 2SO_3$$

The sulfur trioxide reacts with water in a absorbing tower to produce a strong sulfuric acid solution.

$$SO_3 + H_2O = H_2SO_4$$

In a double absorption process, the SO_3 gas formed from the primary converter is sent to a first absorber where the SO3 is removed to form H_2SO_4. The remaining unconverted SO_2 and SO_3 are directed to a second set of converter and absorber to further produce H_2SO_4.

FIGURE 6-1
Sulfuric Acid Manufacturing Process



The conversion to H_2SO_4 is always incomplete, and is affected by the number of stages in the catalytic converter, the type and amount of catalyst used, temperature and pressure, and the concentrations of the reactants, SO_2 and O_2. A 98% - 99% conversion to H_2SO_4 is typical. The

exhaust gas stream from the absorbers can be vented to ESPs, scrubbers, and mist eliminators to remove SO_2 and acid mist prior to venting to the atmosphere. The process produces a great deal of heat. Steam driven compressors, waste heat boilers, and heat exchangers are utilized throughout the process to recover and convert the waste heat into useful energy.

6.2 Current Allocations and Emissions

6.2.1 Allocations

Facility A and B are the two facilities in the District that operate a sulfuric acid manufacturing plants. In 1993, allocations were provided to these processes based on an emission factor ranging from 4 lbs/ton acid produced to 9.478 lbs/ton acid produced. The existing SCAQMD Rule 469 limits the SO2 concentration in effluent process gas from a sulfuric acid unit to 500 ppmv and the mass emissions to 198.5 lbs/hr of sulfur compounds expressed as SO2; and NSPS requires a sulfuric acid manufacturing plant to meet an emission level of 4 lb SO_2 per ton of 100% acid produced, maximum 2 hour average. The allocations provided to these two facilities are shown in Table 6-1.

TABLE 6-1
Allocations for Sulfuric Acid Furnace/Reactor

Facility	Peak Year	Emission Factor (lbs per ton acid produced)	Allocations (lbs/year)	Allocations (tons/day)
A	1988	4.000	598,028	0.82
B (Plant 1)	1987	4.380	371,139	0.51
B (Plant 2)	1987	4.577	329,031	0.45
B (Plant 3)	1989	9.478	549,904	0.75
			Total	**2.53**

Note: Prior to 1990, Facility B operated three sulfuric acid units that were built between the late 1920's and late 1950's. In 1990, these three furnaces were replaced with a double absorption furnace to achieve 99.85% conversion efficiency and currently subject to EPA Consent Decree limiting the emission rate to 1.7 lbs SO2 per ton of acid produced.

In addition to SO_2, there is acid mist generated from the absorber of the sulfuric acid manufacturing process. Acid mist is generated when SO_3 combines with water at temperature below the dew point of SO_3. Acid mist is a very stable compound and usually is controlled and captured by mist eliminators. Sulfuric acid mist is limited to 0.15 lbs per ton acid produced under NSPS and 0.30 lbs per ton acid produced under SCAQMD Rule 469.

6.2.2 Emissions

The 2005 emissions reported from these processes are presented in Table 6-2. Facility B reported 1.13 tons per day and Facility A reported 0.04 tons per day.
The two facilities also reported their 2006 and 2007 emissions through the SCAQMD Survey conducted in 2008, as shown in Table 6-2. The production rate of 100% sulfuric acid at Facility B is approximately 3 times larger than the production rate at Facility A.

TABLE 6-2
SO2 Emissions from Sulfuric Acid Furnace/Reactor

Facility	Device Description	2005 Emissions (tons/day)	2006 Emissions (tons/day)	2007 Emissions (tons/day)
A	Reactor	0.04 (1)	0.06	0.05
B	Furnace	1.13 (2)	1.02	0.96
		1.17	**1.08**	**1.01**

Note: 1) The emissions are from a single absorption unit and controlled by a Cansolv scrubber, 2) The emissions are from a double absorption unit.

The emissions from Facility A's reactor are low compared to the emissions from Facility B's furnace. Facility A's single absorption unit uses a Cansolv scrubber to control their SOx emissions from the reactor, whereas the emission from Facility B's double absorption unit is currently not controlled by scrubbers. The SOx outlet concentrations from Facility B's furnace were in a range of 144 ppmv – 185 ppmv, whereas the SOx outlet concentrations from Facility A's reactor were in a range of 17 ppmv – 51 ppmv. The emission rates calculated based on the information reported through the 2008 Survey are from 1.58 lbs/ton – 1.84 lbs/ton acid produced for Facility B, and 0.28 lbs/ton acid for Facility A.

6.3 Control Technology

6.3.1 EPA BARCT Clearinghouse

Staff researched the U.S. EPA RACT/BACT/LAER Clearinghouse to identify the BARCT level for sulfuric acid manufacturing plant. A summary of the information posted on the Clearinghouse is presented in Table 6-3. [35]

In general, in addition to double absorption, the sulfuric acid manufacturing plants in the U.S. have upgraded their converters and absorbers, used cesium promoted vanadium catalysts, and added tail gas scrubbers to meet an emission level ranging from 0.2 lbs – 3.5 lbs SOx per ton of 100% acid produced.

6.3.2 Clean Air Act Settlements

Recently in 2007, the U.S. Department of Justice and the U.S. EPA have announced several Clean Air Act settlements with two major sulfuric acid plants in the country to lower the SO2 emissions from their sulfuric acid plants in the country.

[35] U.S. EPA RACT/ EPA RACT/BACT/LAER Clearinghouse.

TABLE 6-3
Emission Levels for Sulfuric Acid Manufacturing Plants [(1)]

Facility	Source	SOx Level
Dupont, Union, New Jersey (New Construction in 2007)	Two identical 400 tons per day double absorption sulfuric acid plants that use spent acid, sulfur, and hydrogen sulfide as feed stocks.	– 0.2 lbs SOx per ton of 100% acid produced and 3 lbs/hr SOx at 3-hour average – 0.10 lbs sulfuric acid mist per ton of 100% acid produced.
Dupont, El Paso, Texas (New Construction in 2007)	Double absorption sulfuric acid plant that use spent acid and hydrogen sulfide as feed stocks.	– 1 lbs SOx per ton of 100% acid produced at 3-hour average – 0.10 lbs sulfuric acid mist per ton of 100% acid produced.
Dupont, New Castle, DE (New Construction in 2005)	Double absorption sulfuric acid plant, 550 tons per day, that use spent acid and hydrogen sulfide as feed stocks.	– 1.35 lbs SOx per ton of 100% acid produced at 3-hour average – 0.12 lbs sulfuric acid mist per ton of 100% acid produced.
General Chemical LLC, Augusta, Richmond	Double absorption sulfuric acid plant, 1,000 tons per day. A new soda ash scrubber was used to lower the standard from 4 lbs to 2.6 lbs/ton	– 2.6 lbs SOx per ton of 100% acid produced at 3-hour average – 0.08 lbs sulfuric acid mist per ton of 100% acid produced.
CF Industries, Hillsborough, Florida	Double absorption plant, 1,600 tons/day, uses spent acid, sulfur, and hydrogen sulfide as feed stocks. This plant has a two-stage ammonia scrubber and upgraded converters. The plant uses cesium catalysts to increase the SO2-SO3 conversion.	– 3.5 lbs SOx per ton of 100% acid produced, 99.5% conversion, and 401 lbs/hr SOx at 3-hour avg. – 0.10 lbs sulfuric acid mist per ton of 100% acid produced, 99% control efficiency, and 11 lbs/hr sulfuric acid mist.
CF Industries, Plant City, Florida	Two 2,750 tons per day double absorption plants that use spent acid, sulfur, and hydrogen sulfide as feed stocks. The converters and absorbers were upgraded and cesium promoted vanadium catalysts were used to increase the SO2-SO3 conversion.	– 3.5 lbs SOx per ton of 100% acid produced, 99.5% conversion, and 401 lbs/hr SOx at 3-hour average – 0.10 lbs sulfuric acid mist per ton of 100% acid produced, 99% control efficiency, and 11 lbs/hr sulfuric acid mist.
US Agri-Chemicals Corp., Polk, Florida	A 3,000 tons per day double absorption sulfuric acid plant with mist eliminators	– A 3.5 lbs SOx per ton 100% acid produced, and 99.9% conversion efficiency, and 1916 tons per year – 0.12 lbs sulfuric acid mist per ton of 100% acid produced, 99% control efficiency, and 65.7 tons per year sulfuric acid mist.

Note: 1) EPA RACT/BACT/LAER Clearinghouse on EPA's web page conducted in November 2007.

– Company #1 operates four sulfuric acid plants in Louisiana, Virginia, Ohio, and Kentucky. Under the recent settlements, the company has agreed to install $66 million state-of-the-art dual absorption control equipment in its largest plant located in Darrow, Louisiana. For the other three plants, the company has the option to install the $87 million additional control technologies or ceasing operations. All four plants have to meet the lower standards ranging from 1.7 lbs – 2.4 lbs SO_2 per ton acid produced by March 1, 2012. When fully

implemented, these plants will reduce SOx by an additional 90%. A summary of these agreements is included in Table 6-4. [36]

– Company #2 has agreed to spend approximately $50 million to upgrade air pollution control at their eight production plants in four states across the country to reduce SO_2 emissions by approximately 95%. As shown in Table 6-4, the consent decree requires the installation of wet gas scrubbers or double absorption technology to meet the BARCT levels ranging from 1.7 lbs – 2.5 lbs SOx per ton acid produced. [37]

TABLE 6-4
Consent Decree for Sulfuric Acid Manufacturing Plants

Company	SOx Level (lbs SO_2 per ton)	Compliance Date
#1, Burnside, Darrow, Louisiana	2.4 (1)	September 1, 2009
#1, James River, Richmond, Virginia	1.5 (1)	March 1, 2010
#1, Fort Hill, North Bend, Ohio	2.2 (1)	March 1, 2012
#1, Wurtland, Wurtland, Kentucky	1.7 (1)	March 1, 2012
#2, Hammond, Indiana (3)	2.5 (2)	Not specified
#2, Martinez, California (4)	2.2 (2)	Not specified
#2, Dominguez, California (3)	1.7 (2)	Not specified
#2, Bayton, Texas (4)	2.2 (2)	Not specified
#2, Houston #8, Texas (5)	1.7 (2)	Not specified
#2, Houston #2, Texas (5)	1.8 (2)	Not specified
#2, Baton Rouge #2, Louisiana (5)	2.2 (2)	Not specified
#2, Baton Rouge #1 Louisiana (5)	1.9 (2)	Not specified

Note: 1) the standard is a 3-hour rolling average. 2) The standard is a 365-day rolling average. Company #2 plants must meet 0.15 lbs/ton acid mist. 3) Double absorption plant. 4) Single absorption with ammonia scrubber. 5) Single absorption with caustic scrubber.

6.4 Proposed BARCT Level and Emission Reductions

As shown in Tables 6-3 and 6-4, the controlled emission level for sulfuric acid manufacturing plants has been improved significantly. The current controlled level can be as low as 0.2 lbs/ton – 0.3 lbs/ton. These levels could be achieved by upgrading the converters and absorbers, using cesium promoted vanadium catalysts, and/or adding tail gas scrubbers.

In the District, Facility A has used Cansolv scrubber to control SOx emissions from its acid production plant, and achieved 0.28 lbs/ton acid produced. As a result, the emissions from its reactor have dropped from 0.82 tons per day in 1993 to 0.04 tons per day in 2005. By using Cansolv scrubber, Facility A has achieved an emission reduction of approximately (1-0.04/0.82)*100 = 95%.

[36] Civil Clean Air Act Settlements. www.usdoj.gov

[37] Civil Clean Air Act Settlement, www.uepa.gov/compliance/resources/cases/civil/caa/rhodia-fcsht.html

The emissions from Facility B's furnace are currently not vented to scrubbers.[38] The SOx emissions from this facility's furnace were in a range of 144 ppmv – 185 ppmv, and this furnace is the #1 SOx emitter in the District at 1.13 tons per day in 2005.

The consultant's analyses (NEXIDEA) for the feasibility and costs of control are summarized in Part 2 of the Staff Report, and the non-confidential portions of the analyses (NEXIDEA & NEC) are available for public information. After considering all feasible technologies, the consultants' recommendation for BARCT level, which staff concurred with, is 10 ppmv for sulfuric acid plants. The consultants' estimates are as follows:

TABLE 6-5
Emission Reductions and Cost Effectiveness Estimated by NEXIDEA and Cost Effectiveness Estimated Based on Input from NEC

	BARCT Level	Emission Reductions	Cost Effectiveness
NEXIDEA	0.14 lbs SOx/ton acid (10 ppmv)	<0.03 tpd (Facility A) 1 tpd (Facility B)	$1.9k - $5.6k Average: $2.0k
NEC	0.14 lbs SOx/ton acid (10 ppmv)	<0.03 tpd (Facility A) 1 tpd (Facility B)	$~~2.8~~3.3k - $8.8k Average: $3.4k

Comparing to an average Tier I level of 3.93 lbs/ton, the proposed new BARCT of 0.14 lbs/ton reflects a 97% reduction from Tier I level.

[38] Permit condition no A72.1 in Facility B's Facility Permit, dated September 2007. The 99.9% efficiency seems not correlated well with the SOx outlet concentrations recorded in the range of 144 – 185 ppmv from the furnace.

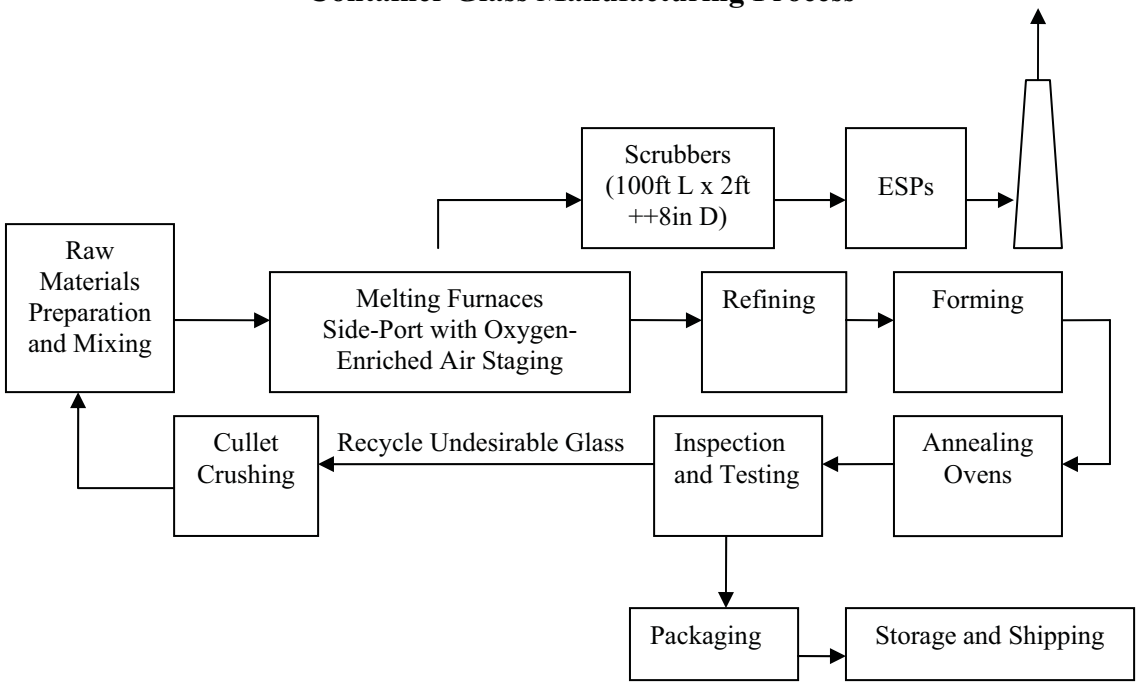
Chapter 7 – Container Glass Melting Furnaces

7.1 Process Description

Owens-Brockway Glass Container Inc. is a container glass manufacturing facility located in Vernon. The company manufactures glass bottles, glass wares, pressed & blown glass, tempered glass, as well as safety glass. The manufacturing process contains four phases 1) preparation of raw material, 2) melting in a furnace, 3) forming, and 4) finishing. Figure 7-1 is a simplified diagram for a typical glass manufacturing process.

Raw materials, which include sand, limestone, and soda ash, are crushed and mixed with cullets to ensure homogeneous melting. The raw materials are then conveyed to a continuous regenerative side-port melting furnace. As the materials enter the melting furnace through a feeder, they float on the top of the molten glass already in the furnace, melt, and eventually flow to a refiner section, and then fore hearths, forming machine, and annealing ovens. The final products undergo inspection, testing, packaging and storage. Any damaged or undesirable glass is transferred back to be used as cullets.

FIGURE 7-1
Container Glass Manufacturing Process



Sulfur oxides are generated from the decomposition of the sulfates in the raw materials and sulfur in the fuel. The melting furnace contributes over 99% of the total emissions from a glass plant. There are currently two melting furnaces at the Vernon facility, 60 mmbtu/hr furnace #23B (Device D147), and 100 mmbtu/hr furnace #23C (Device ID D112). Each furnace is limited to approximately 400 tons glass pulled per day. The SOx emissions are controlled by two scrubbers, of which one scrubber has a permit condition of 80% efficiency. The scrubbers are manufactured by PPC Industries, use sodium bi/sesquicarbonate as scrubbing agent, have two passes, and about 101 ft in length and 2ft 8 in diameter. The outlet flue gases from the scrubbers are directed to a common manifold and are vented to three dry ESPs downstream, one standby, for particulate emissions control. The furnaces currently have oxygen-enriched air staging (oxy-fuel), a control technique that is commonly used to reduce NOx.

7.2 Current Allocations and Emissions

7.2.1 Allocations

The allocations provided to the facility for their furnaces are presented in Table 7-1. These allocations were estimated based on SOx emission factors ranging from 2.12 lbs/ton to 3.15 lbs/ton of glass pulled and their peak activities in 1992. The total allocations provided for the three furnaces were 1.01 tons per day.

TABLE 7-1
Allocations for Container Glass Melting Furnaces

Equipment	Peak Year	Emission Factor (lbs per ton glass)	Allocations (lbs/year)	Allocations (tons/day)
Furnace #1	1992	3.150	231,475	0.32
Furnace #2	1992	2.480	269,673	0.37
Furnace #3	1992	2.120	237,605	0.33
			Total	**1.01**

7.2.2 Emissions

The emissions reported in 2005, 2006 and 2007 from Owens-Brockway's furnaces are presented in Table 7-2. In total, the two furnaces emitted about 0.21 tons per day SOx in 2005, 0.27 tons per day in 2006, and 0.35 tons per day in 2007. The emissions from the two furnaces were vented to two scrubbers (one scrubber dedicated to each furnace); and three parallel ESPs (shared between two furnaces). The emissions were measured by three CEMS. The SOx outlet concentrations were averaged 64 ppmv for the first CEMS, 69 ppmv for the second CEMS, and 85 ppmv for the third CEMS. In addition to Owens-Brockway, Saint-Gobains Containers Inc. operated a 78 mmbtu/hr glass melting furnace that emitted about 0.13 tons per day SOx in 2005, but this operation has ceased since then.

TABLE 7-2
SOx Emissions from Glass Melting Furnaces

Facility	SOx Avg Concentration (ppmv)	2005 Emissions (tons/day)	2006 Emissions (tons/day)	2007 Emissions (tons/day)
Owens-Brockway, A CEMS	64	0.076	0.27	0.35
Owens-Brockway, B CEMS	69	0.084		
Owens-Brockway, C CEMS	85	0.036		
Saint-Gobain (shutdown)	NA	0.128	NA	NA
		0.32	**0.27**	**0.35**

Note: The 2005 SOx emissions were from SCAQMD database for the period from January 2005 – December 2005. The 2006 and 2007 emissions were reported by the facilities through a Survey Questionnaire distributed by SCAQMD in 2008.

Through the 2008 Survey, Owens-Brockway reported that the two furnaces were in operating at > 90% maximum rated capacity from 2005-2007 and have emission rates ranging from 0.62 lbs/ton – 1.05 lbs/ton glass pulled, as shown in Table 7-3.

TABLE 7-3
SOx Emission Rates from Glass Melting Furnaces

Year	SOx Emission Rates (Lbs/Ton of Glass Pulled)
2005	0.62
2006	0.80
2007	1.05

7.3 Control Technology

In 2005, the U.S. Department of Justice and the U.S. EPA have reached an agreement with Saint-Gobain Containers, Inc. and required Saint-Gobain to install state-of-the-art pollution control at a cost of $6.6 million to reduce SO2 emissions from their melting furnaces. The Saint-Gobain plant located in Seattle Washington was permitted to a level of 1.6 lbs SOx per ton glass produced with the use of Tri-Mer Cloud Chamber Scrubber (CCS). [39] The installation of the CCS was just recently finished, and the plant started testing in mid of December 2007. The capital costs for the CCS at this plant were approximately $1,694,000, designed for an inlet flow of 40,000 acfm at 700 degree F. [40]

Other Saint-Gobain facilities must meet a level of 0.8 lbs SO2 per ton of glass pulled. This 0.8 lbs/ton is the most recent BARCT level for container glass melting furnaces and has been

[39] Title V Permit & Statement of Basis for Saint-Gobain Containers Inc. located in Seattle prepared by the Puget Sound Clean Air Agency, dated June 6, 2007.

[40] E-mail from Mr. Gerry Pade of Pudget Sound Clean Air Agency to Minh Pham, dated November 30, 2007.

proposed by San Joaquin Valley APCD in their proposed rule 4354. [41, 42] Tri-Mer Corporation estimates that their technology can achieve a level as low as 0.1 lbs SO2 per ton of glass produced, 0.1 ppmv outlet SO2, and 99.9% control efficiency. The BARCT information for glass melting furnaces is summarized in Table 7-3.

TABLE 7-3
BARCT for Container Glass Manufacturing Plant

Facility	SOx Level
Saint-Gobain Containers, Inc., Seattle, Washington (Tri-Mer Cloud Chamber Scrubber)	Permitted at 1.6 lbs per ton glass produced. Source tested at 0.01 lbs per ton glass [1, 2, 3]
San Joaquin Valley APCD Rule 4354	0.9 lbs/ton glass produced
Tri-Mer Cloud Chamber Scrubber	0.1 ppmv SO2 outlet 0.1 lbs per ton glass produced 99.9% control efficiency [4]

Note: 1) This is the permitted level of SOx from Saint-Gobain furnaces controlled by a Tri-Mer Cloud Chamber Scrubber which was designed to handle an exhaust flow of 40,000 acfm at 700 deg F. The furnaces are either operated at a) 205 tons per day capacity with an exhaust flow rate of 35,600 acfm at 350 deg F, or b) 195 tons per day capacity with an exhaust flow rate of 15,000 acfm at 500 F. 2) Fuel oil burning in these furnaces is limited to 15 ppmv by weight of sulfur (0.0015%). 3) Based on the most recent source test at this facility in September 2009, the facility achieved an outlet SOx concentrations between 0.2 – 0.7 ppmv at 99% control efficiency which resulted in about 0.01 lbs SOx per ton glass. 4) Information provided by Tri-Mer Corporation based on their own source testing information.

7.4 BARCT Level and Emission Reductions

As noted earlier, Owens Brockway achieved a level of 0.62 lbs/ton in 2005, averaged 64 ppmv - 85 ppmv SOx, with the use of dry scrubbing. Saint-Gobain Containers Inc. in Seattle Washington, with the use of Tri-Mer Cloud Chamber scrubber, can achieve an emission rate of 0.01 - 0.1 lbs/ton, or an outlet concentration of 0.1 ppmv – 0.7 ppmv SOx, further emission reductions from container glass manufacturing is feasible.

The consultant (ETS, Inc.)'s recommendation for BARCT is a level of 1 ppmv or below:

TABLE 7-4
Emission Reductions and Cost Effectiveness Estimated by ETS

Equipment	BARCT Level	BARCT Emission Level	Emission Reductions	Cost-Effectiveness
Owens-Brockway A, B & C CEMS	99% control (≤1 ppmv)	0.0058 lbs/ton glass pulled	0.19 tpd	$ 5.201 K/ton

[41] Consent Decree for Saint-Gobain Containers, Inc. www.epa.gov/compliance/resources/reports/endofyear/eoy2005/2005aircasehighlights.html.

[42] San Joaquin Valley APCD Rule 4354 – Glass Melting Furnaces, Proposed Amended Rule and Draft Staff Report, dated February 8, 2008.

This is the only container glass facility in the basin. Because of the economic reason, staff's recommendation for BARCT is 5 ppmv or below. The emission reductions and cost effectiveness are in Table 7-5.

TABLE 7-5
Staff's Proposed Emission Reductions and Cost Effectiveness for Glass Furnace

Equipment	BARCT Level	BARCT Emission Level	Emission Reductions	Cost-Effectiveness
Owens-Brockway A, B & C CEMS	95% control (≤5 ppmv)	0.03 lbs/ton glass pulled	0.19 tpd	$ 5.198 K/ton

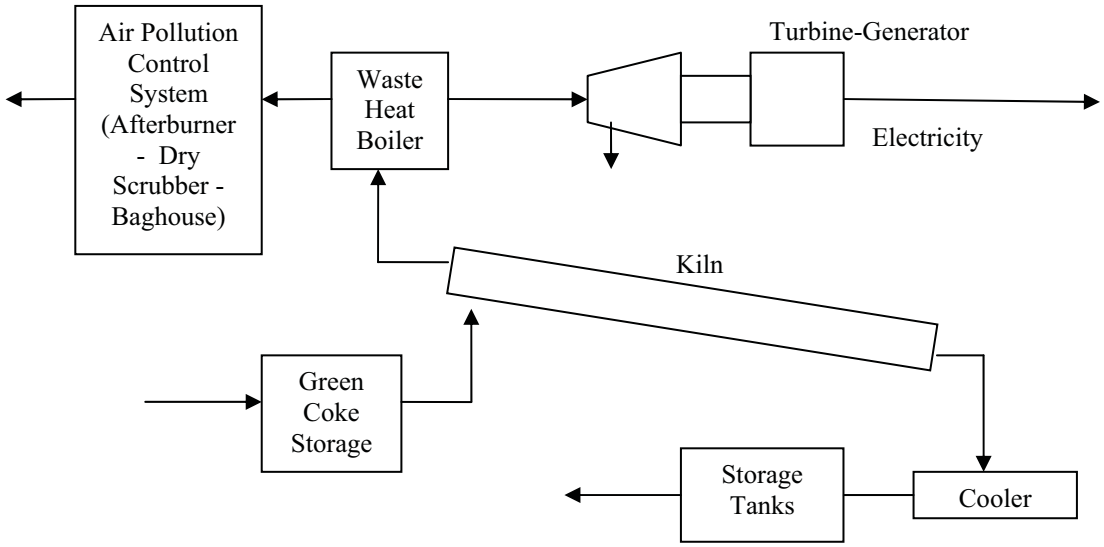
Chapter 8 – Coke Calcining

8.1 Process Description

Engineering of the coke facility began in 1978 by Martin-Marietta. Initial production of calcined coke occurred in February 1983. The company was purchased by BP Products Company in 1985. BP produces calcined coke in two locations in the United States: Wilmington California and Cherry Point Washington, and two locations in Germany: Gelsenkirchen and Lingen.

Basically, coke calcining is a process to improve the quality and value of "green coke" produced at a delayed coker in a refinery. At BP Wilmington, the green feed, produced by BP's nearby Carson Refinery, is screened and transported to the BP Wilmington Calciner by truck, where it is stored under cover in a coke storage barn. The screened and dried green coke is introduced into the high end of the rotary kiln, 3 feet diameter x 270 ft long, is tumbled by rotation, moves down the kiln countercurrent to a hot stream of combustion air produced by the combustion of natural gas or oil. The kiln temperatures are in a range of 2000 – 2500 degrees Fahrenheit. The green coke is retained in the kiln for approximately one hour to drive off the moisture, impurities, and hydrocarbon. After discharging from the kiln, the calcined coke drops into a cooling chamber, where it is quenched with water, treated with dedusting agents for dust control, carried by conveyors to storage tanks, and later are transported by trucks to the Port of Long Beach for export, or is loaded into railcars for shipments to domestic customers. A simplified process diagram of the calcining process is shown in Figure 8-1.

FIGURE 8-1
Coke Calcining Process



BP Wilmington produces approximately 400,000 short tons per year of calcined products.[43] The Wilmington coke calciner is limited to a maximum processing rate of 1,980 tons green coke per day, and is increasing to 2,400 tons of green coke per day.[44] BP Wilmington is a global supplier of calcined coke to the aluminum industry, and fuel grade coke to the fuel, cement, steel, calciner, and specialty chemicals businesses.

8.2 Current Allocations and Emissions

8.2.1 Allocations

As shown in Table 8-1, the allocations for BP coke calciner was estimated based on a controlled emission factor of 2.473 lbs SOx per ton of calcined coke and a production rate of 378,264 tons calcined coke. [45] The coke calciner was in compliance with SCAQMD Rule 1119 – Petroleum Coke Calcining Operations – Oxides of Sulfur, adopted March 2, 1979, which requires that the uncontrolled SOx emissions from coke calcining operations must be reduced by at least 80% by July 1, 1983.

TABLE 8-1
Allocations for BP Coke Calciner

Peak Year	Emission Factor (lbs per ton coke)	Allocations (lbs/year)	Allocations (tons/day)
1989	2.473	935,447	1.28
		Total	**1.28**

8.2.2 Emissions

The 2005-2007 reported emissions from BP coke calciner are presented in Table 8-2. Note that the 2005-2007 emissions are much less than the allocations provided to BP in 1993.

TABLE 8-2
SOx Emissions from BP Coke Calciner

Device ID	Rating (mmbtu/hr)	2005 Emissions (tons/day)	2006 Emissions (tons/day)	2007 Emissions (tons/day)
20	120	0.35	0.62	0.55
	Total	**0.35**	**0.62**	**0.55**

Note: The 2005 SOx emissions were from SCAQMD database for the period from January 2005 – December 2005. The 2006 and 2007 emissions were reported by the facilities through a Survey Questionnaire distributed by SCAQMD in 2008.

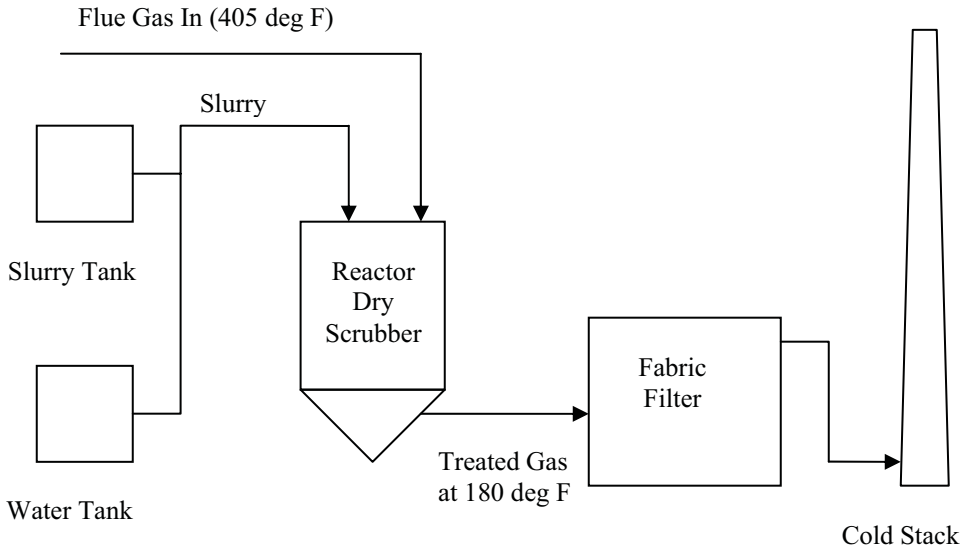
[45] SCAQMD Tier I Emission Rate, RECLAIM, 2002

8.3 Control Technology

8.3.1 Dry Scrubber at BP Wilmington

Dry scrubbing is the chosen control technology for the BP Wilmington coke calciner. The control system includes a spray dryer, a reverse-air baghouse, a slurry storage system, a slurry circulating system, and a pneumatic conveying system. Calcium hydroxide (CaOH) slurry is the absorbing medium for SO_2 control. Figure 8-2 shows a simplified process diagram for the dry scrubber system at BP Wilmington..

FIGURE 8-2
Dry FGD System for Coke Calciner at BP Wilmington



The system was designed and guaranteed to achieve 90% control efficiency for SOx at a calcined coke capacity of 54 tons/hour (1,296 tons/day or 473,040 tons/year). The SOx emission rates were tested in July 1983 to provide verification of guarantees. Production rate during the tests averaged 50 tons per hour and the emission rates ranged from 0.21 lbs/ton – 1.64 lbs/ton, averaged at 1 lbs/ton coke.[46] It should be noted that the Tier I controlled emission level of SOx from the calciner provided in 1993 is 2.47 lbs/ton coke, even though the system was designed and tested to meet lower levels than 2.47 lbs/ton.

A recent source test conducted at BP Wilmington calciner kiln reported a level of approximately 66 ppmv SOx at a processing rate of 1,848 tons green coke per day. The processing rate was substantially higher than the processing rate used for the original design at 1,296 tons per day to achieve 90% efficient.[47]

[46] *Performance of Dry Flue Gas Desulfurization on a Petroleum Coke Kiln Application*, R.J. Horn of Ecolaire Environmental Company and J.F. Bent of Martin Marietta Aluminum, Journal of the Air Pollution Control Association, September 1984.

[47] SCAQMD Source Test Report, R01032.

In responding to the 2008 Survey, BP indicated that the performance of the dry scrubber in 2005-2007 exceeded the design levels. The control efficiencies for the dry scrubber in 2005-2007 were in a range of 98% - 99%. The averages of SOx outlet concentrations in 2005-2007 were in a range of 27 ppmv – 43 ppmv, with some RATA tests conducted in 2006 and 2007 showed a higher level at 82 ppmv at 4% O2 and 84 ppmv at 5% O2. BP reported that with the dry scrubber, their emission rates in 2005-2007 were in a range of 0.56 – 0.89 lbs SOx per ton coke. Table 8-3 shows a comparison between design parameters and current performance in 2005-2007.

TABLE 8-3
Design Parameters and Current Performance of
Dry Scrubber for BP Wilmington Coke Calciner

	Design Parameter	2005 Performance	2006 Performance	2007 Performance
Processing Rate (tpd)	1,296			
Control Efficiency (%)	90%	99%	98%	99%
Emission Rate (lbs/ton)	0.21–1.64	0.56	0.97	0.89
SOx Concentration (ppmv)	Not Measured	27 ppmv	52 ppmv	43 ppmv

8.3.2 Wet Scrubber and Wet ESP at BP Cherry Point Refinery

In addition to the coke calciner ay Wilmington, BP operates three calciners at Cherry Point Refinery in Blaine, Washington. Originally, BP voluntary installed a wet scrubber to control SOx. Later, the company removed a portion of the wet scrubber and installed a wet electrostatic precipitator (WESP) to further control sulfuric acid mist emissions from the calciners, as shown in Figure 8-3.

In addition, the company added a baghouse to further control PM. The calciners had an uncontrolled emission rate of 1125 – 1425 ppmv SOx, corrected to 7% O2. With the use of the wet scrubber, the SOx emissions were reduced to about 160 ppmv at 90% control efficiency. With the addition of a WESP, SOx emissions were reduced by 96%, and met a standard of 35 ppmv SO2, corrected to 7% O2, on a daily average basis. The particulate fine including sulfuric acid mist was at 0.01 grains/dscf, corrected to 7% O2.[48, 49] The performance of BP Cherry Point coke calciners is summarized in Table 8-4.

FIGURE 8-3
FGD System for Coke Calciner at BP Cherry Point

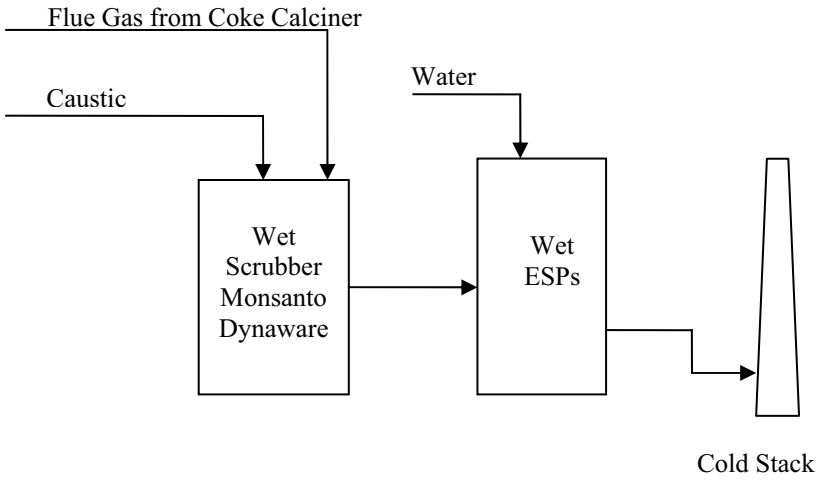

TABLE 8-4
Performance of Wet Scrubber and WESP
for BP Cherry Point Coke Calciners

Equipment:	Combination of Wet Scrubber and WESP
Processing Rate:	1,301 tons per day
Control Efficiency:	97% - 98%
Emission Rate:	0.14 lb SOx per ton coke
Outlet Concentration:	35 ppmv Limit (Test Results: 10 -12 ppmv)

8.4 BARCT Level and Emission Reductions

Given the facts that the dry scrubber at BP Wilmington designed up to 90% efficiency could perform at 98% - 99% control efficiencies to achieve emission rates ranging from 0.21 lb – 1.64 lb SOx per ton calcined coke; and that a combination of wet scrubber and wet ESP can achieve 96% control efficiency with an emission rate of 0.14 lb SOx per ton calcined coke, staff believe that further emission reductions from coke calciner is possible.

In September 2008, staff, WSPA and the refineries awarded a contract to NEXIDEA Inc. to conduct a feasibility and costs analysis of control technologies for coke calciner. A summary of the consultant (NEXIDEA)'s analysis is in Part 2 of the draft Staff Report. The consultant's recommendation was 10 ppmv, which reflects 95% additional control above Tier I. Staff concurred with the consultant's recommendation. After reviewing NEXIDEA's cost analysis, NEC also recommended WGS as BARCT for coke calciner, however NEC's cost-effectiveness was much lower as shown in table below.

TABLE 8-5
Emission Reductions and Cost Effectiveness Estimated for Coke Calciner

BARCT Level	BARCT Emission Level	Emission Reductions	Cost-Effectiveness
≤10 ppmv	0.11 lbs/ton calcined coke	0.28 tpd	$ 9,902 per ton per NEXIDEA $23,036 per ton based on input from NEC

Chapter 9 – Portland Cement Manufacturing

9.1 Process Description

There are two Portland cement manufacturing facilities in the Basin, California Portland Cement Company (CPCC) and TXI Riverside Cement Company (TXI). CPCC manufactures gray cement, and TXI manufactures white cement and produces gray cement from clinkers delivered to the facility by railcar. CPCC ranks #10 on the list of top SOx emitters in the District in 2005 with total facility emissions of 100.5 tons per year, whereas TXI is ranked #25 with total facility emissions of 0.7 tons per year. Therefore, staff will only focus on the technology to reduce SOx emissions at CPCC in this amendment.

The production of Portland cement at CPCC is a four step process presented in Figure 9-1 which includes: 1) raw materials acquisition; 2) preparation of raw materials into raw mix; 3) pyroprocessing of raw mix to make clinkers; and 4) grinding and milling of clinkers into cement.

Raw materials for manufacturing cement include calcium, silica, alumina and iron. Calcium is the element of highest concentration, and iron is raw material for gray cement but not used for white cement. These raw materials are obtained from minerals such as limestone for calcium; sand for silica; shale and clay for alumina and silica. CPCC obtains limestone from the quarry located on site. Other raw materials are delivered to CPCC by truck or rail car.

Preparing the raw mix includes crushing, milling, blending and storage. Primary, secondary and tertiary crushers are used to crush the raw materials until they are about ¾ inch or smaller in size. Raw materials are then conveyed to rock storage silos. Belt conveyors are typically used for this transport. Roller mills or ball mills are used to blend and pulverize raw materials into fine powder. Pneumatic conveyors are typically used to transport the fine raw mix to silos for storage until it is used to the pyroprocessing..

Pyroprocessing is the chemical and physical process of transforming the fine raw mix into clinkers. Pyroprocessing occurs in a rotary kiln and includes three steps:

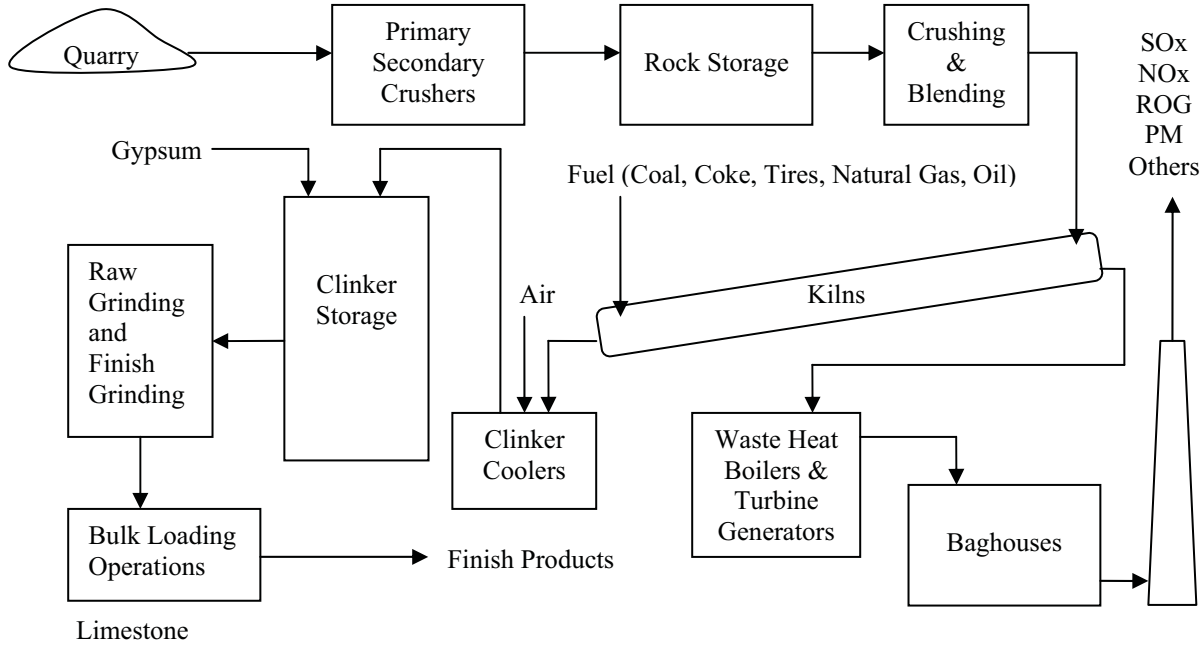
— Evaporating free water and dehydrating to form oxides of silicon, aluminum, and iron. This process occurs in a drying and preheating zone of the rotary kiln at temperatures of about 212 ^{o}F – 800 ^{o}F;

— Calcining of calcium carbonates ($CaCO_3$) to form calcium oxides (CaO) and carbon dioxide (CO_2). This process occurs in the calcining zone of the rotary kiln at temperatures of about 1100 ^{o}F – 1800 ^{o}F; and

— Chemical reacting, melting and restructuring of materials occur between calcium oxides (CaO), silica, alumina and iron to form clinker. Clinker is a solid silicate material ranges in size from 1 inch – 2 inch diameter, and formed in the "burning" zone of the rotary kiln at temperatures of about 2200 ^{o}F – 2700 ^{o}F.

The pyroprocessing process at CPCC is called a "long dry process" consisting solely of a simple long rotary kiln. CPCC operates two rotary kilns in parallel, each is 18 ft in diameter and 500 ft in length for gray clinker. The kiln is slightly inclined and rotates on its longitudinal axis. Raw materials are fed into the upper end of the kiln while fuels are burned in the lower end. As the kiln rotates, the raw materials move slowly from the upper end to the lower end, and the combustion gases move in countercurrent direction. The residence time of raw materials in a gray cement kiln is about 2 hours – 3 hours. The hot clinker, which exits at about 2000 ^{o}F from the kiln, is quickly cooled in the clinker cooler and is conveyed to storage. Clinker is water reactive and should be protected from moisture. If clinker gets wet, it will hydrate and set into concrete. Heat used in the kiln is supplied through the combustion of different fuels such as coal, coke, oil, natural gas, and tires. The combustion gases are vented to baghouse for dust control, and dusts are returned to the process or recycled if they meet certain criteria, or is discarded to landfills.

FIGURE 9-1
Portland Cement Manufacturing Process at CPCC Colton



Grinding and milling clinkers into cement is the last step of the manufacturing process. Up to 5% of gypsum is added to the clinker during this stage to control the setting time of cement. Other specialty chemicals are also added. After grinding and milling, the cement is pneumatically conveyed to the product silos, and either sold in bulk or is bagged.

9.2 Current Allocations and Emissions

9.2.1 Allocations

The allocations provided to CPCC in 1993, as well as the peak activities and emission factors, were presented in Table 9-1. The majority of the allocations was provided to the combustion of coal in boilers/heaters and cement kilns.

TABLE 9-1
Allocations for Kilns and Boilers at CPCC

Equipment	Fuel Type	Peak Yr	Emission Factor	Emissions (lbs/yr)	Emissions (tons/day)
Ovens	Natural Gas	1987	0.83 lbs/mmcf	101	0.00
Boilers/Heaters	Coal	1987	3.055 lbs/ton coal	217,018	0.30
Cement Kilns	Natural Gas	1987	21.45 lbs/mmcf	1,285	0.00
Cement Kilns	Fuel Oil	1987	1.08 lbs/thousand gals	12	0.00
Cement Kilns	Coal	1987	0.351 lbs/ton coal	22,569	0.03
Cement Kilns	Natural Gas	1987	7.55 lbs/mmcf	536	0.00
Cement Kilns	Fuel Oil	1987	3.07 lbs/thousand gals	384	0.00
Cement Kilns	Coal	1987	0.013 lbs/ton coal	948	0.00
				Total	**0.33**

9.2.2 Emissions

The calendar year 2005 reported emissions from CPCC's kilns and steam boiler are presented in Table 9-2. The 2005 facility emissions are still slightly below the overall allocations. However, the emission distribution within the facility was substantially changed: the kilns generated most of the facility emissions in 2005, whereas in 1987, most of the emissions originated from boilers/heaters at CPCC. Particulate matter from the kilns and steam boiler are controlled by baghouses. Limestone used in the kilns and boiler creates an alkaline environment that promotes a direct internal absorption of SO_2. Post combustion control for SOx is not currently used at CPCC.

In responding to a 2008 Survey conducted by the SCAQMD, CPCC reported that the average SOx concentrations from the two kilns were 49 ppmv at 13% O2 (approximately 111 ppmv at 3% O2). The emission rate for the two kilns was approximately 0.5 lbs SOx per ton clinker..

Regarding the coal-fired steam boiler, CPCC reported that the coal-fired steam boiler has not been in operation since 2002, however CPCC may operate the boiler in the near future if circumstances in energy costs or fuel sources change. The boiler used coal and natural gas as combustion fuel. The emission rate for this coal fired boiler was approximately 7 lbs SOx/ton coal.

TABLE 9-2
SOx Emissions from CPCC

	Dev ID	Rating (mmbtu /hr)	SOx Level (ppmv)	2005 Emissions (tpd)	2006 Emissions (tpd)	2007 Emissions (tpd)
Kiln #2	368	260	49 (13% O2)	0.193	0.146	0.186
Kiln #1	321	260	49 (13% O2)	0.074	0.129	0.112
Steam Boiler	851	232	NA	0.002	0.000	0.000
			Total	**0.269**	**0.275**	**0.298**

Note: The 2005 SOx emissions were from SCAQMD database for the period from January 2005 – December 2005. The fiscal year 2006 and 2007 emissions and the SOx concentrations were reported by the facilities through the 2008 Survey.

Kilns	0.5 lbs SOx/ton clinker
Steam Boiler	7 lbs SOx/ton coal

9.3 Control Technology for Coal-Fired Fluidized-Bed Boilers

9.3.1 In-Process Control Technology

The control technologies for coal fired boilers are described abundantly in literature. [50] Almost all SO2 emission control technologies for coal-fired boilers are post-combustion control. The exception to this universal rule is found in the fluidized bed steam boiler (Device ID 851) used at CPCC. Fluidized bed boilers generally operate at about 1500 – 1600 degree F, a lower temperature regime than other combustion systems. This temperature regime allows the addition of limestone. Limestone (CaCO3) is converted to CaO at about 1500 degree F, and CaO captures SO2 to form CaSO4, which is thermodynamically stable at 1500 – 1600 degree F. A removal efficiency of about 90% SO2 can be achieved with a Ca/S molar ratio of 2 to 2.5, which also varies from application to application, and depends on the sulfur content of the fuel, reactivity of the limestone, and the operation of the boiler.

[50] Assessment of Control Technology Options for BART-Eligible Sources – Steam Electric Boilers, Industrial Boilers, Cement Plants, and Paper and Pulp Facilities. Northeast States for Coordinated Air Use Management (NESCAUM) in partnership with the Mid-Atlantic Northeast Visibility Union (MANE-VU), March 2005.

9.3.2 Dry and Wet Scrubber

Post-combustion control for SO2 is accomplished by scrubbers. A calcium- or sodium-based reagent is typically used in a scrubber to absorb SO2. Sulfate or sulfite formed are either disposed, or further processed for commercial use. Scrubbers are commonly classified based on the process conditions (wet versus dry); the product utilization (throwaway versus saleable); and the reagent utilization (once-through versus regenerable). Scrubbers are widely used in commercial applications such FCCUs (Chapter 3), utility/industrial boilers/heaters (Chapter 4), sulfur recovery and tail gas treatment (Chapter 5), sulfuric acid manufacturing (Chapter 6), container glass manufacturing (Chapter 7), and coke calcining (Chapter 8). Please refer to these chapters for further descriptions on this technology.

9.3.3 Costs and Cost Effectiveness Reported in Literature

Both wet and dry scrubbers are widely used in the U.S. for coal-fired utility boilers. The control efficiency, costs, and cost effectiveness reported abundantly in literature are provided in Table 9-3 and 9-4.

TABLE 9-4
SOx Control Technology for Boilers ≥ 250 mmbtu/hr

Type	Type of Control	Control Efficiency	Cost Effectiveness
Coal Fired	Dry Scrubber	90% - 95%	$1,622 - $3,578
	Wet Scrubber	90% - 99%	$1,881 - $3,822
Oil Fired	Dry Scrubber	90% - 95%	$1,841 - $5,219
	Wet Scrubber	90% -99%	$1,956 - $5,215

Note: The data in this table are from *Best Available Retrofit Technology (BARCT) for Selected Non-Electric Generating Units (EGU) Source Categories*, MACTEC Federal Programs, Inc. developed for Lake Michigan Air Directors Consortium (LADCO), June 28, 2005.

TABLE 9– 5
SOx Control Technology for Coal-Fired Boilers

Source	Type of Control	Control Efficiency	Capital Costs	Cost Effectiveness
Utility Boilers	Dry or Wet Scrubber	90%	$180/kW for >600 MW units $350/kW for 200-300 MW	$200 - $500 per ton SOx removed
Industrial Boilers	Dry Sorbent Injection	40%	$8,600 - $26,000 per mmbtu/hr	Not Estimated
	Spray Dryer Absorber	90%	Double of the costs for dry sorbent injection	$400 - $4000 per ton SOx removed
	Wet Scrubber	90%	50% higher than spray dryer absorber	Not Estimated

Northeast States for Coordinated Air Use Management (NESCAUM) in partnership with the Mid-Atlantic Northeast Visibility Union (MANE-VU), March 2005

9.4 Control Technology for Cement Kilns

SOx emissions from a cement kiln are generated from 1) combustion of sulfur in fuel, and 2) oxidation of sulfides (e.g. pyrites) in the raw materials. Fuel switching, process alterations, dry and wet scrubbers are commercially available control technologies to reduce SOx emissions from a cement kiln. [51, 52] Table 9-4 presents the control efficiency for each technology and a brief description for each technology is presented below.

TABLE 9-6
Available Control Technology for Dry Cement Kilns

Type of Control	Control Efficiency
Fuel Switching and Process Alterations	0 – 100%
Spray Dryer Absorber	55% - 90%
Wet Scrubber	90% - 99.9%

Reference: *Assessment of Control Technology Options for BART-Eligible Sources – Steam Electric Boilers, Industrial Boilers, Cement Plants, and Paper and Pulp Facilities.* Northeast States for Coordinated Air Use Management (NESCAUM) in partnership with the Mid-Atlantic Northeast Visibility Union (MANE-VU), March 2005.

9.4.1 Fuel Switching

Cement kilns at CPCC use coal, coke, natural gas, oil and tires as combustion fuel. When the fuel sulfur levels in the primary fuels are high, switching to a lower sulfur content fuel is an appropriate strategy. However, this strategy may not be sufficient if the fuel sulfur content is much less than the sulfur content of the kiln feed (e.g. limestone). In this case, staged combustion with mid-kiln injection of a low-sulfur fuel, or high pressure air, may need to be considered. A post-combustion add-on control device may also be needed to further reduce SO2 emissions.

9.4.2 Process Control

The following process control can be used to reduce SOx emissions from the calciner kilns:

– It has been found that having sufficient oxygen to stabilize the alkali and calcium sulfate compounds formed in the burning zone of the rotary kiln minimizes SOx formation. The downside of this technique is that it can generate more NOx.

[51] Assessment of Control Technology Options for BART-Eligible Sources – Steam Electric Boilers, Industrial Boilers, Cement Plants, and Paper and Pulp Facilities. Northeast States for Coordinated Air Use Management (NESCAUM) in partnership with the Mid-Atlantic Northeast Visibility Union (MANE-VU), March 2005.

[52] *Best Available Retrofit Technology (BARCT) for Selected Non-Electric Generating Units (EGU) Source Categories*, MACTEC Federal Programs, Inc. developed for Lake Michigan Air Directors Consortium (LADCO), June 28, 2005.

- It has been found that avoiding flame impingement in the burning zone, avoiding flame impingement on the clinker, or improving distribution of kiln feed to equalize temperatures in the kiln can minimize SO2 formation.

- It has been found that when alkali is in excess of sulfur, SO2 can be retained in clinker as alkali sulfate. In addition, reducing the amount of pyritic sulfur, or organic sulfur, in raw materials can lower the SOx emissions substantially. The downside of this technique is that the amount of alkali added, or the amount of pyretic sulfur removed, are often limited by the product specifications or market and economic factors.

9.4.3 Lime or Limestone Spray Dryer Absorber

Lime and limestone contains calcium, in the form of calcium carbonate (CaCO3), which reacts with SO2 and captures SO2 to form of calcium sulfate (CaSO4). Water is typically sprayed into the feed at the end of the kiln or introduced through dilution air at the air coolers. Two most common spray dryer absorbers are the RMC Pacific's Alkaline Slurry Injection System and the EnviroCare Microfine Lime System. The RMC Pacific uses a hydrated lime as scrubbing agent. The captured sulfur compounds are returned as a portion of the raw material feedstock to the roller mill, which results in no scrubber effluent or sludge disposal. The process has obtained efficiencies ranging from 55% to 65%. The EnviroCare uses water suspension of finely pulverized calcium hydroxide Ca(OH)2 as scrubbing agent. Lime injection rate can be optimized through a feedback control loop from an SO2 monitor which helps to reach a SOx removal efficiency of 90% or more.

9.4.4 Wet Scrubber

Wet scrubbing is a technique applicable to all types of cement kilns to remove SOx and particulate matter simultaneously. A wet scrubber is usually installed downstream of the baghouse and uses limestone as absorbent. The most common system is the DynaWare scrubber, developed by Monsanto, installed by Fuller Company, and used on several cement kilns in the U.S. Limestone slurry containing 20% limestone and 80% water is produced in a mixing tank and sprayed countercurrent to the gas flow, cools the gases, reacts with SO2 to form calcium sulfite (CaSO3), calcium sulfate (CaSO4), and gypsum which in turn precipitate at the bottom of the absorbing tower and must be disposed of. A single-stage DynaWave scrubber in full-scale operation has a reported SO2 removal efficiency of about 90%., and a multiple-staged unit may achieve 99.9% control efficiency. Please refer to Chapter 5 for further description on DynaWave scrubber.

9.4.5 Costs and Cost Effectiveness

Since wet and dry scrubbers are commonly used to further control SOx from the cement kilns, the costs and cost effectiveness of these technologies are abundantly available in literature, and are summarized in Table 9-5 and 9-6.

TABLE 9-7
Costs for Control Technology for Dry Cement Kilns

Source	Clinker Capacity (tpy)	Spray Dryer		Wet Scrubber	
		Capital Cost ($/ton clinker)	Annual Operating Cost ($/ton clinker)	Capital Cost ($/ton clinker)	Annual Operating Cost ($/ton clinker)
Medium Kiln	600,000	$39.75	$14.79	$31.83	$17.21
Large Kiln	1,200,000	$23.17	$9.43	$20.42	$13.05

Note: (1) For comparison, CPCC Colton kiln #1 capacity is approximately 45 tons clinker per hour or 394,200 tons clinker per year based on a source test conducted in 2005, and an assumption that the kiln is operated 24 hours a day, 365 days a year. (2) The data in this table are from *Assessment of Control Technology Options for BART-Eligible Sources – Steam Electric Boilers, Industrial Boilers, Cement Plants, and Paper and Pulp Facilities,* Northeast States for Coordinated Air Use Management (NESCAUM) in partnership with the Mid-Atlantic Northeast Visibility Union (MANE-VU), March 2005.

TABLE 9-8
Control Efficiency and Costs for Control Technology for Dry Cement Kilns

Source	Dry Scrubber		Wet Scrubber	
	Control Efficiency	Cost Effectiveness ($/ton SO2 removed)	Control Efficiency	Cost Effectiveness ($/ton SO2 removed)
Small Kiln	90%-95%	$2,000 - $6,917	90%-99.99%	$2,030 - $6,861
Medium Kiln	90%-95%	$1,925 - $7,379	90%-99.99%	$2,004 - $6,831
Large Kiln	90%-95%	$1,881 - $7,201	90%-99.99%	$1,990 - $6,816

9.5 BARCT Level and Emission Reductions

In September 2008, staff, WSPA and the refineries awarded a contract to ETS Inc. to conduct an independent feasibility and costs analysis of control technologies for cement kilns and coal-fired boiler. A summary of ETS, Inc.'s analysis is in Part 2 of the draft Staff Report. NEC indicated that they would recommend WGS as BARCT for both cement kilns and coal fired boilers but did not provided costs information. They indicated that WGS would be more cost-effective than the technologies that ETS recommended. However, if the technologies recommended by ETS were used, NEC would recommend adding contingencies to the ETS's estimates. The consultants' recommendations are shown in Table 9-9.

TABLE 9-9
Initial Emission Reductions and Cost Effectiveness for Kilns & Coal Fired Boiler Estimated by ETS, Inc.

Equipment	BARCT Level	BARCT Emission Level	Emission Reductions	Cost Effectiveness by ETS
Kilns	95% control (≤2 ppmv)	0.03 lbs SO_x/ton clinker	0.25 tpd SO_x	$18.9 K per ton
Coal-Fired Boiler	95% control (≤5 ppmv)	---	0.36 tpd SO_x	$ 3.8 K per ton

Staff concurred with the consultants' recommendation for the coal-fired boiler, which is not in operation, at this time, and suggested the following BARCT level for the two cement kilns as shown in Table 9-10.

TABLE 9-10
Revised Emission Reductions and Cost Effectiveness for Cement Kilns

Equipment	BARCT Level	BARCT Emission Level	Emission Reductions	Cost Effectiveness
Kilns	5 ppmv	0.04 lbs SO_x/ton clinker	0.25 tpd SO_x	$19.3 k per ton per ETS $26.8 k per ton based on input from NEC

Chapter 10 – Continuous Emissions Monitoring System

Staff [53] conducted an inventory of the current Continuous Emissions Monitoring Systems (CEMS) used at the facilities to measure SOx from the seven affected categories of sources. The CEMS supplier and the SOx detection range, both low and high ranges, are presented in Table 10-1.

TABLE 10-1
Current CEMS System

Sources	Facility	CEMS Supplier	SO_2 Detection Range in ppm (High – Low)
FCCU	Refinery F	Rosemount	0-250
FCCU	Refinery C	Ametek	0-50
FCCU	Refinery A	Bovar	0-100
FCCU	Refinery D	Horiba	0-50 / 0-0.50 (diluted)
FCCU	Refinery E	API	0-50 / 0-200
FCCU	Refinery B	Teledyne	0-50 / 0-225
SRU/TG	Refinery F	Rosemount	0-500 / 0-2000
SRU/TG	Refinery C	Bovar	0-100
SRU/TG	Refinery A	Bovar	0-150 / 0-1000
SRU/TG	Refinery D	Rosemount	0-250
SRU/TG	Refinery E	API	0-20/0-50/0-1000
SRU/TG	Refinery B	Ametek	0-100 / 0-500
Sulfuric Acid	Facility Y	Bovar	0-1000
Sulfuric Acid	Facility X	Thermo Electron	0-200 / 0-1000 (actual); 0-4 / 0-20 (diluted)
Coke Calciner	BP	Rosemount	0-150
Cement	Cal-Portland Cement	Bovar/Ametek	0-500
Glass	Owens-Brockway	Thermo Electron	0-100 / 0-800

(Data provided by AQMD Source Testing Team)

To assure that there are systems capable of measuring low concentration levels of 5 ppmv – 40 ppmv SOx, staff conducted a research of market availability of CEMS for low level detection. For detection at the lower ranges for SO_2 (<10 ppm level), there are currently two main extractive methods for sampling the flue gas from a stack: dilution-extractive and extractive non-dilution.

10.1 Dilution-Extractive

This sample acquisition method allows for the sampling and detection of flue gas pollutants on a wet basis. This is convenient, since the mass emission rate is also determined on a wet basis. The extracted sample is diluted with clean air (typically in a 100:1 ratio) before analysis. The

[53] The author for Chapter 10 is Kevin Orellana.

analysis is performed with an ambient SO_2 analyzer, since the diluted pollutant concentration is near an ambient concentration level.

10.2 Extractive Non-Dilution

This sample acquisition method requires that the sample be clean and dry for measurement. Therefore, significant emphasis must be placed on particulate and moisture removal to ensure an accurate reading. This is often achieved by way of particulate filters and heated sample lines to prevent gas sample condensation. Furthermore, any remaining moisture in the sample is removed by way of a sample conditioning system. Usually, the technology employed involves refrigerated condensers, thermoelectric chillers, or gas permeation dryers. The cleaned, dry sample is then analyzed via an SO_2 gas analyzer.

For both sample acquisition methods, gas cleanup and sample conditioning is of foremost importance. For systems using dilution-extractive methods, the dilution air must be dry and free of contamination. For extractive non-dilution methods, the sample gas must be conditioned (free from particulate contamination, acid mist, ammonia, and moisture) since SO_2 is soluble in water.

The majority of the CEMS analyzers currently installed at SOx RECLAIM major sources employ extractive non-dilution sampling, and has the capability of monitoring in the 25ppm SO_2 full span range (FSR). As expected, some upgrades may have to be performed to the existing systems to achieve readability in the lower ppm SO_2 full span ranges. The first choice will be whether to install a dilution-extractive system with an ambient SO_2 analyzer as a replacement for an extractive non-dilution system. Both dilution-extractive and extractive non-dilution systems can be installed in SO_x RECLAIM source category equipment. However, some process-specific stack conditions may determine which type of system will work best at sample cleanup and analyte detection.

If sample dilution is determined as the best method for SO_2 detection, a completely new sampling system must be installed to measure pollutant gases on a wet basis approach. This will replace an existing extractive non-dilution system. The hardware required will consist of a dilution probe, sample lines, air clean up hardware, an ambient analyzer, plus integration hardware (cabinet, calibration hardware, programmable logic controller, and data acquisition system). The estimated cost for a new dilution-extractive system, including installation, is around $250,000. Since SO_2 will be detected on a wet basis, other criteria pollutants such as NO_x and CO may also be detected on a wet basis. New analyzers will have to be installed for these respective analytes in order to be sampled from the same dilution probe.

If a facility is currently operating an extractive non-dilution system and opts to continue criteria pollutant measurements on a dry basis, the two essential components required for an upgrade would be a new SO_2 gas analyzer and a gas conditioning system, such as a Nafion-based permeation drying system. Ametek Process Instruments, for example, manufactures an SO_2 gas analyzer whose minimum full scale is from 0-25 ppm SO_2. However, lower readings are possible by way of increasing the sample pressure and/or shifting to lower UV wavelengths for detection down to 0-10 ppm SO_2 FSR.

It is worth mentioning that if certain critical hardware components (e.g. probes, data acquisition systems, etc.) are near the end of their useful operating lives, a completely new extractive non-dilution system will need to be installed. This will consist of a probe, sample lines, gas conditioning system, analyzer, and integration hardware. The estimated cost for a new extractive non-dilution system, including installation, is also around $250,000.

However, if a facility that operates an extractive non-dilution system wants to only replace the SO_2 analyzer and install a stack–mounted, Nafion-based, permeation drying system, the cost is much less: around $35,000. The operator can continue to use its existing CEMS setup until the end of its useful life. The heated sample lines and condensation chillers can still be retained as a backup to the Nafion permeation drying system.

These above-mentioned systems have been in use at various SOx RECLAIM sources throughout the District. Each system uses industry-proven technology that achieves the required calibration results, analyte measurements, and valid Relative Accuracy Testing Audit (RATA) results.

Due to each individual facility's equipment setup, the CEMS shelter may or may not require relocation. The retrofits mentioned above are applicable to a scenario where the shelter is not being relocated. In this scenario, the sampling lines would be rerouted from the new SOx control equipment stack to the existing shelter.

However, the unique setup of a facility may necessitate the placement of the new control equipment at the current location of the CEMS shelter. If the facility elects to relocate its shelter, a concrete pad may need to be laid at the new shelter location and utility lines may have to be routed there. The facility may reuse and move the existing shelter and sample lines to the new shelter location, or purchase brand new equipment. A new air-purged, climate-controlled, Class 1 Division 2 shelter that can accommodate an analyzer rack costs about $250,000, and the facility may use general contractors or hire an engineering firm to design and manage the project, and the associated costs for these services may vary depending on the firm chosen.

TABLE 10-2
Future CEMS Capability

CEMS Supplier	Detection Range (ppm)	What needs to be done to upgrade existing setup?	Costs Per Unit
Horiba	0-0.05/0-0.1/0-0.2/0-0.5 (wet basis)	New sampling system (dilution probe, sample lines, dilution air cleanup, analyzer, integration hardware) + installation	$250,000
Ametek Process Instruments	0-25 (or lower, 0-10, with increased sample pressure and/or shorter UV wavelength detection, dry basis)	New sampling system (probe, heated sample lines, gas conditioning system, analyzer, integration hardware) + installation	$250,000
Perma Pure	for dry measurements	Nafion-based permeation drying system is directly mounted at the stack	$15,000
Ametek Process Instruments	0-25 (or lower, 0-10, with increased sample pressure and/or shorter UV wavelength detection, dry basis)	Direct SO_2 analyzer replacement at CEMS rack	$20,000

Chapter 11 – Water & Wastewater

11.1 District's Survey

11.1.1 Water Demand

A Survey Questionnaire shown in Appendix D was sent to the facilities in July 2009 to gather information on the water usage at the facilities. The facility's responses to this Survey Questionnaire were summarized in Table 11-1. Staff's assessment of the information presented in Table 11-1 is below:

— Total water demand is below 1 million gallons per day. As shown in Table 11-1, the increase in total water demand (fresh and recycled water) for this project, consisting of 11 wet gas scrubbers and 2 dry gas scrubbers, is estimated about 364 million gallons per year (or 1 million gallons per day).[54, 55]

— Increase in total water demand. It should be noted that as shown in Table 11-1, eleven affected facilities currently use about 53 million gallons of water per day. The increase of 1 million gallons of total water per day demand for this project, while meaningful, represents a rather modest 2% increase over the current level of total water usage at the 11 facilities.[56]

— Water suppliers can meet additional demand. CEQA staff has consulted the water suppliers for all eleven affected facilities to ask if they can support the modest 2% increase in water demand of this project. The water suppliers indicated to staff that they can provide the amount of water increase.

[54] Information on water demand listed in the consultants' final report for SRU/TGTU's wet gas scrubbers were incorrect. Staff used information provided directly by the wet gas scrubbers' manufacturers as listed below. Tri-Mer information was based on the use of caustic as a scrubbing agent.

Water Demand Information for SRU/TG's wet gas scrubbers		Refinery 6	Refinery 3	Refinery 2
Incorrect numbers listed in the consultants' final reports	MM gals/yr	614	158	342
Draft numbers listed in the consultants' draft final reports	MM gals/yr	75	19	25
Numbers provided by Tri-Mer	MM gals/yr	51	26	78
Numbers provided by DynaWave	MM gals/yr	31	11	47
Staff's Revised Numbers	MM gals/yr	51	26	78

[55] The six refineries alone would need about 264 million gallons water per year (0.7 million gallons per day) for this project. The six refineries currently consume 46 millions gals water per day. This project reflects a 1.5% increase in water demand for the refineries.

[56] Ten out of eleven facilities will have about 1% - 4% increase in water demand. Owens Brockway will experience a 44% increase in water demand. However, Owens Brockway has used wet gas scrubbers in the past before they switched to dry scrubbing technology and their water supplier (City of Vernon) indicated to staff that they can accommodate this increase of water demand.

— No cap on purchasing water. As shown in Table 11-1, the facilities reported that they have no cap in the amount of water (fresh or recycled) that they can purchase from the water suppliers. Some of the refineries indicated that they may have to pay an increase in water price in a near future because of the drought in California.[57] Since the water suppliers indicated that they can provide the water and there is no cap on the buyers, the 2% increase in water demand for this project can be met by the suppliers.

— Recycled water available at major refineries. As shown in Table 11-1, of the eleven facilities, three refineries (Refinery #2, 3, and 6) consume the largest amount of water, ranging from 3,000 – 4,500 million gallons per year. These refineries however already have access to recycled water. Currently, 50%-90% of the water used in these major refineries is recycled water. The suppliers of recycled water indicated that they are working in expanding their capacity to supply recycled water to the facilities in the basin and can supply the water demand increase for this project.

— Pumping capacity remained for in-house ground water wells. As shown in Table 11-1, seven of the eleven affected facilities have ground water wells. All seven facilities have unused pumping capacity. The remaining pumping capacity is well above the increase in water demand at the facility due to this project.

— Potable water demand is about 96,786 gallons per day. Based on the information in Table 11-1, two facilities (coke calciner and glass manufacturing) currently have no wells and no access to recycled water, and the increase in potable water demand from these two facilities will be about 96,786 gallons per day. The water suppliers indicated to CEQA staff that they can supply this increase in water demand.

11.1.2 Wastewater

Based on the facility's responses shown in Table 10-2 and staff's collected information, staff believes the wastewater impacts from this project would be less than significant because of the following reasons:

— Small increase in discharge. As shown in Table 11-2, the project would generate about 2% increase in wastewater (range from <1% - 11%).

— Wastewater treatment & discharge capacity available. As shown in Table 11-2, the facilities have available discharge capacities. Their on-site wastewater treatment plan can handle the small increase. In addition, since the increase in discharge is less than 25%, the facilities need not to revise their discharge permit.

[57] Regarding the price increase, a facility indicated that one of their facilities located in Northern California will install a wet gas scrubber as required by a U.S. EPA consent decree. The facility will pay premium price for the water usage above their cap, or conduct in-house program to monitor and conserve the water usage at their facility.

(note 9)**	**Wet gas scrubbers are past practice. Percent increase in water is meaningful but can be met.**	**No limit on groundwater pumping. Nomimal increase of 2% can be met.**	**This project is expected to result in less than 2% increse in water demand. Adequate supply of water is available.**

TABLE 11-1 – Water Demand Information (Cont.)

Notes:

1. Information from survey responses was submitted by the facility in August 2009. The facility indicated that there was no cap on fresh or recycled water supply but the facility may have to pay a 21% increase in price of water in 2009, and may have been required to reduce water usage by 20%

2. Information from survey responses submitted by this facility on August 6, 2009. The facility indicated that there was no cap on water supply, however the WBMWD may mandate a 20% reduction in near future.

3. - 6. Reserved

7. Based on the Survey Responses submitted on August 8 and 13, 2009, the facility indicated that they do not have a cap on water supply, however LADWP must review any increase to assure that there is no physical constraint (e.g. piping, pump)

8. Based on the Survey Responses submitted on August 10, 2009, the facility indicated that they do not have limits on water supplied but they do expect to pay higher fees on discharged wastewater because the fees on discharged wastewater are based on total dissolved solids and COD

9. Rhodia water information from survey responses submitted by Rhodia on August 4, 2009.

TABLE 11-2 – Wastewater Information (Cont.)

Notes

1. This facility reported a maximum treated capacity of 8,000 gpm (12 million gals per day) and a normal treated rate of 4,000 gpm (6 million gals per day). SCAQMD data (e-mail from Hanh Le to Minh Pham on August 5, 2009) provided a slightly smaller discharge levels
2. This facility has two distinct wastewater treatment systems. The first system has primary treatment only. The second system has both primary and secondary treatment. The facility also has wastewater storage capacity to handle surges due to storms and upset
3. Reserved
4. For this refinery, see e-mail from Cynthia Carter to Minh Pham on August 5, 2009. Wilmington site has no maximum limit of discharge. LACSD indicated that they did not expect to see any significant impacts to their waste water treatment system
5. For this facility, see e-mail from Sawsan Andawis to Minh Pham on August 6, 2009. The facility reported that if they are over 25% baseload of waswater discharge limit, they will be subject to a large connection fee minimum of $7.8 MM & claimed that with a wet gas scrubber installation, they will exceed the 25% baseload, which is unlikely to occur.
6. From the Survey Responses submitted on August 8, 2009, the facility responded that they do not have a wastewater treatment facility, and currently send all wastewater to LACSD for treatment. Currently, the permit given by LACSD has a cap
7. Reserved
8. Based on the Survey Responses submitted on August 10, 2009, the facility indicated that "Additional scope and cost should have been included to reduce/offset/treat the quantity generated from this project....".
9. For Rhodia, based on the Survey Responses submitted on August 4, 2009, all wastewater is pumped into above ground agitated tanks and sodium hydoxide is added to elevate the pH above 6.0. The discharge limit is 0.6 MM gals per day max (425 gals/min).

11.2 California Water Plan

The California Water Plan provides a framework for water managers, legislators, and the public to consider options and make decisions regarding California's water future. The Plan, which is updated every five years, presents basic data and information on California's water resources including water supply evaluations and assessments of agricultural, urban, and environmental water uses to quantify the gap between water supplies and uses. The Plan also identifies and evaluates existing and proposed statewide demand management and water supply projects to address the State's water needs. The California Department of Water Resources (DWR) just recently released the 2009 California Water Plan update in February 2010.[58]

The 2009 Plan focuses on strategies to use water efficiently, improve water reliability and water quality, and for the first time, integrate water resource management with flood management throughout the state. In addition, the Plan for the first time discussed the impacts of climate change and included the effects of climate change in estimating the water demand and supply for each of the ten hydrologic regions in California. The Plan includes 5 volumes: Volume 1 describes the current water conditions in California and challenges, presents the strategic plans for the state as well as for the 10 hydrologic regions, and identifies recommendations that will be incorporated statewide in the next couple years; Volume 2 describes 27 resource management strategies (e.g. reduce water demand, improve operational efficiency and transfers, increase water supply, improve water quality, practice resources stewardship, and improve flood management) that can be implemented in a mix and match fashion to help the 10 hydrologic regions to diversify their water portfolio and become more regionally self-sufficient; Volume 3 contains specific regional reports, and each regional report includes a water balance summary of water use and water supply for the region from 1998 through 2005, and scenario results that project the region's water needs through year 2050 with the use of three future scenarios (i.e. Current Trends, Slow and Strategic Growth, and Expansive Growth)[59] and 12 climate change scenarios; Volume 4 and Volume 5 contain references and technical information. For further information about the 2009 California Water Plan Update, please visit the website the California Department of Water Resources.[60]

[58] The 2009 California Water Plan Update, http://www.waterplan.water.ca.gov/cwpu2009/index.cfm,
http://www.waterplan.water.ca.gov/docs/cwpu2009/0310final/highlights_cwp2009_spread.pdf
http://www.waterplan.water.ca.gov/docs/cwpu2009/0310final/v3_southcoast_cwp2009.pdf
http://www.waterplan.water.ca.gov/docs/cwpu2009/0310final/v2c11_recycmuniwtr_cwp2009.pdf
http://www.waterplan.water.ca.gov/docs/cwpu2009/0310final/v2c03_urbwtruse_cwp2009.pdf

[59] In the "Current Trends" scenario, it was assumed that the existing trends in California will continue to 2050, the population increases to nearly 60 million people in California in 2050, affordable housing has drawn families to the interior valleys, and people take longer trips in distance and time. In the "Slow and Strategic Growth" scenario, it was assumed that there will be more efficient planning and development, population growth is slower and projected to increase to 45 million people, families live in compact urban development and commute less, Californian embraces water and energy conservation, and state government successfully implements and coordinates program to improve water quality. In the "Expansive Growth" scenario, it was assumed that the population will increase to 70 million people in 2050, Californian prefers low-density housing, some water and energy conservation was offered but at a slower rate than current trends.

[60] California Department Water Resources website - http://www.waterplan.water.ca.gov/

A big picture of the current water demand and use, the predicted water demand and use for the next 30 years, as well as the Best Management Practices (BMP) and the strategies to conserve water that the DWR recommends can be found in the 2009 California Water Plan Update. Staff focuses its research in the South Coast Hydrologic Region. The South Coast region is the California's most urbanized and populous region with the largest population of the state at almost 20 million. The South Coast region covers all of Orange County and portions of Ventura, Los Angeles, San Bernardino, Riverside and San Diego counties. The region has numerous sources of water supplies: imported water, surface water, groundwater, recycled water, and desalination. According to Metropolitan Water District of Southern California (MWD), half of the water supplied to the Southern California is from local supplies (e.g. groundwater wells. lakes) and the other half is imported water from Northern California via the State Water Projects (SWP) passing through the Sacramento-San Joaquin Delta (Delta), the Colorado River, and Owens Valley/Mono Basin.

The State Water Project (SWP) is an important source of water for the South Coast region. The SWP is managed by the California Department of Water Resources (DWR). There are about 6 major contractors for the SWP. These contractors take delivery and convey the suppliers to regional wholesalers and retailers. The MWD is one of the major contractors. The contract between MWD and DWR is approximately about 1.91 MAF per year, half of the total SWP.[61]

Another key imported water supply for the South Coast region is the Colorado River. The DWR is entitled to 4.4 MAF per year from the Colorado River, of which 3.8 MAF are assigned to agricultural users and the remaining to MWD. Within the last couple years, MWD routinely uses 1.2 MAF from the Colorado River because the agricultural users have not been using their full entitlement. MWD conveys the water through a 242-mile Colorado River Aqueduct to supply to the retailers in Southern California.

Another source of imported water is the water from Mono Basin and Owens Valley. Approximately 480,000 acre-feet per year of water is delivered by the LADWP through the Los Angeles Aqueduct to the City of Los Angeles. However, this amount varies from year to year due to fluctuating precipitation in the Sierra Nevada Mountains

Local surface water (e.g. Lake Casitas, Lake Piru, Castaic Lake, Lake Perris) plays an important part in the big picture of water supply to Southern California. More than 75 impound structures are used to capture runoff for direct use and groundwater recharge, operational and emergency storage, and food protection.

Groundwater production within the Metropolitan service area is estimated at 1.6 MAF per year. However, natural recharge is typically insufficient to maintain the groundwater basin water levels and current pumping levels due to the extent of impervious surfaces and the presence of clay soils. Many local water agencies must rely on artificial recharge (e.g. using recycled water). The Water Replenishment District of Southern California (WRD) has the mission to manage and protect the groundwater supply in the basin. In the past couple years, most basin adjudications

[61] 2009 California Water Plan Update, South Coast, Volume 3 Regional Report.

have resulted in either a reduction or no increase in the amount of groundwater that can be extracted.

Within MWD's service area, there are approximately 355,000 acre-feet of planned and permitted uses of recycled water supplies. Actual use is approximately 209,000 acre-feet, mainly in golf course, landscape, irrigation, industrial uses, construction applications, maintenance of seawater barriers, and groundwater recharge. The MWD projected a development of 500,000 acre-feet recycled water supplies by 2025. The use of recycled water by LADWP is projected to approximately 50,000 acre-feet per year by 2019.

Besides imported water, groundwater, and local surface waters, urban water conservation and desalination are also the sources of water supplies in the area. Local water agencies utilize a mixture of local and imported waters, and implement diverse water management strategies to meet the urban and agricultural demands. The total water use in the South Coast Hydrologic Region is reported to be approximately 4.8 MAF averaged from 1998-2005 period and about 5.2 MAF in 2005. In the 2009 California Water Plan Update, it is projected that the urban water demand will have a range of increase from 1.65 MAF in 2050 for the "Current Trends" scenario to 3.24 MAF with "Expansive Growth" scenario. The "Slow & Strategic Growth" scenario resulted in relative smaller increase in water demand of 0.145 MAF.

To meet the California's water challenges, Governor Schwarzenegger and state lawmakers have successfully crafted a plan that passed legislation and signed into law in November 2009. The plan is comprised of four policy bills (Senate Bills No. 1, 6, 7, 8) and $11.14 billion bond. Senate Bill No. 1 establishes the framework to provide a more reliable water supply to California and restore the Delta ecosystem. Senate Bill No. 6 requires, for the first time in California's history, that local agencies monitor the groundwater levels during both normal water years and drought conditions. Senate Bill No. 7 requires urban water agencies/suppliers to reduce the potable water consumption by 20% per capita by 2020, and Senate Bill No. 8 requires stronger accounting of the location and amounts of water being diverted from the Delta and appropriates existing bond funds to various activities to benefit the Delta ecosystem and secure the reliability of the state's water supply. In addition, the newly funded bond of $11.14 billion is approved by the Governor to fund drought relief, water supply reliability, Delta sustainability, statewide water system operational improvements, conservation and watershed protection, groundwater protection, and water recycling and water conservation programs. A summary of the four Senate Bills and bonds are provided in the 2009 California Water Plan Update.[62] The focus of the next section is to discuss the 20x2020 Water Conservation Plan which is the backbone of information for the Senate Bill 7 (SBX7 7) which calls for a 20% reduction of potable water per capita by 2020.

[62] The 2009 California Water Plan Update, 2009 Comprehensive Water Package – Special Session Policy Bills and Bond Summary. http://www.waterplan.water.ca.gov/docs/cwpu2009/0310final/v4c15a05_cwp2009.pdf.

11.3 20x2020 Water Conservation Plan

In February 2008, the Governor directed state agencies to develop a 20x2020 Water Conservation Plan that aims to reduce statewide per capita urban water use by 20 percent by the year 2020. In order to develop the 20x2020 Plan, an Agency Team was formed which consisted of state and federal agencies including the Department of Water Resources (DWR), State Water Resources Control Board (SWRCB), California Energy Commission (CEC), Department of Public Health (DPH), California Public Utilities Commission (CPUC), Air Resources Board (ARB), California Bay-Delta Authority (CBDA), and the US Bureau of Reclamation (USBR), with the contribution of the California Urban Water Conservation Council and water suppliers/purveyors and organizations through public workshop and meetings.

Several important facts of the scope of the 20x2020 Plan are summarized below:

1. **The Plan addresses only urban water use and conservation, not agricultural water use**;

2. **The Plan addresses only potable water use**. Urban potable water use includes all residential, commercial, institutional, and industrial users as well as non-revenue water. Non-potable recycled water was excluded while estimating baseline per capita urban water use to give credit to agencies that have promoted recycled water in the past. Additional use of recycled water will be a significant method by which regions can continue to offset baseline potable urban water demand to meet the 2020 goals;

3. **The plan does not address water supplied by customers for their own use.** The plan focuses on potable water supplied in municipal distribution systems and does not include quantities of self-supplied water (groundwater or surface water) in per capita use calculations.

4. **The plan recommends actions that will reduce per capita use, not total urban use, by 20 percent.** Since the population is always increased, total urban water use will never go down, therefore the plan aims at improving water supply reliability and water use efficiency.

5. **This plan does not set targets for individual water suppliers.** There are wide variations among water suppliers. This plan does not provide specific guidance to move from regional planning targets to supplier-specific targets. Water suppliers are to develop their own plan to meet the state goals.

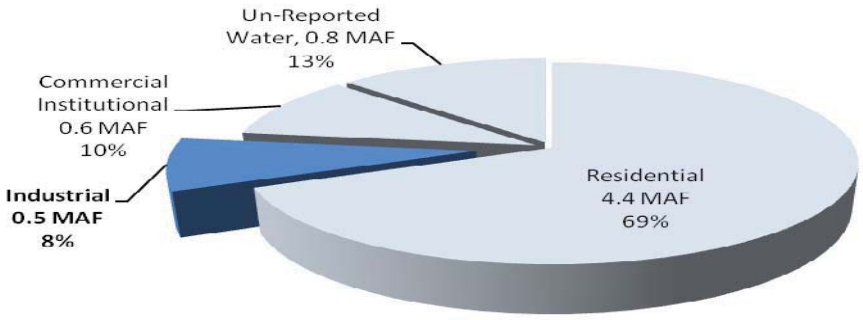
The 20x2020 plan is based on the 2005 baseline urban water use. As shown in Table 11-3, the total baseline for the South Coast region is 253 Gallons Per Capita Day, which approximately amounts to 6.37 million acre-feet per year using the projected 2020 population of 22.5 million in the South Coast Hydrologic Region. As shown in Table 11-3, the average water use for the industrial sector is approximately 8% of the total water use in the South Coast region.

TABLE 11-3
Urban Water Use Pattern in 2005 for South Coast Hydrologic Region

	Water Use
Residential (Single-and Multi-Family)	174 GPCD
Commercial and Institutional	25 GPCD
Industrial	21 GPCD
Un-Reported Water	33 GPCD
Total Baseline	**253 GPCD (6.37 MAF per year)**

Reference: Table 3 of the 20x2020 Water Conservation Plan, February 2010. Total projected 2020 population = 22.5 million. Therefore, 253 GPCD = (253 gallons per capita per day)(22.5 million)(365 days/year)(1 acre-ft/326,000 gals = 6.37 million acre-feet/year = 6.37 MAF/year)

TABLE 11-1
Urban Water Use in South Coast Hydrologic Region



After establishing the 2005 baseline, the Agency Team held numerous public meetings/workshops to establish the conservation targets and develop recommendations for future actions to achieve the targets.

Many urban water suppliers currently implement and enforce the 14 Best Management Practices. The Agency Team studied the results of the current actions and estimated future savings based on implementing current BMPs listed in Table 11-4. The Agency Team also evaluated new measures. Estimated savings for current and new measures are listed in Table 11-5.

The nine (9) Agency Team's recommended actions to achieve the Governor's statewide strategic goal of 20x2020 are listed below:

1. Establish a statewide conservation strategy
2. Reduce landscape irrigation demand
   - Require water-efficient landscapes at state-owned properties
   - Support the implementation and enforcement of landscape design and irrigation programs and the development of new landscape programs
   - Mandate the landscape irrigation Best Management Practices (BMP)

TABLE 11-4
List of Best Management Practices (BMPs)

BMP1	Water survey programs for residential customers
BMP2	Residential plumbing retrofit
BMP3	System water audits, leak detection and repair
BMP4	Metering with commodity rates for all new connections and retrofit of existing unmetered connections
BMP5	Large landscape conservation programs and incentives
BMP6	High efficiency clothes-washing machine financial incentive program
BMP7	Public information programs
BMP8	School education programs
BMP9	Conservation programs for commercial, industrial, institutional (CII)
BMP10	Wholesale agency assistance programs
BMP11	Retail conservation pricing
BMP12	Conservation coordinator
BMP13	Water waste prohibition
BMP14	Residential ultra-low-flush toilet (ULFT) replacement programs

TABLE 11-5
Summary of 2020 Savings from All Evaluated Measures for South Coast Region

	Water Saving (GPCD)
Efficiency Code Water Savings	
Residential – Indoor	4
Residential – Outdoor	0
Commercial, Institutional, Industrial (CII)	1
2020 Water Savings from Cost Effective Measures	
Residential – Indoor	2
Large Landscape	4
Commercial, Institutional, Industrial (CII),	7
Non-Revenue Water	4

Residential Flow Controllers	3
Total for Basic Measures	**24**
Accelerated coverage goals	7
Recycling	4
Water loss controls	4
Irrigation restrictions (2 days/week)	13
Miscellaneous measures	2
Total Additional Measures	**29**
Total Savings	**53**

Reference: Table 7 of the 20x2020 Water Conservation Plan, February 2010

3. Reduce water waste
   - Accelerate installation of water meters
   - Establish a state standard for water meter accuracy
   - Revise the water loss BMP to incorporate improved methodologies and accelerate coverage goals
4. Reinforce efficiency codes and related BMPs
   - Obtain authorization for state standards for high efficiency clothes washers
   - Support landscape irrigation equipment standards
   - Accelerate replacement of inefficient showerheads, toilets and urinals
   - Accelerate adoption of proven water saving technologies in new businesses
5. Provide financial incentives
   - Encourage or mandate conservation water pricing
   - Provide grants, loans, and rebates to wholesale and retail water suppliers and customers
   - Establish a public goods charge for water
   - Fund the installation of water meters
6. Implement statewide conservation public information and outreach campaign
7. Provide new or exercise existing enforcement mechanisms to facilitate water conservation
   - Require implementation of water conservation as a condition to receive state financial assistance
   - Take enforcement actions to prevent waste and unreasonable use of water
   - Provide additional enforcement tools for water suppliers
8. Investigate potential flexible implementation measures
   - Investigate requiring conservation offsets for water demand generated by new development
   - Investigate establishment of a cap-and-trade regime
9. Increase the use of recycled water and non-traditional sources of water

For comparison, the water savings from Table 11-5 are converted to million gallons of water savings per year and graphically shown in Figure 11-2. It should be noted that from Table 11-5, reducing water in irrigation to 2 days/week is the measure that would generate the most water savings. The two most important conservation measures which generate more than 50% of the conservation amount are conservation in irrigation and residential sector. The residential sector is expected to conserve more than the commercial, institutional, and industrial sector. Interestingly though is that the conservation from water loss controls is as significant as the conservation estimated for additional water recycling.

FIGURE 11-2
Comparison between Measures in the 20x2020 Plan

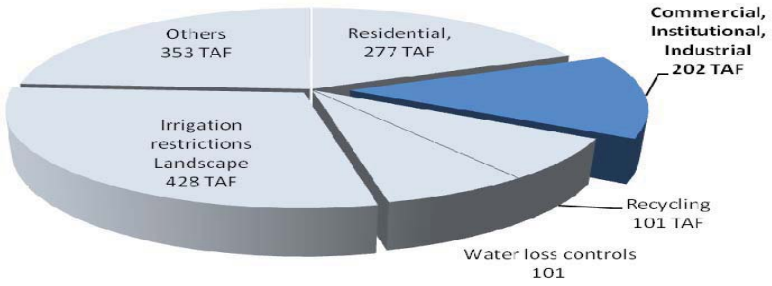

Table 11-7 shows a comparison of SOx RECLAIM total water and potable water demand to the water demand and savings of the statewide strategic plan of the South Coast Hydrologic Region. The total water demand for the proposed SOx RECLAIM project is about 0.02% of the total water usage in the South Coast Hydrologic Region. The increase in potable water demand of the proposed SOx RECLAIM project (for scenario that used wet gas scrubbers if future supplies of recycled water are available) is about 0.05% of the potable water savings estimated for the CII sector of the South Coast Hydrologic Region in 2020. Staff believes that the impacts on water demand and potable water demand is negligible based on the information in the 20x2020 Plan.

TABLE 11-7
Comparison of water demand for SOx RECLAIM Project
to the Statewide Strategic Plan of the South Coast Hydrologic Region

Total Water Usage

- Baseline for South Coast region = 253 GPCD = 6.37 million acre-ft per year (MAF)
- Future water demand for SOx RECLAIM = 1,000 acre-ft per year total water
- Percentage = 1,000 / 6.37 million = **0.02 %**

Potable Water Savings

- Savings estimated for Commercial, Institutional and Industrial sector for the South Coast region= 8 GPDC = 201,423 acre-ft per year

- Potable water demand for scenario where wet gas scrubbers (or SOx reducing catalysts) are used if future supplies of recycled water are available = 99,360 gals/day = 111 acre-ft per year. Percentage = 111 / 201,423 = **0.05%**

- Potable water demand for scenario where wet gas scrubbers are used if future supplies of recycled water are not available = 201,587 gals/day = 226 acre-ft per year. Percentage = 226 / 201,423 = **0.11%**

- Potable water demand for scenario where ~~De~~SOx reducing catalysts are used in FCCUs if future supplies of recycled water are not available = 108,436 gals/day = 121 acre-ft per year. Percentage = 121 / 201,423 = **0.06%**

11.4 Urban Water Management Plans

The Urban Water Management Planning Act (Act) became effective on January 1, 1984, and requires that every urban water supplier that provides municipal and industrial water to more than 3,000 customers, or supplies more than 3,000 acre-feet per year (AFY) prepare and adopt an urban water management plan in accordance with prescribed requirements. The Act requires the water purveyors to provide information on water supply and demand in their service area, focus primarily on water supply reliability and water use efficiency measures and put strong emphasis on drought contingency planning and recycled water. With the passage of Senate Bills 610 and 221 in 2001, the Urban Water Management Plan (UWMP) becomes more important. With SB 610 and 221, the UWMP becomes a written verification and indication to whether or not the urban water suppliers can provide water to the people living in the area. The UWMP serves as the master plan for water supply and resources management, a guidance document for policy makers to secure a sustainable water supply, as well as an ultimate source of information to the citizens in the basin. Because of this magnitude of its importance, staff conducted a research on the UWMPs of the major suppliers in the basin to understand a big picture of the water supply and demand in the basin and to consciously and intelligently answer the following questions related to the SOx RECLIAM project:

- What is the current and future water supply and demand in the basin? What is the distribution of water use in the basin?
- What are the Best Management Practices (BMPs) recommended by the water experts to conserve water and secure water resources in California? What are their effectiveness and how much water that they can help to conserve? To what extend ~~does~~is recycled water used in the basin?
- How does the water demand increase for this SOx RECLAIM project measure up to the overall water use in the basin? Can the urban water suppliers supply this amount of increase? Can this amount of increase be mitigated?

The information on the water supply/demand and water reliability analysis in the UWMPs of the three major water suppliers in the basin, Los Angeles Department of Water & Power (LADWP), West Basin Municipal Water District (WBMWD), and Metropolitan Water District of Southern California (MWD) are presented below.

West Basin Municipal Water District (WBMWD)

The WBMWD is the sixth largest water district in the state of California, serving a population of about 915,000 in 17 cities. The WBMWD currently supplies an average of 220,000 acre-feet of water annually combined of groundwater, imported water and recycled water. WBMWD is currently the wholesale supplier of recycled water for three refineries in the SCAQMD – Refinery 2, 3, and 6, and will expand its service to deliver recycled water to the sulfuric acid plant in 2013.

The WBMWD actively produces and provides recycled water, supports a desalination project,

and conducts numerous programs to promote water conservation. Some of its accomplishments are highlighted below:

— In 1992-1993, the WBMWD received state and federal funding to construct a world-class state of the art water treatment/recycling facility in the City of El Segundo named Edward C. Little Water Recycling Facility. The WBMWD is in the process of expanding the capacity of its facility to double the amount of recycled water produced in 2013. To promote the use of recycled water, the WBMWD advances funds for retrofit expenses which can be reimbursed through the water bills. The onsite plumbing retrofit costs are amortized over a 10 years period at WBMWD's cost of funds. Repayment can be made using the differential between potable and recycled water rates so that customers never pay more than potable rate. Once the loan is repaid, the rate reverts back to the current recycled rate

— The WBMWD incorporates all 14 Best Management Practices (BMPs) recommended by the California Urban Water Conservation Council (CUWCC) such as distributing water-saving showerheads and toilets, smart controllers, and conducting water recycling and water education workshops to increase public awareness about water conservation and help to increase water reliability within the region. As an example, providing $50 rebates for customers to replace/install Ultra-Low-Flush Toilet (ULFT) has saved from 44 acre-ft (1,544 toilets) to 123 acre-ft per year (4,234 toilets) in 5 years from 2000-2004. In addition, with the demand on the water supply continuing to increase, the WBMWD proactively pursues a demonstration-scale ocean-water desalination facility to explore the feasibility of large-scale ocean-water desalination for future supply.

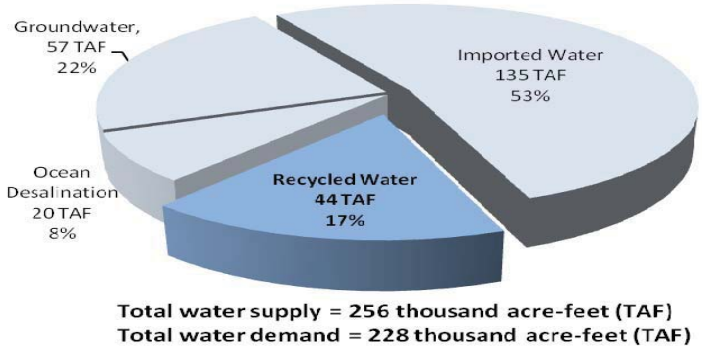
The WBWMD is in the process of developing its 2010 Urban Water Management Plan (UWMP) which is due to the Department of Water Resources in 2011. As shown in its 2005 UWMP, the WBWMD is able to supply reliable water to meet the demands projected for 25 years from 2005 to 2030 in both single dry-year scenarios or multiple dry-year scenarios. The projected water demands, supplies, and surplus from the 2005 UWMP are presented in Table 11-8 for multiple dry-water years. The projected multiple dry-year scenarios were based on the low rainfall years in FY 2001-02, 2002-03, and 2003-04. **The WBMWD estimates that they will supply reliable water with a surplus varying from 7,800 acre-feet per year to 33,236 acre-feet per year for the next 30 years.**

TABLE 11-8
Projected Water Demands and Supplies for Multiple Dry-Year Reliability [1, 2]

	Year 2010 (Acre-Feet)	Year 2014 (Acre-Feet)	Year 2015 (Acre-Feet)	Year 2020 (Acre-Feet)	Year 2030 (Acre-Feet)
Groundwater	56,797	56,797	56,797	56,797	56,797
Imported Water	135,334	130,940	135,334	135,334	135,334
Recycled Water	21,848	31,000	32,500	36,250	43,750
Ocean Desalination	0	20,000	20,000	20,000	20,000
Total Supply	**213,979**	**238,737**	**244,631**	**248,381**	**255,881**
Total Demand	**206,188**	**205,855**	**211,395**	**216,733**	**227,816**
Surplus	**7,791**	**32,882**	**33,236**	**31,648**	**28,065**

Note: 1) WBMWD 2005 Urban Water Management Plan, Chapter 4. 2) Supply reliability covers only water demand in municipal/industrial sectors and does not include replenishment.

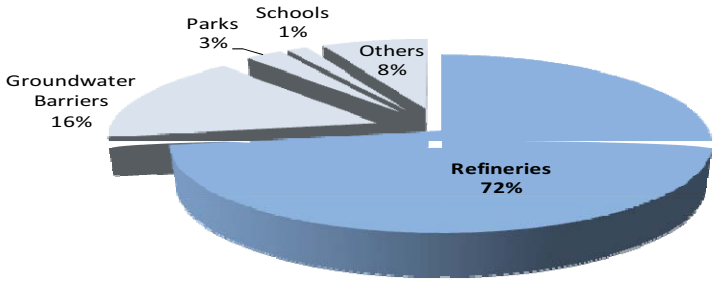
FIGURE 11-1
Projected Water Supplies for WBWMD Area (Year 2030)



Regarding recycled water, the WBWMD produces five different types of water quality from irrigation water (tertiary treated meeting California Title 22 regulation) to ultra pure Reverse Osmosis water for groundwater injection and industrial boiler feed as shown in Table 11-9.

The recycled water from WBMWD is used in various commercial, institutional and industrial operations, but mostly by refineries, with the distribution shown in Figure 11-2.

FIGURE 11-2
Distribution of Recycled Water Use for WBWMD Area



Regarding the WBMWD's water rates, the irrigation water is typically sold at a cost of $73 per acre-foot whereas ultra pure Reverse Osmosis Water is sold at a cost of $750 per acre-foot as shown in Table 11-1-B. Refinery A, B and D purchase a combination of nitrified water, one single pass pure RO water, and ultra pure RO water. **The consultants (ETS/AEC) have conservatively used a rate varying from $800 per acre-ft - $1,350 per acre-ft to estimate the annual water costs for SOx RECLAIM project accordingly to the information given to them by the refineries.**

The recycled water consumption by the three refineries located in the WBMWD's service areas is summarized in Table 11-10, side-by-side with the amount of recycled water that the refineries reported to staff, and the potential increase demand for this SOx RECLAIM project. The total

recycled water purchased by the three refineries from WBMWD is about 18,945 acre-ft in 2008-09. The total recycled water usage reported to the District is about 21,785 acre-ft. The total increase due to SOx RECLAIM is about 678 acre-ft per year, approximately 3% increase over the baseline of 21,785 acre-ft.

As shown in its 2005 UWMP and the 2008-2009 Annual Report, the WBWMD has a potential to increase its supply of recycled water to 70,000 - 100,000 acre-feet, and will reach 31,000 acre-ft by 2014, 32,500 acre-ft by 2015, and 36,250 acre-ft by 2020. **Using the current distribution of 72% for refineries, staff projects approximately 22,320 acre-ft will be available to the three refineries in 2014, 23,400 acre-ft by 2015, and 26,100 acre-ft by 2020. The projected supply of recycled water is sufficient to cover the current demand of 21,785 acre-ft and the potential increase of 678 acre-ft for SOx RECLAIM project at these three refineries.** It is anticipated that the refineries will not implement all of the SOx RECLAIM measures at the same time in 2014, and they have extra underground pumping capacity available to balance the demand when in need.

TABLE 11-9
Type of Recycled Water & Rates [1]

Disinfected Tertiary Water	Treated secondary water from Hyperion that undergoes coagulation, flocculation, filtration and disinfection to meet the Title 22 standards. Tertiary water can be used for a wide variety of industrial and irrigation purposes where high-quality, non-potable water is needed.	$73 -$169 per acre-ft
Nitrified Water	Nitrified water is tertiary water that has been nitrified to remove ammonia, which can be corrosive to pipe material. This water is used in cooling towers.	$292 per acre-ft
Softened RO Water	Secondary treated water from Hyperion that has been treated with microfiltration, lime softeners and reverse osmosis. This water is used to replenish groundwater supplies. This water is superior to State and Federal drinking water standards.	$430 per acre-ft
Pure RO Water	Secondary treated water from Hyperion that has been treated with microfiltration and reverse osmosis. This water is used for low pressure boiler feed water for large scale industrial sites such as refineries.	$568 per acre-ft
Ultra Pure RO Water	Secondary treated water from Hyperion that has been treated with microfiltration and treated twice with reverse osmosis. This water is used for high pressure boiler feed water for large scale industrial sites such as refineries. This water is so pure that there is no mineral buildup and it can be used multiple times as boiler feed water before being discharged.	$750 per acre-ft

Note: 1) WBMWD 2005 Urban Water Management Plan, Chapter 8 – Water Recycling. 2) Rates from Chapter 7 of the WBMWD 2005 UWMP. 3) ETS/AEC has used a water rate of $2,794 per million gallons (or $910 per acre-ft, 20% higher than WBMWD's rate for the ultra pure RO water) in the cost analysis for SOx RECLAIM.

TABLE 11-10

Water Use and Potential Increase (Acre-Ft)

	WBWMD's 2008-09 Water Use Report [1, 2, 3]	Refinery's Data Reported to SCAQMD [4]	Potential Increase [5]
Refinery 3	8,587	8,650	169
Refinery 6	4,759	6,853	254
Refinery 2	5,599	6,282	255
Recycled Water Use by Refineries	18,945	21,785	678
Recycled Water Use by All Customers	23,588		
Capability of WBMWD	Projected: 31,000 by 2014; 32,500 by 2015; 36,250 by 2020; and 43,750 by 2030. Capability: 70,000 - 100,000		

Note: 1) Refineries purchase a combination of nitrification, pure single pass RO, and ultra pure double pass RO. 2) Refinery's recycled water use is about 90% - 95% of the total recycled water use by the city. 3) Refineries purchase 75% - 80% recycled water produced by WBWMD. The variation for past 10 years is shown. 4) SCAQMD's Survey. 5) Potential increase in water use by addition of wet gas scrubbers for FCCUs and SRUs, and by modification/addition of fuel gas treatment.

Los Angeles Department of Water & Power (LADWP)

On average, LADWP supplies 621,765 acre-feet of water per year (5-year average of supply from 1980-2009). The water distribution in the LADWP service area is shown in Figure 11-3. It should be noted that LADWP actively implements all 14 BMPs recommended by the California Urban Water Conservation Council (CUWCC) [63] and the DWR described in the 2009 California Water Plan. LADWP also implements many water conservation efforts (e.g. ultra-low-flush toilet retrofit program, indoor and outdoor conservation), public outreach, and school education program. As a result, the water usage in the city is the same as it was 20 years ago despite an increase in population of about 750,000 people. [64]

LADWP has a water shortage contingency plan with actions that can be undertaken in response to water supply shortages, including up to 50% reduction in water supply. Some of the actions identified in the water shortage contingency plan and currently implemented are: restricting landscape irrigation to two times a week, developing a large industrial customer incentive program that provides a monetary credit for all water conservation, irrigating public parks only with recycled water, requiring recycled water to be used at commercial car washes and construction projects, and enforcing a tired billing structures to promote water use efficiently.[65]

---

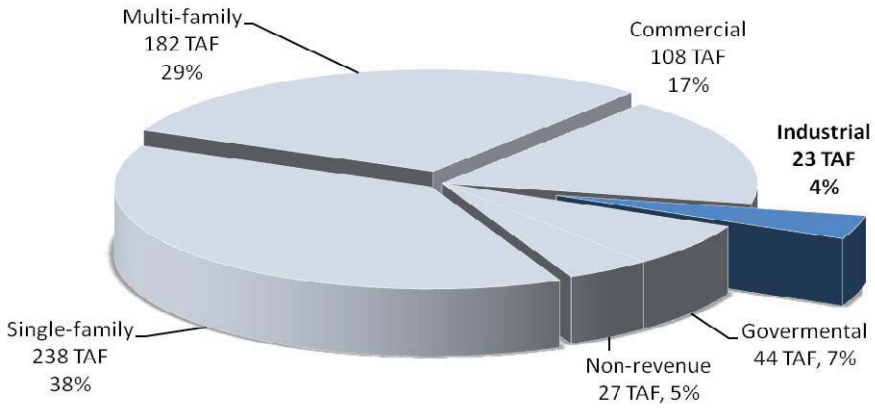
[63] The California Urban Water Conservation Council (CUWCC) is an organization formed in 1991 comprised of water suppliers and governmental agencies with a mission to promote water conservation in California. The CUWCC was instrumental in developing the "Memorandum of Understanding Regarding Urban Water Conservation in California (MOU) signed by numerous local water suppliers in California. The MOU identifies fourteen "Best Management Practices (BMPs) listed in Table 11-4 of this Staff Report, commits water suppliers to develop comprehensive conservation programs to implement the 14 BMPs, and establishes the CUWCC to monitor the implementation of the BMPs and to maintain and update the list of BMPs.

[64] City of Los Angeles Department of Water and Power, 2005 Urban Water Management Plan.

[65] To promote the use of water efficiently, LADWP restructured its water rates to a two-tier structure in 1993 with a lower first tier rate for water used within a specified allotment, and a higher second tier rate for every billing unit that exceeds the first tier allotment. The water rates are also higher during shortage periods. For example, the Tier 1 rate for commercial and industrial customers is $1.21 per hundred cubic feet, and Tier 2 rate is $3.70 per hundred

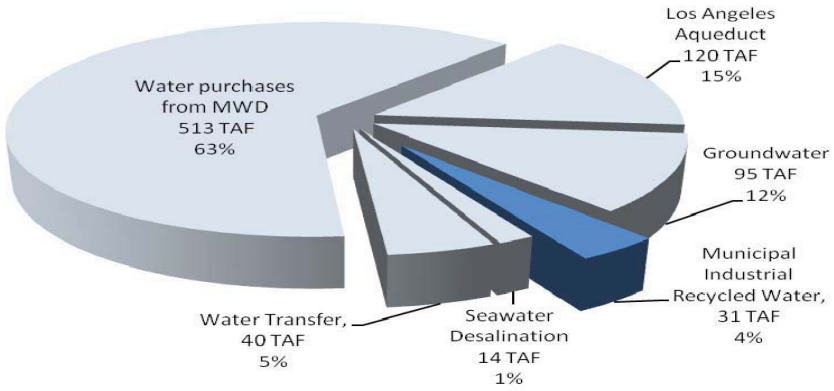
The projected water demand/supply for the LADWP is presented in Figure 11-4 and Table 11-11 for the next 30 years. The projected water supply from municipal & industrial recycled water is only about 4% of the portfolio. It is interesting to note that LADWP expected to purchase more than 60% of its water from the Metropolitan Water District in 2030. **LADWP projected that they will have reliable water supply for the next 30 years for the area that they serve.**

FIGURE 11-3
Water Distribution in the LADWP Service Area



Total Water Use = 622 thousand acre-feet (TAF)

FIGURE 11-4
Water Supply in the LADWP Service Area (Year 2030)



Total Water Supply = 813 Thousand Acre Feet (TAF) in Year 2030

cubic feet during 10% shortage period. The Tier 1 rate remains at $1.21 for 15%, 20% and 25% shortage periods but Tier 2 rate increases to $4.44, $5.18 and $6.05 per hundred cubic feet in these shortage periods, respectively.

TABLE 11-11
LADWP Projected Water Demands and Supplies for Multiple Dry-Year Reliability [1, 2]

	Year 2010 (Acre-Feet)	Year 2015 (Acre-Feet)	Year 2020 (Acre-Feet)	Year 2030 (Acre-Feet)
Existing Supplies

Total Supply	**717,000**	**739,000**	**766,000**	**813,000**
Total Demand	**717,000**	**739,000**	**766,000**	**813,000**

Note: 1) LADWP 2005 Urban Water Management Plan, Chapter 6. 2) Project with existing water conservation program.

Metropolitan Water District of Southern California (MWD)

The MWD is a public agency formed in the late 1920's. Its function is to manage the supply of water in Southern California. Its first function was building the Colorado River Aqueduct to convey water from the Colorado River in the early 1940s. In 1960, to meet increasing water demands, MWD contracted water supplies from the State Water Project (SWP) via the California Aqueduct, which is owned and operated by the DWR. The MWD currently receives imported water from two main sources: the Colorado River and the SWP. The MWD's service area covers a portion of Los Angeles, Orange, Riverside, San Bernardino, San Diego and Ventura counties. The MWD is a wholesaler and has no retail customers. The MWD distributes treated and untreated water directly to its 26 member agencies including 14 cities, 11 municipal water districts, and one county water authority (San Diego).

On daily average, the MWD delivers 6,023 AF. The record annual sales are 2.5 MAF in 1900. The projected sales for the next couple years for the commercial, institutional, industrial retail sector are estimated to be 1 MAF as shown in Table 11-12. Water is supplied at a unit price of $701 per acre-foot for treated water and $484 per acre-foot for untreated water. A balance of water supply and demand in Table 11-13 shows that MWD can provide reliable water under multiple dry year hydrologies. In addition, MWD has identified buffer supplies, including additional State Water Projects groundwater storage and transfer that could serve as a supply when additional water is needed.[66]

[66] The 2005 Regional Urban Water Management Plan – Metropolitan Water District of Southern California. November 2005. Metropolitan Water District website www.mwdh2o.com.

Just like the LADWP, the MWD has its water shortage contingency plan that outlines the necessary actions to be taken during water supply shortages including up to 50% reduction in its water supplies. The MWD also has a water surplus and drought management plan that outlines various resources to minimize the possibility of severe shortages by integrating the management of surplus and shortage into one plan. **Through effective management, the MWD indicated in its 2005 UWMP that it expected to be 100 percent reliable (with surplus supply) in meeting all demands in its service area.**

TABLE 11-12
MWD Projected Water Demands in Commercial. Industrial, Institutional Retail Sector

	Year 2010 (Acre-Feet)	Year 2020 (Acre-Feet)	Year 2030 (Acre-Feet)

Reference: Table II-8 Multiple Dry Year Supply Capability and Projected Demands, The Regional Urban Water Management Plan of Metropolitan Water District of Southern California, November 2005.

11.5 Conclusion

In summary, the information and analysis above shows the following:

- The water demand increase due to this SOx RECLAIM project (consisting of installing/operating eleven wet gas scrubbers and two dry gas scrubbers at eleven major facilities to reduce 6.2 tons per day of SOx) is negligible at 1,000 acre-feet per year compared to the water use of 6.37 million acre-feet per year for the South Coast Hydrologic region. It represents 0.02% increase over the current water usage baseline.

- The potable water demands of this SOx RECLAIM project are approximately from 1~~2~~1 acre-ft per year to 226 acre-ft per year which represent about 0.0~~6~~5% - 0.11% of the potable water savings of 200 thousand acre-feet per year estimated for the South Coast Hydrologic region.

- Table 11-4 provides a comparison of the water demand for SOx RECLAIM project with the water use/demand in California, South Coast Hydrologic region and other local water suppliers. The purpose of Table 11-14 is to put the water demand of SOx RECLAIM project into the perspective of others.

TABLE 11-14
Comparison of Water Supplies and Demands

	Water Use (Acre-Feet Per Year)
California (Year 2005 Urban Use)	7,900,000
South Coast Hydrologic Region (Year 2005 Urban Use)	6,370,000
MWD's contract with DWR (State Water Project)	1,910,000
MWD's entitlement from Colorado River through DWR	1,200,000
MWD's projected supplies (Year 2030)	2,848,000
MWD's projected supplies for commercial, industrial, institutional sector (Year 2030)	1,084,000
Groundwater production in MWD's service area	1,600,000
LADWP – All sectors	621,765
LADWP – Industrial sector	23,384
Recycled water supplied by MWD	355,000
Projected total water supplied by West Basin (Year 2030)	255,881
Projected recycled water supplied by West Basin (Year 2030)	43,750
Baseline for 11 Major SOx RECLAIM Facilities	**57,798**
Project Increase for SOx RECLAIM	**1,000**

- The water suppliers can reliably supply water, including recycled water, for the next 30 years and meet the nominal increase in water demand from this project based on the predicted water supply/demand shown in the 2005 UWMPs.

- The average water use in industrial sector is only about 8% for the South Coast Hydrologic Region, 4% for the LADWP service area, and 25% for the MWD. The Best Management Practices for conserving water focus in the areas that can significantly reduce water such as irrigation and residential sector. The Agency Team of the 20x2020 Plan estimated that water savings from the Commercial, Institutional, Industrial sector only contributes approximately 15% to the overall water savings required to meet the 20% reduction by 2020 asked for the Governor. Increased use of recycled water, if available, is a BMP that can be used to mitigate increase in water demand from this project.

- The consultants have appropriately used a rate varying from $800 per acre-ft to $1,350 per acre-ft to estimate the annual water costs for SOx RECLAIM project accordingly to the information provided to them by the refineries.

While this project would result in water demand that can be viewed as meaningful, the proposal can be met by current and future portable and recycled water suppliers. The substantial air quality and health benefits of the project far outweigh the potential water impacts. However, in the spirit of carrying out abundance of caution in response to the drought affecting California, CEQA staff made the determination that the SOx RECLAIM project would be considered significant if recycled water is not available. Please refer to the August 18, 2010 Draft Program Environmental Assessment document for further information.

Chapter 12 – Costs & Cost Effectiveness Analysis

12.1 Scenario Analysis

Staff conducted the following four scenario analysis to estimate overall emission reductions for the project, costs, cost effectiveness, control factors, and RTC reductions.

Scenario 1 – Most Stringent
1 ppmv for FCCUs (98% control),
1 ppmv for SRU/TGTUs
Tier I level for boilers/heaters (40 ppmv, or to appropriate sensible levels)
5 ppmv for coke calciner
5 ppmv for sulfuric acid
1 - 2 ppmv (99% control) for glass furnace
1 - 2 ppmv (99% control) for cement plant

Scenario 2 – Consultants' Recommendations
5 ppmv for FCCUs,
5 ppmv for SRU/TGTUs
Tier I level for boilers/heaters (40 ppmv, or to appropriate sensible levels)
10 ppmv for coke calciner
10 ppmv for sulfuric acid
1 – 2 ppmv (99% control) for glass furnace
1 - 2 ppmv (99% control) for cement plant

Scenario 3A – Staff's Recommendations on January 8, 2010
The controls with cost effectiveness less than $50K per ton at the following proposed BARCT levels:
5 ppmv for FCCUs
5 ppmv for SRU/TGTUs
Tier I level for boilers/heaters (40 ppmv)
10 ppmv for coke calciner
10 ppmv for sulfuric acid
5 ppmv for glass furnace
5 ppmv for cement plant

Scenario 3B – Alternative to Staff's Recommendation in Scenario 3A.
The controls with cost effectiveness less than $50K per ton at the following proposed BARCT levels:
7 ppmv for FCCUs
10 ppmv for SRU/TGTUs, coke calciner, glass, cement
Tier I level for boilers/heaters (40 ppmv)

The results were presented in Table 12-1 using the information provided by ETS/AEC and NEXIDEA. In addition, staff added two more scenarios in the analysis, Scenario 4 and 5. In Scenario 4, there would be no BARCT for SRU/TGs and Scenario 5 is to meet the minimum requirements in the 2007 AQMP. Please refer to Section 12.~~3~~4 for further information.

After January 8, 2010 Governing Board meeting, staff received feedback from WSPA and the refineries, and as a result, Scenario 3A was modified to not include costs associated with the modifications for boilers/heaters to meet the existing Tier 1 BARCT at 40 ppmv. In addition, modification to the cost effectiveness was made to exclude any incurred costs and emission reductions from projects that have already been completed. The results in Table 12-1 for Scenario 3A are revised to:

Scenario 3A – Staff's Current Recommendation

Present Worth Values = $745 million – $116 million (for boilers/heaters) = $630 million
Emission reductions = 6.20 – 0.85 (for boilers/heaters) – 1.00 (reductions that already been achieved) = 4.36 tons per day
Weighted average cost effectiveness = $15,845 per ton

12.2 Cost-Effectiveness Analysis Using NEC's Estimates

In March 2010, staff contracted with NEC, Inc. to conduct a refinery walkthrough in an effort to resolve any pending issues not addressed by the previous consultants and to review the feasibility and costs estimated by ETS/AEC and NEXIDEA. NEC provided a review of the capital costs and annual operating costs only, and recommended that staff re-estimate the cost effectiveness of the project. Staff's estimates using NEC's recommendations are summarized below.

Fluid Catalytic Cracking Units

NEC's estimates of capital costs for five new wet gas scrubbers at the refineries were:

- $60,823,000 for Refinery #1 (approximately 1% higher than ETS's estimate)
- $94,281,000 for Refinery #2 (approximately 6.6% lower than ETS's estimate)
- $89,953,000 for Refinery #3 (approximately 16% higher than ETS's estimate since NEC included $1.88 million for additional PM10 control. If NEC did not include the $1.88 million for additional PM10 control which would not be required under the proposed rule, staff estimated the total capital costs for Refinery #3 would be $83,028,000 by using NEC's approach, NEC's multipliers for vendor bias factor, and equipment budget factor, and NEC's estimates for piping, ductwork, knife gate valves, insulation etc.)
- $66,670,000 for Refinery #4 (approximately 1.4% higher than ETS's estimate)
- $83,164,000 for Refinery #6 (approximately 4.4% lower than ETS's estimate)

NEC recommended that the maintenance costs should be about 0.6% of the capital costs. Turnaround occurs every 5 years, and during this period, NEC estimated that the maintenance costs should be double the regular maintenance costs. Staff adjusted the maintenance costs in ETS/AEC's analyses to reflect NEC's recommendation. An example of staff's approach is provided below:

Example for Refinery #1:
Maintenance costs = (Capital costs by NEC)(0.6/100) = ($60,823,000)(0.6/100) = $364,938
Annual costs = $1,050,951 (by ETS) - 156,000 (maintenance costs estimated by ETS) + $364,938 (maintenance costs recommended by NEC) = $1,259,889

Staff then estimated the Present Worth Values (PWV) and Cost Effectiveness (CE) using NEC's capital costs and annual operating costs. An example is given below for Refinery #1. The PWV and CE for the 5 refineries are summarized in Table 12-2.

PWV = Capital Costs + (15.62)(Annual Operating Costs) – (0.35)(Salvage Value)[67] + (2.4)(Maintenance Costs Every 5 Years) = $60,823,000 + (15.62)(1,259,889) – (0.35)(250,000) + (2.4)(364,938) = $81,290,817

CE = ($81,290,817)/((211.82 tpy)(25 years)) = $15,351 per ton

[67] Salvage value is value of the control equipment at the end of its useful life (after 25 years).

TABLE 12-2
Cost Effectiveness of Wet Gas Scrubbers for FCCUs using NEC's Data

	Ref #1	Ref #2	Ref #3 (note)	Ref #4	Ref#6
Capital Costs ($)	60,823,000	94,281,000	83,028, 000 – 89,953,000	66,670,000	83,164,000
Annual Operating Costs ($)	1,259,889	$2,492,288	1,457,776 – 1,499,326	1,058,782	1,603,872
Present Worth Values ($)	81,290,817	126,253,530	106,906,571 – 114,580,302	84,080,722	109,333,879
Cost Effectiveness ($/ton)	15,351	72,393	41,292 – 44,25~~6~~7	45,12~~1~~0	12,78~~3~~2

Note: the low numbers in the range are for WGS without additional PM10 control capability, and the high numbers are for WGS with additional PM10 control capability

Sulfur Recovery/Tail Gas Units

NEC's estimates of capital costs for WGSs were:

- $49,100,000 for Refinery #2 (approximately 29% higher than ETS's estimate)
- $58,210,000 for Refinery #6 (approximately 13% higher than ETS's estimate)

NEC's indicated that the oxidation catalyst technology has not yet been proven in practice. NEC recommended wet gas scrubber as BARCT for SRU/TGs. However, if the oxidation catalyst technology was selected, the capital costs would increase by a factor of at least 5 versus ETS/AEC's estimates, or $63,416,089 for Refinery #3. NEC estimated that the maintenance costs should be about 0.6% of the capital costs. Turnaround occurs every 5 years, and the maintenance costs should be double the regular maintenance costs in these years. Staff adjusted the maintenance and annual operating costs in ETS/AEC's analyses to reflect NEC's recommendation. An example of staff's approach is provided below.

Example for Refinery #2:
Maintenance costs = (Capital costs by NEC)(0.6/100) = ($49,100,000)(0.6/100) = $294,600
Operating costs = $1,446,727 (by ETS) - 48,000 (by ETS) + $294,600 (by NEC) = $1,693,327

Table 12-3 summarizes the results for SRU/TGs.

TABLE 12-3
Cost Effectiveness of Controls for SRU/TGs using NEC's Recommendations

	Ref #2	Ref #3	Ref #6
Capital Costs ($)	49,100,000	63,416,089	58,210,000
Annual Operating Costs ($)	1,693,327	570,859	3,305,106
Present Worth Values ($)	76,151,815	73,229,787	110.463,974
Cost Effectiveness ($/ton)	49,626	55,270	41,56~~4~~3

Cement Kilns & Coal Fired Boilers

NEC recommended wet gas scrubber as BARCT for both cement kilns and coal fired boiler but did not provide any cost estimates for wet gas scrubbers. NEC commented that ETS's analysis did not include contingencies. With contingencies added as recommended by NEC, the capital costs were estimated as:

- $32,700,000 for cement kilns (approximately 67% higher than ETS's estimate)
- $10,300,000 for coal fired boiler (approximately 67% higher than ETS's estimate)

NEC estimated that the maintenance costs should be higher for cement kilns, increased from $312,000 as estimated by ETS to $467,000, and turnaround would occur every 2 years instead of every 5 years. Staff estimates of the cost effectiveness using NEC's input are provided the results in Table 12-4.

TABLE 12-4
Cost Effectiveness of Controls for Cement Facility using NEC's Recommendations

	Cement Kilns	Coal Fired Boiler
Capital Costs ($)	32,700,000	10,300,000
Annual Operating Costs ($)	1,633,250	$385,293
Present Worth Values ($)	62,086,085	17,498,910
Cost Effectiveness ($/ton)	~~26,824~~27,402	5,312

Glass Furnaces

NEC recommended the use of a large bore, open throat wet gas scrubber as BARCT for glass furnaces instead of packed-bed wet gas scrubber. NEC recommended a different location than ETS which results in an increase in the costs for ducting, substation additions, knife gate valve, and indirect costs. While NEC did not propose cost estimates for a large bore, open throat WGS, NEC agreed with ETS that wet gas scrubber would be cost effective. Without any cost information from NEC, staff used ETS's data instead.

Sulfuric Acid Plants

NEC agreed that wet gas scrubber should be recommended as BARCT for sulfuric acid plants, but estimated the following capital costs:

- $18,746,000 for Plant 1 (3 times higher than ETS's estimate)
- $1,500,000 for modification of Plant 2 at a refinery (3 times higher than ETS's estimate)

NEC recommended a turnaround every 5 years for sulfuric acid plants, and an additional maintenance cost of 0.6% capital costs. Following NEC's recommendations, staff estimated the cost effectiveness shown in Table 12-5.

TABLE 12-5
Cost Effectiveness of Controls for Sulfuric Acid Plants using NEC's Recommendations

	Plant 1	Plant 2 Modification
Capital Costs ($)	18,746,000	1,500,000
Annual Operating Costs ($)	684,092	$71,610
Present Worth Values ($)	29,701,459	2,640,148
Cost Effectiveness ($/ton)	~~2,833~~3,255	8,768

Coke Calciner

NEC recommended wet gas scrubber as BARCT for coke calciner, estimated a capital cost of $45,700,000, recommended every 2 years turnaround for the unit, and maintenance cost of 0.6% capital costs. Based on NEC's recommendations, staff estimated the cost effectiveness shown in Table 12-6:

TABLE 12-6
Cost Effectiveness of Controls for Coke Calciner Using NEC's Recommendations

Capital Costs ($)	45,700,000
Annual Operating Costs ($)	734,188
Present Worth Values ($)	58,857,089
Cost Effectiveness ($/ton)	23,036

12.3 Comparison of Costs and Cost-Effectiveness

In calculating the overall cost effectiveness using NEC's data for the project, staff 1) excluded cost-ineffective scenarios (cost effectiveness more than $50,000 per ton emission reduced), and 2) excluded the scenarios where emission targets already had been met.

Present Worth Values (million dollars) = (81.29+114.58+84.08+109.33) for FCCUs + (76.15+110.46) for SRU/TGs + 58.86 for coke calciner + (2.64+29.70) for sulfuric acid + 8.83 for glass + 62.1 for cement kilns = 389.29 + 186.62+58.86+ 32.34 + 8.83 + 62.09
= $738 million.

Emission Reductions (tons per day) = (0.58+0.28+0.20+0.94) for FCCUs + (0.17+0.29) for SRU/TGs + 0.28 for coke calciner + (0.03+1) for sulfuric acid + 0.19 for glass + 0.25 for cement = 2.01 + 0.46 + 0.28 + 1.03 + 0.19 + 0.25 = 4.22 tpd

Cost Effectiveness = 738.02 millions / (4.22 tpd x 365 days per year x 25 years) = $15,516 per ton SOx reduced = **$19 K per ton**

A comparison between the total present worth values estimated by ETS/AEC, NEXIDEA and staff's estimates based on NEC's recommendations is shown in Tables 12-7 and 12-8.

TABLE 12-7
Comparison of Costs for Scenario 3A of Staff's Proposal

Sulfuric Acid	10	1.03	19	1.03	32.34
Glass	5	0.19	8.83	0.19	8.83 (as ETS)
Calciner	10	0.28	25.3	0.28	58.86
Cement	5	0.25	43.7	0.25	62.09
FCCU	5	2.01	359	2.01	389.28
SRU/TG	5	0.60	174	0.45	186.61
Total		**4.36***	**629.83**	**4.21**	**738.02**

*The total emission reductions from 2005 baseline are 5.36 tons per day which include the 1.00 tons per day early reductions already in place for FCCU to meet R1105.1 requirement and SRU to meet other regulatory requirement.

TABLE 12-8
Comparison of Cost Effectiveness for Scenario 3A of Staff's Proposal

Equipment Category	**Proposed Standard (ppmv)**	**Cost Effectiveness and Cost Effectiveness Range ($/ton) Based on ETS/AEC/NEXIDEA**	**Cost Effectiveness and Cost Effectiveness Range ($/ton) Based on Input from NEC**
Sulfuric Acid	10	2,016 (1,896 – 5,556)	3,431 (~~2,833~~3,255 – 8,768)
Glass	5	5,198	5,198 (ETS's estimate)
Coke Calciner	10	9,902	23,036
Cement	5	19,300	27,402
FCCU	5	19,652 (12,849 – 42,103)	21,271 (12,782 – 45,120)
SRU/TG	5	31,455 (12,880 – 39,000)	44,514 (41,563 – 49,626)
Weighted Average		**15,845**	**19,199**

The analyses above indicated that the overall costs and cost effectiveness recalculated based on input from are within +20% of ETS/NEXIDEA's estimates. Staff concluded that ETS Inc. and NEXIDEA's estimates are valid.

12.4 Cost Effectiveness for Scenario 4 and Scenario 5

Scenario 4 – In this scenario, as shown in Table 12-9, SRU/TG will not be subject to new BARCT:

Present Worth Values using ETS/AEC and NEXIDEA's costs = $455.83 million
Emission reductions = 3.76 tons per day
Cost effectiveness = $13.29 K per ton ($16 K per ton if using NEC's data)

TABLE 12- 9
Costs and Cost Effectiveness for Scenario 4

Equipment Category	Proposed Standard (ppmv)	Emission Reductions from 2005 Baseline (tpd)	Present Worth Values ($ Million)
Sulfuric Acid	10	1.03	19
Glass	5	0.19	8.83
Calciner	10	0.28	25.3
Cement	5	0.25	43.7
FCCU	5	2.01	359
SRU/TG	N/A	0.00	0.00
Total		**3.76***	**455.83**

*One ton per day reduction from 2005 baseline is already in place for an FCCU and a SRU/TG

Scenario 5 – In this scenario, as shown in Table 12-10, there will be no BARCT for SRU/TGs, FCCUs, and cement kilns. This scenario is intended to mimic the reduction estimated in the 2007 AQMP. The emission reductions of 1.5 tpd from 2005 is equivalent to approximately 3.23 tpd RTC reductions due to the unused RTCs available in the market (1.5 tpd emission reductions + 1.73 tpd unused RTCs = 3.23 tpd)

Present Worth Values using ETS/AEC and NEXIDEA's costs = $53.13 million
Emission reductions = 1.50 tons per day
Cost effectiveness = $3.88 K per ton ($7.31 K per ton if using NEC data)

TABLE 12- 10
Costs and Cost Effectiveness for Scenario 5

Equipment Category	Proposed Standard (ppmv)	Emission Reductions from 2005 Baseline (tpd)	Present Worth Values ($ Million)
Sulfuric Acid	10	1.03	19
Glass	5	0.19	8.83
Calciner	N/A	0.28	25.3
Cement	N/A	0.00	0.00
FCCU	Tier 1	0.00	0.00
SRU/TG	N/A	0.00	0.00
Total		**1.50**	**53.13**

*One ton per day reduction from 2005 is already in place for an FCCU and a SRU/TG

12.5 Incremental Cost Effectiveness

To assess the incremental cost effectiveness as required under H&SC §40440.11, staff proposal is compared to the most stringent proposal proposed by the consultants. Comparing the consultants' proposal (including modifications for fuel gas treatment system) and staff's current proposal (not including modifications for fuel gas treatment system), the cost attributed to an additional 1.17 tpd incremental emission reductions was $377 million, which translated to **an incremental cost effectiveness of $35K per incremental ton SOx reduced**. [68] This significantly high level of incremental cost between the two options was the driving force leading staff to select the BARCT levels in Scenario 3. In staff assessment, the BARCT levels in Scenario 3 seeks to optimize the efficacy of the staff proposal - maximizing emission reductions and balancing the requirements for additional controls with economic impacts. The BARCT levels in Scenario 3 finally reflect "*... emission limitation that is based on the maximum degree of reduction achievable, taking into account environmental, energy, and economic impacts by each class or category of source."* as required by California Health and Safety (H&S) Code §40406.

12.6 Comparison of Cost Effectiveness to Other Rules Adopted by the Governing Board

The weighted average cost effectiveness of staff's proposal is approximately $15K - $19K per ton of SOx reduced, or equivalent to $1K - $1.3K per ton NOx reduced, or $10K – $13K per ton PM2.5 reduced. [69]

The cost effectiveness factors should only be used as a relative measurement for comparison. Table 12-~~3~~11 shows a comparison between the cost effectiveness derived for the 2009 SOx RECLAIM to the cost effectiveness of the 2005 NOx RECLAIM and other command-and-control rules.

As shown in this table, controlling SOx to the BARCT levels proposed by staff would result in cost effectiveness which mostly falls within, or lower than, the range of the rule cost effectiveness approved by the Governing Board in the past.

[68] Incremental cost effectiveness = (1,007 – 630) million dollars / ((6.53 – (6.20 - 0.85)) tpd x 365 days per year x 25 years) = $ 35,312 per ton.

[69] Staff used the following equivalency factor: 1 ton of SOx reduced will have the same effect as 15 tons of NOx reduced, or 1.5 tons of PM2.5 reduced (Appendix C of CARB's 2007 SIP Submittal.)

TABLE 12-~~3~~11
Cost Effectiveness Comparison

2009 SOx RECLAIM ($/ton SOx reduced)	Command-Control SOx Rule
Sulfuric acid plant: $2K per ton SOx reduced Glass melting furnace: $5K per ton SOx reduced Coke calciner: $10K per ton SOx reduced FCCUs: $20K per ton of SOx reduced Cement kilns: $19K per ton SOx reduced SRU/TGTUs: $26K per ton of SOx reduced Project Overall: $13K per ton SOx	Flares: $5K - $9K per ton of SOx reduced (Rule 1118 amended 11/4/05)
2009 SOx RECLAIM ($/equivalent ton NOx reduced) (1)	**2005 NOx RECLAIM**
Sulfuric acid plant: $133 per ton NOx reduced Glass melting furnace: $333 per ton NOx reduced Coke calciner: $700 per ton NOx reduced FCCUs: $2K per ton NOx reduced Cement kilns: $2K per ton NOx reduced SRU/TGTUs: $3K per ton NOx reduced Project Overall: $1K per ton NOx reduced	Metal melting/heat treating and miscellaneous combustion: $4K – $11K per ton of NOx reduced Industrial boilers: $9K - $10K per ton FCCUs, refinery boilers/heaters: $11K-$17K per ton
2009 SOx RECLAIM ($/equivalent ton PM2.5 reduced) (1)	**Command-Control PM Rules**
Sulfuric acid plant: $1K per ton PM2.5 reduced Glass melting furnace: $3K per ton PM2.5 reduced Coke calciner: $6.5 K per ton PM2.5 reduced FCCUs: $13K per ton PM2.5 reduced Cement kilns: $12K per ton PM2.5 reduced SRU/TGTUs: $17K per ton PM2.5 reduced Project Overall: $9K per ton PM2.5 reduced	FCCUs: $13K-$23K per ton filterable PM, $3-$5K per ton filterable and condensable (Rule 1105.1, adopted 11/7/03) Coke/Coal/Sulfur Handling: $3-$30K per ton PM10 (Rule 1158, amended 6/11/99)

1) The comparison in this table uses the following equivalency: of 1 ton of SOx reduced has an equivalent effect to 15 tons of NOx reduced, or 1.5 tons of PM2.5 reduced provided in Appendix C to CARB's 2007 SIP Submittal.

Chapter 13 – RTC Reductions & Implementation

13.1 RTC Reductions Estimated from 1997 Baseline

Staff applied the same methodology used for NOx RECLAIM to estimate the projected year 2019 SOx emissions for the entire SOx RECLAIM universe as follows:

Projected Emissions at New BARCT Levels = (1997 Baseline x Growth Factor$_{2019}$) x New BARCT Adjustment Factor (or Tier 1, if no new BARCT is recommended)

Where:

Projected Emissions at New BARCT Levels = Emissions in year 2019 at new BARCT levels.
1997 Baseline =Actual emissions from July 1, 1997 – June 30, 1998. [70]
Growth Factor$_{2019}$ = Growth factor from 1997 – 2019 for each facility
New BARCT Adjustment Factor = New BARCT Emission Factor / Starting Emission Factor (in Table 2 of Rule 2002)

Staff applied the 10% upward adjustment factor to the 2019 projected emissions at new BARCT levels, and calculated the year 2019 RTC reductions for each of the scenarios described in Chapter 13 as follows:

Programmatic RTC Reductions = 11.77 - [Projected Emissions at New BARCT Levels x 10% Compliance Margin]

Where:

Projected Emissions at New BARCT Levels = Remaining emissions of the entire SOx universe in year 2019

The entire SOx RECLAIM universe was captured in this approach. In this approach, it was assumed that the year 1997 emission rates were similar to the starting emission factors. Staff estimated the projected remaining 2019 emissions, the RTC reductions and the percent reductions for the scenarios outlined in Chapter 12: Scenario 1 represented the impacts of the most stringent control measures, Scenario 2 represented the impacts based on the consultants' recommendations, Scenario 3A reflected staff's recommendations, Scenario 3B and Scenario 4 are alternatives to staff's proposal, and the last Scenario 5 is to get the minimum of 3 tons per day reductions. The RTC reductions for Scenario 3A, 4 and 5 are summarized in Table 13-1. Scenarios 1 and 2 will result in more than 70% RTC reduction, and Scenario 3B will result in approximately the same shave as Scenario 3A.

[70] In this analysis, staff used the actual CEMS reported emissions from July 1, 1997 – June 30, 1998. The period used in the 2003 AQMP is from July 1, 1996 – June 30, 1997. According to the RECLAIM Annual Audit Reports based on the CEMS data, the inventory for the compliance year 1996 was 6,484 lbs (17.76 tpd), and the inventory for the compliance year 1997 was 6,464 lbs (17.71 tpd). Since there is very little difference between the two inventories, staff believes that the results presented here, even for the 1997-1998 period, would reflect the 1996-1997 period as well.

As a result of the current BARCT analyses, staff proposal is to reduce the RTC holdings by 6.14 tons per day (55% reduction of the current 11.77 tons per day RTC holdings) to ensure that the SOx market incentive program will *"achieve an equivalent or greater level of emission reductions at an equivalent or lower cost as would have been achieved under a command-and-control rule"* as required by California H&S Code §39616.

In addition, staff proposes a eight-year implementation program to get 6.1 tpd RTC reduction:

- 1.5 tons per day reductions in Compliance Year 2012
- 1.5 tons per day reductions in Compliance Year 2013
- 1.5 tons per day reductions in Compliance Year 2014
- 0.32 ton per day reductions in Compliance Year 2015
- 0.32 ton per day reductions in Compliance Year 2016
- 0.32 ton per day reductions in Compliance Year 2017
- 0.32 ton per day reductions in Compliance Year 2018
- 0.32 ton per day reductions in Compliance Year 2019

The first 4.5 tons per day reduction will meet and then exceed the commitment under the 2007 AQMP, to help the Basin achieve the federal annual average PM2.5 standard by 2014. The remaining reductions will help the Basin to achieve the federal 24-hour average standard by 2020.

It should be noted that the difference between the RTC holdings of 11.77 tons per day and the actual emissions of 9.22 tons per day in year 2008 is about 2.55 tons per day. This margin can be proven quite useful in meeting the proposed emission reductions during the initial phase of implementation. The remaining tons per day actual emission reductions in compliance year 2014 and beyond must be generated by implementing additional control measures. Assuming the rule is adopted in 2010, a 4 to 5-year window is likely needed to implement all control measures recommended by staff and the consultants. The consultants estimated about 2 - 3 years for implementation. An additional 2 years may be needed to reconcile the turn-around for some refineries in the District. To ease the implementation of this large project, especially to ease some environmental/energy impacts that may occur, staff recommends spreading the tons per day RTC reductions into eight years, from 2012 to 2019.

TABLE 13-1 - RTC Reductions Estimated From 1997 Baseline

Equipment Type	AQMP Method - Projected to 2019											
	Audited 97-98 Fiscal tpd	Growth Factor 1997-2019	2019 with growth	Scenario 3 - Staff's Proposal			Scenario 4 - Intermediate			Scenario 5 - AQMP

For alternative shave, % reduction w 1.1 = (shave/11.09)				**55%**			48%					
RTC Reduction in Year 2019 w/o 1.19 Factor = 11.77 - (1.19*Remaining)										3.00		
% Reduction Across Universe w/o 1.1 to compare w AQMP = (shave/11.78)										25%		

13.2 Alternative Shave

As a result of staff's analysis in Section 13.1, the overall proposed shave is approximately 52% across the 32 facilities in the SOx universe. Staff received comments from the 22 facilities with no equipment subject to new BARCT indicating that the uniform shave was not equitable, and would create significant difficulties for them to stay in compliance, and indicated that they had limited ability to buy RTCs from large facilities

Because of the non-uniform characteristics (actual emissions and RTC distributions) of the SOx RECLAIM market (11 major facilities hold 87% RTCs and contribute more than 90% of emissions, and the remaining 21 facilities hold only 6% RTCs and contribute about 7% of emissions), uniform percent shave across the board is not the ultimate solution. The 21 facilities that have no equipment subject to the new BARCT cannot reduce their emissions further and cannot sustain operation and remain in compliance after the shave. To keep the 21 facilities active in the SOx market, staff is proposing to not shave the RTC holdings for these facilities if the RTC holdings are below their initial allocations provided to these facilities at the start of the RECLAIM program. However, the amount of RTC holdings above their initial allocations will be shaved at the same rate as other 11 facilities and investors. With this approach, staff estimated that instead of shaving across the board, the 11 facilities will have a shave of 55%, 18 of the 21 facilities will be exempt totally from the shave, and 3 of the 21 facilities that have RTC holdings above their initial allocations will be shaved to the initial allocation levels. Any traded RTCs from August 29, 2009 to the date of adoption will also be shaved at the rate of the 11 facilities.

The results of this analysis are presented in Table 13-2

13.3 RTC Reductions Estimated from 2005 Baseline

One of the elements included in the Work Plan presented to our Governing Board in January 2010 is the commitment for staff to work closely with the Western States Petroleum Associations (WSPA) and its members in evaluating its alternative proposal. Staff held numerous meetings with WSPA and its members on this subject. As part of its proposal, on July 30, 2010, WSPA and the refineries proposed the 2005 baseline to be used to estimate the RTC reductions arguing that the 2005 baseline has been used to estimate cost effectiveness by the consultants and the 2005 emissions represent the most current emission profile for SOx RECLAIM. In addition, WSPA and its members proposed to exclude RTCs converted from ERCs (1.98 tons per day) from any future shave. WSPA's proposal was obscure and did not show how the RTC reductions were related to actual emission reductions estimated from the 2005 baseline. It seems that WSPA's position was to treat RTC reductions as equivalent to actual emission reductions, ignoring the surplus RTCs in the market. Before July 2010, WSPA proposed a 25% shave characterized as an emission reduction shave. On August 18, 2010, WSPA revised its proposal agreeing to 33% shave (3.9 tpd) across the board by the end of 2019. On September 16, 2010, WSPA again revised its proposal agreeing to 40% shave (4.7 tpd) across the board by the end of 2019. [71] In order to fully understand WSPA's proposal and provide meaningful

[71] WSPA's presentation to staff on July 30, 2010 and August 18, 2010; WSPA's proposal to Barry Wallerstein on September 16, 2010; and WSPA's presentation at the Refinery Committee Meeting on September 22, 2010.

comments to WSPA, staff contacted WSPA several times since July 30 to ask for an explanation on its methodology, specifically how to calculate the percent shave and RTC reductions from actual emission reductions. Unfortunately, WSPA offered very limited explanation to staff. To keep the project moving in a positive direction, staff provides the following initial comments on WSPA's proposal.

SOx RECLAIM started in 1993 and the initial allocations (or RTCs) provided to the RECLAIM facilities were ample, generally more than the amount that they emitted. The surplus of RTCs in 2005 is about 1.73 tons per day and the surplus of RTCs in 2008 is about 2.55 tons per day. The amount RTCs converted from ERCs contributed to the size of the surplus. For the RECLAIM facilities to actually install BARCT and reduce "real" emissions, the surplus RTCs must be removed. RTCs reflect the "Potential to Emit" and thus even though RTCs carry the same unit (i.e. in lbs SOx) as actual emissions, they represent different "currencies" than actual emissions. To fully demonstrate command-and-control equivalency due to the implementation of BARCT, due to the surplus, the amount of RTC reductions should be more than the amount of actual emission reductions and the percent reduction estimated using RTCs should be higher than the percent reduction estimated using actual emission reductions.

It seems that the proposal by WSPA and its members calls for the calculation of the percent shave by taking the ratio of the actual emission reductions estimated off the 2005 baseline emissions over the RTCs held in the market excluding any RTC converted from ERCs (1.98 tpd) at the inception of the RECLAIM program for which WSPA argued that should be excluded from any future shave. Staff acknowledges that the 2005 year emissions were used as a baseline by the consultants to formulate their recommendation on feasibility and cost of controls because they reflected the most recent year emission profile available at the time. However, dividing the "emission reductions" estimated off the 2005 baseline by the RTCs to derive the percent reduction amounts to using two different "currencies" to compute a percent figure. This approach will not yield a result that can be used to demonstrate equivalency to command-and-control. Staff uses the "remaining emissions", a constant currency, to calculate the amount of shave and to compare with a command-and-control program.

Furthermore, WSPA and the refineries proposed to exclude RTCs converted from ERCs (1.98 tons per day) from any future shave which is inconsistent with the RECLAIM program. As explained above, the RTCs converted from ERCs (1.98 tons per day) is a layer of cushion added to the surplus. Integrating the shave through this layer of surplus is one of the RECLAIM approach since the start of the program in 1993. The RTCs converted from ERCs were shaved approximately 35% from Tier 1 to Tier 2 to match AQMP emission budgets for the RECLAIM program. It was clearly the Board's policy to achieve programmatic equivalency with command & control without providing a special status to ERC converted to RTCs. When NOx program was shaved in 2005, ERCs converted to RTCs were treated the same as regular RTCs. Future economic growth was included in the emission projection. The RTCs converted to ERCs have also been used by many of the RECLAIM facilities in lieu of their emission reductions requirements under Tier 1 BARCT, which is not allowed for non-RECLAIM facilities. Therefore, it would be appropriate to include these RTCs in the future shave, retain equivalency with command and control, and attain the air quality objectives of the region. In addition, for non-RECLAIM facilities, the emissions from shutdown equipment are required to be discounted to BACT level, before ERCs can be issued. Furthermore, new or modifying non-RECLAIM facilities undergoing New Source Review (NSR) are required to offset any emission increase for SOx and NOx by a 1.2 to 1.0 ratio. On the other hand, RECLAIM facilities undergoing

NSR are not subject to the 1.2 to 1.0 offset ratio that non-RECLAIM facilities are. The following table summarizes the comparison between ERC generation and use between RECLAIM and non-RECLAIM program. Considering all of the above facts plus the benefits incurred by the RECLAIM facilities utilizing such RTCs during the 17-year life of the program since 1993, staff believes that the 1.98 tons per day RTCs converted from ERCs do not deserve a special status, and thus the 1.98 tons per day RTCs converted from ERCs, which add to the RTC surplus, should be subject to the future RTC shave of 55%. In summary:

	Non-RECLAIM	RECLAIM
Usable in lieu of BARCT	Yes	No
BACT Discount	No	Yes
Offset Ratio 1.2 to 1.0	Yes	No

TABLE 13-2 – Shave Adjustment Factors for Staff's Proposal – 55% Shave in 2019

Year 2012 RTC Inventory as of August 29, 2009

11 major	21 others	investors	total
10.21	**0.73**	**0.83**	**11.77**

Three of 21 facilities have RTC holdings larger than initial allocations by a total of 0.05 tpd

Therefore, non-shaved portion for 22 facilities - 0.73 - 0.05 = 0.68 tpd

Estimation of Adjustment Factors for Rule 2002

	RTC subject to shave for 11 major facilities, 3 of the remaining 21 facilities, and investors	RTC Non-Shaved Portion	RTC Reduction for the following year	RTC for Shave	Adjustment Factor for next year	TOTAL (total for shave + non-shaved)

Summary

RTC HOLDINGS	RTC subject to shave	Non-shaved	Total
Starting	11.09	0.68	**11.77**
Ending (Remaining)	4.99	0.68	**5.67**
Reduction	6.10	0.00	**6.10**
% reduction	**55.0%**	**0%**	

This table includes the following RTC Holdings: 10.21 tpd from 11 major facilities, 0.05 tpd from 3 of the remaining 21 facilities, and 0.83 tpd from investors

Chapter 14 – Comments & Responses

Responses to WSPA's Comments Received in Refinery Committee Meeting on October 14, 2010

Comment #1:
At the Refinery Committee Meeting on October 14, 2010, WSPA commented that staff is required by the California H&SC §40406 to estimate the cost-effectiveness numbers by each class or category of source, and that staff should not pre-exclude the cost-ineffective scenarios of more than $50,000 per ton SOx reduced in estimating the weighted average cost effectiveness for the project.

Response #1
The California H&SC §40406 does not specifically dictate where in the calculation process staff should exclude the cost-ineffective scenarios. However, in response to WSPA's comment, staff estimated the weighted average cost effectiveness for each class or category of sources regardless of each of the individual cost-effectiveness numbers. Tables 1 and 2 below show the costs and cost-effectiveness for each individual class or category of sources and the overall weighted average cost-effectiveness for the project. The weighted average cost effectiveness for the project ranges between $19K per ton based on ETS/AEC and NEXIDEA data and $22K per ton based on NEC data (see Note 2 of Table 1) and does not alter staff's conclusions regarding proposed BARCT.

Table 1 - Present Values

		ETS/AEC and NEXIDEA		Norton Engineering (NEC)	
Equipment Category	Proposed Standard (ppmv)	Emission Reductions (tpd)	Present Values ($ Million)	Emission Reductions (tpd)	Present Values ($ Million)
Sulfuric Acid	10	1.03	19	1.03	32
Glass	5	0.19	8.83	0.19	8.83
Calciner	10	0.28	25.3	0.28	59
Cement	5	0.25	43.7	0.25	62
FCCU	5	3.07	567	3.07	590
SRU/TG	5	0.95 (note 1)	318	0.95	404 (note 2)
Total		5.76	981	5.76	1,156

Note: (1) Refinery 3 has three existing sulfur plants vented to two tail gas units. ETS/AEC recommended Emerachem technology for the first unit at a cost effectiveness of $12,880/ton and 0.15 tpd reductions, and a WGS for the second unit at a cost effectiveness of $32,109/ton and 0.12 tpd reductions. In the final report, ETS/AEC selected Emerachem for the first tail gas unit because it was more cost-effective than WGS for the second tail gas unit. In this exercise, staff included ETS/AEC's costs for both tail gas units at Refinery 3. (2) NEC did not re-estimate the costs for (i) the WGS for the second unit of Ref 3, (ii) the Emerachem for Ref 1 of which the emission reductions were already achieved, and the Emerachem for Ref 4, and (iii) the WGS for Ref 5 since. This task was not in the NEC's contract. To complete this analysis, staff substituted ETS/AEC information for these situations in which NEC did not provide a cost estimate.

Table 2 – Cost Effectiveness

Equipment Category	Proposed Standard (ppmv)	Cost Effectiveness ($/ton) Based on ETS/AEC/NEXIDEA	Cost Effectiveness ($/ton) Based on Input from NEC
Sulfuric Acid	10	2,016	3,431
Glass	5	5,198	5,198
Coke Calciner	10	9,902	23,036
Cement	5	19,300	27,402
FCCU	5	20,251	21,088
SRU/TG	5	36,734	46,709
Weighted Average		18,664	21,992

Responses to INTERCAT's Comments Received on October 10, 2010

Subject: Achieving 5ppm SOx emissions from FCC units with SOx additives.

Dear Dr. Tisopulos,

Comment #1

Thank you for the opportunity to comment on the ability of FCC SOx emissions reduction catalysts to meet the proposed new AQMD regulatory amendments requiring 5 ppm SOx emissions from refinery FCC units.

It is INTERCAT's opinion, based on analysis of the commercial use of our SOX reduction additives by refineries that the five FCC units operating in the district without wet gas scrubbers could use our Super SOXGETTER SOx reduction additive to achieve 5 ppm SOx emissions. We believe that this can be done without impact to FCC processing rates and yields or to PM emissions from the refinery ESP units – ammonia injection may be required in some units to maintain PM compliance. We base this opinion on our experience delineated below along with our understanding of the FCC units and their feed characteristics. Each refiner could and should conduct their own assessment, and we would recommend short-term trials of SOx reduction additives to measure their performance and prove their feasibility for meeting the proposed emission limits for each FCC unit.

We have also included comments on the proposed amendments to Regulation XX - RECLAIM along with our opinions and observations comparing and contrasting SOx reduction additives with wet gas scrubber technology.

INTERCAT is the leading supplier of SOx reduction catalysts used in FCC units, with over 70% market-share worldwide. INTERCAT's additives have been used in over 80% of the nearly 40 EPA Consent Decree SOx reduction demonstration tests conducted to date. We currently supply our SOx additives to over 50 FCC units, enabling these refiners to meet a variety of emissions limits, many as low as 25 ppm.

During the EPA Consent Decree testing program, many FCC units achieved SO_2 emissions of 5 ppm as the testing protocols required SOx additive additions at a minimum of 5% of catalyst makeup. This resulted in refiners using more additive than required to meet the 25 ppm SO_2 targets of the EPA process. Recently, three FCC units

PO Box 412, Sea Girt, NJ USA 08750 · +1 732-223-4644 · +1 732-223-3447 (FAX) · garu@intercatinc.com

have conducted short-term testing using our Super SOXGETTER additive to determine if 5 ppm SO_2 emissions can be achieved – all three met this target.

The Consent Decrees also required several refiners to add as much as 10% SOx reduction catalyst, and one refinery has been required to use 20% SOx additive (our Super SOXGETTER additive) for the past several years. No refiners have reported any impact to their FCC yields or feed processing rates – most Consent Decrees had clauses that would limit additive additions should either occur. Particulate Matter (PM) emissions limits have also been maintained by these refiners, with some requiring operational changes to their PM control equipment such as ammonia injection for ESP units.

It is important to understand that ammonia injection is required as a surrogate to the SO_3 that is being removed from the FCC flue gas when SOx emissions are reduced to low levels (< 25 to 50 ppm). SO_3 and NH_3 both act to reduce the resistivity of FCC base catalyst particles to the optimal level for collection in the ESP. Without these gases, the resistivity of these particles is too high for optimal ESP performance. Increases in PM emissions from units with ESPs operating at low SOx levels is the result of losses of FCC base catalyst, not SOx additives – SOx additives have optimal resistivity for collection in ESP units, especially as they exit the regenerator and are in the sulfated state.

With regard to the proposed amendments, we would offer the following comments:

1. Refinery Continuous Emissions Monitors (CEMs) measure SO_2, not SOx. Other forms of SOx in the FCC stack, such as SO_3, are minor components usually estimated at less than 5%. Measurement of such species on a continuous basis would be costly and likely unreliable. Therefore, we would recommend the applicable protocol be written as 5 ppm SO_2.
2. While both SOx additives and wet gas scrubbers would enable the refiners to meet 5 ppm, sudden feed changes, FCC unit upsets or problems with the wet gas scrubber could cause this limit to be exceeded on a short-term basis. The EPA accounted for this by specifying their 25 ppm limit as a 365 day rolling average and allowing a higher 7-day rolling average. We would recommend that the 5 ppm be specified as a 365 day rolling average, and the refiners be allowed a higher 7-day rolling average, such as 50 ppm, to account for any excursions.

Comment #2

As compared with wet gas scrubbers, we believe that our Super SOXGETTER SOx reduction additive offers a better solution for the refineries, the SCAQMD and the interests of the general public to meet the proposed 5 ppm SOx rule. Specifically:

1. All five refiners have facilities to inject SOx reduction catalyst at this time, thus no capital expenditures are required; this compared with estimates of $500 million to over $1 billion for wet gas scrubbers at all five refineries.
2. Because all the refiners have the capability to use additives now, they could begin compliance with lower SOx emissions levels virtually immediately and phase-in a

INTERCAT®

5 ppm emissions level. Wet gas scrubbers will require significant time to permit and construct.

3. No additional plot space in the refinery will be required to use a SOx additive, whereas significant space is required to install a wet gas scrubber and the associated equipment.
4. Water consumption by the refineries will not increase with the use of SOx reduction additives, as compared with the significant water consumption required by wet gas scrubbers.
5. There will be no aesthetic changes to the refineries when using SOx reduction additives, compared with installation of wet gas scrubbers which will add visible equipment and large steam plumes.
6. Using SOx reduction additives creates a recoverable product, elemental sulfur, which is recovered and sold by the refinery, compared with wet gas scrubbers which convert an air pollutant into a water pollutant.
7. Using SOx reduction additives will not increase green house gas emissions from the refineries, compared with wet gas scrubbers that require power to operate and significant energy should reheat be required to eliminate the visible steam plume (as was required at Valero, Benicia).
8. Using SOx reduction additives will not orphan the significant investment the refiners have made in ESP units for compliance with SCAQMD Rule 1105.1, equipment which would likely be abandoned if the refiners install wet gas scrubbers.
9. SOx reduction additives will not require the transportation or use of hazardous materials, such as the over 13 tons/day of NaOH that would be transported to and used by the refineries if they all implement wet gas scrubbers.
10. SOx reduction additives continue to evolve and improve in their performance and cost for SOx removal. Wet gas scrubbers offer a fixed technology, and any performance improvement would likely require a significant capital investment.

Comment #3

Thank you again for the opportunity to comment on the proposed regulatory amendments. Please call me if you have any questions or require any further information.

Very Truly Yours,

Guido Aru
Director of Sales – North America
INTERCAT, Inc.

Response #1

Staff appreciates the commenter for informing staff that it is technologically feasible for INTERCAT SOxGETTER to achieve 5 ppm SOx without impacting adversely ~~to~~the FCC processing rates and yields or PM emissions from the refinery ESPs. Staff also appreciates the commenter for providing the information about the performance with INTERCAT SOxGETTER that 1) three refineries recently conducted short-term testing with INTERCAT Super SOXGETTER and all three refineries achieved 5 ppmv SO2, and 2) many other FCCUs have already achieved 5 ppmv demonstrated through the EPA testing protocols during the EPA Consent Decree testing program. Staff is in agreement with the commenter that each refiner should conduct short term testing to measure the performance of INTERCAT SOxGETTER (or Super SOxGETTER) prior to long term use. A short term testing was conducted at a refinery in the District in 2008, and during a three-month testing period, the refinery showed that their FCCU could achieve 7 ppmv SOx at about 6% - 7% catalyst addition rate without negative impacts to FCC processing rates, FCC yields, or PM emissions. Since this was a short-term testing and there were no legal requirements to achieve 5 ppmv, the refinery stopped the testing at 7 ppmv. Had this refinery continued the testing process, it would very likely demonstrate the proposed BARCT standard 5 ppmv level at a slightly higher addition rate than 6%-7%.

Furthermore, staff acknowledges that ammonia and SO3 can be used to reduce the resistivity of particulate matters and enhance the capture of particulate matters in the ESPs. However, please note that SCAQMD Rule 1105.1 contain two standards: (1) a filterable PM10 standard of 0.005 grain per dry standard cubic foot of flue gas corrected to 3% O_2 dry (or 3.6 lbs pounds per hour, or 2.8 pounds per thousand barrels of fresh feed); and (2) an ammonia slip standard of 10 ppmv, corrected to 3% O_2 dry, averaged over 60 consecutive minutes. The ammonia slip standard is to minimize the condensable particulate emissions from the FCCU. Therefore, using ammonia in the ESPs which results in a slip of more than 10 ppmv ammonia is not allowed. Staff would highly encourage the manufacturers of SOx reducing additives to continue their research to identify ways to reduce the resistivity of SOx reducing additives at the molecular level, and thus help optimizing the collection of the used catalysts in the ESPs, and minimizing the use of toxic enhancers such as ammonia in the ESPs.

Response #2

The definition #72 in Rule 2000 – General, amended May 6, 2005, states that "*SOx EMISSIONS means sulfur dioxides emitted.*" The BARCT level of 5 ppmv proposed by this rule is based on an annual average (i.e. averaged over 365 days of a compliance year. The compliance year for Cycle 1 facilities is from January 1 to December 31, and for Cycle 2 facilities is from June 1 to July 31.) The facility operator is not required to meet the "equipment-BARCT" level, equipment by equipment, however the facility is required to meet the "programmatic-BARCT" level, which means that the facility must comply with the annual facility cap (and RTC reductions), determined based on the equipment-BARCT level, by the end of the reconciliation period of any compliance year.

Staff does not propose a SOx limit for excursions. Excess emissions during these excursions may be excluded in determining compliance with the facility's annual cap if the facility meets all

the requirements specified under Rule 2004(i). The facility operator must be in compliance with the annual facility cap by the end of the reconciliation period of any compliance year.

Response #3

Staff appreciates the information provided by the commenter on the benefits of using SOx reducing catalysts. Staff is in agreement with the commenter that there are many benefits of using SOx reducing additives: 1) The refineries can use additives virtually immediately to reduce the SOx emissions from their FCCUs; 2) no additional plot space is required; 3) no increase in water consumption; 4) no steam plume; and 5) no increase in energy used and GHG associated with the use of SOx reducing additives.

Regarding the costs and cost-effectiveness, using SOx reducing catalysts will reduce capital expenditures but not necessarily annual operating costs. Staff estimates on costs and cost-effectiveness for SOx reducing catalysts and WGSs are provided in Chapter 12 of the Staff Report.[72] The weighted average cost-effectiveness for WGS to achieve 5 ppmv is approximately $20K per ton (average of 4 refineries that can cost-effectively install WGSs) and the weighted average cost-effectiveness for SOx reducing catalysts is approximately $19K per ton (average of 5 refineries that can cost-effectively use additional SOx reducing catalysts) to achieve 7 ppmv. With the competitiveness of the market and the improvement of SOx reducing technology, the cost-effectiveness numbers for SOx reducing catalysts may improve, and the present worth values of using SOx reducing catalysts may amount to only half the costs for installing WGSs as estimated by the commenter.

It should be noted that staff does not agree with the commenter that the use of WGSs would orphan the significant investment that the refiners had made in the ESPs. ESPs are required to control PM10 emissions while WGSs are to control SOx emissions. Further explanations are provided in Response #1 to WSPA's comment received from March 2010 – August 2010 under the topic discussing about whether or not there is stranded investment of Rule 1105.1.

In addition, staff does not agree with the commenter that the use of WGSs will convert air pollutant into water pollutant. Various types of absorbents (e.g. caustic or lime) can be used to absorb SOx and converts SOx to soluble sulfates (e.g. sodium sulfates) or non-soluble sulfates (e.g. calcium sulfates). These sulfates can be collected and reused, or treated and safely discharged to the waste water stream. As an example, the suspended solid waste and the used catalyst fines from a FCCU's WGS in the District are collected and sold to a cement plant to be reused.

[72] With limited information at this time on the amount of SOx reducing catalysts needed for each FCCU, staff used the information from a refinery in the District that tested SOx reducing catalysts and achieved 7 ppmv in a 3-month period in 2008 to estimate the cost-effectiveness for SOx reducing additives shown in Scenario 3B of Chapter 12. Please note that since this refinery did not use INTERCAT product in 2008, the costs of SOx reducing additives and the quantity needed may be different than those estimated by the commenter.

Furthermore, staff does not agree that the transportation of caustic solution would pose any new transportation hazards. If all five refineries would use SOx reducing additives in lieu of installing WGSs, the NaOH demand would be reduced from 13.24 tons per day to 8.79 tons per day for the SOx RECLAIM project, and as analyzed by CEQA staff, the transportation of additional NaOH would not pose any new transportation hazards: [73]

> *"All of the refineries (Facilities A through G) currently receive NaOH from local suppliers located in the greater Los Angeles area. For the remaining facilities that do not currently use NaOH, but will begin using it, the local suppliers are expected to be able to accommodate the additional demand. As is currently the case with existing NaOH deliveries, deliveries of additional NaOH would be made to each facility by tanker truck via public roads. NaOH is typically delivered in 6,000 gallon trucks, so the proposed project would not introduce any new transportation hazards for NaOH."*

[73] SCAQMD Program Environmental Assessment, Chapter 4, August 2010.

Re: Owens-Brockway Glass Container Inc. - Vernon, CA Facility (SCAQMD ID 7427)
Proposed Amended Regulation XX

Dear Mr. Cassmassi:

On behalf of my colleagues, I write to thank you for your time and attention to the compliance issues that Owens-Brockway Glass Container Inc. ("O-B") faces relative to Proposed Amended Regulation XX – SOx RECLAIM. As we discussed on Wednesday, this letter outlines the key technical issues that OB has identified based on our meeting and the engineering analyses that have been performed by ETS, Inc. and Norton Engineering Consultants (NEC), Inc. relative to further control of SOx emissions from the OB Vernon facility.

Comment #1

1. **The ETS report does not properly state Best Available Retrofit Control Technology (BARCT) level and estimated emission reductions:** The Vernon facility currently employs dry scrubber (Trona injection) coupled with electrostatic precipitators to control SOx and particulate matter, respectively. These controls were installed in 2002 and met District BACT at the time of permitting. As described by District staff, the proposed BARCT would have OB discontinue the use of the current dry scrubbing technology, continue to use the existing electrostatic precipitators, and install a new caustic wet scrubber that achieves 95% control of existing SOx emissions.. The ETS report estimates BARCT at 95 percent control, with sulfur emissions equal to or less than 5 parts per million (ppm). This is incorrect. Without a control device in place (i.e., dry scrubber), SOx emissions from Furnace B and C can range from 200 to 250 ppm. Application of wet scrubber controls with a 95% control efficiency would therefore realize an emission rate that ranges from 10-12.5 ppmv, not 5 ppmv as stated in the ETS report.

Comment #2

2. **Technical feasibility of wet scrubber controls.** As discussed at our meeting, there are no glass manufacturing operations that apply electrostatic precipitators combined with wet scrubber control technology. ETS recommends use of a pack tower as proposed by Vendor B; however, NEC "does not recommend" this technology, and recommends a wet scrubber technology that relies on a large bore injector or Reverse Jet Nozzle to introduce the caustic solution into exhaust gases. Neither report contains engineering evaluations to support the continued efficiency of the ESP to remove particulate, although the removal of the dry scrubber will substantially reduce PM concentrations.

October 21, 2010

Neither report contains an analysis of the new pressure drop introduced by the revised control configuration relative to the operating levels that must be maintained in the furnace. Neither report defines how wastewater streams generated in the new wet scrubber will be managed, although the ETS report suggests four different options and assigns a cost of $225,000 to complete implementation of these alternatives. Neither report provides an analysis of whether BARCT will comply with District New Source Review regulations (BACT for all pollutants, ambient impact analyses and Rule 1401 requirements). Neither report included reasonably anticipated costs such as relocation/recertification of the CEMS, construction of new exhaust/stack systems, permitting costs, etc. Our correspondence to you dated September 21, 2010 provides additional information on these NSR issues.

3. **Assistance in Securing District Approval for BARCT.** Given that no glass manufacturing operation currently applies BARCT as recommended by both engineering reports - ESP plus wet gas scrubbers - we ask for your assistance in securing permit NSR approvals to support BARCT retrofit at the Vernon facility. As I emphasized during our meeting, the OB Vernon facility is committed to compliance with environmental, customer and internal quality requirements. As detailed above and in prior correspondence, there are a number of issues associated with retrofit of BARCT at the OB Vernon. Your assistance will be critical for us to successfully address the proposed SOx shave absent new technology, and current trading prices cannot be accommodated with our cost structure.

Comment #3

Thank you again for the time, attention and courtesy that you and your colleagues extended to us on Wednesday. Please feel free to contact me or Sandra Guzmàn (323) 586-4207) if you have any questions or concerns.

Very truly yours,

Dean Harris

Page 2 of 2

Response #1

Based on recommendations from its two technical consultants and information from other glass melting furnaces elsewhere, staff concluded that ~~T~~today's BARCT for container glass melting furnaces is 5 ppmv outlet concentration, or 95% control or more. This BARCT level is achieved in practice at Saint-Gobain glass container facility in Seattle, Washington. In addition, achieving this level of BARCT is cost-effective. In an effort to determine costs, ETS provided equipment vendors with flue gas flow rates, inlet concentrations, and other necessary parameters. Flue gas flow rate is an important parameter in determining equipment size and costs for the WGS, while inlet concentration is an important parameter in determining the amount of caustic sorbent needed to achieve 5 ppmv outlet SOx concentration and annual operating costs. The present value for two WGSs (25-year life) estimated by ETS was $8.8 million, in which the capital costs were $1.90 million, and the annual operating costs were $0.44 million. ETS estimated a cost-effectiveness of $4,988 per ton SOx reduced. Assuming that Owens-Brockway was correct in stating that their inlet concentration were 200 ppmv-250 ppmv without the use of the dry scrubbers, and assuming that it would need roughly 3 times more caustic solution to reduce a stream of flue gas at 250 ppmv down to a level of 5 ppmv than to reduce from 100 ppmv to 5 pmmv, then the present value of these two WGSs would be conservatively estimated to be $22.5 million and the cost-effectiveness would be $12,988 per ton.[74] At $12,988 per ton, it would still be cost-effective to control the SOx emissions from glass melting furnaces at Owens-Brockway to a BARCT level of 5 ppmv (95% control or more). Thus, the WGS is capable of controlling an exhaust stream at 250 ppm down to 5 ppm (i.e., 98% control efficiency).

Response #2

Staff's responses to the issues raised are as follows:

- Wet gas scrubber is used to control acid gas (SOx) emissions for many decades and there are many types of wet gas scrubber that can reduce 95% or more of SOx emissions from the glass melting furnaces – either a packed bed scrubber recommended by ETS and by Manufacturer A, or an open-throat scrubber recommended by NEC, or a Cloud Chamber scrubber as installed at Saint-Gobain glass facility in Seattle.

- The purpose of SOx RECLAIM is to implement BARCT for SOx, therefore ETS and NEC did not discuss about "primary particulate matter" control in their analyses. However, SOx is a precursor to particulate, and therefore reducing SOx will reduce "secondary particulate matter". Another added benefit of the **ETS**'s proposal is that ETS recommended the removal of the two dry scrubbers upstream of the ESPs. Reducing the Trona used in the two dry scrubbers to zero will substantially reduce the primary particulate loadings to the ESPs, save energy, and annual operating costs. These savings have not yet been factored in ETS's estimate of cost-effectiveness.

[74] Present Value estimated by ETS = $1.90 million + (15.62)(0.44 million) = $8.8 million. Present Value where annual operating costs are 3 times higher than estimated by ETS = $1.90 million + (3)(15.62)(0.44)(3) = $22.5 million and Cost Effectiveness = $22.5 million/((0.19 tpd)(365)(25)) = $12,988 per ton.

- The commenter complains that the consultants failed to address a variety of issues. This is incorrect.

- Wet gas scrubbers for acid gas removal are low-energy scrubbers with pressure drop of about 5 in – 10 in. Removing the two dry scrubbers in front of the ESPs will compensate for the pressure drop across the two wet scrubbers downstream of the ESPs. Manufacturer D also include a fan in their equipment package to compensate for any potential pressure drop.

- Owens-Brockway currently has a waste water treatment at their facility. Owens-Brockway discharges waste water to LACSD. The facility has a permit discharge limit of 250 gpm and the current discharge rate is below 100 gpm. A typical waste water stream from a caustic scrubber contains mostly soluble sodium sulfate.

- The costs for new stacks were included in Manufacturer D equipment costs. NEC did recommend ETS to add 50% contingency to cover other miscellaneous costs such as costs for CEMS relocation/recertification, permitting costs etc. Adding 50% contingency would result in a cost-effectiveness of about $5,607 per ton SOx reduced. [75] Thus WGS would be still be cost-effective to control emissions from a glass melting furnace.

- The consultant did not address NSR issues because they were not tasked to do so. However, NSR issues should not be significant since Owens-Brockway should not be increasing emissions due to the installation of WGS.

Response #3

Staff is committed to work with Owens-Brockway and all other impacted facilities to facilitate permitting and ensure the successful implementation of the staff proposal. However, NSR related issues are best handled during the permitting phase. Please be cognizant that while NSR issues related to NOx and SOx are covered in Rule 2005, NSR issues related to other criteria pollutants are covered in Regulation XIII. Both regulations provide that permit modifications that do not increase emissions do not trigger BACT.

[75] PV = ($1.9 million)(1.5) + (15.62)(0.44) = $9.72 million, CE = ($9.72 million) / ((0.19)(25)(365)) = $5,607 per ton.

Re: Proposed Amended Regulation XX – Technical Comments - Owens-Brockway Glass Container Inc. Vernon Facility (SCAQMD ID 7427)

Dear Ms. Pham:

Comment #1

By this letter, Owens-Brockway Glass Container Inc. Vernon, California facility (Owens Vernon facility) provides its comments on the August 17, 2010 draft proposed amendments to Regulation XX as presented and discussed during the September 8, 2010 Public Consultation Meeting. Specifically, we provide to the District additional technical information that should be considered in setting Best Available Retrofit Control Technology (BARCT) for glass manufacturing. As summarized below, the Owens Vernon facility has already installed BARCT, which the District has recognized as Best Available Control Technology for the control of sulfur oxides. Our outside technical consultant has found no example of a glass container manufacturing facility with a control configuration as suggested by the December 2008 ETS, Inc. engineering evaluation and the December 2009 District draft staff report. In addition, we have identified numerous technical feasibility issues not considered in the District's analyses to date. Therefore, for the reasons outlined below, the Owens Vernon facility should be excluded from the facilities subject to the SOx shave proposed by the Rule 2002 revisions.

To put these technical issues in perspective, it is helpful to have an understanding of our plant's customers, employees, and our facility's role in sustainable manufacturing resources in the Los Angeles area. The Owens Vernon facility has been in business for over 70 years. Over the past 25 years, some six individual glass container manufacturing facilities have ceased to operate in the Los Angeles basin, such that the Owens Vernon facility is the only remaining container glass manufacturing facility located within the District. We produce between 2 and 3 million glass bottles per day on five production lines pulling from two furnaces and purchase approximately 330 tons/day of recycled glass. We have 260 employees that represent 15 different countries and territories of origin, over one third of whom have worked at the Owens Vernon facility for over 20 years. The average salary for Owens Vernon staff is three times the minimum wage,

Comment #2

with medical, dental and pension plan benefits. Our customers are here in Los Angeles; over 75% of our shipments are to customers within 25 miles of the of the Owens Vernon plant. Thus, the Owens Vernon Facility plays a vital role in maintaining sustainable container glass manufacturing in the Los Angeles area.

It is also important to put our environmental controls into proper perspective. Owens has been an innovator of emission controls on glass manufacturing. At significant cost, our company implemented oxygen-fuel fired glass manufacturing technology to reduce nitrogen oxide emissions from high temperature furnace exhaust. This innovative process control technology was installed to comply with NOx RECLAIM allocations. To comply with SOx RECLAIM, Owens Vernon first employed a SOx control system that injected a water-based sorbent into the exhaust stream prior to the existing electrostatic precipitators (ESPs). However, our facility experienced numerous problems with this technology [*Petition for an Ex Parte, Emergency, and a Short Variance*, Case No. 4472-9, Facility ID 007427, May 15, 1997, paragraphs 6-10]. We also note that the Ball-Foster El Monte facility experienced significant operating problems with its wet scrubber technology, which resulted in the company's decision to replace the wet scrubber with a dry scrubber followed by an electrostatic precipitator [*Petition for Modification and Extension of a Variance*, Case No. 108-20, Facility ID 108701, April 9, 1997, paragraphs 6-14].

Therefore, with the District's approval, Owens Vernon selected dry scrubbing technology (Trona injection) to reduce sulfur dioxide to comply with RECLAIM. It is important to note that this dry scrubbing technology was identified by the District as Best Available Control Technology (BACT) for the control of sulfur oxides. The dry scrubber controls are followed by the existing three ESPs that operate in parallel to remove entrained Trona sorbent and particulate emissions from the two glass melting furnaces. These technologies reduce sulfur oxide emissions by up to 90%. It is critical to note that the Owens Vernon facility actual SOx emission rate (approximately 0.6 pounds/ton of glass pulled) is significantly lower than the permitted SOx emission rate established for the container glass manufacturing facility in Seattle, Washington that is controlled by the wet scrubber technology evaluated by the District in its BARCT determination.

With this background, we now turn to consider technical issues raised by the District's BARCT analysis that supports the Rule 2002 revisions. As a threshold matter, we know of no container glass facility that currently operates the control configuration that is being proposed as BARCT:

- Dry scrubber/Trona injection, followed by
- Three separate electrostatic precipitators operating in parallel, followed by
- Two wet scrubber (50% NaOH) towers.

Comment #3

The December 2008 engineering evaluation suggests that this is technically feasible and cost effective for the Vernon facility. Owens retained Ashworth Leininger Group (ALG) to review this engineering evaluation, and the technical feasibility of installing retrofit wet scrubber technology at the Vernon facility. Their comments are attached for your review. We note the following:

- ALG is not aware of any glass manufacturing facility that currently operates with the BARCT control configuration recommended by staff for Owens Vernon: dry scrubbers followed by ESPs followed by wet scrubbers;
- To maintain the current redundancy of controls, which is essential as the glass melting operations cannot be temporarily shut down, it will be necessary to install three wet scrubbers instead of the two suggested in the ETS, Inc. report;
- The ETS, Inc. report does not consider/address how proper operating pressures will be maintained in both the oxy-fuel furnaces and existing ESP controls when the new wet scrubbers are added onto this system;
- The ETS, Inc. report does not address how the integrity of the wet scrubbers will be maintained should there be an upset condition in the ESPs, which will result in high particulate loadings directed to the wet scrubbers;
- The ETS, Inc. report does not properly consider site limitations associated with adding three wet scrubber towers that will be required to control the three existing ESP control systems;
- The ETS, Inc. report does not include all foreseeable costs associated with the wet scrubber retrofits;
- The ETS, Inc report provides no technical analysis of how wastewater discharges will meet RWQCB effluent limitations for selenium and other inorganic compounds;
- If retrofit with wet scrubber technology, the new exhaust gas will have a significantly lower temperature, and therefore significantly reduced plume buoyancy. No modeling analysis has been presented to demonstrate that ambient impacts from the Owens Vernon facility glass manufacturing operations will continue to comply with state and federal ambient air quality standards, including the new short term federal nitrogen dioxide standard; and

- The ETS, Inc. report and District draft staff report/evaluations do not properly consider the acute health risks posed by sodium hydroxide emissions from the wet scrubbers, as required by District Rule 1401.

Comment #4

Finally, the District's technical analysis does not consider what will happen should the Owens Vernon facility be unable to afford new, yet-to-be demonstrated control configurations, or secure adjusted RECLAIM Trading Credits in sufficient quantities to continue to operate. Should the Owens Vernon facility discontinue operations, over 100,000 tons/year of recycled glass will either have to be landfilled, or shipped out of the basin. Over two to three million glass containers per day will have to be shipped into the basin to our customers. We believe that this issue, along with the land use impacts associated with urban decay resulting from our plant's potential closure and adverse impact on environmental justice areas should be addressed in the District's Program Environmental Assessment for the proposed rule change. Our formal comments on that document will be provided by October 1, 2010.

We recognize that these comments are provided at the end of this public comment period for Rule 2002 modifications. If you think helpful, we would be willing to meet with you to clarify our comments. We look forward to working with the District to finalize Rule 2002 amendments.

Very truly yours,

Dean Harris

Randolph Visser, Esq.

Ashworth Leininger Group Comments on Proposed Amended Rule 2002
On Behalf of Owens-Brockway Glass Container Inc.

Ashworth Leininger Group (ALG) was retained by Owens-Brockway Glass Container Inc. (Owens) Vernon facility to review the August 17, 2010 draft Rule 2002 rule modifications, and data provided by the South Coast Air Quality Management District (District) staff at the September 8, 2010 Public Consultation meeting[1]. Comments 1-3 address proposed amended Rule 2002 revisions; comments 4-8 address technical issues associated with the Best Available Retrofit Control Technology (BARCT) analysis.

Specific Comments on Proposed Amended Rule 2002:

Comment #5

1. Owens-Brockway should be included in the list of SOx RECLAIM holders exempted from proposed "shave". As discussed further below, Owens Vernon has already installed dry scrubbing technology considered by the District to be Best Available Control Technology (BACT). Further, there are unique site conditions that have not been fully evaluated in the December 2008 ETS, Inc. engineering report, and make installation of additional retrofit controls infeasible. Since additional SOx controls are infeasible (as discussed below), it is inappropriate to subject Owens to the same SOx shave requirements as the other ten SOx RECLAIM participants impacted by section (f)(1)(J). For these reasons, the Owens Vernon facility should be added to Table 5 that lists the RECLAIM facilities that are exempted from the proposed SOx RTC adjustments ("shave") described in section (f)(1)(J).

Comment #6

2. Table 4 should be revised to remove the Best Available Retrofit Control Technology level for container glass melting furnaces. As discussed in more detail below, Owens has already installed dry scrubbing technology equivalent to what should be considered as Best Available Retrofit Control Technology (BARCT) to reduce container glass furnace SOx emissions. As discussed below, the District's evaluation of wet gas scrubber (WGS) controls with respect to the existing Owens facility process and control configuration did not properly consider the technical and operational issues associated with installing retrofit WGS controls in conjunction with existing dry scrubbers and electrostatic precipitators. The evaluation did not consider the need to install three, not two, WGS units, nor physical site limitations with respect to installing three new WGS units (in addition to the existing two dry scrubbers and three ESPs.) The District's evaluation also

[1] The rule development history for the proposed amended Rule 2002 is somewhat complex and lengthy. Briefly, Table 4 of Proposed Amended Rule 2002 indicates that BARCT for container glass melting furnaces is a SOx emission rate of 5 ppm, equivalent to 0.03 pound of SOx per ton of glass pulled. The District's December 2009 *Draft Staff Report for Proposed Amended Regulation XX* identifies this as representing 95% control from Owens' 2005 SOx emission rate of 0.62 pound per ton of glass pulled. As the final BARCT study report indicates, emissions at the Owens facility are already controlled with two dry scrubbers, followed by three electrostatic precipitators (ESPs). Based on information presented by the District at its September 8, 2010 SOx RECLAIM Public Consultation Meeting, Tier I BARCT had previously been determined to be the 1993 average Reported Value of 2.51 pounds SOx per ton of glass pulled; therefore the proposed BARCT level represents a 99% reduction in SOx emissions.

Comment #6

Comments on Proposed Amended Rule 2002

did not consider the severe operational difficulties encountered by another container glass manufacturer when it attempted to operate a WGS in conjunction with an oxy-fueled glass furnace. As described below, the engineering analysis did not fully calculate the cost of WGS retrofits and RECLAIM compliance modifications. Considering these issues, BARCT for container glass melting furnaces should not be established any lower than presently achieved at Owens with its dry scrubbers operated in conjunction with ESPs.

Comment #7

3. Section (f)(1)(Q) should be clarified to indicate that it applies only to new SOx RECLAIM program entrants. Rule 2002 section (f)(1)(Q) provides that:

"SOx Allocations for compliance years 2012 and after, for facilities that enter RECLAIM after (date of adoption) and for basic equipment listed in Table 4 shall be determined according to the BARCT level listed in Table 4 or the permitted emission limits, which ever is lower."

Section (f)(1)(Q) should be clarified to indicate that SOx allocations for facilities entering RECLAIM after rule adoption (new facilities) with equipment listed in Table 4 will receive allocations for 2012 and later based on the BARCT limits in Table 4 or based on permitted levels (whichever is lower). As written, section (f)(1)(Q) could be interpreted as also requiring allocations for existing facilities with basic equipment listed in Table 4 be reduced to Table 4 BARCT levels effective 2012, which runs contrary to the provisions of proposed sections (f)(1)(I) and (f)(1)(J).

Specific Comments on Best Available Control Technology:

Comment #8

The Owens Vernon facility operates two oxy-fuel furnaces (Furnace B, rated at 60 MMBtu/hr, and Furnace C, rated at 100 MMBtu/hr). These two process units are controlled by dry scrubber sorbent (Trona) injection, followed by three 3-field electrostatic precipitators (ESPs) which remove the sorbent and particulate emissions associated with glass melting. The use of three ESPs is required to provide redundancy in controls, as the underlying equipment (glass melting furnaces) cannot be shut down. Furnace B has a permitted SOx emission rate of 3.15 pounds SOx/ton of glass pulled; Furnace C has a permitted SOx emission rate of 2.4 pounds SOx/ton of glass pulled.

Following the adoption of RECLAIM, the facility first installed a United McGill semi-dry SOx scrubber on Furnace B in 1994. This control configuration proved infeasible in the long term due to maintenance and operational issues, as agreed to by the District Hearing Board, and was subsequently replaced by a dry scrubber, which was optimized through the use of Trona sorbent materials. Testing on the unit demonstrated up to 90% control efficiency relative to SOx; however, the systems typically operate at a 75-85% control level. With this general background, we provide specific comments related to the District's BARCT evaluation and proposed control level:

– 2 –

Comments on Proposed Amended Rule 2002

4. The emission reductions associated with the specific combination of controls relied upon by the District to achieve its proposed BARCT level has not been achieved in practice. We know of no installation in which a facility relies upon dry scrubbing, dry ESPs, followed by wet scrubbing to achieve the emission reductions anticipated by the District. Further, we have talked to equipment vendors, engineering/environmental staff at glass manufacturing facilities, and independent consultants, and they are aware of no such control configurations. We anticipate such a combination of controls would encounter the following challenges:
   - There is no discussion as to why two wet scrubbers (with a combined capacity of 60,000 cfm) are to be applied to control emissions from three ESPs (with a combined capacity of 90,000 cfm). To maintain the quick dispatch, operating pressures (addressed further below) and current redundancy in the existing control configuration, a single wet scrubber is required to follow each ESP. Thus, three wet scrubbers will be required to support the Vernon facility, as opposed to the two units considered in the ETS, Inc. analysis.
   - Pressure drop over the dry scrubber and dry ESP stages could preclude the wet scrubber stage from achieving the anticipated SOx removal efficiencies, and unless properly managed, can adversely affect the operation of the oxy-fuel furnace itself. Management of the furnace operating pressures and pressure drop across all three controls (Trona injection, ESP, wet scrubber) would require use of variable fans/process controls that are not addressed in the December 2008 ETS, Inc. report. Failure to properly maintain pressures throughout the system will compromise the furnace operation (including potential catastrophic failure), particulate control and sulfur oxide control efficiencies. In addition to these technical issues, the costs for viable induction fan motors/drives and process controls do not appear to have been considered.
   - Injection of sodium sesquicarbonate (Trona) in the dry scrubber stage results in increased particulate loading that is removed by three ESPs operating in parallel. While there is redundancy in the use of three ESPs, the ESP control units break down and when this occurs, increased particle loading to be routed directly to the wet scrubbers would occur at an uncontrolled rate of 120-150 pounds/hour. No discussion is provided as to how the wet scrubber technology will be protected when there is an upset condition in the Trona injection/ESP operation. This is a significant issue as high particulate loading will foul and compromise the wet scrubber technology.
   - We note that the particulate loading design value provided by ETS to the various equipment vendors understated the particulate loading allowed by the permit by an order of magnitude (0.008 grains/dry standard cubic foot cited in the ETS report versus the permit limit of 0.08 grains/dry standard cubic foot). The ETS, Inc. analysis should be corrected, and vendors contacted to assure that increased particulate loading can be accommodated by the wet scrubber technology.
   - Selenium is present in Owens' exhaust gas. Large quantities of water will be required to cool the exhaust gas to the temperature range required for the wet scrubbers, as well as for operation of the wet scrubbers. This water will require

Comment #8

– 3 –

Comment #8

treatment to remove the selenium prior to off-site disposal. There is no detailed analysis of the technical feasibility to treat this stream; rather the ETS, Inc. report assumes that one of four options is feasible at a cost of $225,000, which in our view ignores technical issues and simply throws money at the problem without solving this issue. As an example, one of the options proposed in the ETS report for treating wastewater (Option 3 on page 6 of the ETS report) is to send blowdown from the scrubbers to a storage tank and then spray it into the duct ahead of the precipitators to evaporate the water and collect the dry particulate in the ESPs. This does not account for the PM loading to the ESPs associated with Trona injection, does not address whether the exhaust temperature will be sufficient to support evaporation of the water, nor does it account for the potential issues associated with adsorption/absorption of the water by the Trona and particulate matter.

Owens encountered a nearly identical situation in 1997, when it experienced moisture buildup in the ESPs resulting in short-circuits within the units, as a result of water injection prior to the ESPs and insufficient temperatures to evaporate the water. At the time, Owens was operating a semi-dry scrubber on Furnace B, in which soda ash and water were injected into the furnace exhaust prior to the ESP. Previously, Owens had been operating three furnaces, and the combined exhaust temperature was sufficient to support evaporation of the injected water. However, once Furnace A was shut down, exhaust temperature dropped, resulting in condensation buildup in the ESPs. The condensation buildup, combined with the ESP dust, became acidic and corroded wiring within the ESPs. Acidic water also began leaking outside the ESPs, necessitating additional abatement efforts. Owens attempted to prevent heat loss by adding insulation on the ducting, which proved insufficient. Owens also considered raising the scrubber exhaust temperature, but recognized that this was infeasible since it would require reducing the exhaust gas residence time and reduce the scrubber control efficiency [*Petition for an Ex Parte, Emergency, and a Short Variance*, Case No. 4472-9, Facility ID 007427, May 15, 1997, paragraphs 6-10].

- We note that the Ball Foster El Monte facility was unable to achieve compliance with its selenium discharge permit limits when operating a wet scrubber. Based on discussions with former company staff, high selenium concentrations in wastewater discharge resulted in non-compliance penalties and was a key consideration in the decision by the company to switch to dry scrubber control technology.
- No analysis is provided of the acute health risk posed by emissions of 50% NaOH scrubber mist that will be released from the operation of the three wet scrubbers, and whether this incremental acute health risk is within District Rule 1401 requirements. The District's CEQA analysis improperly focuses on storage of sodium hydroxide, and fully ignores emissions from the wet scrubber stack. As indicated below, this toxics analysis is especially important, as the wet scrubber controls require that exhaust temperatures be reduced to ~150

degrees F. This lower exhaust temperature will reduce the buoyancy of the plume, and increase ambient concentrations near the facility.

- No analysis has been performed to show compliance with the new federal ambient standard for nitrogen dioxide. The wet scrubber technology requires that the temperature of the exhaust gas has to be reduced from 650 degrees F to ~150 degrees F. This significant reduction in exhaust temperature will significantly reduce the buoyancy of the plume, and thus increase ambient concentrations of exhaust gases, including nitrogen dioxide, particulate, air toxics, and combustion gases. This refined analysis must be performed as it will be required by the District.
- As we will comment as part of the CEQA documentation, the District has not evaluated the ability to introduce a new hazardous material (50% sodium hydroxide solution) into a manufacturing process consistent with the California Legislature's directive under the new Green Chemistry Initiative, which will be in effect when SOx emission reduction process modifications will be made.

5. Adding a wet scrubber stage to the Owens SOx emissions control system is technically infeasible. Beyond the technical issues identified in the immediately preceding comment, Owens will encounter the following issues which preclude addition of a wet scrubber stage:
   - There is insufficient space next to the existing controls to install three wet scrubbers, stacks, and necessary support equipment adjacent to the existing facility. As explained to ETS at the time of their site visit, there is a single 14'x22' pad proximate to the existing three ESPs. In our experience, this is insufficient to locate three wet scrubber towers rated at 30,000 cfm each, and associated pumps/Continuous Emissions Monitoring Systems (CEMS) and related process equipment.
   - Owens would have only two options for installing the required wet scrubber controls: 1) installing the control systems in its parking lot located to the east of the existing ESPs and running ducting over the top of a building (which would pose unacceptable safety issues); or 2) tearing down a building. No cost/feasibility analysis was provided for these two options.

Comment #8

6. Costs associated with BARCT for container glass melting furnaces is understated. Costs are underestimated for the following reasons:
   - As previously stated, BARCT for container glass melting furnaces is currently established at a level of 2.51 pounds of SOx per ton of glass pulled. Based on the District's evaluation of BARCT, achieving the proposed BARCT level of 0.03 pound SOx per ton of glass pulled would require a combination of dry scrubbers, dry ESPs, and wet scrubbers. Therefore, at a minimum, the costs for all three technologies need to be incorporated into the cost-effectiveness analysis.
   - The BARCT cost estimates need to account for three wet scrubbers and associated ducting/support equipment as each ESP will require a dedicated wet scrubber to maintain needed control redundancy for the oxy-fuel furnaces.

- As indicated above, the ETS report provides no basis for the estimated $225,000 in capital costs associated with wastewater treatment, which can be significant as selenium is especially hard to treat to RWQCB discharge limits.
- No costs are provided for the construction of three new exhaust stacks, for relocation and installation of the CEMS on each of these three stacks, for permitting of the CEMS with the District's RECLAIM group, for the new Relative Accuracy Test Audits that must be performed, or for the costs of RTCs to cover the missing data that will be recorded by the new CEMS. Our prior experience on CEMS monitoring systems indicates that costs for three such systems can exceed $250,000 for each CEMS.
- No technical data are provided to support the estimated 25-year useful life of a caustic wet scrubber. Our experience with caustic wet scrubbers suggests a shorter useful life (10-15 years), which is also typical of useful life assumptions based on EPA and other local air district control technology analyses.

Comment #8

7. The District did not consider the implementation challenges faced by Ball-Foster when attempting to utilize a wet scrubber to control SOx emissions from an oxy-fueled glass furnace in the mid-1990s. In February 1995, Ball-Foster converted its regenerative glass furnace to oxy-fuels operation at its El Monte facility. Previously, the furnace had utilized a venturi wet scrubber to control PM emissions. After the conversion, Ball-Foster reconnected the furnace to the wet scrubber. Starting one month later, the scrubber began experiencing numerous equipment failures, including component overheating and damage, plugging, and excessive solids buildup – prompting numerous emergency breakdowns. After struggling with the scrubber operational problems for a year, Ball-Foster informed the District Hearing Board that it intended to replace the wet scrubber with an ESP to control particulate emissions, and a dry scrubber to control SOx emissions. By mid-1997, the wet scrubber had been removed and replaced by a dry scrubber and ESP [*Petition for Modification and Extension of a Variance*, Case No. 108-20, Facility ID 108701, April 9, 1997, paragraphs 6-14]. Like the Ball-Foster furnace, both of Owens' glass furnaces are oxy-fuel fired.

8. BARCT for container glass meting furnace SOx emissions should be established as the emission rate achievable by Owens' current dry scrubber/ESP control system. Based on information presented in the District's December 2009 Draft Staff Report, this would be a level of between 0.62 and 1.05 pounds SOx per ton of glass pulled, and represent the combination of process modifications and control technology. Notably, this SOx emissions limit is below the permitted SOx emission rate (1.6 pounds SOx/ton of glass pulled) established for the Seattle, Washington container glass plant that that is controlled by the wet scrubber technology evaluated by the District in its BARCT determination.

Response #1

Staff appreciates the efforts that your facility operators have made to lower SOx emissions and your position that BARCT for glass manufacturing should be the controls currently operating at your facility. However, the application of wet gas scrubbers still remains the recommended BARCT for glass manufacturing furnaces as explained in Response #2.

Furthermore, Owens-Brockway Glass Container Inc. (Vernon Branch) is a subsidiary of Owens-Illinois, Inc. According to website for Owens-Illinois, the parent company of Owens-Brockway, in 2009 Owens-Illinois had 22,000 employees in 21 countries with net sales of $7.1 billion[76]. SCAQMD records confirm that Owens-Brockway is the only glass container facility in the District.

Response #2

Control technology has improved over time. The dry scrubbers with 80 percent to 90 percent control efficiency were considered as BARCT for SOx in 1994. However, in between 2008 and 2010, two consultants (ETS and NEC) expressed agreement that non-regenerative wet scrubbers can achieve 1 ppmv - 5 ppmv SOx outlet concentration (95 percent control efficiency or more from the 2005 emissions baseline, 99% from the uncontrolled level assuming that the dry scrubbers operated at 80% control) and thus, should be considered as BARCT for SOx for glass melting furnaces. While these two consultants recommended different types of WGSs, they both concurred that WGSs would be cost-effective and staff concurs with the consultants' recommendations. The two consultants both recommended keeping the existing ESPs in place for particulate control and placing the wet scrubbers downstream of the ESPs.

In addition, the proposed BARCT level for glass melting furnaces has been achieved in practice. Specifically, the Puget Sound Clean Air Agency in Seattle, Washington provided SCAQMD staff with source test and CEMS data from Saint-Gobain, a glass container facility, that demonstrates compliance with 5 ppmv SOx levels (96 percent control) via Tri-Mer's Cloud Chamber scrubber. The furnace at Puget Sound has a permit limit of 1.6 pound of SOx per ton of glass pulled but tested at 0.0062 pounds of SOx per ton of glass pulled.[77,78] Staff had multiple conversations with Tri-Mer about their WGS technology, and Tri-Mer indicated to staff that they provided many types of WGS that can be used to achieve 5 ppmv SOx outlet concentration, either packed bed, open throat, venturi, or Cloud Chamber scrubber. The Cloud Chamber scrubber can also be used as particulate control device.

[77] Horizon Engineering, "Source Test Evaluation Report for Saint-Gobain, Seattle, Washington, Glass Melting Furnace No. 5 with Cloud Chamber Scrubber," September 18, 2009.

[78] CEMS Summary Report from Saint-Gobain to Puget Sound Clean Air Agency, for a period from October 1, 2009 to October 31, 2009.

Furthermore, staff believes that the problems occurred at Owens-Brockway and Ball-Foster Glass Container between 1994-1997would not occur with the two WGSs proposed by ETS Inc. because ETS proposed to place the two WGSs downstream of the ESPs. The ESPs located upstream of the wet scrubbers will collect particulate matter and prevent excessive particulate buildup in the wet scrubbers. In addition, ETS proposed to remove the two dry scrubbers located upstream of the ESPs. Trona injection in the dry scrubbers would no longer be needed, and thus Trona leakage to the ESPs would drop to zero, and the particulate loading to the ESPs would be reduced significantly.

To put the problems occurred at Owens-Brockway and Ball-Foster Glass Container into perspective, staff provides the following explanations:

Owens-Brockway

Previously, Owens-Brockway operated three furnaces (Furnace A, B and C). In 1994, Owens-Brockway installed a United McGill semi-dry/wet scrubber using soda ash as the scrubbing agent to control SOx. The particulate matter emissions from the three furnaces are controlled by three ESPs located downstream of the semi-dry scrubber (any two ESPs are in operation at one time, while one ESP is standby.) One of the furnaces (Furnace A, non-oxy fuel furnace) was shutdown in December 1996. During this period, the exhaust temperature dropped, resulting in condensation buildup and corrosion within the ESPs. Because of this reason, Owens-Brockway had to seek several variances from the SCAQMD Hearing Board in 1997 and finally decided to remove the semi-dry scrubber and replaced the semi-dry scrubber with the two dry scrubbers using Trona, a very fine powder, as absorbent.

Staff believes that the problems with the semi-dry/wet scrubber and ESPs were not caused by equipment capability but equipment operation. Condensation problems would not have occurred in the ESPs if Furnace A were not shut down and the temperature of the flue gas entering the ESPs was high enough to prevent moisture condensation in the ESPs. The following, excerpted from Owens-Brockway Glass Container Corp.'s May 14, 1997 Petition for an Ex Parte, Emergency, and a Short Variance (Case No. 4472-9) supports this belief:

> *"Prior to discontinuing the operation of Furnace A, the temperature of the combined exhausts from Furnaces A and C, when mixed with Furnace B exhaust, was high enough to keep the exhaust moisture content as vapor in the ESP. Since Petitioner has only been operating Furnaces B and C, the volume of exhaust has been reduced and the combined exhaust temperature has not been high enough to keep exhaust mixture in the form of vapor as exhaust enters the ESPs. Consequently, moisture condenses in the ESPs."*

Staff believes that the problem with the semi-dry/wet scrubber and ESPs would not occur with the ETS's proposal where the wet scrubbers would now be located downstream of the ESPs. The temperature of the exhaust gas stream from the furnaces would remain high enough to prevent condensation in the hot ESPs.

Ball-Foster Glass Container

The problem occurred at Ball-Foster Glass Container (aka Saint-Gobain Containers) was very different in nature than the problem occurred at Owens-Brockway. Ball-Foster Glass Container did not use ESPs to control particulate matter. They operated a wet venturi, variable throat scrubber using soda ash as absorbent to control both SOx and particulate matter. In 1993, they converted their existing glass furnace to an oxy-fuel furnace which was operated with significantly less combustion air, which subsequently resulted in reducing the volume of exhaust flue gas from the furnace to the venturi scrubber and increasing the particulate loading to the scrubber. Staff believes that the excessive solids build-up in the scrubber system was due to failure to redesign the venturi wet scrubber to handle the excessive particulate loading after the conversion to the oxy-fuel furnace. In 1999, Ball-Foster Glass Container removed the venturi wet scrubber and replaced with a dry scrubber to control SOx and an ESP to control particulate matter.

Staff believes that the problem with excessive particulate buildup in the Ball-Foster Glass Container's scrubber would not occur with ETS's proposal since ETS proposed to place the wet scrubbers downstream of the ESPs. The ESPs reduces particulate matter emissions substantially and thus prevents particulate entrainment to the packed bed scrubbers.

It should be pointed out that Owens-Brockway and ALG had incorrectly assumed the configuration of ETS's proposal. ETS proposed the removal of the two dry scrubbers upstream of the ESPs and replace those with two WGSs located downstream of the ESPs.

Response #3

First, to put this matter into perspective, it should be noted that two sets of consultants, ETS and NEC, visited the Owens-Brockway facility, collected data, interviewed facility representatives and then independently ascertained that WGSs are technically and economically feasible for this facility's furnaces. Both ETS and NEC have direct experiences in DGS, WGS technology as well as ESPs as applied to furnace operations at Owens-Brockway facility. Because of these reasons, staff has forwarded Owens-Brockway's comment letters and staff responses to the consultants for their input, and their input are incorporated in this response.[79]

Second, the timing issue should also be mentioned. It has been almost two years since the consultant's (ETS) analysis of the Owens-Brockway facility was finalized in December 2008. During this time, representatives from Owens-Brockway rarely participated in the SOx RECLAIM Working Group meetings or provided staff with any questions or feedback on the

[79] SCAQMD staff sent Owens-Brockway comment letter and staff's responses to the consultants for review, and received confirmation back that they were in agreement with staff's assessment. The consultants' feedback is included in this response. E-mails from James Norton of NEC to Minh Pham on October 12, 2010, Marshall Bell of NEXIDEA to Minh Pham on October 12, 2010, and John McKenna of ETS to Minh Pham on October 27, 2010.

consultant's report. Staff recently received three comment letters from Owens-Brockway submitted on September 22, October 1 (addressed in Program Environmental Assessment), and October 21, 2010. The letters contain several incorrect assumptions and technical errors relative to ETS's analysis as outlined below:

- (1st bullet) The commenter incorrectly assumes that the proposed BARCT configuration contains the dry scrubbers. In actuality, ETS proposed to remove the two dry scrubbers upstream of the ESPs and replace them with two new WGSs downstream of the ESPs.

- (2nd bullet) Owens-Brockway current setup shows that redundancy is needed for particulate control but not for SOx control. Owens-Brockway operates two dry scrubbers and has three ESPs connected by piping/valves, but only two are in operation at any one time and one remains in standby mode. ETS recommended the removal of the two dry scrubbers and the discontinue use of Trona, a very fine powder, in the two dry scrubbers will reduce the particulate loading and Trona entrainment to the ESPs. ETS recommendation may improve the reliability of the two on-line ESPs substantially and reduce the need to use the stand-by ESP. Owens-Brockway operates sufficiently with two dry scrubbers for SOx control without a need for redundancy. For these reasons, ETS recommended replacing the two existing dry scrubbers with two new WGSs to improve control efficiency but not necessarily redundancy.

- (3rd bullet) Additional pressure drops were a concern for ALG since ALG incorrectly assumed that the BARCT control configuration recommended by ETS included both the two dry scrubbers and the two wet scrubbers. With ALG's incorrect assumption, there would be additional pressure drops across the wet scrubbers that would need to be taken into consideration. However, ETS recommended the removal of two dry scrubbers upstream of the ESPs, and to replace those with two wet scrubbers downstream of the ESPs, and there would be no significant increase in pressure drop. In addition, if additional pressure were needed, it could be supplied with a fan. In ETS's analysis, ETS had included the costs for a system fan in the vendor's budgetary quote:

  > *"Each system comes complete with all necessary pumps, reagent storage tanks,* ***system fan****, and stack."*

  ETS made a determination based on their extensive knowledge and experiences with ESPs, wet gas scrubbers, and also dry gas scrubbers that the pressure drop would not be a concern in this situation. An additional fan or blower to push or pull the flue gas through the WGS would not make the control system recommended by ETS cost-ineffective since it has already been included in existing cost calculation.

- (4th bullet) The three ESPs (two in operation and one stand-by) were designed to ensure that if one ESP experiences operational difficulties, the stand-by ESP will take its place. ETS recommended removing the dry scrubbers, and without Trona injection, the particulate loading to the two ESPs is expected to be reduced substantially and will improve the ESP reliability. ETS however did not recommend the removal of the stand-by ESP, but recommended Owens-Brockway to keep one stand-by ESP to handle upset conditions, and

thus maintain the integrity of the two wet scrubbers downstream of the ESPs. ETS did not view that building redundancy for SOx control by adding a third scrubber was necessary because monitoring the pH level and increasing the use of caustic may work as efficiently.

- (5th bullet) As explained above, only two WGSs would be needed. Two consultants, ETS and NEC, both identified suitable, separate locations for placement of the WGSs, Owens-Brockway is not expected to have site limitations associated with the placement of two WGSs within their facility.

- (6th bullet) The commenter failed to specifically identify what foreseeable additional costs that the consultants might not include in their analyses. ETS estimated a cost effectiveness of about $5,000 per ton SOx reduced and both ETS and NEC concurred that WGS technology is cost-effective.

- (7th bullet) Owens-Brockway reported that the facility is currently sending wastewater to the LACSD and the City of Vernon to be treated at a rate of 41.89 million gallons per year which equates to approximately 80 gallons per minute (gpm). Owens-Brockway has a maximum discharge limit of 131.4 million gallons per year (250 gpm). The increase in discharge due to the two wet gas scrubbers (WGSs) is 10 gpm which is expected to mainly contain soluble sodium sulfate that would result from using caustic solvent as the scrubbing agent. With an additional discharge of 10 gpm, Owens-Brockway is far below their permitted threshold of 250 gpm. In addition, on October 26, 2010, following staff's request, Owens-Brockway provided staff with their facility's industrial wastewater discharge permit issued by the LACSD which shows that currently LACSD has effluent concentration limits for Arsenic, Cadmium, Chromium, Copper, Lead, Mercury, Nickel, Silver, Zinc, Cyanide, and total dissolved sulfides. There is no effluent discharge concentration limit for Selenium on Owens-Brockway's industrial discharge permit. Furthermore, staff estimated the concentration of selenium that potentially could present in the waste water stream of Owens-Brockway facility based on their annual emission reports from 2002-2009. Selenium concentrations in their waste water stream would be around 0.022 mg/L,[80] much less than the threshold set in CFR, Part 268 – Land Disposal Restrictions for wastewater and non wastewater. For these reasons, staff believes that both the LACSD and the City of Vernon will be able to receive and treat an additional 10 gpm waste stream that contains trace of selenium and other inorganic compounds. The consultant (ETS) also allocated $225,000 into the scrubber equipment cost to handle the waste stream from the scrubbers (e.g. selenium). The amount of $225,000 was estimated based on information provided by Manufacturer D which has expert knowledge of WGS technology and WGS effluent waste treatment, and this amount was based on relevant experience with the waste stream from a glass manufacturing facility located in Seattle, Washington.[81] In addition, ETS provided four options for Owens-Brockway to treat the waste stream onsite in the Final Report:

[80] E-mail from Kevin Orellana to Minh Pham on October 26, 2010.

[81] E-mail from ETS, Inc. to Minh Pham on October 27, 2010.

1) *"The liquid blowdown from the scrubbers could be sent to a storage tank and recycled back to the furnaces for the batch wetting process.*
2) *The blowdown could be sent to a storage tank and then to an energy efficient dryer for liquid evaporation. The solid waste could then be placed in a hopper and recycled back to the furnaces.*
3) *The blowdown could be sent to a storage tank and then sprayed into the duct ahead of the precipitators to evaporate the water and collect the dry particulate in the ESP's.*
4) *The blowdown could be sent to a storage tank and ran through a small skid-mounted (app. 6'x 6') filtration system prior to discharge to the local sanitary sewer system."*

Further, since technology for selenium treatment is available, SCAQMD staff recommends that Owens-Brockway operators conduct their own evaluation of these recommended options to find an appropriate method to treat any selenium in the WGS wastewater. There are no significant environmental impacts expected with the options quoted above. While the commenter criticized Option 3 (the comments were based on the incorrect assumption about the continued use of dry scrubbers and Trona injection), no comments were submitted relative to Options 1, 2 and 4.

- (8th bullet) One WGS for a FCCU has been installed and is currently operating at a refinery in the District. The exhaust gas stream from this existing WGS is expected to have similar characteristics (i.e. lower temperature, reduced plume buoyancy, caustic mist) as the proposed WGSs for Owens-Brockway. The WGS at the aforementioned refinery was evaluated to assure that it complies with all state and federal ambient air quality standards and a Permit to Operate was issued by the SCAQMD. If applications for the proposed WGSs are submitted by Owens-Brockway, the WGSs scrubbers will undergo an equivalent or similar evaluation. Moreover, there is no evidence of potential slip of caustic from WGS.

Response #4

As a matter of maintaining perspective, it is important to note that Owens-Brockway currently holds 0.31 ton per day of RTCs and the remaining RTCs allocated to Owens-Brockway would be 0.14 ton per day after the proposed 55 percent shave. Owens-Brockway's SOx emissions in 2005 were approximately 0.2 ton per day. Owens-Brockway indicated that the control efficiency of their dry scrubbers was demonstrated at 90 percent, but that they are operated at 75 percent to 80 percent.[82] If Owens-Brockway can operate their dry scrubbers at 90 percent, then the facility will be in compliance without any additional controls with the 55 percent shave since their emissions at 90 percent control would be 0.1 ton per day, [83] below the 0.14 ton per day allocation after the shave. Under this scenario, Owens-Brockway will have surplus credits of 0.04 ton per day, which can be made available in the open market and could generate a substantial revenue

[82] SCAQMD Engineering Evaluation, A/N 288744, March 1994.

[83] 80% control of 1 ton per day = 0.2 ton per day, and 90% control of 1 ton per day = 0.1 ton per day

stream to the company. This revenue stream can be even larger if Owens-Brockway elects to install higher efficiency WGSs.

However, if Owens-Brockway elects not to operate their dry scrubbers at 90 percent control, then the facility operators can purchase 0.06 ton per day (0.2 ton per day 2005 baseline – 0.14 ton per day = 0.06 ton per day) to be in compliance with 55 percent shave. The RTCs can be purchased from investors or from other SOx RECLAIM facilities that have surplus RTCs. The surplus pool has approximately 1.73 tons per day of unused RTCs in 2005, and 2.55 tons per day of unused RTCs in 2008. For these reasons, SCAQMD staff did not assume that Owens-Brockway would shut down their facility because of the proposed 55 percent shave for SOx RECLAIM.

Response #5

Staff disagrees with ALG's recommendation, BARCT technology is improving over time. For example, dry scrubbers operating at 80% control efficiency were considered as BARCT in 1994. Today's control technologies routinely demonstrate 95+% control efficiencies and can achieve control levels of 5 ppmv or better. Therefore, Owens-Brockway should not be included in the list of exempt facilities in Table 5 of the PAR 2002.

Response #6

Staff and the consultants[84] disagree with ALG's technical assessment in a number of areas:

- ALG incorrectly assumed configuration of the proposed BARCT to contain the dry scrubbers. Monitoring pH and sufficient use of caustic solvent for SOx control and having ESPs upstream for particulate control would prevent excessive particulate loading and catastrophic failure to the WGSs located downstream of the ESPs.

- Three WGSs are not required for redundancy as each can be sized to handle the entire flue gas flow from the ESPs, therefore plot space limitations should not be a problem. Both consultants visited the site, evaluated the situation, and concurred that space would not be a problem.

- Operational problems are site- and equipment-specific, particularly in cases where process changes are made upstream of existing systems (e.g. the problem at Ball-Foster was due to excessive particulate loadings to the venturi scrubber after they converted their furnace to oxy-fuel furnace. The venturi scrubber should be redesigned to handle a lower flow with higher particulate loading from the oxy-fuel furnace. As new equipment would be designed for a specific installation, the design would take into account all operating modes and

[84] SCAQMD staff sent Owens-Brockway comment letter and staff's responses to the consultants for review, and received confirmation back that they were in agreement with staff's assessment. The consultants' feedback is included in this response. E-mails from James Norton of NEC to Minh Pham on October 12, 2010, and Marshall Bell of NEXIDEA to Minh Pham on October 12, 2010.

upstream conditions. Therefore, staff finds the problems which occurred at a different facility, which reused control equipment without being redesigned, would not apply to the Owens-Brockway facility. In addition, Owens-Brockway has three ESPs located upstream of the scrubbers to control particulate matter and thus will help prevent excessive buildup of particulate in the WGSs.

- Most importantly, dry scrubbers operating at 80 percent control efficiency is not today's BARCT. Current state-of-the-art systems can reliably achive 95% or more SOx reductions and achieve SOx emission levels of 5 ppmv or lower. Staff therefore recommends the BARCT level for glass melting furnaces at 5 ppmv.

Response #7

Regarding the commenter's suggestion to clarify the language in subparagraph (f)(1)(Q) of Rule 2002, staff believes that the language, as currently stated, makes it clear that any facility entering the RECLAIM program after the date of adoption and that operates the basic equipment in Table 4 shall have its SOx allocations determined according to the BARCT level listed in Table 4 or the permitted emission limits, whichever is lower. Existing facilities that operate the basic equipment listed in Table 4 will have their allocations adjusted in accordance with Rule 2002, subparagraphs (f)(1)(I) and (f)(1)(J) at the Table 4 BARCT levels, effective 2012.

Response #8

The background on Owens-Brockway's furnaces and control equipment provided by ALG is consistent with the information documented by ETS (i.e. testing on the dry scrubber demonstrated up to 90% control efficiency, however the systems typically operate at a 75 percent to 80 percent control.) In addition, staff knows of no installation in which a facility relies upon using dry scrubbers, dry ESPs, followed by wet scrubbers to achieve the emission reductions recommended by the consultants. However, staff believes that the level of 5 ppmv SOx (95 percent control efficiency or more) can be achieved in practice using WGSs, is cost-effective and is not expected to create the severe problems alleged by the commenter's technical assessment. SCAQMD staff's responses to the individual comments are summarized as follows:

- Regarding the control efficiency of the dry scrubbers, it is interesting to note that the 2005 emissions from the Owens-Brockway's glass furnaces were about 0.2 ton per day. Owens-Brockway reported that their dry scrubbers were demonstrated to achieve 90 percent control efficiency, but that they were typically operated at a 75 percent to 85 percent control efficiency. If the dry scrubbers are operated at 90 percent control efficiency level, then Owens-Brockway would emit approximately 0.1 ton per day and as such, would be in compliance with the proposed 55 percent shave without additional control.

- (Response to point #4 of ALG's assessment) The proposed BARCT level for glass melting furnaces has been achieved in practice. Specifically, the Puget Sound Clean Air Agency in Seattle, Washington provided SCAQMD staff with source test and CEMS data that demonstrates compliance with 5 ppmv SOx levels at 96 percent control efficiency via Tri-

Mer's Cloud Chamber scrubber for a furnace with a permit limit of 1.6 pound of SOx per ton of glass pulledbut tested at 0.0062 pounds of SOx per ton of glass pulled.[85,86] Staff received information directly from the vendors and also from ETS (e.g. guarantee letters) demonstrating that the Cloud Chamber scrubber as well as packed bed scrubber, venturi scrubber, or open throat type of scrubber can be used to achieve 5 ppmv SOx level when appropriately designed and operated. The Cloud Chamber scrubber is functionally identical to other types of WGS in controlling acid gas (SOx). In addition, the commenter's assessment about the control configuration recommended by ETS is incorrect. The control configuration recommended by ETS (which was proposed by Manufacturer A) consists of three existing ESPs followed by two new wet scrubbers. Manufacturer A and ETS recommended the removal and replacement of the two existing dry scrubbers with two WGSs downstream of the three existing ESPs.

- (Response to 1st bullet under Point #4 of ALG's assessment) The commenter assumes that three WGSs would be needed to correspond with the three ESPs units. Even though the three ESPs are connected by piping/valves, only two are in operation at any one time and the one remains in standby mode. Thus, there is no need to install three WGSs when there are only two operational ESPs at any one time. In addition, removing the dry scrubbers upstream of the dry ESPs and stopping the use of Trona would reduce the excessive particulate loadings to the ESPs, and consequently would reduce the likelihood of future loadings to the WGSs downstream of the ESPs. For these reasons, ETS recommended replacing the two existing dry scrubbers with two new WGSs. Owens-Brockway may choose to build a larger system for redundancy (e.g. 90,000 acfm instead of 60,000 acfm), which will cost more but will not make the BARCT recommended by the consultants become cost-ineffective (i.e. larger than $50,000 per ton) since the cost-effectiveness for the 60,000 cfm system was estimated to be only about $5,000 per ton, and the capital costs are proportional to the $(90{,}000/60{,}000)^{\exp 0.6} = 1.28$ factor.

- (Response to 2nd bullet under Point #4 of ALG's assessment) Additional pressure drops were a concern for ALG since ALG incorrectly assumed that the BARCT control configuration recommended by ETS included both the two dry scrubbers and the two wet scrubbers. However, ETS recommended the removal of two dry scrubbers upstream of the ESPs, and to replace those with two wet scrubbers downstream of the ESPs. There would be no pressure drop across the dry scrubbers. If indeed, additional pressure drop is needed, a fan and a blower can be used to provide the required energy. Manufacturer A did include the fan into their proposal, therefore the concern of pressure drop seems irrelevant.

- (Response to 3rd bullet under Point #4 of ALG's assessment) The commenter incorrectly assumes that Trona will still be needed. Since ETS recommended removing the dry scrubbers with Trona injection upstream, and placing the WGSs downstream of the

[85] Horizon Engineering, "Source Test Evaluation Report for Saint-Gobain, Seattle, Washington, Glass Melting Furnace No. 5 with Cloud Chamber Scrubber," September 18, 2009.

[86] CEMS Summary Report from Saint-Gobain to Puget Sound Clean Air Agency, for a period from October 1, 2009 to October 31, 2009.

particulate loading to the ESPs. There will no longer be any need for Trona, and the proposed configuration is expected to reduce substantially the amount of particulate loading to the ESPs.

- (Response to 4th bullet under Point #4 of ALG's assessment) There are several types of WGSs: 1) quench, vertical packed bed scrubbers as recommended by Manufacturer A; 2) simple open-throat scrubbers as recommended by Manufacturer D; or, 3) fluidized rotating scrubber as offered by Manufacturer B. NEC recommended Manufacturer D's open-throat type and ETS recommended Manufacturer A's packed bed scrubber. Manufacturer A indicated that the packed bed scrubber can tolerate up to 20 mg/Nm3 of insoluble particulate without clogging; and if the particulate is soluble (e.g. sodium sulfate), then the packed bed scrubber would not have a problem with plugging. [87] Since ETS proposed to use caustic which would form soluble sodium sulfate, plugging problem is not likely to occur. The SOx RECLAIM program does not require Owens-Brockway to install any particular type of scrubber. In fact, Owens-Brockway is encouraged to further conduct study and research to determine the type of WGSs and solvent that best fit their operation and emission profiles.

- (Response to 5th and 6th bullet under Point #4 of ALG's assessment) Please refer to Response #3 (7th bullet). Owens-Brockway reported that the facility is currently sending wastewater to the LACSD and the City of Vernon to be treated at a rate of 41.89 million gallons per year which equates to approximately 80 gallons per minute (gpm). Owens-Brockway has a maximum discharge limit of 131.4 million gallons per year (250 gpm). The increase in discharge due to the two wet gas scrubbers is 10 gpm which is expected to mainly contain soluble sodium sulfate that would result from using caustic solvent as the scrubbing agent. With an additional discharge of 10 gpm, Owens-Brockway is far below their permitted threshold of 250 gpm. For these reasons, SCAQMD staff believes that both the LACSD and the City of Vernon will be able to receive and treat an additional 10 gpm waste stream for selenium. However, in the event that the LASCD or City of Vernon would reject the additional 10 gpm in the waste stream, ETS provided four options for Owens-Brockway to treat the waste stream onsite and allocated $225,000 for this treatment in response to Owens-Brockway's comment received on December 2, 2008.[88] Further, since technology for selenium treatment is available, SCAQMD staff recommends that Owens-Brockway operators conduct research to find the solution for their particular facility if the problem would occur if WGSs were installed. While the commenter criticized Option 3 (the comments were based on the incorrect assumption about the continued use of dry scrubbers and Trona injection), no comments were submitted relative to Options 1, 2 and 4 implying that the commenter did not disagree with the consultant. In addition, please refer to Response #2 for discussion related to the breakdown variances at Owens Brockway and Ball Foster El Monte facility.

[87] Email from Manufacturer A to Minh Pham – Solution Based Absorbents for Scrubbers, January 29, 2010.

[88] ETS's responses to Comment letter from Owens-Brockway. E-mail from Mark Tussing of Owens-Brockway to Minh Pham on December 2, 2008

- (Response to 7th, 8th and 9th bullet under Point #4 of ALG's assessment) There are hundreds of scrubbers operating across the nation that currently utilize caustic solution (NaOH, 50 percent by weight) as a scrubbing agent. The commenter has failed to provide evidence to support the claim that the use of caustic solution will create additional environmental impacts, other than what was already identified and analyzed in the Draft PEA. While caustic solution is a very common scrubbing agent, it is not the only solvent that can be used in Manufacturer A's scrubber. Owens-Brockway may select other solvents such as soda ash, a common element at a glass plant, as an alternative scrubbing agent

- (Response to Point #5 of ALG's assessment) Three WGSs are not required for redundancy as each can be sized to handle the entire flue gas flow from the ESPs in the existing facility. Both ETS and NEC were in agreement that three WGSs are not needed and space is not a problem. They identified two different separate locations at the site for the scrubbers.

- (Response to Point #6 of ALG's assessment) ETS analysis included all of necessary costs. NEC recommended raising ETS's costs to include contingencies, costs for additional ducting and valves for an alternative location; and the commenter indicated that additional costs for CEMS upgrade were also needed. Including all of the additional costs suggested by NEC and the commenter would not make the BARCT recommended by ETS cost-ineffective. NEC concurred that the control costs for WGSs would be cost-effective for glass melting furnaces.

- (Response to Point #7 of ALG's assessment) Refer to Response #2. The commenter refers to a site-specific problem (clogging problem) that occurred at Ball Foster, El Monte facility which is not applicable to their particular facility.

- (Response to Point #8 of ALG's assessment) Refer to Response #2.

Responses to WSPA's Comments Received from March 2010 to August 2010

Stranded Investments of Rule 1105.1

Comment #1
Actual cost information from refineries has been submitted to the District. We understand that Staff has initially reviewed the information and still feel that the documented costs seem "high" compared to District expectations.

The District Staff's position is a concern to WSPA and our members, because the affected refineries documented actual costs incurred to comply with previous SCAQMD rules. WSPA members have been open and factual in providing this documentation.

The result is entirely consistent with WSPA's previous Rule 1105.1 cost-survey that showed implementation costs were 3-5 times (or more) greater than the preliminary cost estimates made by District Staff and District consultants. We believe the documented actual installation costs are superior to any pre-rule cost estimates.

The District should accept the cost data provided by the refineries and acknowledge the fact that the actual costs are higher than the District's pre-implementation estimates. As we move forward, the District should consider these actual costs in establishing future cost estimates for control technology.

Response #1
The cost information submitted by the refineries to comply with Rule 1105.1 has varied considerably in content and level of detail. On this basis, it has been very difficult for staff to ascertain costs that were directly attributable to the Rule 1105.1 and the costs that were the result of corporate decisions or those that extend to other facility operations (e.g., augmentation of substations).

However, there was a reasonable agreement relative to the equipment cost estimates and actual equipment cost incurred but large divergence relative to the actual installation costs asserted by the refinery and original estimates by the AQMD consultant and even WSPA's consultant. The industry's delay in implementation (due to the litigation initiated by WSPA) had a direct impact on the increased costs on construction materials and labor. As reported by the refineries, all refineries selected to use the same ESP's manufacturer (Hamon Research Cottrell) and same contractors (Jacobs Engineering/ Hamon Research Cottrell) during a short construction/installation period from the mid of 2007 – mid of 2008. This compressed construction schedule had a strong negative impact on the union labor costs and the management costs, and thus inflated the implementation costs of the projects. In addition, all refineries selected to build extra redundancy to their ESPs, and upgrade other systems (e.g. substation, NOx and SOx monitoring) that may not be directly related to the FCCUs. Furthermore, the market experienced a surge in steel prices in 2008. These facts together explain the differences in the costs estimated pre- and post- rule development by staff and AQMD consultants as well as

those that were provided by industry. Please also note that all of the cost figures submitted significantly varies with the costs incurred by Chevron for their ESP installation in the early nineties, even when adjusted to current dollars. Detailed analysis is shown in Appendix E.

It is very important to note that in several meetings with the District, WSPA members indicated that if they installed wet gas scrubbers, they need to remove the ESPs and thus the installation costs for the ESPs would be stranded. None of the consultants supported the perspective that there is a stranded investment issue. In other words, based on the feedback received, the installation of the SOx control technology under consideration to meet the proposed BARCT levels will not necessitate removal of previously installed equipment to control PM. It is understandable that there would be certain costs associated with such equipment alterations as augmenting the exhaust flow to overcome increased pressure differentials. However, the potential problem of a stranded investment, according to the consultants, does not exist.

Legal Mandates and SOx Shave Methodology

Comment #2

In a meeting with the District on March 5, 2010, one WSPA's member cited H&S Code 39616(b)(2) – "A market-based incentive program ..... may substitute for current command and control regulations and future air quality measures that would otherwise have been adopted as part of the district's plan for attainment, and may be implemented in lieu of some or all of the control measures adopted by the district pursuant to Chapter 10 (commencing with section 40910) of Part 3." This person asked whether the District has legal authority to make BARCT more stringent for SOx, a primary pollutant that is already in attainment, solely because SOx is a precursor of PM2.5 and the Basin is not in attainment of PM2.5/PM10.

Response #2

The cited provision does not limit the market incentive program to pollutants listed under Chapter 10. Indeed, Section 39616(b)(1) provides that the District Board may adopt a market incentive program as an element of the district's plan for attainment of the state or federal ambient air quality standards. Thus, the District has legal authority that goes beyond controlling primary pollutants stated in Chapter 10. Chapter 10 covers pollutants such as NOx, SOx, and CO. In this case, the District is in non-attainment for PM2.5 and PM2.5 is a pollutant that is not covered under Chapter 10. One of the reason staff is amending Regulation XX is to reduce SOx in order to help the Basin attain the PM2.5 standards in 2015 and 2020.

It should be noted that SOx is a significant building block of PM2.5. Chemical speciation of PM2.5 samples indicated that in the South Coast Air Basin 25% of the ambient PM2.5 is attributed to contribution from sulfates. Furthermore, SOx reductions are highly effective in reducing ambient PM2.5 levels as compared to other primary and secondary contributors to PM2.5 formation (1 ton SOx = 1.5 tons PM2.5 = 15 tons NOx). Therefore, considering the level of NOx reduction needed to meet future ambient standards of PM2.5 and ozone and the fact that much of the needed NOx reductions are in the "black box", the reductions of SOx are essential for the basin to meet the federal annual standard of PM2.5 by 2015 and the federal 24-hour average standard of PM2.5 by 2020.

As indicated in the 2007 AQMP, the control strategies included in the Plan to meet the annual PM2.5 standard when fully implemented will fall short meeting the 24-hour standard by approximately 30%. Therefore, additional reductions above and beyond the control strategies committed in the 2007 AQMP for meeting the 2015 annual PM2.5 standard are necessary to meet the 24-hour PM2.5 standard in 2020. For further information, please refer to Chapter 5 of the 2007 AQMP. It should be noted that EPA is in the process of revising the PM2.5 standard.

Comment #3

In a meeting with the District on March 5, 2010, one WSPA's member cited H&S Code 39616(c)(1) "The program will result in an equivalent or greater reduction in emissions at equivalent or less cost compared with current command and control regulations and future air quality measures that would otherwise have been adopted as part of the district's plan for attainment". This person indicated that RECLAIM universe changed substantially from 1993 from 42 facilities to 32 facilities today with a very different emission profile. Why can't the district use the most current emissions distribution (e.g. 2005-2009) to estimate future RTC reductions and demonstrate attainment (or equivalency)? Why is there a need to base the estimation of RTC reductions on 94 or 97 baseline and emission profile? Does the H&S Code (or Regulation XX) restrict the district to use current emission profile?

Response #3

For a market based incentive program, staff is required by the H&S codes to conduct periodic BARCT reassessment and demonstrate equivalency with command-and-control rules which would otherwise be developed as a result of BARCT reassessment:

> *"…achieve an equivalent or greater level of emission reductions at an equivalent or lower cost as would have been achieved under a command-and-control rule"*

The H&S codes do not ~~restrict staff in using the current emission profile in 2005 to estimate RTC shave~~ specify a specific compliance year that staff must use to estimate the RTC reductions. The H&S code requires staff to apply BARCT when it is available and cost-effective, and demonstrate equivalency with command-and-control rules. Staff selected to use the 1997 baseline to be consistent with the NOx RECLAIM approach which was also recommended by WSPA's members in 2008-2009. The 1997 baseline reflects the emission profile at the time frame where no significant SOx control effort were undertaken by the RECLAIM facilities and therefore reflects equitable capture for future control efforts than the 2005 baseline. Please refer to Section 13.3.

Comment #4

District Staff has proposed a SOx RECLAIM shave methodology that was designed to be consistent with the method used for the NOx RECLAIM shave. WSPA feels, however, that the District's proposed methodology inappropriately overstates the required reduction (i.e., % shave) in the RTC allocations, thereby making the shave extremely cost-ineffective. This holds true for both the BARCT adjustment as well as the market-adjustment that was recently proposed.

WSPA only recently (June 18) received the RTC allocation data that we requested at our meetings with Staff on March 5 and again on April 7. While the allocation data report forwarded to us by District Staff does not provide the level of detail we requested, we have begun a detailed review of the information. Having this information is a key to understanding how a reduction in RTC allocations can affect compliance costs and, indeed, the RTC market.

Response #4
WSPA is correct that the SOx shave methodology proposed by staff is consistent with the methodology used for the NOx RECLAIM shave. The idea of keeping the shave methodologies consistent was a theme that was repeatedly requested by WSPA and its members during our extensive dialogue over the last several months as well as through several comment letters. Staff believes that the proposed methodology for SOx RECLAIM, as in the case of NOx RECLAIM, reduced RTC allocations fairly and equitably, remaining true to the design principles of RECLAIM.

As mutually agreed upon in the Work Plan, staff was open to alternative proposals, and as such, when asked by WSPA, staff provided WSPA with initial allocation data that was highly resource intensive to produce. At the March 5, 2010 meeting WSPA and its members did not request the RTC allocations. At the April 7, 2010 meeting such a request was made with very little input on the level of detail. In response, staff explained that the information requested would be a very resource intensive undertaking and would take several weeks to assemble. To that end staff spent a considerable amount of time assembling the allocation tables and meeting with each of the refineries, explaining their particular allocation profile line-by-line or equipment-by-equipment specification. The level of detail and the form of the information presented was, in part, staff's effort to be sensitive to WSPA's concerns regarding confidentiality and anti-trust issues.

Comment #5
WSPA proposed methodology (WSPA's presentation in the Refinery Committee Meeting on August 18, 2010) is summarized as follows: 1) use the 2005 actual emissions as baseline, 2) no new BARCT for boilers/heaters, SRU/TGs and cement kilns, 3) no shave for 1.98 tons per day unused RTCs converted from ERCs and Clean Fuel adjustments, 4) consider 10% - 20% compliance margin consistent with the operating requirements at some facilities and past practice. WSPA's proposal results in 3.86 tpd shave. WSPA proposes 3 tpd shave by December 2014 and the remaining no sooner than December 2019. WSPA also proposes across-the-board shave.

Response #5
Please see Responses to Comment #3 and #4. Using the 2005 baseline will result in 59% shave, not 55% shave as using 1997 baseline. BARCT for heaters/boilers will remain as Tier 1, and staff did not claim any reductions from 2005 from boilers/heaters category. Staff believes that a new BARCT can be set for SRU/TGs and cement kilns at 5 ppmv because retrofit control technologies are available. A 10% compliance margin is used to be consistent with NOx RECLAIM. The 1.98 tons per day RTCs converted from ERCs should be shaved in a similar fashion than other RTCs. Currently, in RECLAIM program, the 1.98 tons per day was shaved at a rate of 35% from Tier 1 to Tier 2. In comparison, ERCs of non-RECLAIM facilities do not

inherently hold their values to eternity, non-RECLAIM ERCs are often recalled and reduced per Regulation XIII. It should be noted that unused RTCs are abundant in the market (in 2005, the unused RTCs were 11.77 – 10.04 = 1.73 tpd, and in 2008, the unused RTCs were 11.77 – 9.22 = 2.55 tpd.) As such, WSPA's proposal of 3.86 tpd for future RTC shave comes short, will not result in the necessary actual emission reductions in order to provide protection to the 17 million people in the Basin against the harmful effects of PM2.5.

BARCT Determination

Comment #6
The Norton Engineering Report (released by the District on June 17 2010) has called into question the cost analyses previously performed by the District and its consultants. It appears that the ultimate conclusion of Norton Engineering is that the District's RECLAIM cost-effectiveness analysis should be revised.

Response #6
It is true that the Norton Engineering Report identified some areas of disagreement related to the cost estimates and recommendations provided by the previous consultants. However, these were limited in scope, primarily reflecting the differential cost of reassessing control equipment and their placement on the refinery property. Staff provides a thorough comparison of the approaches by the two sets of consultants in this revised draft staff report.

Comment #7
While NEC only relied upon the analysis and data provided by the initial consultants, NEC found numerous instances where the District's initial consultants erred by identifying unproven or untested technology and underestimating construction, labor or materials costs.

Response #7
We need to be clear on the term "unproven or untested" technology. In some instances, NEC indicated that the control technologies have not yet been proven or tested in the petroleum refinery and cement industry areas. However, these are not "unproven or untested" in the sense of not being commercially available or in use in other applications. These types of controls would be better characterized as transferrable technologies. NEC incorporated increased costs in order to compensate for uncertainty relative to technology transfers.

Staff did not agree with WSPA that NEC found the initial consultants severely underestimated construction, labor and materials costs. NEC has used a different approach than the initial consultants to estimate the project costs. For example, for FCCU's wet gas scrubbers, NEC indicated that: "*The NEC workup for the TIC[89] for four of the five plants agreed reasonably well with that of the original estimates, being within +8%/ -3%. The NEC estimate for Refinery #3 was 25% higher due to the necessity to design for particulate collection…..*" Staff has estimated the project costs based on NEC's input as shown in Chapter 12. The project costs based on the

[89] TIC = Total Installed Costs

initial consultants' input are $630 millions, and the project costs based on NEC's input are $738 millions, within 20% of the initial consultants' estimates.

Comment #8
Norton Engineering Report cites examples that would raise compliance costs in all source categories, which in turn would raise the District Staff's cost estimate for the District's proposed shave significantly above the current level of $745 million.

Response #8
When one considers the capital investment to comply with staff's proposal there is about a 21 percent cost differential between Norton Engineering and the previous consultants. Such differential are within the margin of error for the analysis conducted and cannot be viewed as significant and in fact reflect different approaches along with newly acquired data. In contrast, staff has difficulties in justifying the cost figures from WSPA which are 200 to 300 percent higher than the estimates presented by the consultants.

Comment #9
The Norton Engineering Report sheds new light on the issue of what technology is technically feasible, achieved in practice and cost-effective; therefore, it directly affects BARCT determination and should cause the District to rethink its proposed reductions in the RTC market.

Response #9
As mentioned above, the cost differential between the two sets of consultants is within the margin of error of the analysis conducted and in staff's view does not materially affect staff's earlier BARCT determination. Please also see response #7.

Comment #10
As a follow-up to the release of the Norton Engineering Report, we request that the District make the Norton Engineering staff available to meet with WSPA members individually so they can understand the details associated with the Norton Engineering Report.

Response #10
In the spirit of being sensitive to WSPA's confidentiality and anti-trust concerns, facilities and vendors in the final report by Norton Engineering are de-identified. Staff would be happy to meet with each of your members to let them know about their facility-specific information meeting with representatives of Norton Engineering may not be necessary after all.

Comment #11
WSPA requests the District to re-estimate the cost effectiveness based on Norton Engineering's estimates and make the report available to WSPA's members for comments. WSPA estimated the total costs to comply are about $2.7 billion as shown in WSPA's presentation at the Refinery Committee Meeting on August 18, 2010. On April 7, 2010, WSPA also provides staff cost estimates based on ENVIRON's report (WSPA hired ENVIRON to collect data and perform analysis with the results aggregated and de-identified). The aggregated cost estimates provided by WSPA on April 7, 2010 include: 1) Total compliance costs are about $2.85 billion for a 60%

shave, and $550 million for 25% shave; 2) Distribution of the total costs for 60% shave: $1.45 billion for FCCUs' controls, $436 million for SRU/TGs' controls, and $960 million for other improvements; and 3) Distribution of the total costs for 25% shave: $84 million for FCCUs' controls, $342 million for SRU/TGs' controls, and $127 million for other improvements. WSPA estimates $60,811.68 per ton for 60% shave scenario and $28,165 per ton for 25% shave scenario for refineries as of April 7, 2010.

Response #11
Staff is very sensitive about the costs estimated by WSPA, and plan to work in concert with WSPA to understand WSPA's estimate of almost 3 billion dollars for the proposed project. It seems that WSPA may include other costs above and beyond the scope of SOx RECLAIM. While the refineries can modernize and upgrade their facilities to respond to market demand and other regulatory requirements, it is not justifiable to attribute all of these project costs to SOx RECLAIM project.

Market Viability

Comment #12
District staff has committed to considering the use of compliance margin and non-tradable RTC accounts as tools to alleviate shortage of tradable RTC and ultimate failure of the SOx RTC market. WSPA is not aware of any progress to date.

Response #12
Staff has used 10% compliance margin in the Draft Staff Report released on January 8, 2009. Staff is proposing additional safety valves to retain market viability, for example the proposed rule language for Rule 2002 (PAR 2002(f)(1)(O)) establishes non-tradable RTC accounts starting in 2015 to be made available in the event the market price of "discrete" RTCs is higher than $50 K per ton. More specifically, in the event that the SOx RTC prices for "discrete" RTCs exceed $50,000 per ton based on the 12-month rolling average, staff will report to the Governing Board at a public hearing to be held no more than 60 days from staff's determination, which will be posted on District's web site. At the public hearing, the Governing Board will decide whether or not to convert any portion of the non-tradable/non-usable RTCs to tradable/usable RTCs. The portion of non-tradable/non-usable RTCs available for conversion will not include any portion of non-tradable/non-usable RTCs that are designated for previous compliance years and has not already been converted by the Governing Board, or any portion that has been included in the State Implementation Plan.

Water Demand & Wastewater Discharge

Comment #13
District Staff indicated they will invite representatives from water regulatory agencies, purveyors and wastewater treatment facilities "to the next Refinery Committee meeting." These representatives will be given the opportunity to provide their insights on the impact the Staff proposal will have on water supply and wastewater treatment. District Staff will also explore the extent to which the water demand can be offset by groundwater from wells owned and

operated by refineries, by recycled water, or by other means. Associated costs will also be examined.

Response #13
Representatives from water regulatory agencies, purveyors and wastewater treatment facilities were invited and attended the Refinery Committee Meeting on August 18, 2010. Representatives of the water purveyors attended the meeting confirmed that recycled water would be made available for the refineries in a near future. In addition, CEQA staff has sent the Draft Program CEQA document to the representatives of state water regulatory agencies, purveyors and wastewater treatment facilities for their comments on this issue. District Staff believes that the water demand can be offset by groundwater from wells owned and operated by refineries, by recycled water, or by other means. Furthermore, the consultants did include the associated costs of water (e.g. they used the costs provided to them by the refineries, $900 per acre-foot recycled water) in their cost effectiveness analysis.

CEQA Implications and Permitting

Comment #14
Specifically with respect to permitting and CEQA compliance, WSPA members have not yet been contacted by District Staff for information related to construction, project emissions or any other environmental impacts. We encourage the District to address the program's effects as specifically and comprehensively as possible, so that subsequent activities at RECLAIM facilities are addressed within the scope of the EIR.

Response #14
Staff has been in direct contact with WSPA members over the last several months for information related to construction, project emissions or any other environmental impacts. Based on this information, as well as information from other sources, staff did and will continue to do their best to address the program's effects as specifically and comprehensively as possible, so that subsequent activities at RECLAIM facilities are addressed within the scope of the EIR.

Comment #15
WSPA appreciates the District's willingness to prepare a comprehensive CEQA programmatic DEIR document to help streamline the permitting process for individual projects carried out in response to the requirements of PAR XX. However, WSPA feels that several projects to reduce SOx emissions will require modification to existing Title V/RECLAIM permitted equipment, may involve changing the existing process units by adding process vessels, enlarging existing process vessels and replacing one type of chemical solution with another type. These activities will be subject to various District regulations, particularly Regulation XIII – New Source Review, Rule 1401 – New Source Review of Toxic Air Contaminants, and PSD for criteria pollutants and perhaps green house gas (GHG) emissions, as well as public review. Other projects may need offset exemption and in the absence of a SIP-approved Rule 1315, we suggest that the SCAQMD begin implementation of this element of the Work Plan as soon as possible. The first tasks would be to review issues such as the availability of offset credits, qualification for Rule 1304 offset exemption, new or larger releases to the flares, NSR and Subpart Ja applicability to flare

modifications, Best Available Control Technology (BACT), Toxics – BACT, and analysis of potential risk increase under Rule 1401.

Response #15
Staff acknowledges WSPA's comments and will plan to work with Engineering & Compliance to address these elements related to permitting as soon as possible.

Comment #16
WSPA met with staff on April 7 and 15, 2010. WSPA hired Environ to collect data from the refineries and perform analysis with the results aggregated and de-identified. The total costs and cost effectiveness provided by WSPA for 25% shave and 60% shave scenarios are summarized below.

Total Costs ($Million) for
SOx RECLAIM Project Summarized by WSPA/ENVIRON

	For 25% Shave	*For 60% Shave*
FCCUs Contribution	*83.57 million*	*1,454.51 million*
SRUs Contribution	*341.79 million*	*436.10 million*
Others	*127.11 million*	*960.20 million*
Total Costs	*550.00 million*	*2,850.00 (2.85 billion)*
Cost Effectiveness	*$28, 165 per ton*	*$60,812 per ton*

Response #16
WSPA did not provide specific information that could be used for meaningful analysis. In addition,WSPA's cost estimates were very different than the costs that staff received from the refineries directly. Furthermore, WSPA's estimates did not reflect the 55% shave scenario that staff currently proposed. Staff identified three scenarios in WSPA's estimates that were substantially different from the consultants' estimates. Staff believes that these three estimates were exaggerated. The table below shows how staff could explain the gap between WSPA's estimates and the cost estimates based on NEC/ETS/AEC and NEXIDEA's recommendations.

Estimates	Explanation
$2,850 million	WSPA's estimate for 60% shave
-$700 million	Remove costs for boilers/heaters control options
-$101 million	Remove costs for early controls already in place
-$467 million	Remove costs for cost-ineffective units
$1,562	
-$700 million	Remove overestimated costs for FCCU's WGSs (2 outliers)
+$196 million	Add consultants' estimated for FCCU's WGSs
-$459 million	Remove overestimated costs for SRU/TG's WGS (1 outlier)
+$73 million	Add consultants' estimated for SRU/TG's WGS
Total $672 million	This compares reasonably well with the consultants' estimates of $630 - $750 million for the SOx RECLAIM project

Responses to WSPA's Comments Received on July 14, 2009

- **BARCT, Cost Effectiveness Analysis, and RTC Reduction Estimates**

Comment #1
A methodology for making the BARCT determination and calculation of the SOx reduction should be developed by the District, and understood by the stakeholders, prior to conducting any analysis or any study. Staff must stay consistent with the 2005 NOx shave methodology. The identification of baseline year, starting emission factors, control factors, etc. has been lacking.

Response #1
The methodology for BARCT determination and RTC reduction estimates is transparent, has been provided to the stakeholders as early as in April 2008, and has been discussed at the June 2009 Public Workshop, and many Working Group meetings since then.

BARCT Determination
SOx RECLAIM program is required by H&S Code 39616 code to:

> "…achieve an equivalent or greater level of emission reductions at an equivalent or lower cost as would have been achieved under a command-and-control rule"

To fulfill this requirement, staff has followed a traditional, transparent, BARCT determination methodology that is similar to the methodology used in any command-and-control rule development. The step-by-step BARCT determination process was summarized in the Draft Staff Report, Part III, released in June 2009.

It should be noted that staff is not required to focus only on achieved-in-practice and fully commercialized available control technology (i.e. technology that either is being offered commercially by vendors, or is in commercial demonstration or licensing). Staff is obligated to find technology that can potentially reduce maximum amount of pollution and meet the requirement sated in H&S Code §40406:

> "… an emission limitation that is based on the maximum degree of reduction achievable, taking into account environmental, energy, & economic impacts by each class or category of source."

Thus technology that is both feasible and cost effective must be considered BARCT even they are not yet proven achieved-in-practice. A feasible technology is a technology that has been previously installed and operated successfully at a similar type of source, or has practical potential for application to the source, i.e. has been successfully applied to similar sources with similar gas stream characteristics.

The potentially proposed BARCT levels for 7 categories of sources were first introduced to the public and the stakeholders in early April 2008, and have become the source of discussion in many Working Group meetings since then. Please refer to the Preliminary Draft Staff Report

dated April 3, 2008 and subsequent Working Group meetings on April 3 and April 30, 2008 as well as in many separate task force meetings with WSPA and WSPA's members since then.

In late September 2008 to April 2009, the consultants carefully conducted another independent feasibility analyses for all of the potential BARCT identified by staff. They estimated the cost effectiveness factors for these technologies on a facility-by-facility basis. In their final reports, the consultants concluded that the proposed BARCT levels were feasible, available, and cost effective.

Subsequent to the release of the consultant studies, their recommendations were carefully evaluated by staff and subject to another step of refinement. The objective of this refinement was to optimize the effectiveness of the subsequent staff proposal by removing certain control technology recommendation with the lowest favorable cost effectiveness that allowed optimizing the emission reductions to be obtained relative to the capital investment to be incurred.

RTC Reductions Estimates & Shave Methodology

Staff followed the commenter's recommendation to stay consistent with the NOx shave methodology that was developed by the District's staff and agreed upon by WSPA and WSPA's members in 2005. Even though staff was in agreement in principal with the desire to stay consistent with the 2005 NOx shave methodology, designing a shave methodology that is workable for the SOx RECLAIM program, but remains fair and equitable is not a trivial and simple task.

To use the 2005 NOx shave methodology, staff invested tremendous amount of time and efforts to recover the 1997-1998 emissions baseline and the starting emission factors in 1993. Using the 1997-1998 emissions baseline and the 1993 starting emission factors, staff estimated the control factors and RTC reductions as shown in Part III of the Draft Staff Report presented in the June 9, 2009 Public Workshop. The RTC reductions shown in the June 2009 Staff Report (i.e. 7.09 tpd – 7.68 tpd) were very similar to the emission reductions estimated by staff in April 2008 (i.e. 6.73 tpd – 6.77 tpd.)

Comment #2
Part I of the Staff report contains premature technology recommendations by the District. The attempt to identify these candidate technologies in advance was in conflict with the concept of utilizing third party consultants to conduct a study to determine potential technology recommendations. Any proposed BARCT should be eliminated from Part I and reserved for discussion in Part III.

Response #2
Staff disagrees with the commenter's recommendation. Utilizing the third party consultants to conduct additional independent studies on BARCT from September 2008 – April 2009 should not be viewed as relinquishing the authority or obligation by staff from conducting their own independent research on BARCT and release any relevant information to the stakeholders. Part I, II and III of the Staff Report reflect the progression in the thought and evaluation process

leading to the most recent staff proposal during this rule making process. Specifically, Part III of the Staff Report has utilized the information presented in Part I of the Staff Report (i.e. feasible control technologies) and Part II (i.e. cost information) in conjunction with other information (e.g. starting emission factors, 1997-1998 emissions baseline, growth factor) to estimate the RTC reductions. This approach is consistent with the requirements in H&S Code §40406 and §39616. Staff is now retaining all the information in Part I, and combining Part III and Part IV into Part I as a complete report. Part II is reserved to serve as a summary of the consultants' analyses.

Comment #3

In the 2005 NOx Shave, District staff established the following specific criteria used to evaluate BARCT. Staff should use these criteria in evaluating measures for this SOx shave rule:

- *Does another air pollution control district or agency have BARCT that we have not identified, or have a more stringent BARCT level than the SCAQMD? WSPA's opinion: No*
- *Is the proposed BARCT level achieved in practice as retrofits? WSPA's opinion: No*
- *Is technology available and feasible for retrofits? WSPA's opinion: Feasibility must take into account environmental, economic and energy impacts, based on this NO*
- *Do manufacturers offer guarantees for achieving proposed emission levels? WSPA's opinion: Guarantee letters were all prospective - contractor has not issued, or presented evidence of, guarantees at the recommended levels and corresponding demonstrated equipment operation functioning under those guaranteed letters.*
- *Is retrofit technology cost-effective? WSPA's opinion: No*
- *Based on the above criteria, could a command and control BARCT rule have been proposed in the absence of the RECLAIM program? WSPA's opinion: No*

Response #3

Staff has examined the criteria listed above; however, staff disagrees with most of the commenter's responses to these criteria. Staff's responses are as follows:

- Does another air pollution control district or agency have BARCT that we have not identified, or have a more stringent BARCT level than the SCAQMD? Staff's response: No. Because of the severity of air pollution its seventeen (17) million residents have to endure, SCAQMD usually sets the most stringent BARCT emission standards in the nation. The more stringent BARCT standards are needed for the Basin to achieve the annual average and 24-hour PM2.5 and ozone federal and state air quality standards in 2015, and 2020, and post 2020, respectively.

- Is the proposed BARCT level achieved in practice as retrofits? Staff's response: Yes. The proposed 5 ppmv BARCT limits are achieved-in-practice for FCCUs (Valero Delaware Refinery, ConocoPhillips Refinery) and SRU/TGTUs (Sinclair Refinery, Casper Refinery.) The proposed technologies (e.g. wet/dry gas scrubbers) are commercially available, feasible to achieve 5 ppmv in all 7 equipment applications identified by staff, and they are cost effective to implement.

- Is technology available and feasible for retrofits? Staff's response: Yes. Wet/dry gas scrubbers are commercially available, feasible and cost effective for retrofits. Emerachem oxidation and absorption catalyst technology is commercially available, has been used in

power plant application, but has not been used in a refinery application and the consultants' conclusion is that the technology is transferable to refinery application.

- Do manufacturers offer guarantees for achieving proposed emission levels? Staff's response: Manufacturers have provided guarantee letters to the consultants and these letters were distributed directly to the refineries, as well as the Governing Board members and the public in the Stationary Source Committee meeting June 2009.

- Is retrofit technology cost-effective? Staff's response: Yes. Please refer to the consultants' analyses.

- Based on the above criteria, could a command and control BARCT rule have been proposed in the absence of the RECLAIM program? Staff's response: Yes. It should be noted that if a command and control BARCT rule would be proposed, they individually could have more stringent reduction requirements than the 55% RTC reduction proposed for SOx RECLAIM.

Comment #4
There is no evidence to support the assertion that RECLAIM sources have the highest possibility to achieve the 3 ton/day target reduction compared to other SOx sources in the basin. Substantial reductions in SOx emissions have been made from refinery flares but are not properly credited in the 2007 AQMP.

Response #4
Staff acknowledges that significant progress has been made in reducing SOx from refinery flares. However, significant additional reductions are needed above and beyond those committed in the 2007 AQMP to meet the federal and state 24-hour PM2.5 standard. A reduction of 3 tons per day is achievable for SOx RECLAIM facilities taken from the following categories:

- 1.76 tons per day RTC surplus for RECLAIM sources (11.76 tpd available RTC – 10 tpd of 2005 emissions = 1.76 tpd RTC surplus)
- Refinery boilers/heaters can reduce approximately 0.89 tpd reduction to meet Tier I standard applicable since year 2000
- FCCU category alone can reduce approximately 3 tpd reduction estimated from the 2005 emissions baseline.

Contrary to the commenter's observation, the 2007 AQMP properly credited the emissions reduction from the refinery flares in estimating the remaining emissions in future years.

Comment #5
WSPA believes that the BARCT analysis should be conducted on a source category by source category basis per the H&S code requirement and past practice of NOx 2005 RECLAIM shave, not on a facility-by-facility basis as performed by the consultants.

Response #5
BARCT analysis was done on a source-by-source basis. In addition to that, staff asked the consultants to conduct a facility-by-facility analysis. Conducting a detailed facility-and unit-specific analysis was very time consuming and not required by the H&S code.

Mindful of the implementation costs of control, staff instructed the contractors to conduct facility-by-facility site specific analysis to ensure that the proposed technology can be implemented cost-effectively at each facility. The BARCT analysis (e.g. use a top-down approach in the selection for BARCT, use of discount cash flow (DCF) method in calculating the cost effectiveness factor) was clearly written in the contracts' Statement-of-Work.

There are at least two reasons that make the facility site specific analysis possible for SOx RECLAIM but not for NOx RECLAIM:

- The universe of sources in SOx RECLAIM is much smaller than the universe of sources in NOx RECLAIM. The NOx RECLAIM universe contains hundreds of boilers, heaters, furnaces, and ovens, which makes unit-by-unit analysis impractical.
- The main control technology for NOx in refineries is low NOx burners which can be installed without the analysis of available plot space. The main control technology for SOx sources is a wet gas scrubber for which a unit-specific analysis was needed to assess available plot space.

Comment #6
WSPA believes that a BARCT determination must consider only technologies that are truly "available" and have been proven successful for an adequate period of time in commercial-scale applications. Even the District's definition in Rule 1302(h) (1) of BACT (apparently intended to be more stringent that BARCT) includes the principle of a control technology having been "achieved in practice for such category or class of source"

Response #6
Because BACT is a permitting requirement, it must be achieved in practice to be available at time of permitting. BARCT however can be more stringent than BACT because additional time can be provided to allow technology to mature.

Comment #7
Proposed BARCT emission levels lack proper substantiation (e.g. six months of operation at a certain performance level). This was not done for any of the source categories examined for the refinery. In fact, it cannot be done for the SRU systems proposed as BARCT because none have been used in refineries, much less sulfur plants.

Response #7
A technology does not have to be achieved-in-practice with 6 months of operation at a certain performance level to be defined as BARCT. A technology can be defined as BARCT if it is technologically feasible and cost effective. Wet gas scrubbing technology however is proven achieved-in-practice, and commercially available for refinery FCCUs and SRU/TGTUs.

Comment #8
The cost effectiveness analyses are undermined because they do not include all of the true associated costs, including additional equipment needed to provide additional heat and steam. These gaps have created a significant problem for evaluating potential emission reduction technology applications, their cost effectiveness, and also the logistical applicability to specific facilities. It is inappropriate for the District to make technology recommendations based on incomplete or incorrect data.

Response #8
The consultants have carefully conducted facility and unit specific cost analysis. A contingency factor has been added to cover miscellaneous costs. This procedure is common to all cost estimates. The commenter did not specifically indicate in what applications the additional heat and steam were needed for, so the comment cannot be addressed .

Comment #9
Analyses of plot space requirements were performed 'at the last minute' and were incomplete and did not include equipment required outside the scope of vendor supplied equipment. This example of incomplete analysis and considerations for a "total application solution significantly understates potential costs and cost effectiveness.

Response #9
The commenter has incorrectly characterized the contractors' analysis related to plot space. Plot space analysis was one of the key elements described in the contracts.

The contractors conducted their plot space analysis early on in the project, not at 'the last minute'. As stated in Task #1 of the Statement-of-Work, the contractors were required to conduct field visits at each RECLAIM facility to:

> "assess both physical and operational factors that would impact the feasibility and the cost of additional emission control equipment."

The contractors did not limit their analysis just to the vendor supplied equipment (e.g. wet gas scrubbers) but extended their analysis to cover 'the total application' and they thoroughly discussed the plot space issues with the facilities. As stated in the contractors' reports:

> "Infrastructure items were discussed extensively. These include available areas for a scrubber for the FCCU, room on existing pipe racks, piling, Electrical Substation..…..., control systems, steam, water, available sewer allocation….."

Comment #10
The "average cost effectiveness" ratio presented in the staff report is not an appropriate representation of the cost effectiveness of available SOx reduction technologies and has the potential to mislead policy makers. A clear cost-effectiveness threshold should have been established upfront. An incremental cost effective analysis should have been completed to provide a clear relationship between incremental SOx reductions, cost and the associated

emission reduction technology employed. At a minimum, incremental cost effective analysis at 4tpd, 6tpd and 8tpd SOx reductions should be completed to satisfy the following requirements in the State H&S Code.

Response #10
Cost effectiveness factors are process and facility-specific. To present all possible information on cost effectiveness factors to the policy makers and the public, staff has provided four types of cost effectiveness factors in Step 3 of Section 17.2 of Chapter 17 of Part III of the Draft Staff Report:

1. Individual cost effectiveness for a specific emitting source (e.g. cost effectiveness for each FCCU);
2. Average cost effectiveness for the category of source (e.g. average cost effectiveness for five FCCUs in the Basin);
3. Average cost effectiveness for the entire project; and
4. Incremental cost-effectiveness for the entire project

The cost effectiveness factors in this project ranged from $2K to $47K per ton. The individual cost effectiveness factors for each control at each facility (e.g. $14K per ton for Refinery 1's FCCU wet gas scrubber), the average cost effectiveness factor across a class of equipment (e.g. $25K per ton for all FCCUs' wet gas scrubbers); and the average cost effectiveness factor for the entire SOx RECLAIM project (e.g. $17K per ton) were shown in Appendix III-A of the Draft Staff Report.

Staff did not select a clear threshold for cost effectiveness at the time the draft staff report was released. After further consideration, staff selected a cutoff threshold of $50K per ton as a means of removing the least cost-effective control technology recommended by the consultants and optimizing the effectiveness of the most recent staff proposal.

At the time the draft staff report was released, staff estimated the incremental cost effectiveness between the consultant's proposal (Scenario 2: 6.5 tpd) and staff's proposal (Scenario 3: from 6.1 tpd to 6.4 tpd) as shown in Section 18.1 of Chapter 18 of the Draft Staff Report. Even though the overall cost effectiveness of the consultants' proposal was within a reasonable range, the incremental cost effectiveness compared to staff's proposal was significantly large ($300 million per incremental SOx reduced), and because of this reason, staff did not select the consultants' proposals.

Comment #11
There is no evidence in this document that staff considered environmental, energy, economic impacts in any of the proposed scenarios. Until all of these analyses and considerations are completed, making a BARCT determination is premature and arguably invalid.

Response #11
Staff is in the process of conducting additional analysis for environmental, energy and economic impacts to support the proposed BARCT determination in the draft staff report released at the Public Workshop in June 2009.

Comment #12
In all cases, the BARCT recommendations are based on technology forcing emission levels. It is unlikely that under command and control, all of these BARCT proposals would become rules - particularly for those source categories that have only a single facility. It would be more appropriate to have a mix of more and less aggressive levels equivalent to a programmatic BARCT to allow the RECLAIM program to be viable.

Response #12
Staff disagrees with the commenter. Wet gas scrubbing achieving 5 ppmv – 10 ppmv outlet concentrations is not a technology forcing technology. It is a mature, commercially available, and achieved-in-practice technology for many of the affected equipment categories (e.g. FCCUs, SRU/TGs, glass furnace, coke calciner).

For SOx RECLAIM, staff estimated a programmatic RTC reduction of 60%-65%. If AQMD would pursue and "single out" a facility for command-and-control rule, the reduction could be in the neighborhood of 80% - 95% or higher based on the feasibility of wet gas scrubbing technology.

Comment #13
The reliance on guarantee letters provided by the manufacturers is faulty and should not be relied upon to validate or support the emission reduction sustainability.

Response #13
Guarantee letters provided by the manufacturers are only one piece of information that staff relied on to judge the feasibility of the control equipment. In addition to the guarantee letters, staff also relied on achieved-in-practice information, source tests data, CEMS data, and expert consultants' analyses. Furthermore, the sustainability of the emission reductions relies heavily on how the facilities operate and maintain their control equipment. If staff develops command-and-control rules, good engineering practices (e.g. annual maintenance, annual testing) would normally be crafted in the rule requirements to assure continuous compliance with the BARCT levels and guarantee the achievability of emission reductions estimated.

Comment #14
There is no BARCT determination for de-SOx additive, therefore it is inappropriate to consider de-SOx additives as an alternative feasible and available control technology

Response #14
In late August 2008, staff developed a testing protocol for de-SOx catalysts with the participation of WSPA and the refineries. Only one of the refineries volunteered to participate in the short-term source testing from September 2008 – November 2008. From this short-term testing, this refinery was able to achieve approximately 7 ppmv SOx at 0% O2 and at the same time also met the PM10 emission level in Rule 1105.1.

Comment #15

Several data requests have been made of the SCAQMD: 1) clarification of how certain emission factors (starting and new) for FCC's, SRU's and boilers were derived for individual facility process units, 2) facility specific data/calculations be sent directly to the six individual WSPA member facilities, 3) derivation of the emission factors referenced in Appendix III-A of the Staff Report SOX RECLAIM Part III, and 4) 1997/2002/2005 baseline.

Response #15
The following information was provided to WSPA and the refineries:

- Clarification of how certain emission factors (starting and new) for FCC's, SRU's and boilers were derived for individual facility process units was explained and provided in the Working Group meetings on July 30, August 13, and August 27, 2009
- Derivation of the emission factors referenced in Appendix III-A of the Staff Report SOX RECLAIM Part III was explained and provided in the Working Group meetings on July 30, August 13, and August 27, 2009
- Facility specific data/calculations were e-mailed directly to the six individual WSPA member facilities on July 17, 2009
- The 1997 and 2005 baselines were presented in the Staff Report released at the June 2009 Public Workshop. Staff did not provide the 2002 baseline, because there was no demonstrated need for that baseline.

- **Water & Wastewater**

Comment #16
There is no information regarding the total water related impacts of the dozen potential scrubber installations. The report provides a broad impact: for fresh water – between 1 and 90 million gallons per year for each scrubber, and for waste water – between 1 and 40 million gallons per year for each scrubber. Thus, the total impact could be as high as one billion gallons per year of fresh water (90 million gallons and 12 installations), and an increased wastewater load to Publicly Owned Treatment Plants (POTWs) as high as 440 million gallons per year (40 million gallons and an assumed eleven systems that would discharge to a POTW).

Response #16
The above estimated water usage and wastewater generated provided by the commenter (1 billion gallons per year water usage and 40 million gallons waste water generated) are incorrect.[90]

In July 2009, staff developed a Survey Questionnaire to gather information on the current usage of water, the current amount of wastewater and solid waste generated, and the existing practice (e.g. ground water capacity and current pumping rate, recycled water usage) at the 11 top emitting facilities. The facility's responses to staff's Survey Questionnaire are summarized in

[90] The reported water usage and waste water generated for the SRU//TGTUs' scrubbers estimated by the consultants in their final reports were not the same as estimated in the draft staff report. Perhaps, there was a typo in the figures (e.g. misplacing the decimal point). Staff has revised these figures based on the numbers provided by the wet gas scrubbers' manufacturers.

Table XX, Chapter XX of the Staff Report. Based on the facility's responses, the impacts of the project on water and waste water are as follows:

- The total current water usage for the 11 facilities is 18,842 million gallons per year. This project would require 364 million gallons water per year. This impact reflects an estimated 2% increase in water demand from these facilities relative to their current water usage.

- The total current wastewater discharged by the 11 facilities is 10,556 million gallons per year. This project would generate about 160 million gallons per year, or about 1.5% increase in wastewater generated from these facilities relative to their current wastewater discharge.

Comment #17
The consultants admitted that there are a number of disadvantages to wet gas scrubbing: 1) Fresh reagent and fresh water must be fed to the unit to replace the water lost as waste water and the reagent consumed in the reaction, 2) The reaction products are generally salts that must be carried away with a waste water stream, 3) Sodium sulfite and sodium bisulfite salts are created and these salts increase the chemical oxygen demand (COD) of the waste water, 4) A large visible plume usually forms as water is evaporated, which is an aesthetic concern and constitutes a loss of water for the refinery.

Response #17
Wet gas scrubbing technology is a mature technology. As any other control technology, wet gas scrubbing also has its own advantages as well as disadvantages. Regardless of the disadvantages cited, many facilities in the U.S. and in the District have chosen to install and successfully operate wet gas scrubbers to control SOx and particulate matter from various types of stationary sources. Clearly, those facilities believe the advantages of the technology outweigh any disadvantages. As written in the Module 3A report, the consultants objectively commented on both the advantages and disadvantages of wet gas scrubbers and cited the following advantages:

> "*There are a number of advantages to wet gas scrubbing. Operation of the package is not particularly complex, and the process hazards that accompany it are typically manageable in a refining environment. In addition, such units are very effective at removing SOx $_{from}$ gas streams and can also reduce emissions of particulate matter into the air.*"

- **Fluid Catalytic Cracking Units, SRU/TGTUs, Boilers/Heaters**

Comment #18
There are no records to support the performance of the wet gas scrubber on the FCCU at the Valero Delaware City Refinery.

Response #18
The Delaware Department of Natural Resources and Environmental Control (DNREC) provided staff with approximately 18-months 1-hour CEMS data (a total of 10,386 records). The average concentration of this 18-months period of operation was 1.2 ppmv at 0% O2, well below the proposed BARCT level of 5 pmv. In addition, there is a wet gas scrubber installed and operated

at a refinery in the District since August 2008. The performance of this wet gas scrubber (i.e. mass emissions from CEMS for a period of 265 days and a performance source test result) was listed in Appendix III-D of the draft Staff Report.

Comment #19
It is inappropriate for the consultants to make a BARCT recommendation.

Response #19
Staff did not view the consultants' action as inappropriate. As shown in the Statement of Work, the consultants were required to present various levels of feasibility and estimate the emission reductions and cost effectiveness at each level. They indicated in their report that wet gas scrubbing technology could achieve a level as low as 1 ppmv and they provided emission reductions and cost effectiveness associated with this level as required by the contract. However, they also concluded that a level of 5 ppmv is more realistic to implement. Therefore, they recommended that level be BARCT even though they were not required to do so by the contract. This is only a recommendation and should not be viewed as inappropriate. During the process of formulating its final BARCT proposal, staff will review, verify and use all technical information provided by the consultants as well as information from other sources. Staff is ultimately responsible to make a final BARCT recommendation to the Governing Board for its consideration, and the Governing Board will ultimately make a final decision on what are the appropriate BARCT levels.

Comment #20
In the report, the contractors stated that "... it is the recommendation of the ETS team that non-regenerative wet scrubbing be considered on a purely technical basis (emphasis added) as BARCT ...with an overall BARCT level of 5 ppmv." It is apparent, that the contractor made their unauthorized recommendation solely on a technical basis, and therefore it is not a defensible BARCT determination.

Response #20
The consultants' recommendation was not purely based on technical information. The consultants conducted a detailed engineering evaluation and cost analysis assessment strictly adhered to the Statement of Work:

> *".....visit each of the six local refineries in the Basin to gather site specific information (e.g. operating conditions) and to conduct site-specific feasibility assessment analysis….evaluate the existing commercially viable control technologies, starting with the most effective control technology, and make recommendations to the District on various technologies that could potentially be used to achieve additional emission reductions, on various concentration targets that could be achieved with each technology, the estimated emission reductions, the multimedia pollutant impacts (e.g. water, waste), energy impacts of the technologies, and the associated cost effectiveness associated with the control technology."*

On a purely technical basis, the consultants recommended a level as stringent as 1 ppmv. However, after carefully considering costs and other impacts, the consultants recommended a

level of 5 ppmv for FCCUs with the use of wet gas scrubbing technology, 5 ppmv for SRU/TGTUs with wet gas scrubbing technology or oxidation catalysts, and 40 ppmv for boilers/heaters with various types of fuel gas treatment techniques. As mentioned in previous responses, in formulating its BARCT proposal, staff carefully evaluated the consultants' recommendations and introduced several refinements to improve and optimize the effectiveness of staff proposal.

Comment #21

The contractors claimed that it was impossible to address every one of the individual cases and therefore the team made use of generic, but representative quotations and published cost studies. Because there are only five FCCUs in the Basin, and because the estimated present worth of implementing the proposal for FCCUs alone is $493 million, it is a flawed practice to attempt to use a "generic" approach.

Response #21

The consultants did not use a "generic" approach to estimate the total costs of $493 million for FCCUs' wet gas scrubbers. As required under the Statement of Work, the consultants conducted site specific analysis for each FCCU at the six refineries and gathered costs information for each individual FCCUs from the manufacturers. As shown in the final report of Module 3A, the consultants included the following items in their cost estimation:

- Categorized costs include:
  - Demolition and decommissioning
  - Civil/concrete
  - Structure
  - Equipment
  - Piping and Mechanical
  - Electrical and controls
- Miscellaneous line items include:
  - Contractor overhead, typically 8 % of direct field labor (DFL)
  - Contractor field supervision, typically 12 % of DFL
  - Mobilization/demobilization, typically 10 % of DFL
  - Overtime/productivity factor, typically 12 % of DFL
  - Freight and shipping, typically 8 %, of materials
  - Sales tax, typically 7 % of materials
  - Commissioning and operating spares, typically 5 % of materials
  - Startup/initial fill material, typically 2 % of materials
  - On-site training/startup assistance, depends on project
  - Front-end engineering design, depends on project size
  - Project management, depends on project size
  - Design development allowance, 10% of total
  - Contingency, 25-40% applied against the bottom-line capital cost estimate

The "generic" approach that the consultants followed was the Discounted Cash Flow (DCF) methodology provided by SCAQMD staff to estimate the cost effectiveness factor. This cost

effectiveness methodology is consistently used in the AQMPs and in all the rules and regulations developed by the SCAQMD.

Comment #22

Adequate consideration needs to be given for plot space concerns.

Response #22

Plot space concerns were addressed in the consultants' report, section H:

> "Wet gas scrubber equipment footprints and space requirements for the FCCUs and the SRU/TGTUs are shown in the confidential appendices for each refinery where measures have been selected. These specifications have been compared with the plot plans provided by the respective refineries, and where applicable, are presented in the costing workbooks."

Comment #23

Regarding Emerachem technology, the fact that the precious metal (presumably a platinum group metal) can be reclaimed at the end of the useful life of the catalyst does not in any way suggest that this is an "investment". Reclaiming the metal is a significant cost and the reclaimed material only exists as a partial "credit" against the purchase of fresh catalyst. The initial purchase price of the metal is only actually recovered when the plant is shut down for good, and the value of the metal can be higher or lower than the original purchase price.

Response #23

Staff is not clear on the term "investment" used by the commenter and is not certain about the purpose of the comment. In Measure M13, the costs to purchase the fresh catalyst system ($1,800,000) are included in the quote from Emerachem. The consultants also included the costs for catalyst change ($420,000) quoted by Emerachem. The consultants gave a salvage value (credit) of merely $50,000 to the Emerachem control system at the end of the equipment life. In lieu of Emerachem, the facility may select to install a wet gas scrubber. In Measure M17, a wet gas scrubber would initially cost approximately $5 million but has a salvage value of $300,000. (Measure M13 and Measure M17 were not to control the same SRU/TG however the costs cited above can only be used qualitatively)

Comment #24

Project timing estimates made by the contractor do not reflect realistic logistical and/or market pressures resulting from multiple refineries and other industries pursuing similar technologies during a closely concurrent timeline.

Response #24

Such timing estimates will be given further consideration as part of the staff analysis.

Comment #25

Inadequate information to substantiate the 5 – 10 ppm performance of the wet gas scrubbers designed for the SRUs/TGTUs. The lack of substantiation beyond the vendor sales literature is highly questionable.

Response #25
Staff recently received the most recent CEMS data (6 months of 1 hour average data) from the Wyoming Department of Environmental Quality which indicated that the DynaWave wet gas scrubbers installed and operated since 2004 at Sinclair Refinery in Wyoming can achieve the performance levels recommended by staff.

Comment #26
The cost effectiveness for this source category (SRU/TG) is on average high (> 30k$/ton) in comparison to the FCCU source category and appears to include higher variability, making a comprehensive review all that more important. WSPA requested and did not receive specific data used by the consultants to arrive at the cost effective conclusions reported. In some cases it appears that the technology vendor has provided promises of very high control efficiency and what appear to be artificially low capital cost estimates – all at no risk whatsoever to themselves. This is particularly true of this source category where the proposed BARCT vendors have no experience
with installation in refineries, which makes their cost estimates highly suspect.

Response #26
Staff has recently removed the emission reductions and associated costs for Refinery #4 and #5 because of the unfavorable cost effectiveness (>$50K per ton). The cost data and performance levels proposed by the consultants for the wet gas scrubbers for Refinery #2 and #6 are reliable, substantiated by the achieved-in-practice performance of the wet gas scrubbers at Sinclair refinery in Wyoming. Staff currently does not have any achieved-in-practice data from Emerachem catalysts technology for Refinery #3 but Emerachem provided the consultants with a guarantee letter and the consultants also considered a wet gas scrubber for Refinery #3 in their confidential analysis.

Comment #27
WSPA would agree that the proposal to maintain the existing 40 ppm limit on the sulfur content of fuel gas is appropriate. Further WSPA notes that the current US-EPA New Source Performance Standard (adopted in April 2008) has a limit that is approximately four times higher.

Response #27
Staff appreciates the comment and continues to maintain that the 40 ppm on the sulfur content of fuel gas is appropriate.

Responses to Chevron's Comments Received on July 14, 2009

Comment #1
It is inappropriate for the District to aggressively pursue SOx shave for PM2.5 attainment. The current trend of PM2.5 is declining and does not warrant a SOx shave that is estimated to cost industry over one billion dollars.

Response #1
For a market based incentive program, staff is required by the H&S codes to conduct periodic BARCT reassessment and demonstrate equivalency with command-and-control rules which would otherwise be developed as a result of BARCT reassessment:

> *"…achieve an equivalent or greater level of emission reductions at an equivalent or lower cost as would have been achieved under a command-and-control rule"*

It should be noted that SOx is a significant building block of PM2.5. Chemical speciation of PM2.5 samples indicated that in the South Coast Air Basin 25% of the ambient PM2.5 is attributed to contribution from sulfates. Furthermore, SOx reductions are highly effective in reducing ambient PM2.5 levels as compared to other primary and secondary contributors to PM2.5 formation (1 tons SOx = 1.5 tons PM2.5 = 15 tons NOx). Therefore, the reductions of SOx are essential for the basin to meet the federal annual standard of PM2.5 by 2015 and the federal 24-hour average standard of PM2.5 by 2020. As indicated in the 2007 AQMP, the control strategies included in the Plan to meet the annual PM2.5 standard when fully implemented will fall short meeting the 24-hour standard by approximately 30%. Therefore, additional reductions above and beyond the control strategies committed in the 2007 AQMP for meeting the 2015 annual PM2.5 standard are necessary to meet the 24-hour PM2.5 standard in 2020. For further information, please refer to Chapter 5 of the 2007 AQMP.

In addition, it is worth mentioning that the U.S. EPA is proposing to set a new, more stringent, one-hour standard for SO2 between 50 – 100 parts per billion (ppb) and revoke the current 24-hour of 140 ppb and the current annual standard of 30 ppb to further protect public health.

In addition, the percent reduction in RTCs (60%-65% prior to January 2010, currently revised to 55%) that staff estimated for the SOx RECLAIM universe as a whole is still much less stringent than the percent reduction in emissions (90% - 98%) that staff could impose to specific categories of sources such as FCCUs, SRU/TGs, sulfuric acid plant, cement plant, coal fired boiler, and glass melting furnaces if staff pursues the command-and-control approach.

Staff however is sensitive to the costs of the current proposal (approximately $745 million). To reduce the cost impacts, staff proposes to spread the potential emission reductions into 6 years starting from 2012. Staff also proposes to submit only 3 tons per day reductions to satisfy the SIP commitment in Phase 1 (i.e. 3 tpd reductions by 2014). The remaining reductions will be submitted later.

Comment #2
Staff proposal does not reflect a comprehensive environmental impact. A negative impact to other environmental media such as water and waste were not discussed. Capital investment to manage additional volumes of water demand, wastewater and solid waste generated were not included. In addition, the proposal did not include the complexities of attaining necessary permits (e.g. NPDES Discharge Permit.)

Response #2
Staff is in the process of analyzing the environmental impact for this proposal. In July 2009, staff sent a Survey Questionnaire to the effected facilities to gather information on current usage of water, wastewater and solid waste generated. A summary of the information received was presented to the stakeholders in the August 2009 Working Group Meeting (please see Table 11-1 in the revised draft staff report).

In general, there will be an increase in total water demand (264 million gallons per year, or less than 1 million gallons per day, for all six refineries)[91] due to the proposed control technologies. On a relative scale, however the increase however will be small (below 2%) compared to the current total water usage at the refineries (16,936 million gallons per year, or 46 million gallons per day). Ground water pumping capacity is available for four out of six refineries. Three out of six refineries have used recycled water. All 6 refineries are not subject to any cap from the water suppliers. The water suppliers indicated to staff that they can supply the additional amount of water to the refineries. In addition, the increase in total water demand is 80% below the current CEQA threshold of 5 million gallons per day for significance. However, in a spirit of taking abundance of caution, CEQA staff classified this project as significant in terms of potable water demand. Please refer to the Program Environmental Assessment for further explanation.

This proposal will generate an additional amount of wastewater ranging from 15 – 50 gallons per minute, (or a total of 94 million gallons per year at 6 refineries). The increase in wastewater discharge will be small (less than 1%) compared to the current discharge at each refinery which varies from 1,000 – 5,000 gpm. Typically, an increase in wastewater discharge in excess of 25% would trigger a discharge permit revision. However, since the increase in wastewater discharge is significantly less than 25%, the refineries will not need to revise their NPDES discharge permits. Staff also believes that the refineries can handle this amount of increase in their current wastewater treatment system. Therefore, the impacts on wastewater are less than significant.

This proposal will generate an additional amount of solid waste depending on how effectively the scrubbers are in controlling particulate matters. The consultants estimated about 2,560 tons per year increase. The current FCCU fines classified as non-hazardous waste generated from the six refineries are approximately 3,348 tons per year. This 67% increase may be trucked to several cement facilities in and around the basin (CPCC in Colton, CEMEX in Victorville, TXI-Riverside in Oro Grande, National Cement in Kern County, CPCC in Mohave Desert, and Lehigh in Tehachapi).

[91] In August 2009, staff revised the water demand reported by the consultants for the SRUs/TGTUs using the information submitted directly by the manufacturers of the wet gas scrubbers.

As shown in the consultants' report, and as quoted below, the consultants did include additional capital costs for waste and wastewater treatment. In addition, the consultants did include additional annual operating costs for additional water, wastewater treatment, and solid waste disposal.

> *"Added charges for waste or wastewater treatment equipment are included in equipment costs unless treatment is performed outside of the boundary limits for the control measure. In these cases, the treatment costs have been calculated according to the treatment requirements and site-specific unit costs provided by the refineries."*

Comment #3
Emerachem technology is not a proven technology. The contractor report does not offer any strategy for dealing with the concentrated SO2 stream captured and released later from the catalysts, therefore this technology cannot be considered as SOx reduction technology.

Response #3
It is true that Emerachem technology has not yet been installed and used in a refinery, and therefore there is no achieved-in-practice data available. However, this argument does not negate the feasibility of this technology in a refinery application. For BARCT, additional time can be provided to allow technology to mature in refinery applications. Furthermore, in addition to the Emerachem technology, the consultants provided three additional options to reduce the SOx emissions from the three SRU/TGTUs at this refinery that reflect achieved-in-practice technologies. In summary:

- Emerachem technology resulted in about 53 tons/year reduction for SRU#10 and SRU#20 and a cost effectiveness of $13K per ton,
- Wet gas scrubbing resulted in about 41 - 44 tons/year reduction for SRU #70 and a cost effectiveness of $32K per ton - $45K per ton (data from 2 WGS vendors were considered),
- Additional 3rd stage Claus units resulted in about 20 tons/year reduction for SRU#10 and SRU#20 and a cost effectiveness of $24K per ton.

If for the sake of an argument, the current scenario (Emerachem for SRU#10 and SRU#20) is replaced with other scenarios (3rd Claus units for SRU#10 and SRU#20 & WGS for SRU#70), it will result in 64 tons per year reductions instead of 53 tons per year reductions at a cost effectiveness of approximately $30K per ton. Implementation of these scenarios will not significantly change the overall cost effectiveness of the proposed overall program.

Comment #4
The shave methodology was not transparent, was disclosed very late in the process, and did not appear to be consistent with the 2005 NOx shave.

Response #4
Staff followed recommendations by WSPA and WSPA members to stay consistent with the NOx shave methodology that was developed by the District's staff and agreed upon by WSPA and WSPA's members in 2005. However, there is no requirement to do so.

While there is an agreement in principal to stay consistent with the 2005 NOx shave methodology, developing an actual shave methodology that will work for the SOx RECLAIM market and is fair and equitable is not a trivial task. To use the 2005 NOx shave methodology, staff invested tremendous amount of time and effort to recover the 1997-1998 emissions baseline and the starting emission factors in 1993. Using the 1997-1998 emissions baseline and the 1993 starting emission factors, staff estimated the control factors and RTC reductions as shown in Part III of the Draft Staff Report presented in the June 9, 2009 Public Workshop. The RTC reductions presented in the June 2009 Staff Report (i.e. 7.09 tpd – 7.68 tpd) were very similar to the emission reductions estimated by staff in April 2008 (i.e. 6.73 tpd – 6.77 tpd) based on the 2005 emission inventory baseline. Staff expects the proposed shave methodology to continue being refined throughout the rule making process.

It should also be noted that the shave methodology was disclosed sooner than in the NOx RECLAIM rulemaking effort in 2004-2005.

Comment #5
The methodology for development of emission factors was not clear in the report, and the background for some of the initial emission factors was not clearly explained.

Response #5
The following information was provided to WSPA and the refineries:

- Clarification of how certain emission factors (starting and new) for FCC's, SRU's and boilers were derived for individual facility process units was explained and provided in the Working Group meetings on July 30, August 13, and August 27, 2009
- Derivation of the emission factors referenced in Appendix III-A of the Staff Report SOX RECLAIM Part III was explained and provided in the Working Group meetings on July 30, August 13, and August 27, 2009
- Facility specific data/calculations were e-mailed directly to the six individual WSPA member facilities on July 17, 2009.
- Staff is always available for additional explanation.

Responses to Tesoro's Comments Received on July 14, 2009

Comment #1
The current proposal goes far beyond what is called for in the AQMP.

Response #1
In addition to the 3 tons per day reduction by 2014 SIP commitment stated in the 2007 AQMP, for a market based incentive program such as RECLAIM, staff is required by the H&S codes to conduct periodic BARCT reassessment and demonstrate equivalency with command-and-control rules which would otherwise be developed as a result of BARCT reassessment:

> *"…achieve an equivalent or greater level of emission reductions at an equivalent or lower cost as would have been achieved under a command-and-control rule"*

As a result of this BARCT reassessment and equivalency demonstration, staff estimates that the SOx RECLAIM program can be amended to provide 6.2 tons per day emissions reduction (or approximately 64% of RTC reductions)

Comment #2
The process for determining BARCT was not well defined. The consultants BARCT determinations appear to be generally based on vendor guarantees. The reports do not contain adequate information to substantiate the BARCT emission limits that are proposed for each source category.

Response #2
The consultants and staff followed the BARCT selection process outlined in Part III of the Staff Report. The BARCT selection process included five steps: 1) identify technology that can achieve maximum degree of reduction, 2) evaluate control effectiveness, 3) conduct a top-down cost analysis, 4) conduct an impact analysis for environment, energy and economic, and 5) select BARCT. Vendor guarantees are important information for Step 2. In evaluating the consultants' recommendation for BARCT and arriving at the staff proposal for BARCT, in addition to vendor guarantees, staff relied on source test data, CEMS data, permitting data, and engineering evaluation. Staff believes that adequate information have been provided to substantiate the proposed BARCT for all source categories.

Comment #3
An analysis of the impact of the proposed shave on the RECLAIM market has not been conducted. Because of the potentially dramatic impact that this shave will have on the RECLAIM SOx market, Tesoro supports a phased approach to the SOx shave. Since the 2007 AQMP did not analyze for attainment with the PM2.5 24-hour standard, we recommend that further analysis be completed during the PM2.5 Plan Update to determine if additional tons are needed for the 2020 attainment.

Response #3
Additional reductions in SOx emissions beyond and above those committed in the 2007 AQMP are needed to meet the federal 24-hour PM2.5 standard in 2020. Although the District has not yet developed the control strategies for the 24-hour PM2.5 standard, it analyzed the input of the standard as part of the 2007 AQMP. This analysis revealed that the PM2.5 control strategies included in the 2007 AQMP will fall short by 30% in meeting the PM2.5 24-hour standard. Staff is in the process of conducting a market analysis for the SOx RECLAIM program. To reduce the impacts to the SOx market, staff is in agreement with Tesoro and proposes to phase in the proposed reduction beginning 2012 through 2017. Staff further proposes that at least 3 tons per day of the reductions be phased in by 2014 to meet the SIP, and the remaining emission reductions submitted into the SIP at a later date.

Comment #4
The costs for implementing the chosen technologies are not adequately considered in the consultant reports or in the Staff reports. The report bundles all the measures into an "average cost effectiveness" ratio. This "average cost effectiveness" ratio is not an appropriate representation of the true cost of the SOx reduction technologies and is misleading.

Response #4
Please refer to Response #10 to WSPA's comment letter received on July 14, 2009

Comment #5
There is a significant increase in water demand, wastewater discharge levels and hazardous waste generation resulting from use of wet gas scrubber technology. Further analysis of these significant environmental impacts should be conducted in the BARCT evaluation.

Response #5
Please see Response #2 to Chevron's comment letter received on July 14, 2009

Comment #6
There are a number of unanswered questions concerning the origin of certain assumptions and numbers used to calculate the current BARCT numbers and shave recommendations.

Response #6
The answers were provided to WSPA and the refineries in the Working Group meetings on July 30 and August7. Refinery specific data were e-mailed to each refinery on July 17, 2009. Staff is always available if further explanations are needed. A summary is provided below:

Derivation of the starting emission factors

FCCUs
Starting emission factor = Total emissions (lbs/year) / Total throughput (barrels/year)
= (6,033,327 lbs/year) / (115,893 thousand barrels refinery feed) = 52.06 lbs/Mbarrels

Sulfur Recovery Units
Starting emission factor = Total emissions (lbs/year) / Total hours operation (hours/year)
= (1,122,050 lbs/year) / (133,764 hours/year) = 8.39 lbs/hrs

Boilers/Heaters

Starting emission factor = Total emissions (lbs/year) / Total fuel usage (mmscft refinery gas/year)

= (3,738,879 lbs/year) / (112,105 mmscft/year) = 33.35 lbs/mmscft

Derivation of the proposed new BARCT level for FCCUs

Consultants' proposed level:

Remaining emissions = 3.52 – (0.58+0.19+0.28+0.20+0.87+0.94) = 3.52–3.07 = 0.45 tpd

Emission rate = (0.45 tpd x 2000 lbs/ton)/(396 thousand barrels feed/day)

= 2.27 lbs/thousand barrels

Staff's proposed level:

Remaining emissions = 3.52 – (0.58+0.28+0.20+0.87+0.94) = 3.52–2.88 = 0.64 tpd

Emission rate = (0.64 tpd x 2000 lbs/ton)/(396 thousand barrels feed/day)

= 3.25 lbs/thousand barrels

Derivation of Tier I factor for heaters and boilers

Tier I factor for boilers and heaters (external combustion Equip/Incinerator using refinery gas) is on Table 2 of Rule 2002 = 6.76 lbs/mmcf = 40 ppmv

Why is the remaining inventory for heaters and boilers different in Part I and Part III of the staff report (1.42 tpd vs. 0.89 tpd)?

The Tier I allocations shown in Table 4-1, Part I of the Staff Report (0.89 tons per day) were for 6 refineries in the basin. The remaining inventory shown in Appendix III-B, Part III of the Staff Report (1.42 tons per day) were derived from the 1997-1998 inventory of all boilers/heaters at all active refineries in 1997-1998.

Responses to BP's Comments Received on July 14, 2009

Since BP requested the opportunity to review and highlight the comments for confidentiality before the comments are printed in public document, staff will not print BP's comments or responses to BP's comments at this time.

Responses to Paramount's Comments Received on July 14, 2009

Comment #1

Unlike the NOx universe, the SOx universe is small enough that the District could come up with a plan for the SOx shave that would take into account the technology employed and individual opportunities for SOx reductions that are available at different facilities. For the rule to be equitable, only facilities that operate certain source categories and do not yet meet the BARCT standard should be required to take the BARCT adjustment. Facilities that do not operate FCCUs should not be responsible for emission reductions from FCCUs.

Response #1

Staff is in agreement with the commenter. The SOx market is very different than the NOx market. Eleven facilities in the SOx market are responsible for 94% of the emissions and hold about 86% of the RECLAIM Trading Credits. The preliminary draft Staff Report released in 2008 focused in finding BARCT and emission reductions from the top eleven facilities and seven categories of sources. It would be difficult for a facility with no equipment subject to new BARCT to reduce SOx emissions. Staff is examining two alternatives: 1) provide an alternative percent shave for these facilities, or 2) not shave these facilities at all. For facilities that have the 2012 RTC holdings higher than the 2012 initial allocations provided to the facilities at the start of the RECLAIM program, staff may shave the surplus up to the 2012 initial allocations. Further discussions are needed to finalize the proposal.

Comment #2

The implementation for the District's proposal can take 3 years to complete, yet the District scheduled for implementing the SOx shave starts with reductions in 2012, which is only 2 years from the planned adoption date. Refineries must make modifications during turnarounds that typically occur every 3 – 5 years. The implementation date should be moved back to 2014 to enable facilities time to pursue these major modifications

Response #2

Staff proposed a first shave of 1.5 tpd at the end of compliance year 2012. This 1.5 tpd comes from the surplus RTC (Total RTC holdings = 11.7 tpd & actual emissions = 10 tpd). Wet gas scrubbers may take may take up to three years to install, therefore staff proposed a second shave of 1.5 tpd at the end of compliance year 2013. The remaining shave was proposed to be distributed in additional four years from 2014 to 2017.

Comment #3

Paramount has been significantly left out of recent developments in this rule making process. Paramount did not have an opportunity to participate in the consultants' study and evaluated the findings along with major refiners. Paramount suggests that a concerted outreach effort be conducted to ensure that all impacted facilities are given the opportunity to understand and comment on the District's SOx shave proposal.

Response #3

The recent developments were all publicly notice. The Request-for-Proposals was also posted on the District's web site. Staff conducted a bidder's conference on July 16, 2008 which was posted on District's web site. Staff's recommendations were presented to the Governing Board at two public meetings on July 11, 2008 and September 5, 2008. There are subsequent public consultation meetings, workshops, and working group meetings held where the consultants' recommendations and suggested amended proposals were further discussed. There were ample opportunities for the commenter to participate. However, staff did not receive any comments, suggestions, or indications of interest from the commenter during this period of time until after the consultants' study was finalized. In addition, it should be noted that most of the information and analysis was conducted on a facility-by-facility confidential basis and cannot be discussed with the commenter. Staff did send copies of the consultants' non-confidential reports to the commenter as requested on September 2, 2009.

WSPA Comments on the Preliminary Draft Part I Staff Report - RECLAIM SOx

WSPA appreciates the opportunity to comment on the "Preliminary Draft Staff Report Sox RECLAIM Part I Allocations, Emissions & Control Technologies" (the "Report"), and we appreciate your patience while we were addressing the other priorities that you had established (e.g., the RFP for the contractor project, FCCU SOx reduction catalyst additives, etc.). WSPA's detailed comments are attached to this transmittal email, in the form of comments and suggested edits provided directly on the draft Staff Report.

WSPA's attached detailed comments speak for themselves, and we need not summarize them in this transmittal. However, there are a few overarching issues that we would like to specifically call to your attention:

Comment #1

1. The draft Report references 2007 AQMP Control Measure CMB-02 as being the impetus for the BARCT reassessment, but the Report does not accurately describe the legal basis for this rulemaking effort, nor does it address the process by which the BARCT reassessment will be conducted. While the Report provides an overview of existing control technologies and suggests new, potentially feasible emission rates or limits, it does not provide detail regarding the process the District will use to identify new 2010 facility annual allocations, does not indicate how the District will determine the feasible reductions to be achieved by the "shave", and does not address the need for a reasonable compliance margin.

An understanding of, and agreement with, the methodology for developing BARCT levels, and the resultant potential shave, needs to precede most of the other work. The facilities that will be subject to any SOx shave need to know exactly how proposed revised allocations and the proposed shave will be calculated. Only once the process has been agreed to should the District move ahead with reassessing the BARCT levels.

Comment # 2

2. The report alludes to the possibility of incorporating both the reassessment of the BARCT levels under the SOx RECLAIM program (as proposed in 2007 AQMP CM CMB-02) and the concept of facility modernization (from 2007 AQMP CM MCS-01) into a combined overall effort to reduce SOx emissions. However, the Report does not explain the process for doing so or why it might be appropriate to include a facility modernization analysis with this effort. WSPA is concerned about the potential for blurring the distinction between a BARCT reassessment and the possibly similar assessment of facility modernization. Since there will likely be overlapping issues, it is very important that the District independently develop, and reach consensus on, the process for implementing each control measure. If both measures are to be considered simultaneously, then the Report must clearly show how each measure will work in tandem with the other (and the feasibility of such an approach) before allocation levels are established.

Comment #3

3. The Report attempts to tie the potential reduction of RECLAIM SOx allocations (i.e., a reduction of SOx emissions) to PM air quality but does not establish the necessary basis for a linkage between the two. The Report cannot be based on an assumed relationship between SOx emissions and ambient PM_{10} or $PM_{2.5}$ levels; rather, it must describe and provide evidence for how SOx emissions contribute to ambient particulate matter concentrations and how the anticipated SOx emission reductions will affect ambient air quality.

Comment #4

4. The "Proposed BARCT Levels and Emission Reductions" section of chapters three through nine includes detailed conclusions with respect to the applicability of various emission control technologies and the resultant BARCT levels for the various source categories in the SOx RECLAIM program. These conclusions are premature and unsubstantiated, and their inclusion in the report is not appropriate given that the District is planning to hire one or more expert third-party contractor(s) to conduct thorough engineering evaluations and cost estimates of potential SOx emission reduction technologies. WSPA is very concerned that the Report's preliminary, and largely unsubstantiated, conclusions will become benchmarks against which the contractors' work products might be evaluated and effectively prejudge the expected conclusions rather than foster an independent analysis.

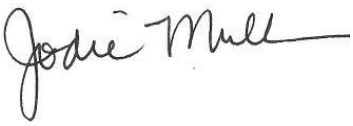
Comment #5

5. Due to the significance of this SOx BARCT reassessment program and the issues that we have identified with the draft Report, WSPA believes that the Report must be substantially re-written. The issues WSPA raises here and in the attached detailed comments cannot (and should not) be handled though responses to comments or preparation of a supplement Report, either of which would require the reader to read and understand two or more separate and likely conflicting documents. WSPA has tried to present its detailed comments in a way that can serve as a useful guide for rewriting the draft Part I Report, and hopes that District staff take advantage of our suggestions in that manner.

Again, WSPA appreciates the opportunity to submit these comments on this important effort. We ask that our detailed comments and this transmittal letter be included in the record for this rulemaking. WSPA looks forward to working with the District as this effort progresses, and we look forward to commenting on future drafts of the Part I and Part II Staff Reports for this rulemaking, as well as on any proposed rule amendments and other related regulatory materials.

Please do not hesitate to contact me if you have any questions.

Sincerely,



Jodie Muller

Staff's Responses to WSPA's Comments

Response #1

Staff appreciates WSPA's comments and suggested edits on Part I of the Preliminary Draft Staff Report. Staff will respond to all WSPA's comments, review WSPA's edits, and if appropriate, will revise the Draft Staff Report.

Regarding WSPA's detailed comments, staff will respond to the key issues and retain the detailed comments in the Administrative Records of this amended rule. This approach is taken to reduce the bulk of the detailed comments/responses portion of the Draft Staff Report.

First, staff would like to direct WSPA to the legal basis of this rule making effort described in Section 1.1 of the Draft Staff Report – Legislative Authority. Secondly, with all due respect, staff disagrees with the sequence of approaches recommended by WSPA for this rule amendment. Staff 's seven-step approach for this rule amendment is described below, in sequence:

1. Conduct an assessment of allocations and emission baselines;
2. Conduct a review of control technologies;
3. Identify areas of potential emission reductions, focusing on these areas with greatest potential reductions;
4. Conduct site-specific evaluation of control technology feasibility and costs
5. Assess BARCT
6. Re-examine the potential emission reductions in Step 3, taking into consideration the final emission reductions, and the amount of allocation shave while maintaining the integrity, equity, and operational characteristics of the SOx RECLAIM program; and
7. Amend appropriate rules in Regulation XX.

The first three steps were presented in Part I of the Preliminary Draft Staff Report and several of staff's presentations at the SOx RECLAIM Working Group Meetings. The last four steps are presented in Part II of the Draft Staff Report, and will be developed in parallel with the contractors' work on the proposals

Response #2

For this rule amendment, BARCT reassessment will be the basis that used to assess the emission reductions and the allocation shaves. The concept of facility modernization, if used, may only

influence the timing of the allocation shave. However, at this stage, staff expects that the facility modernization concept will not play a significant role in this rule amendment effort.

Response #3
Please refer to Appendix 5 of the 2007 AQMP for the evidence of how SOx emissions contribute to ambient particulate matter concentrations, and how the anticipated SOx emission reductions will affect ambient air quality.

Response #4
Staff 's seven-step approach for this rule amendment is described in Response #1. The first three steps were presented in Part I of the Preliminary Draft Staff Report and several staff's presentations at the SOx RECLAIM Working Group Meetings. To assist staff in the BARCT assessment, expert third-party contractor(s) conduct a thorough, independent, site-specific engineering evaluations and cost estimates of potential control technologies in Step 4. The results of the contractors' analysis will be used in Step 5 and Step 6. Staff will develop Part III of the Draft Staff Report Staff to cover the information in the last four steps in parallel with the contractors' work in Step 4.

Response #5
Staff will respond to all comments received and revise the Draft Staff Report appropriately. Regarding WSPA's detailed comments, staff will response to the key issues and retain the detailed comments in the Administrative Records of this amended rule. This approach was selected to reduce the bulk of the detailed comments/responses portion of the Draft Staff Report.

Diamond Bar, CA 91765

Subject: **2nd Round of Comments on RECLAIM SOx Shave Staff Report Part 1**

Dear Ms. Pham

BP appreciates the opportunity to comment on the draft Part 1 of the staff report for the RECLAIM SOx shave. I provided some initial comments on this report back on April 29th. Below are some additional company specific comments for these facilities that are not appropriate to share with WSPA. Please note that some of this information is to be treated as business confidential.

Refinery

Comment #1

- I suggest removing the sentences related to the CanSolv scrubbing system installed at the Cherry Point SRU mentioned in Section 5.3.3.2 of the report. It is true that the unit was started in July of 2006, but it only operated for about 4 months due to equipment problems outside of the CanSolv system. It is still not operating. It was also not designed to achieve 10 ppm as stated. In fact, the unit is designed to meet what the state regulatory agency determined to be **BACT** – 250 ppm SO2 12-hour rolling average (same as NSPS Subpart J/Ja) and it has a 135 tpy mass limit annually which I believe translates to 150 ppm. The following is an excerpt from the from the Marsulex Agreement for the design of the unit:
  SO_2 Removal. The concentration of SO_2 in the treated gas (stack gas) shall be less than 250 ppmv, oxygen fee, dry basis, (no nitrogen adjustment).

Calciner

Comment #2

- Similar to the request above, we respectfully ask that you eliminate the brief discussion about the BP Cherry Point Calciner control system in section 8.3.2 of the report. There are two reasons for this request. First, much of the basic information is inaccurate such as the permit chronology and statements suggesting that SO2 was reduced as a result of the installation of a wet ESP (specifically designed for particulate and acid mist removal, not SO2). Any apparent SO2 reduction was likely coincident with this change but due to something else. The likely cause of inaccuracies in the chronology is the result of having multiple calciners undergoing modifications at different times, but none of the dates mentioned line-up correctly with the specified modifications. To clarify all the permit history would require an expansive discussion without any real value added to the report. There is also 'test' data presented that the unit met 10-12 ppm SO2 in the stack. I did not see any such test data when I reviewed source test results.

  Secondly, the data from the Cherry Point calciner does not necessarily support the conclusion that the Wilmington calciner emission performance could be improved. While it is true that the stack concentration is consistently lower at Cherry Point, the removal efficiency is not any better. You list an inlet concentration range at Cherry Point of between 1125 and 1425 ppm. This information appears accurate based on some tests and translates into an inlet mass of 1200 – 1500 lbs/hr. However, as provided in our survey to SCAQMD, our analyzer data for 2007 shows inlet mass ranging at about 5200 lb/hr (2700 ppm) at Wilmington. I am not sure why the different levels of sulfur in the inlet exist, but this explains the slightly higher removal efficiency reported at Wilmington mentioned previously in my comments.

  None of this information suggests that wet scrubbing, as an option to the existing dry scrubbing system at Wilmington, should not be explored in the 3rd-party engineering analysis in Part II of the staff report or discussed generically in this section. I also do not have a concern if it is mentioned that such a system is installed and operating at the BP Cherry Point refinery. However, to avoid having to rewrite the complex permit history and trying to explain why Cherry Point has a consistently lower stack concentration while Wilmington has higher removal efficiency, I suggest removing the discussion of the Cherry Point performance in its entirety.

If you have any questions regarding these comments, do not hesitate to call me at (714) 670-5493 or reply to this e-mail.

Sincerely,
Miles Heller
Air Issues Specialist

Staff's Responses
Note that the commenter did not specifically identify or justify which information was confidential; therefore the comments will be treated as non-confidential.

Response #1
Staff does not agree with BP's suggestion to remove Section 5.3.3.2 of the Preliminary Draft Staff Report related to the Cansolv scrubbing system installed at Cherry Point Refinery's Sulfur Recovery Units.

Staff acknowledges the information provided by BP that 1) the Cansolv scrubber has been designed to a level *less than* 250 ppmv, 0% O2, currently required by NSPA Subpart J/Ja or MACT II, and 2) is subject to a mass annual limit of 135 tons per year, translated to 150 ppmv SOx, as BP. However, staff believes that it is not uncommon for a system to achieve levels below the designed levels. This fact is supported by the following examples:

- Two Cansolv scrubbers were designed for a FCCU and a FCU at Valero's Delaware City Refinery. The designed outlet SOx concentration is 25 ppmv. These scrubbers have been in operation for more than a year, and have actually achieved levels of 2 ppmv SOx outlet concentration on a continuous basis.

- Two DynaWave scrubbers were installed at Sinclair oil refineries in Wyoming and designed to meet less than 250 ppmv limit of MACT II and NSPS Subpart Ja. These scrubbers have been in operation more than a year and actually achieved a level below 1 ppmv (e.g., 0.3 ppmv which represents the lower detection limit of stack testing.)

Staff has provided accurate information in Section 5.3.3.2 related to the Cansolv system in the Preliminary Draft Staff Report, and as such, will not remove this section. However, staff will add a footnote to reflect the current non-operational status of the system as indicated by BP.

Response #2
Staff does not agree with BP's suggestion to eliminate Section 8.3.2 of the Preliminary Draft Staff Report related to the Cansolv scrubbing system at Cherry Point Refinery's coke calciners. Staff's responses to several issues stated in Comment #2 are as follows:

- **Permit Chronology**
  Following BP's suggestion, staff will not discuss the operational history and permit chronology of the calciners at BP Cherry Point Refinery. As such, staff removed the dates (e.g. 1984, 1994, 2001) mentioned in this section.

- **Accuracy of Emissions and Performance Information**
  Staff believes that it is important to state relevant public information related to the performance of the wet scrubbers/wet ESPs for the calciners at Cherry Point Refinery accurately. The information provided in the Preliminary Draft Staff Report was all correct and accurate, and will be repeated below with specific references provided:

Information	Reference
The inlet SOx concentration from the calciners at Cherry Point Refinery ranges from 1125 ppmv – 1425 ppmv	November 1, 1977 PSD Applicability Determination – ARCO Petroleum
Permit limit concentration of 160 ppmv and 90% control efficiency previously given to the wet scrubber	Northwest Clean Air Agency, Notice of Construction Worksheet for BP Cherry Point Refinery (NOC #985), dated December 2006
Permit limit concentration of 35 ppmv	Northwest Clean Air Agency, Air Operating Permit of BP Cherry Point Refinery
Control efficiency of the control system including wet scrubber and wet ESP	Estimated from inlet and permitted levels: (1 – (35 ppmv / 1125 ppmv))*100 = 96.9% (1 – (35 ppmv / 1425 ppmv))*100 = 97.5%
Test results showing 10 – 12 ppmv	From a paper titled "Eliminating a Sulfuric Acid Mist Plume from a Wet Scrubber on a Petroleum Coke Calciner", Brown & Hohne. This paper indicated an average annual SOx concentration of 18 ppmv and a SO2 removal efficiency of 99%.

Staff acknowledges that the main function of the wet ESP is to further control sulfuric acid mist emissions and eliminate visible plume. This fact was already mentioned in Section 8.3.2 of the Preliminary Draft Staff Report. However, the permit limit for SOx was reduced from 160 ppmv to 35 ppmv, and this fact speaks for itself about the concurrent effect on SOx removal efficiency.

- **Stack Concentration (ppmv), Removal Efficiency (%), and Emission Rate (lbs/ton)**
  The control efficiencies (98% - 99%) for Wilmington's coke calciners were based on actual outlet concentrations (27 – 52 ppmv) and inlet concentration (2700 ppmv). The control efficiencies (96.9% - 97.5%) for Cherry Point Refinery's coke calciners were based on *permitted* outlet concentration (35 ppmv) and inlet concentrations. When the actual outlet concentrations are used (10-12 ppmv), the control efficiency for Cherry Point Refinery's coke calciners will approach 99% or more.

  The emission rate of Cherry Point Refinery's coke calciner (0.14 lbs/ton) is lower than those at BP Wilmington (0.56 lbs/ton – 0.89 lbs/ton). The Tier I emission rate for BP Wilmington calciner was set high at 2.47 lbs/ton. In addition, the current reported production rate of Wilmington's coke calciner is approximately 22% higher than the past production rate reported by BP and used in Tier I allocation calculation. To balance the increase in production rate and to meet a potential lower BARCT level, staff strongly believes that BP should improve the performance of its control system at Wilmington's coke calciner.

Responses to Valero's Comments Received July 1st, 2008

-----Original Message-----
From: Gonzales, Susan [mailto:Susan.Gonzales@valero.com]
Sent: Tuesday, July 01, 2008 1:26 PM
To: Minh Pham
Subject: FW: Valero Del City
Importance: High

Hi Minh -listed below are the comments on the preliminary draft report. The comments are from our Valero Delaware City environmental department.

I've attached the document portion that I had them review. Thanks. Sue

Valero Delaware City Refinery Comments:

On page 1, in addition to Valero DE City, Motiva DE City is listed. The Motiva entry is a duplicate. We are the old Motiva DCR. The Valero DCR entry contains two footnotes (#2, #5). #5 footnoted below the table has an (a) and a (b). The (b) references a scrubber on an HF Alkylation Unit...and I don't know what this is referring to (some other Premcor refinery?) because we do not have an HF Alkylation Unit. I'm also not sure what the 65% reduction is referring to. The two regenerative WGS units on the FCCU and FCU here in DE City were designed to reduce emissions by 99% at the FCU and 97% from the FCCU.

Page 3 mentions inlet flow volume to the WGS. The design inlet volumes from the final permit applications are 258,200 scfm for the FCU and 442,400 scfm for the FCCU. These values are not on a moisture corrected (dry) basis. I also have no knowledge of the statement in the last sentence about the FCCU being "twice bigger than the largest refinery in the District."

Staff's Responses to Valero's Comments

Staff contacted Delaware Department of Natural Resources and Environmental Control (DNREC)'s Division of Air Waste Management to clarify about the name of the refinery and the status of operation. DNREC's staff confirmed that Valero had recently bought Delaware City Refinery from Motiva. DNREC's staff also indicated that there have been several ownership changes for this Delaware City Refinery; however this refinery is still referred to as "Premcor Refinery" on various documents such as permits.

Based on the information provided by Valero and DNREC, staff has:1) deleted the duplicate entry for Motiva in Table 3-3; 2) made a clarification in footnote #5 that Premcor Delaware City Refinery is now owned by Valero; 3) deleted several wordings in footnote #5 which referred to HF alkylation unit and 65% reduction (which was the estimated overall facility emission

reduction from DNREC;) 4) included the two flow rates for FCCU and FCU in Paragraph 3.3.2.3 of the Staff Report; and 5) included additional information provided by DNREC that the two scrubbers have indeed achieved SOx levels of 1 ppm - 2 ppmv, corrected to 0% O2, on a continuous basis. The scrubber system for the FCCU is in operation for about 1.5 years, and the scrubber system for FCU is on line for more than 2 years. Based on a comparison on the exhaust flow rates from the FCCUs and feed rates, Delaware Refinery's FCCU is about twice larger than the largest FCCU in the District.

Responses to Rhodia's Comments Received April 29th, 2008

Rhodia Inc. provided comments and edits on Chapter 6 of the Preliminary Draft Staff Reports – Sulfuric Acid Manufacturing Process on April 20, 2008. Staff appreciates the comments and has incorporated many of Rhodia's edits in the newly revised version of the Draft Staff Report.

Responses to Rhodia's Comments Received November 25th, 2008

Comment #1

State law prohibits the District from setting BARCT levels without considering the relative environmental and economic impacts on each affected source category. The Draft Report fails to make any findings at all concerning (1) the relative cost-effectiveness of requiring the proposed SO2 controls at a sulfuric acid plant like Rhodia instead of requiring more reductions from sectors responsible for greater PM2.5 and/or SO2 contributions; (2) relative PM2.5 reductions available from tighter controls on sulfuric acid plants versus other sectors/sources; (3) relative costs and environmental benefits of imposing more aggressive controls directly on PM2.5 sources rather than on sources of SO2 (which is only a precursor to PM2.5); or (4) whether imposing stricter PM2.5 and/or SO2 controls on other sectors may cause less overall adverse economic impact than imposing those controls on Rhodia. For example, requiring additional reductions from highly emissive direct sources of PM2.5 very well could result in a greater and more cost-effective reduction of PM2.5 than driving down BARCT levels for sulfuric acid regenerators, who are a very small source of PM2.5 in the South Coast Air Basin. In any event, reciting control costs and cost-per-ton figures in a vacuum tells the District nothing about whether tighter regulation of other sources may be less economically burdensome and/or more effective at producing PM2.5 attainment by 2015. Accordingly, the Draft Report fails to provide a complete BARCT analysis.

Response #1

Staff recognizes that for a BARCT assessment to be made state law requires an emission limitation that is based on the maximum degree of reduction achievable, taking into account environmental, energy, and economic impacts by each class or category of sources. (H&S Code §40406) However, it should be noted that the results provided in the subject report is not the BARCT assessment but rather input for the staff to generate a recommended BARCT for the various equipment subject to SOx RECLAIM.

Comment #2

Since the District began its effort to investigate and redefine BARCT for SOx from sulfuric acid plants and other sources, both the credit markets and the broader economy have suffered major downturns. Financing for major projects is extremely difficult to secure, and most economic analysts predict that these credit issues will extend into 2009 and potentially 2010. The Draft Report makes no mention of these changed economic circumstances, and fails to discuss the potential impacts of tightening BARCT levels at a time when sources could find it difficult or impossible to complete the required capital projects by 2015.

Response #2
Addressing the current economic situation's impact on financing major projects is outside the scope of this report. Such dialogue has transpired as part of the SOx Working Group. Staff will try to schedule implementation of these projects with the lowest possible financial impacts while maintaining the 2015 emission reduction goals as presented in the 2007 AQMP.

Comment #3
AQMP Control Measure CMB-02 is a measure designed to secure appropriate SOx reductions pursuant to RECLAIM, primarily (as the AQMP describes) from refineries. It is not a control measure designed to achieve PM2.5 reductions required for District wide attainment. While the District certainly has an interest in achieving PM2.5 attainment in the South Coast Air Basin, Control Measure CMB-02 makes no mention of requiring SOx reductions as a PM2.5 reduction strategy. If the District's aim is to secure sufficient PM2.5 reductions to achieve PM2.5 attainment by 2014, it must fairly compare the costs and benefits of securing PM2.5 reductions from the universe of PM2.5 sources throughout the Basin, not disproportionately from a handful of SOx RECLAIM sources.

Response #3
The staff report will address the relationship between SOx and PM2.5. However, the commenter is referred to such documents as Appendix V of the 2007 AQMP for a much more detailed discussion of this relationship.

Comment #4
The capital cost estimates in the Draft Report (summarized in Table 3 on page 8 and in Table R-2 in Section V.L. of the confidential appendices) appear to be inaccurate, and vary from each other by over $6 million. Rhodia has been unable to verify the sources of these equipment cost estimates, both of which are well below the likely installed equipment costs of installing a caustic scrubber. Recent experience within our company and throughout the market suggests to us that the installed cost of a scrubber is approximately $15 million. For these reasons, the cost effectiveness values in Table 4 on page 9 are also too low, and do not reflect real world costs. Moreover, in Section V.M., Table R-3., the operating cost estimates for caustic makeup also appear to be too low, given that current market value for caustic is approximately $1,000 per ton (100% NaOH). These data errors undermine the Draft Report's cost effectiveness conclusions on page 10, and suggest that actual capital and operational costs may be significantly higher than the numbers cited. Because California law mandates that the District make proper cost-effectiveness findings before setting or changing BARCT, Rhodia strongly recommends that the District take the PDSR off the December calendar, ask its vendors to document the sources for all of the cited cost data, and work with Rhodia to resolve the data discrepancies before moving forward.

Response #4
The consultant has conducted a very thorough analysis with respect to the cost analysis of the subject equipment. However, given the very low cost effectiveness derived by the consultant the

costs would have to be several-fold greater than assessed in order for the cost-effectiveness to no longer being attractive.

Comment #5
The Draft Report assumes that Rhodia could install a new caustic scrubber as soon as 2011. Rhodia estimates that, if it were required to install a new scrubber, it would not be ready for operation for at least 2 to 3 years after initial funding of the project. Even in a best-case scenario, emissions reductions from any new scrubber installed at Rhodia may not be available to help PM2.5 attainment until 2012 or later, depending on when the District approves the BARCT revision. The Draft Report fails to address the relative costs and benefits of requiring SO2 emissions reductions that would not yield PM2.5 reductions until those years, nor does it address whether reductions in other sectors may be more timely and cost-effective.

Response #5
The SOx emission reduction goal of at least 2.9 tons per day needs to be made prior to 2015. Staff will assess the feasibility of achieving this emission reduction in the indicated timeframe as part of the rulemaking process, taking into consideration the time needed to install control equipment.

Comment #6
In the first paragraph of page 4 of the Draft Report, we would recommend adding the following underlined language: "Historically double absorption plants have needed no further SO2 reduction before the tail gas is emitted to the atmosphere, because their emissions are typically well below the New Source Performance Standard of 99.7% conversion or 4 lbs. per ton." In the second paragraph on page 4, we would recommend deleting the word "pentoxide" from the catalyst description. Extensive research conducted by Rhodia's catalyst supplier indicates that the vanadium is in a form of complex salts rather than vanadium pentoxide.

Response #6
The consultant opted not to include the language in the subject report. If appropriate staff may include such language in the staff report.

Comment #7
In Figure 1 on page 6, "Facility 1, 2, 3", should be changed to "Facility A, B, C," respectively, to be consistent with the rest of the Draft Report. In the confidential section of the Draft Report

Response #7
The consultant corrected the facility identification as indicated by the commenter.

Comment #8
Finally, though Rhodia provided extensive comments and edits to the last draft of the PDSR, none of those comments appear to have been incorporated into the version that was posted on the District's website. Rhodia also provided comments to an earlier version of the PDSR, but only a fraction of those comments appears to have been incorporated into the current version. Indeed, the District has failed to provide any response at all to most of Rhodia's comments on the PDSR. Rhodia is concerned that the District may be on a path to adopting a new and stricter

set of BARCT requirements without sufficiently considering or incorporating Rhodia's written comments.

Response #8
Staff will respond to such comments as part of the staff report development.

Responses to WSPA's Comments Received April 29th, 2008

Comment #1
Part I, as drafted, contains numerous examples of the topics that are apparently intended to be covered in Part II. In addition to being premature, the discussion of these items in Part I is largely unsubstantiated and lacking adequate detail. WSPA strongly suggests that contents of the Part I Staff Report should conform to the scope specified in the above paragraph.

The methodology by which the District will actually develop the recommended RECLAIM SOx allocations shave is a critical discussion that should be included up-front, in the Part I Staff Report. (There is currently no mention of this essential topic.)

WSPA notes that the revised draft RFP for the third-party contractor project mentions that the Part II Staff Report will include "... a discussion on the process for reassessing BARCT, appropriate BARCT levels, emission reductions (aka allocations shave) and cost effectiveness for RECLAIM program (sic)." However, we submit that an understanding of, and agreement with, the methodology for developing a recommendation for an allocations shave – along with the necessary compliance margin – needs to proceed most of the other work (e.g., the third-party contractor project). In fact, arguably, we have already gotten "ahead of ourselves".

The methodology for the NOx shave proved to be very complex. Because we would expect a similar level of complexity with regard to SOx, the discussions regarding process cannot wait for a Phase II Staff Report. We should not delay those discussions any further – they need to commence now.

Response #1
Staff appreciates the concerns raised by WSPA in having an understanding of the SOx shave methodology. In recent meetings with the refineries and as requested by the refinery task force, staff has agreed to provide an estimate of SOx RTC reductions following the methodology that was used in the January 2005 NOx RECLAIM amendment. However, as in the January 2005 NOx RECLAIM amendment, further discussions are warranted (e.g. BARCT assessment) prior to finalizing the RTC reductions.

Comment #2
The decrease in the number of RECLAIM SOx facilities warrants some discussion and analysis. In particular, there would be interest in knowing whether or not any facilities have ceased operations, and, if so, why they did.

Response #2

Please refer to the Annual RECLAIM Audit Reports presented to the AQMD Governing Board on an annual basis in March. The most recent reports were presented to the Governing Board for the 2007 compliance year. These reports provide information pertaining to the number of RECLAIM facilities. Such a discussion would be outside of this proposed SOx RECLAIM amendment.

Comment #3
WSPA understands that BARCT reassessments for the District's RECLAIM program are required by the California Health and Safety Code rather than by the Federal Clean Air Act. The discussion should clarify that advancements in control technology may or may not have actually occurred. Further, it is the RECLAIM program itself that dictates the timing for the planned reductions in emissions – a BARCT reassessment does not, by itself, impact implementation timing.

Response #3
A BARCT reassessment and the timing for this process (e.g. as expeditiously as practicable) is required by both the federal and California Clean Air Act, namely Section 172(c)(1) of the federal CAA, and Health and Safety Code (H&SC) Section 40913, 40914 and 40920.5, 40440(b)(1), 40406, and 39616. Staff conducts a BARCT reassessment every three years which realign well with the frequency for amending the Air Quality Management Plan.

Comment #4
The relationship of the Federal Fine Particulate Implementation Rule is this current effort to reassess BARCT for source categories that emit SOx needs to be clearly explained. The District's Rule and Control Measure Forecast item that describes this RECLAIM effort refers only to AQMP Control Measure CMB-02, and CMB-02 is a measure to achieve a proposed 2.9 ton per day reduction of SOx emissions.

Response #4
SOx is a key precursor of particulate matter (PM2.5). Reducing SOx is very important since it would help the Basin to meet the annual PM2.5 standard in 2014, the 24-hour PM2.5 standard in 2010, and ready to face a potential revision of the PM2.5 standard in a near future. Other than mentioning the importance at reducing SOx because it is a key precursor to PM2.5, there is no real need to provide detailed information regarding this phenomenon. The commenter is referred to such documents as the Appendix V of the 2007 AQMP for more details on this subject.

Comment #5
The value of the target SOx reduction in the final version of CMB-02 is "2.9 tons per day" (and that was a change from the initial estimate of "3.0"). The regulated community needs to know, and fully understand, the District's goals with respect to MCS-01, and the process for potentially combining "facility modernization" with this current effort to reassess BARCT for RECLAIM sources. These issues need to be included in the Part I Staff Report.

Response #5
As stated in Control Measure CMB-02, the minimum target emission reductions are expected to be 2.9 tons per day (~ 3 tpd) from 2010 through 2014 and are expected to remain constant after

2014. Such reduction in allocations can be across-the-board shaved or source specific reductions. As stated in CM CMB-02, staff may need to explore the feasibility to incorporate the concepts of Control Measure MCS-01 - Facility Modernization, to achieve reductions beyond 2014. If needed, staff will discuss the concepts in Part II of the Staff Report.

Comment #6

It would be appropriate to include discussion and analysis of the following topics:

- *The appropriateness of using CY 2005 as a "baseline" year.*
- *The methodology for calculating CY 2005 emissions since RECLAIM facilities are found in both calendar year and fiscal year cycles (i.e., there are both Cycle 1 and Cycle 2 facilities).*
- *The 2 ton per day differential between RECLAIM SOx allocations and actual SOx emissions. (For example, how much was allocated to operating facilities compared to third-parties who do not operate facilities. This information goes to establishing an appropriate compliance margin, and determining how deep a hypothetical shave would cut into facility operations.*

Response #6

Staff provides the following explanations:

- The development process for the amended SOx RECLAIM rules started in late 2007. At that time, the most recent set of emission data that has been available and audited is the 2005 emission data, therefore staff used this set of data in the analysis of the Staff Report. For further information, please refer to the "Annual RECLAIM Audit Reports for 2005 Compliance Year" published in March 2, 2007.

- Staff did not "calculate" any emissions for RECLAIM facilities. Cycle 1 and Cycle 2 facilities are required to report emissions according to the same reporting protocol in Rule 2012 for SOx (e.g. major SOx sources must report emissions on a daily basis and process SOx sources must report emissions on a quarterly basis.) Following are the reporting emissions group by compliance year (e.g. Emissions for compliance year 2002 means emissions reported from January 1, 2002 – December 31, 2002 for Cycle 1 facilities, and July 1, 2002 – June 31, 2003 for Cycle 2 facilities. Emissions for calendar year 2002 means emissions reported from January 1, 2002 – December 31, 2002 for both Cycle 1 and Cycle 2 facilities.)

- The 12 tons per day corresponds to allocations and also emissions reported in APEP for compliance year 2002 (from Jan – Dec 2002 for Cycle 1 facilities and from July 2002 – June 2003 for Cycle 2 facilities). The 10 tons per day emissions are the emissions reported for 2005 calendar year. The difference in 2 tpd between year 2002 & 2005 is mainly the result of shrinkage in SOx universe from 41 facilities since the start of the RECLAIM program to 33 facilities in 2005 including 12 facility shutdowns, 8 inclusions and 4 exclusions is only about 10%.

Comment #7

The calculations above do not appear to be correct. Because the seven highest emitting source categories had CY 2005 emissions of 7.53 tons per day out of a total of 10 tons per day, their contribution is 75 percent (10 tons per day x 95 percent x 90 percent = 8.6 tons per day [or, 86 percent] – but that does not agree with 7.53/10).

Response #7
The following values need to be part of the calculation in order to derive the correct product:
9.92 tpd x 93.95% x 80.79% = 7.53 tpd (for the top 11 facilities)
9.92 tpd x 95.46% x 81.09% = 7.68 tpd (for the top 12 facilities, where Saint Gobain Containers Inc has ceased operation).

Comment #8
WSPA believes that SOx allocations, which are held by entities other than RECLAM facilities, need to be noted and that Table EX-1 should show possibly those allocations if they are significant.

Response #8
Staff added Table A-2 in Appendix A to provide information (RECLAIM Trading Credits) that is held by entities other than RECLAIM facilities.

Comment #9
Notwithstanding staff's efforts in this regard, WSPA believes that the discussion of potentially applicable control technologies must be a work product of the third-party contractor study that the District has proposed. The discussion and analysis of control technologies should be included in the Part II Staff Report – not in this Part I.

It is both premature and inappropriate to present this list of candidate potential control technologies as being proposed technologies. The candidate control technologies will need to be evaluated against the BARCT criteria, and that analysis needs to take place in Part II of the staff report. More appropriately, the analysis needs to occur within the scope of the potential third-party engineering contractor project, on which, WSPA would expect, Part II of the staff report will be based.

Response #9
There is nothing premature and inappropriate in presenting information in Table EX-2 based on staff's research presented in Part I of the Staff Report. Staff views most rulemaking efforts as an iterative process. Staff expects that the independent work of the third party contractors will not result in much of a difference to the information presented in Table EX-2. However, if there is a difference, staff will consider the difference in the BARCT assessment process for SOx RECLAIM.

Comment #10
It is highly speculative to propose combinations of control technologies for these various sources because, in many cases, the technologies are essentially mutually-exclusive[92]*. There would need to be a robust demonstration of the feasibility, the effectiveness, and the cost-effectiveness of potentially combining multiple control technologies for these source categories.*

[92] For example, it is extremely unlikely that, due to "diminishing returns", anyone would: Combine wet scrubbing of FCCU flue gas with any other SOx-reduction technology, or, combine enhanced fuel gas treating for fuel gas combustion devices with stack scrubbing, or, combine enhanced SRU/TGU efficiency with stack scrubbing, etc.

Response #10
Under certain situations, control technologies are mutually-exclusive. It is, however, not highly speculative that control technologies would be used in combination. For example, it is quite possible for a facility to combine wet scrubbers with SOx reducing additives. Table EX-2 provides possible control technologies, not the proposed BARCT. In addition to the information provided in Part I, the BARCT analysis will be made with the results provided by the third-party contractors as well as additional input from the regulated community.

Comment #11
As noted previously, the actual target emission reduction in CMB-02 is 2.9 tons per day (not 3 tons per day). The claim that the listed control technologies "would be employed to generate at least 3 tpd" suggests that the staff has already reached important conclusions regarding the potential BARCT reassessments and the amount of the potential reduction of SOx allocations, respectively. Given the facts that the proposed third-party engineering study has not yet begun, and that Part II of the Staff Report has not been written, all such conclusions are premature and inappropriate for inclusion in the Part I Staff Report.

Response #11
Staff conducted a first estimate of emission reductions of 2.9 tons per day shown in Control Measure BCM-02. A more refined estimate of emission reductions (4.7 tpd – 6.7 tpd from the 2005 baseline inventory) was conducted during the development of Part I of Staff Report and was provided in the April 3 and April 30 Working Group Meetings. A subsequent estimate of emission reductions (6.5 tpd from the 2005 baseline inventory) were provided by the third-party contractors.

Comment #12
WSPA submits that the definition of BARCT is critical to this current effort. BARCT is not BACT or LAER. BARCT applies on a retrofit basis and it must consider environmental, energy and economic impacts.

Response #12
Staff agrees with the commenter. However, it should be noted that it is not unusual in which the levels of BARCT are equal to the levels for BACT (or LAER), especially for add-on control devices such as wet/dry scrubbers. In some situations (e.g. PAR 1146 and 1146.1), the BARCT level for certain categories of equipment may be more stringent than the corresponding BACT level. The primary reason for this difference was that the BACT assessment has not been conducted for 8 years, not taking into recent advancements on control technologies. In addition, BARCT may anticipate future technological development.

Comment #13A
Although WSPA recognizes the precursor relationship between SOx emissions and ambient PM 2.5, as a practical matter, the discussion in the following section is confusing – largely because it fails to establish a clear and understandable relationship between PM and this effort regarding the RECLAIM SOx program.

Comment #13B
First, the two statements in the preceding paragraph, taken together, are not clear. Second, the statistic regarding the exposure of Southern California residents to PM 2.5 needs to be substantiated. For example, there needs to be some discussion regarding the nation-wide monitoring for PM 2.5, etc. (if PM monitoring data for the rest of the nation is sparse, then PM monitoring in a densely populated area such as Southern California would skew the result).

Comment #13C
Without establishing the basis, the discussion in the paragraph above is seemingly unrelated to SOx RECLAIM.

Response #13A-13C
Please refer to the 2007 AQMP and specifically Appendix 5, for further explanations.

Comment #14
WSPA is concerned that the discussion in the paragraph above implies that the District intends to use RACM and RACT as two barometers for evaluating potential SOx reduction technologies rather than using BARCT, as discussed earlier in the staff report.

As stated previously, the preliminary draft Part I report has not established a basis for linking SOx reductions to improvements in PM air quality. The discussion regarding the effectiveness of controlling SOx and/or NOx for PM air quality improvement needs to be substantiated.

Response #14
RACM and RACT call out for a minimum level of control required by the U.S. EPA in their Clean Air Fine Particle Implementation Rule. The District is required to establish BARCT for this proposed SOx RECLAIM rule amendment as discussed earlier in the Staff Report. BARCT would more likely be more stringent than the levels presented in RACM/RACT.

This Staff Report incorporates other documents which establish a basis for linking SOx reductions to improvements in PM air quality as part of the rule making documents. This linkage is well documented and substantiated in other public documents such as the 2007 AQMP, and documents that were used as the basis to develop the Clean Air Fine Particle Implementation Rule.

Comment #15
WSPA suggests that the staff report should list the SOx facilities that have exited RECLAIM, and should indicate the reason for their leaving the program (and, if due to plant closure, did the business claim that the decision to close was in any way related environmental regulations, or, the RECLAIM program in particular).

Response #15
Please refer to the District's annual RECLAIM audit reports published annually in March for this information. Typically plant closure is the result of several factors. Staff believes that discussions on plant closures, or facilities opt-in into SOx RECLAIM is better placed in the RECLAIM annual audit reports.

Comment #16
The first two sentences are unclear (e.g., were the decreasing allocations based on BARCT that was initially in place or, that would likely be implemented in the future?).

The statement assumes that advancements in control technology are occurring constantly but, as a practical matter, that is not the case. The sentence should read, "capture any advancement ...".

The concept of declining emissions allocations, which were a basic design element of the RECLAIM program, already incorporate the goal of expeditious emissions reductions. The sentence could report a more accurate number – the actual reduction was 22.5 percent.

Response #16
The decreasing allocations were based on, in part, the levels of BARCT that would be implemented as expeditiously as possible in the future.

Staff did not intend to imply the control technologies are "constantly" being improved. Rather staff is alerted at technology advancements, or retrospectively leads back to ascertain if control technology improvements warranted a BARTC assessment. Either approaches recognized progress made by the regulated industry, vendors and contractors in control technology advancements.

The concept of declining emission allocations indeed incorporates expeditious emission reductions. The facility allocations since 2003 remain constant based on a BARCT assessment in 1993. A BARCT re-assessment today will in all likelihood establish further declines in SOx emission allocations in order to reach PM2.5 attainment in 2015.
Since its initial rule making effort, there have been several amendments to the RECLAIM rules. In January 2005, a BARCT analysis was re-conducted for NOx, and as a result of this analysis, the RECLAIM rules were amended and the NOx annual allocations previously given to the NOx RECLAIM facility were further reduced by approximately 20% to reflect BARCT.

Comment #17
WSPA recalls that the 2003 allocations included an extra "shave". Tier 1 represented BARCT at the time; Tier 2 was an additional 34 percent shave

The BARCT analysis for SOx is being re-evaluated through the current staff effort. It would be more correct to state that an amendment is (or, will be) based on the BARCT reassessment.

Response #17
A BARCT assessment in 1993 established the declining Tier 1 and Tier 2 allocations. BARCT is undergoing a reevaluation in this Staff Report and will in all likelihood set another reduction for SOx allocations.

Comment #18
WSPA strongly believes that, as was the case for the RECLAIM NOx program shave, any SOx shave must apply to the universe of RECLAIM SOx facilities.

Although the estimated SOx reductions in the AQMP control measure are accurately stated, the AQMP control measure did not contain any documentation regarding the basis for the numbers. Because it is not possible to verify, or even comment on, the reasonableness of the estimates, they must not become benchmarks for evaluating the potential outcome of the BARCT reassessment and SOx-shave.

As previously stated, there needs to be an explanation of the process for evaluating the possible secondary goal of including MCS-01 with this BARCT reassessment. WSPA is concerned that potentially combining two the goals will make it difficult to conduct their respective analyses.

Response #18
The paragraph written in Section 1.4 correctly stated the information presented in the Control Measure CMB-02.

Staff first conducted an analysis for emission reductions in 2006 during the development of Control Measure CMB-02 which resulted in a minimum of 2.9 tpd (approximately 3 tpd) emission reductions. Staff conducted a follow-up analysis in April 2008, resulting in a range of emission reductions from 4.7 tpd – 6.7 tpd from the 2005 emissions baseline. This range was presented in the April 3 and April 30 Working Group Meetings. Expert contractors conduct a third independent analysis of emission reductions and cost effectiveness in September 2008 to assist staff in making its final determination of BARCT. They estimated about 6.5 tpd emission reductions from the 2005 emissions baseline. The final results of potential RTC reductions and how the reduction would be distributed to maintain the integrity, equity and characteristics of the RECLAIM program will be discussed in Part III of the Staff Report. If needed to achieve addition emission reductions for 2014, staff will incorporate the concepts of Control Measure MCS-01 as stated in CM CMB-02, and will discuss the process in Part III of the Staff Report.

Comment #19
In view of the potential review of BARCT to be conducted by an engineering contractor, the staff's recent effort can only be regarded as preliminary. Further there is an important distinction between identifying technologies that might be applicable to a particular source category, and making an assessment that any technology or combination of technologies represents BARCT.

Response #19
Staff has conducted an extensive engineering research to identify the control technologies and assess the possible potential emission reductions that can be achieved. The third party contractors will conduct their own engineering assessment on control technologies, and cost estimates to assist staff in making the final decision on BARCT and emission reductions.

Comment #20
It is premature to state that the SOx reductions technologies, which are described in the staff report, are "applicable" – those determinations have not yet been made, and can only be made at the conclusion of the proposed engineering contractor study.

Reports of installed costs and resultant cost-effectiveness, as reported in the "literature", are usually for uncontrolled sources. The reports are rarely applicable to sources that are already well-controlled, as is the case for facilities in the South Coast Basin.

Generally speaking, reliance on cost or cost-effectiveness values from "the literature" would be a serious mistake. In many cases the District has access to information regarding the actual costs of installations at local refineries. In other cases, site-specific engineering estimates need to be made because this entire BARCT reassessment exercise has to focus on potential retrofit installations.

Response #20
As pointed out in previous responses, the technical feasibility and cost analysis is developed over the entire rule making process. Relying upon data from literature is acceptable in the earlier stage of the rule development process.

Comment #21
WSPA notes that, in the absence of specific documentation regarding the reason that a facility installs emissions control equipment, it cannot be assumed that such installations have been determined to be cost effective. Many installations of emission control equipment have nothing whatsoever to do with cost-effectiveness considerations – rather, they might be part of negotiated Consent Decrees, they might be based on need to provide emissions offsets, etc. Where any determinations regarding cost-effectiveness might have been made, and when those determinations are quoted in the Staff Report, they need to be documented.

It is premature to suggest any definitive conclusions with respect to the amount of SOx emission reductions that might be expected. If various control technologies are ultimately determined to be feasible and cost effective, then the resulting reductions will be used in calculating the specific amount of the allocation shave for SOx RECLAIM sources.

Response #21
In CM CMB-02, staff estimated a range cost effectiveness from $10,000 - $16,000 per ton SOx reduced. The third party contractors will assist staff in conducting detailed cost estimates for this rule amendment and the results will be presented in Part II of the Staff Report.

Comment #22
The discussion in the preceding paragraph should reflect the proposed engineering contractor study.

Response #22
Staff will revise the Preliminary Draft Staff report accordingly when new information surfaces. The third party contractors' analyses will be summarized and presented in Part II of the Staff Report.

Comment #23
WSPA believes that the 12 ton per day value represents SOx allocations, not actual emissions. We also note that not all of the allocations are held by RECLAIM facilities (some allocations are held by third-party investors, etc.). WSPA cautions that care needs to be taken to distinguish between SOx allocations and actual emissions.

It is also important to show the SOx allocations held by facilities compared to those held by investors for both current and future years because the amount of allocations held by investors will increase proportionally in 2012 (compared to 2008) while the amount held by facilities will decrease.

Response #23
As shown in Table 3-4 of the "Annual RECLAIM Audit Report for the 2002 Compliance Year", dated March 5, 2004, the actual emissions for compliance year 2002 was 4,374 tons (12 tpd). The total RTCs (allocations and converted ERCs) were reported to be 4,924 tons (13 tpd).

The RTCs held by investors and by facilities may change on a daily basis. As of March 11, 2009, the RTCs held by the investors were 295 tons for compliance year 2009, 207.5 tons for compliance year 2010 (a decrease compared to year 2009), and 339.9 tons for 2011 and beyond.

Comment #24
Because Table 2-1 makes a comparison between the RECLAIM NOx and SOx programs, respectively, it is important to note the following:
- *The NOx shave applied equally to all facilities in the RECLAIM NOx universe.*
- *The NOx shave recognized the need for, and included, a compliance margin.*

These two characteristics of the NOx shave must also apply to the present consideration of a SOx shave.

Although the data show that, with respect to SOx, RECLAIM facilities represent a greater portion of the emissions inventory, they do not by themselves support a claim of any unusual importance for the current BARCT reassessment exercise for SOx. As stated above, WSPA believes that the 12 ton per day number represents allocations not emissions.

Response #24
In the NOx universe, 87% of the total emissions (24.02 tpd out of 27.61 tpd for compliance year 2003) are generated from the top 16% (54 out of 346 facilities) of the facilities. Yet the NOx shave is divided equally (by percentage) across the NOx universe. Therefore, similarly in the SOx universe, even though 95% of the total emissions (9.47 tpd out of 9.92 tpd) is generated from the top 12 facilities out of 33, the SOx RTC reductions will probably be divided equally (by percentage) across the SOx universe. As indicated in Control Measure CMB-02, however, the shave may be divided equally to 33 facilities, or may be restricted to specific facilities. As

indicated in Part III of the Draft Staff Report, additional analyses will be conducted to provide more information on how the RTC reductions should be executed to maintain the integrity and operational of the SOx RECLAIM program.

See Response #3 regarding the requirement of BARCT reassessment. The 12 tpd is actual emissions in compliance year 2002.

Comment #25
Projected emissions for future years 2014 and 2023 are speculative at best. The staff report should indicate whether or not future year emission projections include the effect of allocation shaves. The precursor relationship of SOx to ambient PM should not simply be described as a "given" because there is no foundation for this claim in the staff report.

Response #25
The future estimated emissions for 2014 and 2023 (11.7 tpd and 11.8 tpd, respectively, without allocation shaves; and 8.8 tpd and 8.9 tpd, respectively, with allocation shaves) are clearly shown in CM CMB-02. The foundation and explanation for a relationship between SOx emissions and ambient PM can be found in Appendix 5 of the 2007 AQMP.

Comment #26
WSPA is not aware of any refineries in the South Coast basin that are not in the RECLAIM program. The staff report should clarify this issue.

Response #26
For clarification, the wording "Non-RECLAIM Refineries" are changed to "Non-RECLAIM Sources". In 2002, the refineries reported 6.9 tpd SOx emissions for flares and upset conditions. Flares and upset conditions were not counted in "RECLAIM Sources", which was ranked #2 in Table 2-2.

Comment #27
The language in the staff report consistently (and, perhaps, misleadingly) suggests that a 3 ton per day (the correct value is 2.9 tons per day) reduction in SOx allocations is a virtual certainty. It is not – primarily because the origin of the 2.9 ton per day goal has not been substantiated. The purpose of the BARCT reassessment is to determine the level of the SOx allocations reduction, if any, that is appropriate and can justified on the basis of available retrofit technology, cost effectiveness, etc. Further, it should be noted that other source categories in Table 2-2 might be reasonable candidates for SOx emissions reductions.

Response #27
As shown in the 2007 AQMP (Table 3-8 of Chapter 3 of the 2007 AQMP), RECLAIM sources were ranked #2 in SOx emissions in 2002, and were expected to rank #2 in 2014 and 2023. Among other stationary sources, RECLAIM sources have the highest possibility to achieve 3 tons per day reductions in 2014 cost effectively, substantiated by staff's analysis in CM CMB-02 and the analysis in Part I of Staff Report. The cost effectiveness ranking of all stationary source control measures in the 2007 AQMP is shown in Table 6-5.

Comment #28
As noted previously, the staff report should address the significance of using CY 2005 as a reference:

- What is the significance of CY 2005?
- Is CY 2005 a representative year? (Some analysis and discussion is needed.)

There needs to be some discussion regarding why the analysis was cut off at twelve facilities. There needs to be some discussion of the reason for, and implication of, including a facility that is shut down in this analysis.

Response #28
Please refer to Response #6.

Comment #29
The derivation of the claimed 80 percent value needs to be presented. (See the comments regarding Table EX-1.)

Response #29
Please refer to Response #7.

Comment #30
There needs to be some demonstration regarding the selection of 2005 as the baseline year.

Response #30
As presented in the April 3 Working Group Meeting (slide #4), the 2005 emissions were selected to be used in this rule amendment because they are within the range of emissions from other current years. The emissions from these top emitting categories of equipment were reported to be 7.5 tpd for 2005, 7.9 tpd for 2006, and 7.3 tpd for 2007. Staff also will estimate RTC reductions using other baseline year (1997) as shown in the 2005 NOx RECLAIM amendment.

Comment #31
There should be some discussion regarding the characterization of a source as "major", and it should be noted that this description has a specific meaning within the context of Regulation XX.

Response #31
The definition for major SOx source is in Rule 2011 (c).

Comment #32
It should be noted that many of the FCCUs at refineries in the South Coast basin are also equipped with expander turbines, which are used to recovery energy from the flue gas leaving the regenerator. An expander turbine, and its associated third-stage separator (used to reduce filterable PM in the FCCU flue gas stream entering the turbine) are additional elements in the flue gas train, which collectively complicate the task of maintaining the required pressure balance within the FCCU.

Response #32
Staff acknowledges this component of the FCCU operation. However, Figure 3-1 is a generic flow diagram that was never intended to show every single piece of equipment included in the

FCCU at each refinery. Any components which would complicate the reductions of SOx emissions should be captured in the third party consultants' analysis.

Comment #33
An electrostatic precipitator and an SCR unit (where one is employed) occupy considerable refinery plot space, and limit the potential use of other systems such as wet gas scrubbers.
The title of the Figure should be "Typical Fluid Catalytic Cracking Unit". A block representing expander turbines should be added because these are common. The block representing SCR should be deleted or labeled as "Optional", because SCRs are uncommon.

Response #33
See Responses #32.

Comment #34
RECLAIM allocations were not issued to process units or individual pieces of equipment but, rather, to the facility as a whole.

Response #34
RECLAIM allocations were issued to the facility as a whole. However, total facility allocations were estimated for each SOx source at the facility according to the methodology described in Rule 2002.

Comment #35
The average value for the three years, 2005, 2006 and 2007 is 3.33 tons per day. There should be an explanation regarding why the highest year was used. Further, there needs to be an analysis regarding the impact of FCCU turnarounds, if any, on the mass emission estimates. (Also see comment for Table 3-2 below.)

Response #35
Staff started the development of this SOx RECLAIM amendment in November of 2007. The most recent set of RECLAIM emissions audited at that time was the 2005 emissions (Ref: *Annual RECLAIM Audit Report for 2005 Compliance Year*, March 2, 2007). Staff will provide two sets of estimation: 1) "real" emission reductions expected from the 2005 actual emissions baseline; and 2) RTC reductions based on the 1997 and the 2005 actual emission baselines. (The RTC reductions estimated from the 1997 baseline will be conducted as suggested by the refinery task force in several meetings with the District following the methodology outlined in the analysis for the 2005 NOx RECLAIM amendment.)

Comment #36
The statement regarding the lack of specific SOx concentration or mass limits for FCCUs is not correct. FCCUs can be subject to Federal New Source Performance Standards, provisions of Consent Decrees, etc.

As noted above, RECLAIM SOx allocations are provided to the facility not to a process unit (e.g., an FCCU). The amount of a facility's SOx allocations have been steadily declining since they were first granted at the start of the RECLAIM program.

Commercial availability is only one issue that needs to be considered when evaluating BARCT – other considerations are environmental, energy and economic impacts.

WSPA is not aware of any basis for the statement implying a hypothetical increase in capacity, and a corresponding need to upgrade any control device. The statement is unsubstantiated and should be deleted.

Response #36
The statement regarding the lack of specific SOx concentration or mass limits for FCCUs was meant for AQMD RECLAIM regulations, not EPA regulations.
The facility's SOx allocations are the summation of all allocations estimated for each SOx source/process category at the refinery. The facility's SOx allocations were steadily declining since 1993 to 2003, and remaining constant after 2003.
In the analysis of BARCT, staff will include only commercial availability technologies but not the technologies in development or at the research phase, and will evaluate BARCT considering environmental, energy and economic impacts as governed by federal/state rules.

The commenter may not be aware of any increase in FCCU capacity since it is confidential information.

Comment #37
WSPA submits that it is unlikely that each refinery had the same FCCU SOx emissions factor. That does not seem reasonable. We wonder if 13.7 lbs/1000 bbls might have been the Tier 1 shave target, not what was actually being emitted in the so-called peak years?

Response #37
The 13.7 lbs/1000 bbls is the emission factor used to calculate Tier I emissions for FCCUs.

Appendix B – Summary of Federal, State and Local SOx Rule Requirements

(Summarized by Kevin Orellana)

Fluid Catalytic Cracking Units

Rule/Regulation	Applicability	Emission Limits	Compliance Date	Monitoring **
SCAQMD R1105	FCCU	132 lbs SO_2 per 1000 bbl feed (60-minute average)	1/1/1987	
BAAQMD 9-1	FCCU	1000 ppmv SO_2	3/15/1995	CEMS
San Diego County APCD R53	Other sources of gaseous sulfur emissions where sulfur compounds emitted are not products of fuel combustion	0.05 % by volume dry, sulfur as SO_2	1/22/1997	
NSPS 40 CFR Part 60 Subpart Ja	FCCU	25 ppmv SO_2 dry basis, 365-day rolling average	5/14/2007	CEMS

Sulfur Recovery Units/Tail Gas Units

Rule/Regulation	Applicability	Emission Limits	Compliance Date	Monitoring **
SCAQMD R468	SRU	500 ppm sulfur compounds (calculated as SO_2 dry) over 15 minute average; and 10ppm H_2S over 15-minutes (dry); and 198.5 lbs./hr sulfur compounds as SO_2	10/8/1976	
BAAQMD 9-1	SRU	250 ppmv SO_2 dry @ 0% O_2	3/15/1995	CEMS
San Diego County APCD R53	Sulfur recovery plants	0.05% by volume dry, sulfur as SO_2	1/22/1997	
NSPS 40 CFR Part 60 Subpart Ja	SRU with capacity >20 long tons/day, followed by incineration	250 ppmv SO_2 dry @ 0% O_2	5/14/2007	CEMS
NSPS 40 CFR Part 60 Subpart Ja	SRU with capacity >20 long tons/day, followed by incineration, with multiple trains or release points	250 ppmv SO_2 dry @ 0% O_2 for each process train or release point; or comply with a flow-weighted average of 250 ppmv for all release points	5/14/2007	CEMS
NSPS 40 CFR Part 60 Subpart Ja	SRU with capacity >20 long tons/day, not followed by incineration	10 ppmv H_2S and 300 ppmv of reduced sulfur compounds (H_2S, COS, and CS_2), each calculated as ppmv of SO_2 dry @ 0% O_2	5/14/2007	CEMS

Refinery Boilers/Heaters

Rule/Regulation	Applicability	Emission Limits	Compliance Date	Monitoring **
NSPS 40 CFR Part 60 Subpart Ja	Fuel gas combustion devices	162 ppmv H_2S in fuel gas determined hourly on a 3-hour rolling average basis or 60 ppmv in fuel gas determined daily on a 365 successive calendar day rolling average basis	5/14/2007	CFGMS
NSPS 40 CFR Part 60 Subpart Ja	Fuel gas combustion devices	20 ppmv flue gas SO_2 (dry @ 0% O_2) determined hourly on a 3-hour rolling average basis, and 8 ppmv flue gas SO2 (dry @0% O2) determined daily on a 365 successive calendar day rolling average basis	5/14/2007	CEMS
SCAQMD R431.1	Fuel gas combustion devices	40 ppmv averaged over 4 hours, calculated as H_2S	5/4/1994	CFGMS or CEMS
SJVUAPCD R4301	Fuel burning equipment	200 lb/hr sulfur compounds, calculated as SO_2	12/17/1992	

Coke Calciners

Rule/Regulation	Applicability	Emission Limits	Compliance Date	Monitoring **
SCAQMD R1119	Coke Calcining	At least 80% reduction of uncontrolled SOx emissions	7/1/1983	
BAAQMD 9-1	Coke Calcining kilns	400 ppmv or 250 lb/hr SO_2	3/15/1995	
San Diego County APCD R53	Other sources of gaseous sulfur emissions where sulfur compounds emitted are not products of fuel combustion	0.05 % by volume dry, sulfur as SO_2	1/22/1997	

Sulfuric Acid Plants

Rule/Regulation	Applicability	Emission Limits	Compliance Date	Monitoring **
SCAQMD R469	Sulfuric Acid	500 ppm sulfur compounds (calculated as SO_2 dry) over 15 minute average; 198.5 lbs./hr sulfur compounds as SO_2	2/13/1981	
BAAQMD 9-1	Sulfuric acid plant equipment	300 ppmv SO_2 @12% O_2	3/15/1995	CEMS
San Diego County APCD R53	Other sources of gaseous sulfur emissions where sulfur compounds emitted are not products of fuel combustion	0.05 % by volume dry, sulfur as SO_2	1/22/1997	
NSPS 40 CFR Part 60 Subpart H	Sulfuric Acid production units	4 lb SO_2 per ton of acid produced (as 100% H_2SO_4)	6/14/1974	CEMS

Cement Kilns

Rule/Regulation	Applicability	Emission Limits	Compliance Date	Monitoring **
San Diego County APCD R53	Other sources of gaseous sulfur emissions where sulfur compounds emitted are not products of fuel combustion	0.05 % by volume dry, sulfur as SO_2	1/22/1997	
SJVUAPCD R4801	Any equipment that discharges gaseous sulfur compounds	0.2% by volume SO_2 dry, over 15 min-average	12/17/1992	

Glass Manufacturing

Rule/Regulation	Applicability	Emission Limits	Compliance Date	Monitoring **
San Diego County APCD R53	Other sources of gaseous sulfur emissions where sulfur compounds emitted are not products of fuel combustion	0.05 % by volume dry, sulfur as SO_2	1/22/1997	
SJVUAPCD R4354	Glass melting furnaces	0.90 lb SOx per ton glass produced (rolling 30-day average)	1/1/2011	CEMS

Information related to the U.S. EPA Consent Decree for FCCUs are summarized below:

Emission Limits	Compliance Date	Monitoring
BP: 50 ppmv SO_2 @ 0% O_2, 365-day rolling average; 150 ppmv SO_2 @ 0% O_2, 7-day rolling average	7/11/2005	CEMS
Tesoro: 36.2 ppmv SO_2 @ 0% O_2, 365-day rolling average; 69.1 ppmv SO_2 @ 0% O_2, 7-day rolling average	2/2/2006	CEMS
Valero: No set limit at this time due to an ongoing demonstration project with SO_2 reducing catalysts due by the compliance date.	4/30/2011	CEMS
ExxonMobil: 25 ppmv SO_2 @ 0% O_2, 365-day rolling average; 50 ppmv SO_2 @ 0% O_2, 7-day rolling average	12/13/2005	CEMS
Chevron: 25 ppmv SO_2 @ 0% O_2, 365-day rolling average; 50 ppmv SO_2 @ 0% O_2, 7-day rolling average	12/31/2005	CEMS
ConocoPhillips: 25 ppmv SO_2 @ 0% O_2, 365-day rolling average; 50 ppmv SO_2 @ 0% O_2, 7-day rolling average	3/1/2011	CEMS

Inlet Total PM Mass	mg	169.90	229.75	330.30	243.32	
Inlet Total PM - as found	gr/dscf	0.09602	0.10958	0.16454	0.12338	
Inlet Total PM at 3% O_2	gr/dscf	0.08770	0.09996	0.15006	0.11257	
Inlet PM emission rate	lb/hr	84.47	101.49	163.82	116.59	

Appendix D – Survey Questionnaires

Staff developed two Survey Questionnaires to collect information for this rule making process. The first Survey was sent out in 2008, and the second set of Survey was sent out in 2009. Please see below.

SOx RECLAIM - SURVEY QUESTIONNAIRE
July 23, 2009

Please provide the following information by August 7, 2009.

Water

1. What is the current water usage and distribution at your facility (e.g. xx gal/year (xx%) used in cooling tower, xx gal/year (xx%) used in refinery processes)?

2. Who is the water supplier for your facility? Does your facility have a maximum cap on the amount of water (fresh and recycled) that the facility can purchase from the supplier? If yes, please specify.

3. How many groundwater wells does your facility have? How much is your facility permitted to pump and how much is your facility currently pumping? Please provide a copy of the groundwater permit for your facility.

Wastewater

1. Your facility may own and operate its own wastewater treatment facility. What is the maximum capacity of this wastewater treatment facility? What is the normal rate of wastewater that your facility is currently handling? Please provide a brief description and schematic of the process.

2. After treating the wastewater within your facility, where does the facility discharge the wastewater to?

3. Does the facility send the wastewater to a third party for further treatment? If yes, who is this third party and what are the average and maximum amount sent to this third party treatment facility? Is there any limit to the amount that your facility can send?

4. Does your facility purchase recycled water to use in the processes at your facility? If yes, who is the supplier and what are the average and maximum amount that can be purchased?

5. Who is the wastewater regulator for your facility? Please provide us a copy of your facility's wastewater discharge permits.

Solid Waste

1. How does the refinery currently handle the catalyst fines from the ESPs? Where are they shipped (or sold) to and what is the quantity? Are they considered hazardous waste?

2. Who is the solid waste regulator for your facility? If your facility is subject to certain requirements on solid waste discharge, please provide a copy of the permits.

South Coast Air Quality Management District

SURVEY QUESTIONNAIRE
FOR PROPOSED AMENDED REGULATION XX
FURTHER SOx REDUCTION FOR RECLAIM
(Request Due Date – February 21, 2008)

Facility Contact

1. Please provide the facility contact for this project:

Name: _____
Title: _____
Phone Number: _____
Email Address: _____

Facility Top SOx Emitters

2. Please list the top 10 SOx emitters at your facility and provide the following information.

- Device description and device identification number
- Emissions (tons per day) in 2005, 2006, 2007
- SOx control technology used

Operational Data

3. Please provide the following information for the following seven specific equipment categories if they are on your facility's list of top ten SOx emitters.

Fluid Catalytic Cracking Units (FCCUs)

a) Please provide the following information:

- Feed rate, average and range (thousands barrels per day)
- Sulfur content of feed, average and range (percent by weight)
- Coke burn-off rate, average and range (thousand pounds per hour)
- FCCU catalyst manufacturer and catalyst recirculation rate (tons per hour)
- Average and range of flue gas exhaust flow rate from regenerator (millions dry standard cubic feet) and exhaust temperatures (degree Fahrenheit)
- Average and range of SOx concentration in the exhaust flue gas from the FCCU regenerator (ppmv at $\%O_2$)

b) Does the facility currently use FCCU SOx reduction catalysts? If yes, please provide the following information:

- Name of catalyst manufacturer and name of SOx reduction catalyst
- Usage rate (pounds of catalysts added per day, or pounds of catalyst per pound of FCCU catalyst)
- Baseline SOx emissions and control efficiency. If available, please submit a copy of manufacturer's quote including specifications and guarantee
- Costs of SOx reduction catalysts. Please provide annual operating costs and any modification costs to the FCCU if needed in order to use the SOx reduction catalysts.
- When were the SOx reduction catalysts first used in the FCCUs and how long has the facility been using SOx reduction catalysts?

c) Does the facility currently use, or plan to use, post combustion control device (e.g. wet scrubber)? If yes, please provide the following information:

- Brief description of the technology (e.g. scrubber)
- Design parameters (e.g. maximum flue gas flow rate, type of absorbent, absorbent flow rate, control efficiency, inlet and outlet ppmv, emission rate)
- Capital costs and annual operating costs for the control technology
- Installation date (or age of equipment)

d) Please provide the most current source testing information (e.g. inlet and outlet ppmv, control efficiency, flue gas flow rate, emission rate, and test method). Please submit a copy of test reports or results if possible.

Refinery Boilers, Refinery Heaters & Coal-Fired Fluidized Bed Boilers

a) Please provide the following information:

- Type of fuel used and fuel usage rate, range and average
- Sulfur content of fuel, range and average (percent by weight or ppmw)
- Flue gas exhaust flow rate, range and average (millions dry standard cubic feet)
- Annual average and range of the SOx concentrations in the exhaust flue gas (ppmv at 3%O2)

b) Does the facility currently use any SOx control technology for the boiler/heater? If yes, please provide the following information:

- Brief description of the technology (e.g. scrubber)
- Design parameters (e.g. maximum flue gas flow rate, absorbent flow rate, control efficiency, inlet and outlet ppmv, emission rate)
- Capital costs and annual operating costs for the control technology
- Installation date (or age of equipment)

c) Please provide the most current source testing information (e.g. inlet and outlet ppmv, control efficiency, flue gas flow rate, emission rate, and test method). Please submit a copy of test reports or results if possible.

Sulfur Recovery & Tail Gas Treatment Units

a) Please provide the following information on the current operational data of the sulfur recovery and tail gas treatment units, including the thermal oxidizers, if appropriate:

- Brief description of the sulfur recovery & tail gas treatment unit including device identification number of the units in the system
- Current design and actual capacity of the sulfur recovery & treatment unit, range and average
- Sulfur content of feed, range and average (percent by volume or ppmv)
- Current sulfur removal efficiency of the system, and method used to determine the sulfur removal efficiency
- Flue gas exhaust flow rate, range and average (millions dry standard cubic feet)
- Annual average and range of the SOx concentrations in the exhaust flue gas
- Installation date (or age of equipment)

b) Please provide the most current source testing information (e.g. inlet and outlet ppmv, control efficiency, flue gas flow rate, emission rate, and test method). Please submit a copy of test reports or results if possible.

Sulfuric Acid Manufacturing Process

a) Please provide the following information:

- Brief description of the basic and control technique/equipment in the sulfuric acid manufacturing process (e.g. furnace, waste heat boiler, catalytic converter, ESP, absorber, scrubber etc) including device identification number
- Design and actual production rate (tons of acid produced)
- Type and input rate of raw materials (e.g. spent sulfuric acid, sulfur)
- Flue gas exhaust flow rate, range and average, (millions dry standard cubic feet)
- Range and average of SOx concentrations in the exhaust flue gas (ppmv)
- Annual average SOx emission rate (lbs SOx per ton of acid produced)

b) Does the facility currently use SOx control technology for the process? If yes, please provide the following information:

- Brief description of the technology (e.g. dual absorption, wet gas scrubber)
- Design parameters (e.g. maximum flue gas flow rate, absorbent flow rate, control efficiency, inlet and outlet ppmv, emission rate)
- Capital costs and annual operating costs for the control technology
- Installation date (or age of equipment)

c) Please provide the most current source testing information (e.g. inlet and outlet ppmv, control efficiency, flue gas flow rate, emission rate, and test method). Please submit a copy of test reports or results if possible.

Container Glass Manufacturing Process – Melting Furnace

a) Please provide the following information:

- Design and actual capacity of each furnace (mmbtu/hr and tons of glass pulled)
- Type and input rate of raw materials (e.g. limestone, soda ash, cullet)
- Flue gas exhaust flow rate, range and average (millions dry standard cubic feet)
- Annual average and range of SOx concentrations in the exhaust flue gas (ppmv)
- Annual average emission rate for SOx (lbs SOx per ton of glass pulled)

b) Does the facility currently use SOx control technology for the process? If yes, please provide the following information:

- Brief description of the technology (e.g. scrubber)
- Design parameters (e.g. maximum flue gas flow rate, absorbent flow rate, control efficiency, inlet and outlet ppmv, emission rate)
- Capital costs and annual operating costs for the control technology
- Installation date (or age of equipment)

c) Please provide the most current source testing information (e.g. inlet and outlet ppmv, control efficiency, flue gas flow rate, emission rate, and test method). Please submit a copy of test reports or results if possible.

Coke Calcining Kiln

a) Please provide the following information on the current operational data of the coke calciner (kiln):

- Maximum and average feed rate (tons per year and per day of green coke)
- Maximum and average production rate (tons per year and per day of calcined coke)
- Type of fuel used, and maximum and average fuel usage rate
- Maximum and average flue gas exhaust flow rate (millions dry standard cubic feet and) and stack temperatures (degree Fahrenheit)
- Range of outlet SOx concentrations (ppmv at % O_2) and annual average
- Annual average SOx emission rate (lbs SOx per ton of glass pulled)

b) Does the facility currently use SOx control technology for the process? If yes, please provide the following information:

- Brief description of the technology (e.g. dry scrubber)
- Design parameters (e.g. production rate, maximum treated flue gas, absorbent flow rate, control efficiency, inlet and outlet ppmv, emission rate in lbs SOx per ton coke)
- Capital costs and annual operating costs for the control system
- Installation date (or age of equipment)

c) Please provide the most current source testing information (e.g. inlet and outlet ppmv, control efficiency, flue gas flow rate, emission rate, and test method). Please submit a copy of test reports or results if possible.

Portland Cement Kiln

a) Please provide the following information on the current operational data of the Portland cement kiln

- Maximum and average feed rate of raw materials (tons per year and per day)
- Maximum and average production rate (tons per year and per day of calcined coke)
- Type of fuel used, and maximum and average fuel usage rate
- Maximum and average flue gas exhaust flow rate (millions dry standard cubic feet and) and stack temperatures (degree Fahrenheit)
- Range of outlet SOx concentrations (ppmv at % O_2) and annual average

b) Does the facility currently use any SOx control technology for the process? If yes, please provide the following information:

- Brief description of the technology (e.g. dry scrubber)
- Design parameters (e.g. production rate, maximum treated flue gas, absorbent flow rate, control efficiency, inlet and outlet ppmv, emission rate in lbs SOx per ton coke)
- Capital costs and annual operating costs for the control system
- Installation date (or age of equipment)

c) Please provide the most current source testing information (e.g. inlet and outlet ppmv, control efficiency, flue gas flow rate, emission rate, and test method). Please submit a copy of test reports or results if possible.

Reports Submitted Under the U.S. EPA Consent Decree

4. If the facility must implement any control technology to further reduce SOx under a consent decree with the U.S. Environmental Protection Agency (EPA), please provide the District a copy of all reports and test results that the facility has been submitted to EPA on this subject.

Other Feasible Control Technology

5. Please provide the following information on any feasible control technology that could further reduce SOx from the above seven categories of equipment.

- A brief description of the technology, manufacturer's name, and control efficiency
- If available, estimated equipment costs, annual operating costs, cost effectiveness analysis, manufacturer's specifications, and guarantee
- If available, the facility's name that currently uses or will use this technology.

If you have any questions on the Survey Questionnaire, please contact:
Minh Pham, P.E.
Air Quality Specialist

Appendix E – Analysis for Rule 1105.1 Costs.

Note that to protect confidentiality, staff used different letters/numbers to refer to the different refineries and these are not the same as the letters/numbers used in the Staff Report of SOx RECLAIM and the Staff Report of Rule 1105.1.

After Rule 1105.1 was adopted in November 3, 2003, the refineries installed control equipment to meet the PM10 and ammonia emission standards of Rule 1105.1. Four refineries selected to install dry electrostatic precipitators (ESPs) and one refinery installed a combination of a wet gas scrubber and a wet electrostatic precipitator (WGS/WESP). A summary of the control equipment manufacturers, contractors, construction period, and reported costs by the refineries is shown in below. Staff's analysis comparing the reported costs and the estimated costs during the rule development is summarized below.

Refinery		Manufacturers	Contractors	Construction Period	Reported Costs
K	ESP	Hamon Research Cottrell	Davenport Engineering	12/2007 – 05/2009	$ 44 M
Y	ESP	Hamon Research Cottrell	Jacobs Engineering	10/2007 – 01/2009	$ 340 M
M	ESP	Hamon Research Cottrell	Hamon Research Cottrell	1993	$ 23 M
W	ESP	Hamon Research Cottrell	Hamon Research Cottrell	2007 - 2008	$ 121 M
X	WGS/WESP	ExxonMobil	Jacobs Engineering	07/2007 – 09/2008	$ 59 M
L	ESP	Hamon Research Cottrell	Jacobs Engineering	11/2006 – 08/2008	$ 102 M
				Total	$ 666 M

Refinery K

During the development of Rule 1105.1 in 2003, Refinery K indicated that they did not have enough space to install dry ESPs but planned to install a WGS to comply with the proposed rule. Refinery K developed a cost estimate for the project including a BELCO WGS, a purge treatment unit, and induced draft fan to overcome pressure drop, a gas-to-gas heat exchanger to reheat the plume, and a wastewater treatment unit to handle the waste. The estimated costs for the project were $68 million dollars. A consultant hired by WSPA, NEXANT, reviewed the costs estimated by Refinery K, and added additional costs for demolition, modification of the SRU/TGs, electrical substation, and wastewater treatment, tie-in costs for NOx control, paving, and opportunity lost costs for extended turnaround. The result was an estimate of $78.7 million dollars capital costs as shown in Table 1.[93]

In 2007-2008, Refinery K decided to install ESPs, and they reported that the project cost was $43.8 million as shown in Table 1. Fifty five percent of that cost, or approximately $36.8 million, was attributed to installation costs without identifying specific details. Refinery K indicated that they selected to install ESPs to save costs. The reported capital costs for the ESPs were about one halve of the estimated costs for the WGS project.[94]

[93] An Evaluation of the Feasibility and Costs for Control of PM-10 Emissions at South Coast Refinery FCCUs (SCAQMD Proposed Rule 1105.1), NEXANT, Inc. for The Western States Petroleum Association, May 2003.

[94] E-mail communication from Refinery K to SCAQMD on February 10, 2010 and at March 18, 2010 site visit.

TABLE 1
Cost Estimates and Reported Capital Costs (Million Dollars)

	Cost Estimates for WGS	Reported Costs for ESPs	Difference
Equipment Cost	68	7.0	10 times lower (68/7 = 9.7)
Demolition	0.5	36.8	3 times higher (36.8/10.7 = 3.4)
Electrical Substation	0.8		
Paving/Pile Driving	0.5		
Modification to wastewater treatment & SRU/TGs	1.1	Not needed	
NOx control tie-in	0.3		
Extended downtime	7.5		
Total Capital Costs	**78.7**	**43.8**	**2 times lower** (78.7/43.8 = 1.8)

Refinery Y

During the development of Rule 1105.1 in 2003, Refinery Y indicated that they would install a dry ESP to comply with the proposed rule. Refinery Y developed a cost estimate for the project including a Hamon Research Cottrell's ESP. There were also extensive costs for ducting/piping and site modification since Refinery Y planned to install the ESP far away from the FCCU. WSPA's consultant reviewed Refinery Y's cost estimates and added costs for additional ducting and supports, insulation, asbestos abatement, SCR/stack relocation, new foundations and paving, electrical instrumentation and controls, piping relocation, and demolition. The estimated capital costs were $48.9 million.[95] In 2007-2008, Refinery Y installed ESPs. Refinery Y reported that the total cost of the project was $340 million. The estimated costs and reported costs are presented in Table 2.[96]

The substantial differences in the reported costs and the cost estimates are shown in Table 2. The reported equipment costs are 35% higher than the estimated costs. The site preparation costs are almost the same as estimated. There are substantial differences in the installation costs including ducting, supports, electrical substation modification, and engineering/management costs. The reported installation costs are 30 times higher than estimated, and the overall reported costs are 7 times higher than estimated.

[95] An Evaluation of the Feasibility and Costs for Control of PM-10 Emissions at South Coast Refinery FCCUs (SCAQMD Proposed Rule 1105.1), NEXANT, Inc. for The Western States Petroleum Association, May 2003

[96] E-mail communication from Refinery Y to SCAQMD on July 7, 2010. Refinery Y reported the following: equipment/materials ($54 million), installation/demolition ($5 million), civil ($25 million), mechanical - steel/piping/ESP assembly ($109 million), electrical and instrumentation ($17 million), support crafts - cranes, scaffolding etc. ($60 million), and engineering and construction management ($75 million).

TABLE 2
Cost Estimates and Reported Capital Costs (Million Dollars)

	Cost Estimates	Reported Costs	Difference
Equipment Cost	40	54	35% higher (54/40=1.35)
Ducting/Support/ Insulation	4.8	186 [97]	30 times higher (186/5.55=30.5)
Induced fans	0.35		
Electrical Substation	0.4		
Demolition	2	25	Almost the same (25/23=1.1)
Asbestos Removal	0.15		
Contaminated Soil Disposal	0.1		
Foundations/Paving	0.75		
Site Upgrade	20		
Engineering/Management	Included above	75	---
SCR relocation	0.35	Not needed	---
Total Capital Costs	**48.9**	**340**	**7 times higher** (340/48.9 = 6.95)

Refinery # M

Refinery M installed a new ESP in 1993. Total capital costs were $13.6 million.[98] At a 3% inflation rate, the capital costs would be approximately $23 million in current dollars.[99]

TABLE 3
Reported Capital Costs (Million Dollars)

	Reported Costs
Equipment Costs	5.83
Installation Costs	7.80
Total Capital Costs	**13.63 (about 23 today)**

[97] The actual costs of $186 million = 109+60+17

[98] Fax communication from Refinery M to SCAQMD on March 9, 1995: Materials = $5,837,000; Engineering = $1,946,000; Construction labor = $4,610,000; Miscellaneous = $1,240,000; and Total Costs = $13.6 million.

[99] The Chemical Engineering Plant Cost Annual Index and the Marshall & Swift Cost Index show that there was a 3% inflation rate from 1993 to 2005. With a 3% inflation rate, the costs in current dollars would be (14) (1.03) exp (2010-1993) = (14) (1.03) exp (17) = (14) (1.65) = $23 million. In a recent e-mail communication with the SCAQMD on February 19, 2010, Refinery M used a 7% inflation rate to estimate the costs at (14)(1.07) exp(2010-1993) = $45 million and claimed the costs would be $60 million with extra compliance flexibility.

Refinery W

During the development of Rule 1105.1 in 2003, Refinery W indicated that they would install a dry ESP to comply with the proposed rule. Refinery W and WSPA's consultant developed a cost estimate for the project including a large ESP and extensive costs for ducting, relocation of a roadway, underground sewers and drains, piling, disposal of contaminated soil, new electrical substation, SCR, engineering/management, and extended shutdown. The estimated capital costs were $38 million. [100] In 2007-2008, Refinery W installed 3 ESPs and reported that the total cost of the project was $121.3 million. [101] The estimated costs and reported as actual costs by Refinery W are presented in Table 4.

The reported equipment costs and engineering costs are about 2 times higher than estimated. However, there are substantial differences in the construction and installation costs including ducting, supports, electrical substation modification etc., which cause the reported installation costs to rise up to 9 times higher than estimated, and the overall reported costs 4 times higher than estimated.

TABLE 4
Cost Estimates and Reported Capital Costs (Million Dollars)

	Cost Estimates	Reported Costs	Difference
Equipment Cost	8 – 12	15	2 times higher (15/8=1.9)
SCR	10	Not specified	---
Site preparation and Construction	9.1[102]	95.4	9 times higher (95.4/10.5=9.1)
Electrical Substation	1.4		
Engineering/Management	4.8	10.9	2 times higher (10.9/4.8=2.3)
Extended turnaround	2.7	Not needed	
Total Capital Costs	**38.0**	**121.3**	**4 times higher** (121/33=3.67)

[100] An Evaluation of the Feasibility and Costs for Control of PM-10 Emissions at South Coast Refinery FCCUs (SCAQMD Proposed Rule 1105.1), NEXANT, Inc. for The Western States Petroleum Association, May 2003. NEXANT estimated ESP costs from $8 - $12 million. Site preparation costs included relocating a refinery road ($400,000), relocating sewers/drains/piping ($650,000), disposal of contaminated soil ($100,000), piling ($350,000), and 35% contingency ($7.6 million). New electrical substation was added ($800,000) and existing distribution system was modified ($600,000). Engineering and management costs were estimated ($800,000) and owners costs ($4 million)

[101] E-mail communication from Refinery W to SCAQMD on March 30, 2010. Refinery W reported the following costs: equipment/materials ($15 million), construction ($62.6 million), material ($21.3 million), incentive ($1.2 million), pre-capital expense ($2.9 million) + demolition ($2.9 million), engineering ($10.9 million) and owner's costs ($4.5 million)

[102] This footnote is to estimate the estimations in Table 4. Site preparation = 0.4+ 0.65+0.35+0.10+ 7.6 = 9.1. Electrical substation = 0.8+0.6 = 1.4. Engineering Management = 0.8+4.0 = 4.8. Construction costs = 62.6+21.3+1.2+4.5+2.9+2.9=95.4. In Table 5, Construction costs = 24.4+ 7.9+ 1.0 = 33.3. In Table 6,

Refinery X

In 2003, Refinery X planned to install 2 ESPs and 2 SCRs to meet R.1105.1 limits at the costs of $43 million.[103] However, in 2007-2008, Refinery X decided to install a WGS at the costs of $58.9 million.[104] The estimated and reported costs are provided in Table 5.

TABLE 5
Cost Estimates and Reported Capital Costs (Million Dollars)

	Cost Estimates	Reported Costs	Difference
Equipment Cost	28	18.9	35% higher (18.9/14 = 1.35)
CO boiler or SCR	10	Not included	
Ducting/Support & Insulation	3.1	33.3	6 times higher (33.3/5.3 = 6.3)
Electrical Substation	0.8		
Asbestos Removal	0.1		
Contaminated Soil Disposal	0.1		
Owner's Costs	1.2	6.7	6 times higher (6.7/1.2 = 5.6)
Total Capital Costs	**43.3**	**58.9**	**2 times higher** (58.9/33.3 = 1.8)

Comparing the two estimates, the costs for the WGS/WESP ($18.9 million including a $5 million cost for a fin fan cooler) is about the same as a single, large ESP ($14 million).
The major differences in the 2010 reported as actual costs and the 2003 estimates are in the installation and owner's costs. The reported installation costs including construction, demolition, and engineering and the reported owner's costs are approximately 6 times higher than 2003 estimates. The overall 2010 reported costs are approximately 2 times higher than the 2003 estimates (not including the SCRs), and three times higher than the ESP costs.

Refinery L

During the development of Rule 1105.1, Refinery L indicated that they would install ESPs to meet the requirements of Rule 1105.1. Refinery L hired a consultant (Jacobs Engineering) to develop a feasibility and cost estimate to comply with the proposed Rule 1105.1 limit for both ESPs and WGS. Jacobs Engineering recommended Refinery L to select dry ESPs, and they designed the ESPs with 25% larger collecting area. In their estimates, they assumed the costs of project engineering and

[103] An Evaluation of the Feasibility and Costs for Control of PM-10 Emissions at South Coast Refinery FCCUs (SCAQMD Proposed Rule 1105.1), NEXANT, Inc. for The Western States Petroleum Association, May 2003. The costs were estimated for two new ESPs in parallel, 200% capacity total, with two new SCRs.

[104] E-mail from Refinery X to SCAQMD on March 19, 2020. Refinery X reported the following: equipment/materials ($18.9 million), construction ($24.4 million), engineering ($7.9 million), demolition ($1 million), and owner's costs ($6.7 million).

services averaged 18.7% of the total capital costs. The total estimated costs are $57 million dollars.[105] The cost estimates are presented in Table 12-3-6.

In 2007-2008, Refinery L installed ESPs. The costs of $102 million dollars reported as the actual costs for this project provided by Refinery L are presented in Table 6. [106]

TABLE 6
Cost Estimates and Reported Capital Costs (Million Dollars)

	Cost Estimates	Reported Costs	Difference
Equipment Cost	10	17.547	2 times higher (17.5/10 = 1.8)
Project Management	10.66	6.23	
Engineering		9.27	2 times higher (15.5/10.66 = 1.5)
Construction Indirects	36.34	15.60	2 times higher (69.1/36.3 = 1.9)
Construction Directs		45.202	
Start –Up		2.269	
Demolition		0.378	
Other Costs		5.635	
Total Capital Costs	**57**	**102.135**	**2 times higher** (102/57 = 1.8)

The differences in the 2010 reported costs and the 2003 estimates are shown in Table 6. The reported equipment costs, installation costs, and capital costs are consistently about 2 times higher than the 2003 estimates.

Summary & Staff's Analysis

A comparison of the costs reported by the refineries as actual costs, and the estimated costs during the rule development process are provided in Table 7 and staff's analysis is as follows.

Equipment Costs

The reported equipment costs are not much different than estimated. The reported costs are about 35% higher for Refinery Y and Refinery X, 2 times higher for Refinery W and L, and 10% lower for Refinery K. The differences are due to inflation (about 3% between 2003 and 2010), extra capacity for redundancy built in the design, and the price surge of steel in 2007-2008 time frames.

[105] An Evaluation of the Feasibility and Costs for Control of PM-10 Emissions at South Coast Refinery FCCUs (SCAQMD Proposed Rule 1105.1), NEXANT, Inc. for The Western States Petroleum Association, May 2003. The costs were estimated for a large ESP with 25% more capacity.

[106] E-mails communication from Refinery L to SCAQMD on January 27, 2010 and February 08, 2010 provide detailed information in cost breakdown. Staff combined the costs provided into these following categories a) Project Management includes contractor costs ($5.760 million) and owner costs ($0.471 million); b) Engineering costs include contractor costs ($9.264 million) and owner costs ($0.01 million); c) Construction Indirect Owner Costs of $1.050 million is for temporary facilities/services/utilities. Construction Indirect Contractor Costs of $14.549 million includes construction management ($6.349 million), equipment not provided by sub-contractors ($4.303 million), and temporary facilities/services/utilities ($3.898 million); d) ISBL Construction Directs of $62.719 million include equipment ($17.547 million); civil/site ($0.419 million), concrete ($0.901 million), steel ($6.331 million), piping ($3.915 million), process air ($2.479 million), electrical ($19.120 million), process control ($5.719 million), paint/insulation/fireproofing ($6.317 million)

WGS/WESP versus ESPs

Refinery X planned to use ESPs but installed a WGS. Refinery K planned to use WGS but installed ESPs. Refinery X data shows that there is no difference in the equipment costs of a WGS/WESP/fin fan cooler system versus two ESPs to meet the requirement of Rule 1105.1 and also to mitigate the plume if necessary. Refinery K data shows that the equipment costs for ESPs are 10 times lower than the costs for a WGS system. It seems that Refinery K over-estimated the costs of their WGS system by building a larger unit than necessary, adding a new wastewater treatment to handling the waste that could be handled by the purge treatment system, and using a gas-to-gas reheat exchanger instead of a fin-fan cooler.

TABLE 7
Cost Estimates and Reported Costs (Million Dollars)

	Ref M	Ref K	Ref Y	Ref W	Ref X	Ref L	Total
Estimated Capital Costs	---	78.7	48.9	38.0	43.3	57.0	**266.0**
Reported Equipment Costs	*7.0*	*7.0*	*54.0*	*15*	*18.9*	*17.5*	***119.4***
Reported Capital Costs [107]	23.0	43.8	340.0	121.3	58.9	102	**666.0**
Reported Capital Costs / Estimated Capital Costs	---	0.6	7.0	4.0	1.8	1.8	**2.5 (average)**
Reported Capital Costs (2010) / Reported Equipment Cost (2010)	*2.0*	*6.3*	*6.2*	*8.1*	*3.1*	*5.8*	***5.6 (average)***

Installation Costs

There are substantial differences in reported installation costs versus estimated installation costs: 2 times higher for Refinery L, 3 times higher for Refinery K, 6 times higher for Refinery X, 9 times higher for Refinery W, and 30 times higher for Refinery Y. Note that site preparation did not cause this substantial difference in Refinery Y case. The vast differences originate from ducting, supports, electrical substation modification, engineering, management, and labor costs. Refinery L provided the following explanations which may apply to other refineries as well: [108]

— Materials Costs. The reported cost includes a) steel, concrete, site excavation, painting, fireproofing for foundation and buildings, b) insulation for ducting/piping, c) substantial amount for wiring/conduit for substation and power distribution, and d) substantial amount for instrument/controls. These categories are underestimated in 2003, especially the costs for steel, electrical wiring, and instrument/controls. Costs of steel increased by at least 2 in 2008 time frame.

[107] WSPA's estimates are in the neighborhood of $750 million based on a wrong estimate for Refinery M at $60 million using 7% inflation rate and $70 million AFE costs for Refinery X. That is, 43.8 + 340 + 60 + 121.3 + 70 + 102.1 = $742 million. Refinery X actual installation costs are only $58.9 million.

[108] E-mail communication from Refinery L to SCAQMD on May 27, 2010.

— Inflation. Construction was completed in 2008, and during 2008, there was a period of hyper inflation in heavy industrial construction equipment and labor costs.

— Union Labor Costs. Due to the volume of construction activity in late 2007 to early 2008, union construction resources were used while the estimate in 2003 was based on non-union construction labor. There is an overall cost differential of over 30% between non-union and union labor forces.

— Compressed Construction Schedule. To meet a FCCU turnaround date, the construction schedule was accelerated. It is important to note that the litigation filed by WSPA immediately after Rule 1105.1 was adopted in November 2003, and subsequent appeal of the original judgment, contributed significantly in further compressing the construction schedule. All five refineries delayed the construction of the control equipment until WSPA finally lost the law suit in late 2006. This scheduling constraints in conjunction with the limited number of control equipment vendors/manufacturers and contractors that the refineries selected to contract with for this project contributed substantially to the price escalation.

— Redundancy. In order for the vendor to guarantee R1105.1 level of particulate capture, the vendor had to add extra capacity to the ESP, larger than estimated in 2003.

Capital Costs

Overall, the reported capital costs are higher than estimated: 2 times higher for Refinery K, X and L, 4 times higher for Refinery W, and 7 times higher for Refinery Y. On average, the reported capital costs are 2.5 times higher than estimated.

Refinery Y and W are the two outliers from the average with reported costs about 2-3 times higher than other refineries:

— Refinery Y's total gas flow rate (540,111 acfm reported in 2003) is about 25% higher than Refinery L's (436,035 acfm total gas flow)[109] however the equipment costs of Refinery Y ($54 million) is about 3 times higher than that of Refinery L ($17.5 million), and their reported capital costs ($340 million) is also about 3 times higher than Refinery L's ($102 million).

— Refinery W's total gas flow rate (218,628 acfm reported in 2003) is about the same as Refinery K's (212,514 acfm total gas flow) however the reported equipment costs of Refinery W ($15 million) is about 2 times higher than Refinery K's ($7 million), and their capital costs ($121 million) is about 3 times higher than Refinery K's ($43.8 million).

— Refinery Y and #4 did seem to add extraordinary capacity to their ESPs and upgrade other systems at their sites along with installing the ESPs.

[109] SP Environmental Report, August 2003.

Comparison between Costs Reported As Actual Capital Costs and Equipment Costs

The costs reported by the refineries as actual capital costs are 2 times higher than the equipment costs for Refinery M, 3 times higher for Refinery X, 6 times higher for Refinery K, Y, and L, and 8 times higher for Refinery W. It is interesting to note that there are two distinct groups: Refinery M and X, with a ratio between 2 and 3, and Refinery K, Y, W and L with a ratio between 6 and 8. It appears that Refinery K, Y, W and L may have spent additional money on upgrading other existing systems (ducting, supports, electrical substation modification, NOx/SOx CEMS) and used more in engineering and management compared to Refinery X and L. However, on average, the reported capital costs are about 5-6 times higher than the equipment costs. **It is important to note that the consultants hired to assist staff with the BARCT and cost analysis of the proposed amended Regulation XX (SOx RECLAIM), namely ETS, Inc., AEC and NEC, have used a ratio of 5x in their cost analyses for refineries.**

20	20	Allianz	Germany	125,999.0	-11.5

The top 20 corporations are listed in the table above. The table above contains information listed in the list of "Fortune Global 500", Fortune magazine, dated July 26, 2010. As explained in the Fortune magazine, Fortune Global 500 ranks 500 corporations that have the largest revenues in the world, in descending order, according to their total revenues for their respective fiscal years ended on or before March 31, 2010. All companies on the list of Fortune Global 500 must publish financial data and report part or all of their figures to a government agency. Figures in the lists are as reported, and comparisons are with the prior year's figures as originally reported for that year. The list shows that general global economy is down for almost all corporations in 2008-2009. However, several of the corporations such as ExxonMobil, BP, Chevron, and ConocoPhillips still remain as the top 20 richest corporations in the world.

Appendix I – Projected 2019 Emissions & Growth Factors

(Authors: Susan Yan, Kathy Hsiao, and Ali Ghasemi)

2019 RECLAIM SOx Baseline Emissions and Reductions Calculation

The AQMD's Annual Emission Reports (AER) team used the FY97-98 audited and revised SOx emissions provided by the AQMD's RECLAIM Engineering & Compliance team on February 23, 2010 as the base. The AQMD's AER team refined and distributed the audited data by rule, by facility and by equipment types. The distributed 97-98 SOx baseline emissions with a total of 19.48 tons per day are then grown to 2019. Staff used composite growth factors from 2002 to 1997 and forecast growth factors from 2002 to 2019 of the 2007 AQMP to project SOx emissions in 2019. There were two existing SOx rules, R431.1 and R431.2, and seven new rules impacting the SOx universe. For this analysis, there should be no overlapping controls among rules. Therefore, overlapping controls from R431.1 & R431.2 are being overridden by the new rules. Sources not impacted by the new rules reflect controls from R431.1 & 431.2 when appropriate. The seven new rules with 2019 control factors impacting the SOx universe are:

Rule#	Description	2019 Control Factor*
R468	Sulfur Recovery Units (SRUs)	0.63
R469	Sulfuric Acid Units	0.04
R1105.1	FCCU	0.06
R1109	Refineries Boilers & Heathers	0.20
R1117	Glass Melting Furnace	0.01
R1119	Coke Calciner	0.05
R1156	Portland Cement Mfg	0.74

*Draft Staff Report, page I-95 to I-99, Agenda#27 of 1/8/10 Board meeting.

The 2019 growth only emissions and the 2019 remaining SOx emissions are calculated to reflect controls from all rules. The 2019 SOx baseline with growth only, reductions and remaining emissions by rule are listed below:

Number	Description	97-98 Audited Emissions	2019 Growth only Emissions	Reductions from Rules	2019 Remaining Emissions
R468	Sulfur Recovery Units	2.03	2.03	0.75	1.28
R469	Sulfuric Acid Units	1.06	1.37	1.31	0.05
R1105.1	FCCU	5.68	5.68	5.34	0.34
R1109	Refineries Boilers & Heaters	6.11	6.11	4.88	1.22
R1117	Glass Melting Furnaces	1.71	2.48	2.45	0.02
R1119	Coke Calciner	1.31	1.31	1.25	0.07
R1156	Portland Cement Mfg	0.53	1.36	0.35	1.01
R431.1&2	Others	1.06	1.18	0.05	1.12
	Total (tons per day)	19.48	21.51	16.40	5.12

The above resulting table with more details is sent to the Rule Staff for further analysis.

Composite Growth Factors (2005-2019)

Rule Staff requested 2005-2019 composite growth factors for R469 (Sulfuric Acid Units), R1117 (Glass Melting Furnace) and R1156 (Cement Mfg.). Using growth factors in the 2007AQMP by county and by facility, the FY97-98 audited SOx values provided by the RECLAIM group are projected to 2005 and 2019. The projected emissions are then grouped by rule by facility. To calculate the composite growth factors from 2005 to 2019 by rule, staff divides sum of 2019 growth-only emissions by sum of 2005 growth-only emissions for each rule.

TABLE OF CONTENTS

NOTE

Final Staff Report, Part 2, includes a summary of ETS, Inc./AEC's analyses and NEXIDEA's analyses in 2008-2009 time frame. In 2010, staff contracted Norton Engineering Consultants (NEC) to review the first set of consultants' analyses, and conducted a cost effectiveness analysis based on NEC's recommendations, which is described in Section 12.2, Chapter 12 of the Final Staff Report, Part 1. The non-confidential reports of ETS, Inc./AEC, NEXIDEA and NEC are available for public information and are posted on the AQMD website. The biographies of the consultants Marshall Bell, Robert Kunz, John McKenna, and James Norton are included in Appendix B of this Final Staff Report, Part 2.

Chapter 1– Request for Proposals & Contract Awards

1.1 Request for Proposal (RFP)

On July 11, 2008, the Governing Board approved a release of Request for Proposal (RFP) to obtain proposals from qualified contractors to conduct an engineering study on existing commercially viable control technologies to further reduce SOx emissions from RECLAIM facilities to assist staff in identifying Best Available Retrofit Control Technologies (BARCT) to be implemented within the 2011-2014 time frame which would help the Basin attain the PM2.5 ambient air quality standards by the 2015 deadline. The project consisted of three (3) modules with a total budget of $375,000.00 as shown in Table 10-1: [1, 2]

1. Module 1 was to seek an engineering evaluation and cost analysis assessment on SOx reducing additives used in fluid catalytic cracking units.

2. Module 2 was to seek an engineering evaluation and cost analysis assessment on SOx control technologies for refinery fuel gas and sulfur recovery/tail gas treatment units.

3. Module 3 was to seek an engineering evaluation and cost analysis assessment on wet/dry scrubbing technologies for seven categories of equipment identified in Part I of this report: 1) FCCUs, 2) refinery SRU/tail gas systems, 3) refinery heaters/boilers, 4) coke calciner, 5) sulfuric acid plant, 6) container glass melting furnaces, and 7) cement kilns & a coal fired boiler located at a cement manufacturing facility.

[1] South Coast Air Quality Management District Board Meeting July 11, 2008, Agenda # 29, Report of RFPs and RFQs Scheduled for Release in July. July 11, 2008.

[2] South Coast Air Quality Management District, Request for Proposal, RFP #P2009-01, Evaluation of Emission Control Technologies for Further Reducing Sulfur Oxides Emissions from Stationary Sources in the South Coast Air Quality Management District's RECLAIM Program. July 11, 2008.

Table 1-1
List of Modules and Estimated Budget for SOx RECLAIM RFP

Project Modules	Budget
Module 1- FCCU DeSOx Additives	$36 K
Module 2 – Refinery SRU/Tail Gas and Fuel Gas Systems	$124 K
Module 3 – Wet/Dry Scrubbers for	
FCCUs, SRU/Tail Gas Systems, Boilers/Heaters	$133 K
Coke Calciner	$14 K
Sulfuric Acid Mfg Plants (w or w/o Cesium)	$24 K
Container Glass Melting Furnaces	$14 K
Cement Plant (Kilns & Coal fired boiler)	$15 K
Total	$360 K (+ $15 K for meetings)

The contractor was asked to complete five specific tasks for each module (or submodule):

1. Identify promising existing commercially viable SOx control technologies/manufacturers;
2. Conduct field assessment and site-specific engineering evaluations;
3. Perform independent costs and cost effectiveness analysis;
4. Prepare reports describing the methodology, findings and recommendations; and
5. Attend in person and give testimony at the AQMD Governing Board hearings for the proposed amended rule as expert witness if asked by staff.

1.2 Contract Awards

After receiving approval from the AQMD Governing Board in July, staff released the RFP and conducted an extensive 1-month outreach in accordance with the District's Procurement Policy and Procedure. In addition, since this project is highly technical in nature, staff contacted eighteen (18) highly specialized contracting firms/contractors recommended by vendors and manufacturers of air pollution control equipment and the Western State Petroleum Association (WSPA). As a result of this effort, within a short time frame, staff received and accepted a total of six (6) technical proposals submitted by the contractors on August 15, 2008.

A four member panel was convened to evaluate the proposals including: one AQMD Assistant Deputy Executive Officer from Planning, Rule Development, and Area Sources Division; one AQMD Supervisor of the Best Available Control Technology team; one AQMD Supervisor of the Refinery Team; and one representative from WSPA. The evaluation process completed in August and staff drafted a proposal to present to the Board.

At the Board meeting on September 5, 2008, the Governing Board approved staff's proposal and awarded the contracts to two consultants, ETS, Inc. and Nexidea, Inc., to conduct the study for this project at their bidding costs shown in Table 10-2. The total amount of awards provided for

this project was $334,860. [3, 4, 5] Note that no contract was awarded to any of the proposals to conduct the Module 1 evaluation.

Table 1-2
List of Contracting Firms and Awards

Project Modules	Consultant Firm	Awards
SRU/Tail Gas & Fuel Gas Systems	ETS	$123,933
Wet/dry scrubbers for FCCUs, SRU/tail gas, boilers/heaters	ETS	$130,107
Wet/dry scrubbers for glass melting furnaces	ETS	$13,910
Wet/dry scrubbers for kilns & coal fired boiler	ETS	$13,910
Attending meetings as requested by AQMD staff	ETS	$7,500
	Total for ETS	*$289,360*
Wet/dry scrubbers for coke calciner (module 3-B)	Nexidea	$14,000
Wet/dry scrubbers for sulfuric acid plants	Nexidea	$24,000
Attending meetings as requested by AQMD staff	Nexidea	$7,500
	Total for Nexidea	*$45,500*
	Total	**$334,860**

Note: Since only one refinery voluntarily participated in the short-term testing with FCCU DeSOx additives, staff decided to conduct the analysis for Module 1 in-house.

The consultants started the projects immediately after receiving the awards. First, the consultants and staff scheduled and conducted site visits at BP, Chevron, ConocoPhillips, Tesoro, Valero, ExxonMobil, California Portland Cement Corp., Owens Brockway, and Rhodia Inc. in September - October 2008. During these site visits, the consultants gathered all necessary technical information on equipment and operating conditions, discussed with the facilities on operational characteristics of the equipment, observed the physical layout of the equipment, as well as listened to any concerns or foreseen constraints provided by the refinery technical experts related to future prospective add-on control devices.

After the site visits, the consultants conducted their own independent research, contacted the control manufacturers and vendors, gathered cost information, and performed their own independent engineering analysis on commercially available control technologies and cost effectiveness. In October 2008, the consultants developed the draft reports which were distributed to the affected facilities and AQMD staff for comments.

[3] South Coast Air Quality Management District Board Meeting September 5, 2008, Agenda # 3, Execute Contract to Evaluate Emission Control Technologies for Further Reducing Sulfur Oxides Emissions from Stationary Sources in the SCAQMD SOx RECLAIM Program. September 5, 2008.

[4] South Coast Air Quality Management District, Contract# C09104 with Nexidea, Inc., Evaluation of Emission Control Technologies for Further Reducing Sulfur Oxides Emissions from Stationary Sources in the SCAQMD's RECLAIM Program. September 5, 2008.

[5] South Coast Air Quality Management District, Contract# C09105 with ETS, Inc., Evaluation of Emission Control Technologies for Further Reducing Sulfur Oxides Emissions from Stationary Sources in the SCAQMD's RECLAIM Program. September 5, 2008.

After addressing all comments received from the facilities, as well as AQMD staff, the consultants finalized their analyses and reports for coke calciner, cement kilns, coal fired boiler, glass furnaces, and sulfuric acid plant on December 16, 2008 as planned in the contracts.

Because of the complexity associated with the refinery systems and extensive communications between the consultants and the refineries, the consultants finalized their engineering analyses for FCCUs, SRU/tail gas, and fuel gas treatment systems in April 20, 2009, four months after the anticipated dates specified in the contract.

A summary of the consultants' recommendations in these engineering studies are provided in Chapter 11 through Chapter 16.

Chapter 2 – Nexidea's Analysis for Coke Calciner & Sulfuric Acid Plant

Nexidea, Inc. (Marshall Bell) [6, 7] was awarded the contract to study the control technologies for a coke calciner and two sulfuric acid plants in the District (named as Facility A, B and C in the consultant's reports). Nexidea Inc.'s analysis and results are summarized this chapter.

2.1 Recommended BARCT Levels

Nexidea's final conclusions in this study are summarized below:

- It is feasible and cost effective to reduce SOx emissions to a level of 5 ppmv using wet scrubbing with caustic solution from coke calciner and sulfuric acid plants. However, the consultant recommended the District to set BARCT at 10 ppmv due to process control related issues. For sulfuric acid plants, the consultant recommended a BARCT level of 0.14 lbs per ton acid, and for the coke calciner, the consultant recommended a BARCT level of 0.25 lbs per ton coke. Excerpts from the consultant's study are presented below:

  "*The results of the study show that simple caustic treating can cost effectively reduce SO2 emissions to less than 5 ppmv for the all of the units in the study; however, the recommended BARCT level is 10 ppmv due to control issues at near-zero SO2 levels. It is recommended that Facility B Acid Plant and Facility C Calciner add a caustic scrubber to meet the 10 ppmv SO2 level. Facility A Acid Plant already uses an SO2-selective amine to reduce SO2 to 20 ppmv. That unit can be revamped at low cost to meet a 10 ppmv SO2 level, thus addition of a caustic treater to that unit is not recommended.*

  Table 1 presents a summary of the key findings of this study. Recommended BARCT is 10 ppmv SO2, limited by process control issues…..

  Table 1: Summary of Recommendations

Equipment	***BARCT Level***	***Emission Reductions***	***Cost Effectiveness***
Facilities A and B	*0.14 lbs SOx/ton acid (10 ppmv)*	*<0.1 tpd (A)* *1.1 tpd (B)*	*$1.4K - $5.6K*
Facility C	*0.25 lbs SOx/ton coke (10 ppmv)*	*1 tpd*	*$2.5K - $5.0K*

  "

[6] A biography of Mr. Marshall Bell is attached in Appendix II-B of this report.

[7] SOx RECLAIM Final Report – Wet/Dry Scrubbing Technology for Sulfuric Acid Plants and Coke Calciner, Nexidea Inc., December 2008.

2.2 Control Technology & Costs

To arrive at the conclusions presented above, Nexidea, Inc. conducted a literature research on wet/dry scrubbing control technology, both regenerative and non-regenerative. The consultant contacted four (4) vendors identified in Part I of the Staff Report and listed below for basic sizing and cost information to achieve 5, 10, and 20 ppmv SOx.

- Cansolv Technologies, Inc.
- Monsanto Envirochem Systems (MECS)
- Belco Technologies
- Tri-Mer

As stated in Nexidea's report:

> "*All four companies were sent requests for basic sizing and cost information for gas treating facilities that can reduce SO2 emissions. Each was asked to supply designs to meet 5, 10 and 20 ppmv SO2 in the treated gas streams. Belco, Tri-Mer and MECS responded with proposals. Cansolv Technologies responded with a letter stating that their technology is not economically attractive as a polishing unit, and they will not bid on Facility B or coke calciner. They will support the necessary upgrades to Facility A's Cansolv Unit to allow it to meet a 10-ppmv SO2 level*."

All four vendors responded that they could achieve 5 ppmv SOx if all process variables are carefully controlled and monitored. Three out of four vendors provided sizing and cost information to achieve 5 ppmv SOx. All four vendors indicated that they could easily treat the existing gas streams from the sulfuric acid plants and the coke calciner to 10 ppmv, and all four vendors provided sizing and cost data for this scenario:

> *"Both Sulfuric Acid Plants and the Coke Calciner start with relatively low levels of SO2 in the current discharge streams: 20 to 145 ppmv. Treating down to 10 ppmv SO2 is easy and straightforward with caustic treating. Belco, Tri-Mer and MECS all state that they can provide designs that will achieve SO2 levels down to 1-2 ppmv with caustic treating for Facilities B and C. Cansolv can achieve 10 ppmv SO2 with minor upgrades to the Facility A Acid Plant, and believe that 5 ppmv is possible if all process variables are carefully controlled."*

Accurate process control at all load changes is critical to achieve 5 ppmv SOx outlet concentration. The consultant recommended 10 ppmv as BARCT to provide the operators some room to respond to plant load changes and to reduce possible scaling of the absorber unit, usage of caustic, and load to the effluent treatment plant:

> *"The recommended treatment level is 10 ppmv for all three facilities. The reason for this slightly higher value is that treating to 5 ppmv is essentially treating to zero. At this extremely low level, control over caustic injection becomes difficult. Refer to Figure 1, which shows caustic addition versus SO2 in the treated gas. Note that the caustic injection rate is given in gallons per hour. A very small change in caustic addition rate*

has a large impact on SO2 level. Even if the caustic is diluted to 20%, the injection rate is still very small, and normal load changes in the units can make constant control difficult. Belco warns that control at <5 ppmv requires an increase in the pH of the caustic solution. As the pH rises, the tendency towards scaling the absorber tower and its internals increases, and the composition of makeup water to the unit must be carefully watched. If the pH is raised too high, it is possible to start absorbing CO2, which can produce a hard, insoluble sodium carbonate scale in the tower. Control at <5 ppmv almost certainly will result in over-injection of caustic, which is both wasteful and adds to the treating load in the effluent treatment plant. Control at 10 ppmv gives the operator more control room to respond to plant load changes without undue attention to the unit."

BELCO and Tri-Mer provided the consultant the inside battery limit (ISBL) equipment costs for caustic scrubbers, whereas MECS supplied the total installed equipment (TIC) for caustic scrubber. It should be noted that the costs for the caustic scrubbers were the same regardless of the SOx desired outlet concentrations (5, 10 or 20 ppmv). Cansolv supported the revamping costs of existing control at Facility A estimated by the contractor.

The estimated installed equipment costs provided in the consultant report were listed in the table below included 1) a 20% location factor increase to account for the difference in labor costs between the U.S. Gulf Coast and the Los Angeles area; and 2) a 35% contingency factor increase to account for other outside battery limit costs that might be needed for the project (e.g. utility upgrade and upgrade for effluent treating system.) added to the base costs.

"*Table 1: Estimated Installed Equipment Costs*

	Facility A	*Facility B*	*Facility C*
Belco	*$3,090,131*	*$6,579,231*	*$13,302,633*
Trimer	*$2,999,249*	*$13,316,664*	*$21,059,914*
MECS	*$4,043,137*	*$7,497,015*	*$16,826,926*
Cansolv	*$500,000*		

The vendors provided the consultant the following information to estimate the operating costs of the equipment:

- Electric power, kilo-watt
- Makeup water, gallons per minute
- Caustic solution (50% grade), gallons per hour
- Waste water treating, gallons per hour
- Operating/Maintenance man-power, # of people

The major differences in the operating costs for the three desired outlet SOx concentrations 5, 10, 20 ppmv were simply the costs of more caustic solution and increased effluent to the waste water treatment.

2.3 Emission Reductions & Cost Effectiveness

The estimated emission reductions from the 2005 actual reported emissions[8] to the feasible levels (5, 10, and 20 ppmv) were presented in the table below from the consultant's final report:

"*Table 3: Estimated Emissions Reductions*

	TPD SO2 Reduction
Facility A @ 5 ppmv	*0.050*
Facility A @ 10 ppmv	*0.033*
Facility A @ 20 ppmv	*NA*
Facility B @ 5 ppmv	*1.192*
Facility B @ 10 ppmv	*1.149*
Facility B @ 20 ppmv	*1.064*
Facility C @ 5 ppmv	*1.122*
Facility C @ 10 ppmv	*0.997*
Facility C @ 20 ppmv	*NA"*

The consultant estimated the following cost effectiveness numbers assuming a 25-year life of caustic scrubbers, 4% interest rate, and using a cost effectiveness equation provided by staff:

"*Table 2: Cost Effectiveness*

	Cansolv	*Tri-Mer*	*Belco*	*MECS*
Facility A @ 5 ppmv	*NA*	*$16,682*	*$17,596*	*$18,675*
Facility A @ 10 ppmv	*$5,556*	*$24,906*	*$26,273*	*$27,892*
Facility A @ 20 ppmv	*NA*	*NA*	*NA*	*NA*
Facility B @ 5 ppmv	*NA*	*$2,158*	*$1,594*	*$1,458*
Facility B @ 10 ppmv	*NA*	*$2,229*	*$1,644*	*$1,503*
Facility B @ 20 ppmv	*NA*	*$2,388*	*$1,77*	*$1,605*
Facility C @ 5 ppmv	*NA*	*$3,375*	*$2,469*	*$2,624*
Facility C @ 10 ppmv	*NA*	*$3,768*	*$2,749*	*$2,923*
Facility C @ 20 ppmv	*NA*	*$4,946*	*$3,589*	*$3,821*

[8] The consultant indicated in his report that the following existing average SOx concentrations were provided which the consultant later used in his estimated emission reductions:

"Facility A Acid Plant: 20 ppmv SOs
Facility B Acid Plant: 145 ppmv SO2
Facility C Coke Calciner: 50 ppmv SO2
.....the potential reduction in SO2 from Facility C based on the 50 ppmv level is higher than reported... suggests that ...this study may overstate the potential emission reduction from Facility C."

The consultant indicated that the current levels reported to the District "…..*are in the 20 - 30 ppmv range*".

2.4 Plot Space

The spaces for caustic scrubbers and associated equipment (e.g. ID fan) provided by the vendors and estimated by the consultant were summarized below:

	Facility A	Facility B	Facility C
BELCO	15 ft L x 20 ft W	20 ft L x 25 ft W	30 ft L x 40 ft W
Tri-Mer	18 ft L x 18 ft W	46 ft L x 28 ft W	70 ft L x 52 ft W
MECS	20 ft L x 20 ft W	25 ft L x 25 ft W	30 ft L x 30 ft W
Cansolv	No additional change in plot space	Not available	Not available

For Facility A, the consultant concluded that:

> "*If the Cansolv Unit is revamped to meet a 10 ppmv treated gas SO2 concentration, the existing equipment will be reused in its current location and current plot space will be sufficient. If a caustic polishing system were to be required, the new unit would have to be located some distance away from the Acid Plant. This would make ducting of the gas steam very difficult, and result in a much larger ID fan, as well as a higher capital cost.*"

For Facility B, the consultant concluded that:

> "*There appears to be sufficient plot space ..... to accommodate all three designs."*

For Facility C, the consultant concluded that:

> *"In all three designs, it appears that some existing equipment will have to be relocated to make room for a new scrubber system……. There appears to be sufficient plot space on the south and west sides of the cooling tower .... to accommodate the Belco and MECS designs, which use a single tower; however, space to locate the proposed Tri-Mer design is questionable."*

In addition, the consultant provided several suggestions to reduce the footprint of the Tri-Mer scrubber should that becomes the choice for the facilities.

2.5 Project Timing

The consultant estimated that the total project time needed to install the new caustic scrubbers at Facility B and Facility C was about 24 – 30 calendar months, and to revamp the existing control system at Facility A was about 12 months.

Chapter 3 – ETS's Analysis for Glass Manufacturing Plant

ETS, Inc. (John McKenna)[9, 10] was awarded the contract to study the control technologies for two container glass melting furnaces located at a container glass manufacturing facility in the District. ETS Inc.'s analysis and results are summarized in this chapter.

3.1 Recommended BARCT Levels

ETS, Inc.'s final conclusion in this study is that it is feasible and cost effective to reduce SOx emissions to a level of 5 ppmv or less using wet scrubbing with caustic solution for container glass melting furnaces. The consultant recommended the District to set BARCT at 0.0058 lbs/ton glass pulled (or 99% control.)

Excerpts from ETS Inc.'s study are presented below:

> "*ETS has conducted a top down analysis of alternative commercially feasible control technologies for the control of SO_x emissions from the glass plant. This analysis considered the technology which was found to be the most effective in terms of sulfur dioxide removal and which can potentially be installed or retrofitted at O-I. Four vendors (Manufacturer A, Manufacturer B, Manufacturer C, and Manufacturer D) submitted quotes and performance claims and one vendor (Manufacturer E) submitted a description of suggested process improvements on the existing system with a rough budgetary equipment cost. Given the higher removal efficiency (99%), the Manufacturer A wet scrubber was selected as BARCT for the glass furnaces.*
>
> *A cost-effectiveness determination was executed for the BARCT case and a summary of the results is provided in the following table:*

Summary of Recommendations

Equipment	*BARCT Level*	*BARCT Emission Level*	*Emission Reductions*	*Cost-Effectiveness*
Owens-Brockway A, B & C CEMS	*99% control (≤1 ppmv)*	*0.0058 lbs/ton glass pulled*	*0.19 tpd*	*$ 5.0 K/ton SOx*

Note: Baseline SO_x emissions used in calculations were from 2005 (SCAQMD database for the period from January 2005 – December 2005)"

[9] ETS, Inc. team in this project included Dr. John McKenna, John Mycock, Dr. James Turner, Christina Clark and Jeff Smith. (AEC Engineering Inc. was a subcontractor for ETS, Inc. in the refinery study discussed in Chapter 14 – Chapter 16. AEC Engineering Inc. was not subcontracted for the analyses for glass in Chapter 12 and cement in Chapter 13.) The consultants' biographies are included in Appendix II-B of this report.

[10] SOx RECLAIM Study - Final Report – Module 3-D: Wet/Dry Scrubbing Technology for Container Glass Manufacturing Plant, ETS, Inc., December 16, 2008.

3.2 Control Technology & Costs

To arrive at the conclusions presented above, ETS Inc. conducted a literature research on wet scrubbing (non-regenerative) and dry scrubbing control technologies. Sources for their literature research included Air Waste Management Association (AWMA), McIlvaine, U.S. EPA, Industrial Clean Air Companies (ICAC), Glass Manufacturing Industry Council, and the Council of Industrial Boilers Association (CIBA). ETS Inc. contacted seventeen (17) vendors in the field of wet/dry gas scrubbing. The following five (5) vendors responded to their request for information:

- Tri-Mer
- Monsanto Envirochem Systems (MECS)
- McGill Clean Air Technologies
- Dustex
- PPC, Industries

As stated in the ETS Inc.'s report:

> "*These vendors were contacted and supplied with a request for a technical response to the RFP shown in Table 6. The vendors were asked to provide a Budgetary Equipment Cost and Estimated Annual Operating Cost at the following three levels of performance:*
>
> 1) *Lowest achievable level of efficiency with guarantee*
> 2) *Next lowest achievable level of efficiency with guarantee*
> 3) *Most comfortable achievable efficiency with guarantee…"*
>
> *"Four vendors (Manufacturer A, Manufacturer B, Manufacturer C, and Manufacturer D) submitted quotes and performance claims, and one vendor (Manufacturer E) submitted a description of suggested process improvements on the existing system with a rough budgetary equipment cost…….*"

	Control Technology	*Efficiency*	*SOx Outlet Conc.*
Manufacturer A	*wet scrubber with 50% NaOH*	*99%*	*Less than 5 ppmv*
Manufacturer B	*wet scrubber with 25% NaOH*	*95%*	*5 ppmv*
Manufacturer C	*dry gas scrubber*	*90%*	*10 ppmv*
Manufacturer D	*wet scrubber with 20% NaOH*	*90%*	*Less than 10 ppmv*

After carefully reviewing the information collected from the literature research and submitted by the vendors, ETS Inc. concluded:

> "*Given the higher removal efficiency (99%), the Manufacturer A Wet Scrubber was selected as BARCT for the glass furnaces...*"

Regarding vendors' cost estimates, ETS Inc. indicated:

".....they were asked to provide a budgetary cost estimate for the supply and installation of their equipment. The vendor was also requested to identify any utilities needed and their expected rate of usage. The vendor was also asked to identify the amount and type of waste generated by the process. If the vendor's approach was to modify or retrofit existing hardware, he was requested to supply a cost estimate for those activities. For example, if the proposed approach was that of dry or wet injection upstream of the baghouse, the proposal should have included an estimate for all required equipment hardware, reagent storage vessels, reagent feed control instrumentation, engineering, construction and installation, etc., as well as pre-engineering costs such as site testing activities to locate the reagent injection site to optimize system performance with respect to SO_2 control and reagent utilization."

The basis for equipment costs was different from each vendor (e.g. two vendors provided total installation costs including freight, and the other two provided just equipment costs without installation costs and freight.) The consultants applied their engineering knowledge and judgment to reconcile all vendors' costs to the same basis. In addition, the consultants included specific costs to cover areas that had been identified by the subject facility in the District (e.g. costs were added to cover additional treatment of the waste stream from the scrubber & additional ducting to the space available at the facility.)

ETS Inc. included the following categories in estimating the capital cost:

"*Demolition and Decommissioning*
Civil/Concrete
Structural
Equipment
Piping & Mechanical
Electrical & Controls
Misc. Direct & Indirect Costs:
- *Contractor overhead and misc. rentals*
- *Contractor field supervision*
- *Mobilization/Demobilization*
- *Overtime/productivity factor*
- *Freight/shipping*
- *Sales Tax*
- *Commissioning and operating spares*
- *Start-up/initial fill material*
- *On-site training/start-up assistance*
- *FEED engineering through detailed design*
- *Project management"*

ETS, Inc. included the following categories in estimating the annual operating and maintenance costs:

"*Annual Maintenance Costs*
Periodic Maintenance Costs
Additional Operating Costs
Utilities:

Natural Gas
Electricity
Water
Wastewater
Cooling Water
Compressed Air
Solid Waste Disposal"

3.3 Emission Reductions & Cost Effectiveness

A summary of emission reductions, cost estimates, and cost effectiveness using 25-year life for a wet gas scrubber and 4% interest rate estimated by ETS, Inc. is shown below:

" 2005 Baseline Emissions	*0.195 tpd*
Emission Reductions	*0.19 tpd (99% efficiency)*
Equipment Costs	*$1.10 million*
Capital Costs	*$1.90 million*
Annual Operating Costs	*$0.44 million*
Present Worth Value (25-year life)	*$8.80 million*
Cost Effectiveness Factor	*$4,988 per ton SOx reduced* "

ETS, Inc. did not estimate emission reductions and cost effectiveness associated with other levels of control (95%, 90%). ETS, Inc. indicated that:

> *"In considering a curve of cost-effectiveness versus level of control there are two considerations. Firstly, will the control device capital cost vary with improved efficiency and secondly, will the operating cost increase with increasing efficiency. Since the capital cost is driven largely by the gas volume and since the volume is essentially constant there is little if any change in the capital cost over the considered range of efficiencies. With respect to operating cost versus efficiency, in the case of sodium hydroxide, while the utilization does increase with increasing efficiency, the cost of the sodium hydroxide was low enough to minimize the impact of efficiency on cost. Thus the merit of plotting a curve of cost versus efficiency seemed of little value."*

3.4 Plot Space

Two vendors provided overall footprint (below) and two provided dimensions for individual components of the control systems. Manufacturer A estimated a footprint of 32 ft L x 10 ft W, and Manufacturer D estimated a footprint of 20 ft L x 20 ft W. In the analysis for available space, the consultant indicated that:

> "*The plant has limited space available for additional equipment, approximately a 14' x 20' footprint between two existing scrubbers. In addition O-I personnel indicated that the height of any new equipment could not exceed 30 feet above the top of the existing scrubbing vessels. A request was made of O-I to provide us with dimensional information pertaining to available space for the Manufacturer A equipment footprint. They stated that*

there is space available. Horizontal distance is 63' depending on the location of the ducting out of the pieces of equipment. This does not take into account the vertical distance which will depend on location of entry to the stream."

3.5 Project Timing

The consultant estimated that startup of the control equipment could occur 12 months after the project begins.

Chapter 4 – ETS's Analysis for Cement Plant

ETS, Inc. (John McKenna) [11, 12] was awarded the contract to study the control technologies for two cement kilns and a coal-fired boiler located at California Portland Cement Co. (CPCC). ETS Inc.'s analysis and results are summarized in this chapter.

4.1 Recommended BARCT Levels

ETS, Inc.'s final conclusion in this study is that it is feasible and cost effective to reduce SOx emissions to a level of 5 ppmv or less using wet scrubbing with caustic solution for two cement kilns and a coal-fired boiler. The consultant recommended the District to set BARCT at 0.03 lbs/ton clinker (or 95% control efficiency) for the two cement kilns, and 95% control efficiency for the coal fired boiler.

Excerpts from ETS Inc.'s study are presented below:

> "*ETS has conducted a top down analysis of alternative commercially feasible control technologies for the control of SO_x emissions from the cement plant. This analysis considered the technology which was found to be the most effective in terms of sulfur dioxide removal and which can potentially be installed or retrofitted at CPCC. In the case of the two kilns, three vendors (Manufacturer A, Manufacturer B, and Manufacturer C) submitted quotes and performance claims. Given the higher removal efficiency (95%), the Manufacturer B $CaCO_3$ Scrubber was selected as BARCT for the kilns.*
>
> *Similarly top down analysis was done for the coal-fired fluidized bed boiler emission control at the cement plant. Four vendors (Manufacturer A, Manufacturer B, Manufacturer C, and Manufacturer D) submitted quotes and performance claims. Given the 95% removal efficiency, both the Manufacturer D Venturi Reactor & the Manufacturer B $CaCO_3$ Scrubber can be considered BARCT for the coal-fired fluidized bed boiler.*
>
> *Cost-effectiveness determinations were executed for the BARCT cases and a summary of the results are provided in the following table.*

[11] ETS, Inc. team in this project included Dr. John McKenna, John Mycock, Dr. James Turner, Christina Clark and Jeff Smith. (AEC Engineering Inc. was a subcontractor for ETS, Inc. in the refinery study discussed in Chapter 14 – Chapter 16. AEC Engineering Inc. was not subcontracted for the analyses for glass in Chapter 12 and cement in Chapter 13.)

[12] SOx RECLAIM Study - Final Report – Module 3-E: Wet/Dry Scrubbing Technology for Cement Kilns and Coal-Fired Fluidized Bed Boiler, ETS, Inc., December 16, 2008.

Summary of Recommendations

Equipment	*BARCT Level*	*BARCT Emission Level*	*Emission Reductions*	*Cost Effectiveness*
Kilns	*95% control (≤2 ppmv)*	*0.03 lbs SO_x/ton clinker*	*0.25 tpd SO_x*	*$18.9 K/ton SOx*
Coal-Fired Boiler	*95% control (≤5 ppmv)*	---	*0.36 tpd SO_x*	*$ 3.8 K/ton SOx*

Note: Baseline SO_x emissions used in calculations were from 2005 (SCAQMD database for the period from January 2005 – December 2005)"

4.2 Control Technology & Costs

To arrive at the conclusions presented above, ETS Inc. conducted an independent literature research on wet scrubbing (non-regenerative) and dry scrubbing control technologies. Sources for their literature research included Air Waste Management Association (AWMA), McIlvaine Co., U.S. EPA, Industrial Clean Air Companies (ICAC), Portland Cement Association (PCA), and Northeast States for Coordinated Air Use Management (NESCAUM). ETS, Inc. research confirmed the information provided by staff in Part I of Staff Report that scrubbing technology had been used to control SOx for existing as well as new cement kilns and coal fired boilers.

After the literature research, ETS Inc. contacted and asked sixteen (16) vendors in the field of wet/dry gas scrubbing to provide a budgetary equipment cost and estimated annual operating cost at the following three levels of performance:

1) Lowest achievable level of efficiency with guarantee
2) Next lowest achievable level of efficiency with guarantee, and
3) Most comfortable achievable efficiency with guarantee

For the vendors to size and estimate the costs associated with the control device, ETS, Inc. provided the vendors some of the following critical operational parameters:

	Kilns	*Coal-Fired Boiler*
Gas Flow Rate	*170,000 – 200,000 acfm*	*60,000 acfm*
Temperature	*275 ^oF*	*300 ^oF*
Inlet SOx Concentration	*5 ppmv – 25 ppmv* [13, 14]	*100 ppmv* [13]
Combustion fuel	*Coal, coke, oil, nat gas, and used tires*	*Coal*
Raw feed material	*Limestone, silica, and clay*	

[13] ETS, Inc. reviewed several RATA tests for the two kilns and the cogen, and in addition, conducted a statistical analysis on the 2005 and 2008 CEMS data for the two kilns, and the 2001 CEMS data for the cogen, and determined that a range of SOx concentrations between 5 ppmv – 25 ppmv would reflect a reasonable range of SOx concentrations from the two kilns, and approximately 100 ppmv would reflect a reasonable range of SOx concentration from the coal-fired boiler. These ranges of concentrations were provided to the vendors for quotes and cost estimates.

[14] ETS, Inc. reported that "*In general, the vendors questioned the low SO_2 levels, stating that 200-400 ppm was more typical of long dry kiln operations. Several also indicated that before guaranteeing performance level, they would require pilot testing to confirm design information and to optimize operational parameters."*

The following four (4) vendors responded to ETS, Inc.'s request of information:

- Dustex
- BoldEco
- Monsanto Envirochem Systems (MECS)
- Solios

Three vendors proposed SOx emission control, submitted quotes, and performance claims for the cement kilns:

- The first vendor (Vendor C) proposed wet scrubbers using 20% NaOH solution to achieve 90% guaranteed control for the two kilns

- The second vendor (Vendor A) proposed a hybrid technology, a dry fluid bed scrubber (reaction tower) following by a pulse jet fabric filter, using hydrated lime (Ca(OH)2) as absorbent reagent to achieve 90% guaranteed reduction for SOx

- The third vendor (Vendor B) proposed two different approaches for emission control:
  - a moving bed reactor where the gas is contacted and absorbed on a bed of limestone granules (CaCO3) to achieve 95% reduction ; and
  - a hybrid technology including a reactor and a polished fabric filter using hydrated lime (Ca(OH)2) as absorbent reagent to achieve 85% reduction

Vendor	*Control Technology*	*Control Efficiency*	*SOx Outlet Concentration*
A	*Hybrid (reactor/scrubber/pulse-jet filter) using Ca(OH)2*	*90%*	*< 5 ppmv*
B	*Hybrid (reactor/scrubber/pulse-jet filter) using Ca(OH)2*	*85%*	*< 5 ppmv*
B	*Dry scrubber/reactor using limestone CaCO3*	*95%*	*< 5 ppmv*
C	*Wet scrubber using NaOH*	*90%*	*< 10 ppmv*

Four vendors proposed SOx emission control, submitted quotes, and performance claims for the coal-fired boilers:

- The first vendor (Manufacturer C) proposed wet scrubbers using NaOH solution to achieve 90% guaranteed control (<10 ppmv SOx)

- The second vendor (Vendor A) proposed a hybrid technology, a dry fluid bed scrubber (reaction tower) following by a pulse jet fabric filter, using hydrated lime (Ca(OH)2) as absorbent reagent to achieve 90% guaranteed reduction for SOx

- The third vendor (Vendor B) proposed two different approaches for emission control:
  - a moving bed reactor where the gas is contacted and absorbed on a bed of limestone granules (CaCO3) to achieve 95% reduction ; and
  - a hybrid technology including a reactor and a polished fabric filter using hydrated lime (Ca(OH)2) as absorbent reagent to achieve 80% reduction

- The fourth vendor (Vendor D) proposed a dry injection system utilizing a venturi reactor and sodium bicarbonate (NaHCO3) to achieve 95% removal efficiency.

Vendor	*Control Technology*	*Control Efficiency*	*SOx Outlet Concentration*
A	*Hybrid (reactor/scrubber/pulse-jet filter) using Ca(OH)2*	*90%*	*< 5 ppmv*
B	*Hybrid (reactor/scrubber/pulse-jet filter) using Ca(OH)2*	*80%*	*< 5 ppmv*
B	*Dry scrubber/reactor using limestone CaCO3*	*95%*	*< 5 ppmv*
C	*Wet scrubber using NaOH*	*90%*	*< 10 ppmv*
D	*Venturi reactor using NaHCO3*	*95%*	*< 5ppmv*

After carefully reviewing all the information collected from the literature research and submitted by the vendors, ETS Inc. concluded:

> *"Given the higher removal efficiency (95%), the Manufacturer B Dry Scrubber was selected as BARCT for the kilns."*
>
> *"Given the 95% removal efficiency, both the Manufacturer D Venturi Reactor & the Manufacturer B Scrubber can be considered BARCT for the coal-fired fluidized bed boiler."*

Regarding vendors' cost estimates, ETS Inc. indicated:

> *".....they were asked to provide a budgetary cost estimate for the supply and installation of their equipment. The vendor was also requested to identify any utilities needed and their expected rate of usage. The vendor was also asked to identify the amount and type of waste generated by the process. If the vendor's approach was to modify or retrofit existing hardware, he was requested to supply a cost estimate for those activities. For example, if the proposed approach was that of dry or wet injection upstream of the baghouse, the proposal should have included an estimate for all required equipment hardware, reagent storage vessels, reagent feed control instrumentation, engineering, construction and installation, etc., as well as pre-engineering costs such as site testing activities to locate the reagent injection site to optimize system performance with respect to SO_2 control and reagent utilization.*"

The basis for equipment costs was different from each vendor. ETS, Inc. applied their engineering knowledge and judgment to reconcile all vendors' costs to the same basis. Regarding the capital costs, ETS Inc. included the following categories in estimating the costs:

> **"***Demolition and Decommissioning*
> *Civil/Concrete*
> *Structural*
> *Equipment*
> *Piping & Mechanical*
> *Electrical & Controls*
> *Misc. Direct & Indirect Costs:*
> *Contractor overhead and misc. rentals*

Contractor field supervision
Mobilization/Demobilization
Overtime/productivity factor
Freight/shipping
Sales Tax
Commissioning and operating spares
Start-up/initial fill material
On-site training/start-up assistance
FEED engineering through detailed design
Project management"

ETS, Inc. included the following categories in estimating the annual operating and maintenance costs:

"*Annual Maintenance Costs*
Periodic Maintenance Costs
Additional Operating Costs
Utilities:
Natural Gas
Electricity
Water
Wastewater
Cooling Water
Compressed Air
Solid Waste Disposal"

A list of assumptions used by ETS, Inc. for cost estimation was summarized by ETS, Inc. in Table 11 of the final report.

4.3 Emission Reductions & Cost Effectiveness

A summary of emission reductions, cost estimates, and cost effectiveness using 25-year life for a wet gas scrubber and 4% interest rate estimated by ETS, Inc. is shown below:

		Two Scrubbers for Two Kilns	*One Scrubber for a Coal-Fired Boiler*
2005 Baseline Emissions	*tpd*	*0.27*	*0.38(if operated)*
Emission Reductions	*tpd*	*0.25*	*0.36(if operated)*
Equipment Costs	*$ million*	*16.6*	*4.7*
Capital Costs	*$ million*	*19.6*	*6.1*
Annual Operating Costs	*$ million*	*1.5*	*0.39*
Present Worth Value (25-year life)	*$ million*	*43.7*	*12.6*
Cost Effectiveness Factor	*$ per ton*	*18,893*	*3,818*

ETS, Inc. did not estimate emission reductions and cost effectiveness associated with other levels of control (90% or 80%). ETS, Inc. indicated that:

"In considering a curve of cost-effectiveness versus level of control there are two considerations. Firstly, will the control device capital cost vary with improved efficiency and secondly, will the operating cost increase with increasing efficiency. Since the capital cost is driven largely by the gas volume and since the volume is essentially constant there is little if any change in the capital cost over the considered range of efficiencies. With respect to operating cost versus efficiency, in the case of limestone, while the utilization does increase with increasing efficiency, the cost of the limestone was low enough to minimize the impact of efficiency on cost. Thus the merit of plotting a curve of cost versus efficiency seemed of little value."

4.4 Plot Space

The plot space needed for each hybrid dry limestone scrubber located upstream of the existing baghouse of the Portland cement kiln was estimated to be approximately 50 ft L x 40 ft W. ETS, Inc. conclusion on plot space availability was as follow:

"*With the exception of moving some existing coal piles, there appears to be no limitation on available space for prospective equipment for additional SO_2 control on the two cement kilns. If necessary, the existing baghouses could be considered for technology approaches (such as spray drying) requiring a filter collector after the reaction vessel. In this scenario the baghouse would serve the dual purpose of particulate control and the dust cake (on the bags) would provide an additional site for the reaction of the reagent with the SO_x.*"

The plot space needed for the dry scrubber located upstream of the existing baghouse of the COGEN coal fired boiler was estimated to be approximately 10 ft L x 10 ft W. ETS, Inc. conclusion on plot space availability was as follow:

"*……there appears to be no limited space for prospective equipment for additional SO_2 removal on the COGEN. In addition, if the physical integrity of the existing pulse jet baghouse is sound, it could probably be utilized in conjunction with some of the dry or semi-dry scrubbing technologies. This could be accomplished by replacing any malfunctioning components such as valves, timers, dampers, etc., and replacing the existing bag set with high efficiency PTFE membrane bags*."

4.5 Project Timing

The consultant estimated that startup of the control equipment could occur 24 months after the project begins for both the cement kilns as well as the coal fired boiler.

Chapter 5 – ETS/AEC's Analysis for Fluid Catalytic Cracking Units

ETS, Inc. (John McKenna) [15,16] was awarded the contract to study the control technologies (wet/dry scrubbers) for FCCUs located at six refineries in the District. ETS, Inc. subcontracted a part of the study to AEC Engineering Inc.[17] The ETS/AEC's analysis and results for FCCUs are summarized in this chapter.

5.1 Recommended BARCT Levels

ETS, Inc.'s final conclusion in this study is that it is feasible and cost effective to reduce SOx emissions to a level of 5 ppmv or less using wet scrubbing with caustic solution for six refineries in the District. ETS's recommended the District to set **BARCT at 5 ppmv, approximately 2.32 lbs/thousand barrels feed, or 87% control, averaging across six FCCUs** in the District. ETS Inc. estimated total emission reductions from the 2005 baseline were 3.07 tpd at an average cost effectiveness of $24.6 K per ton SOx reduced. [18,19]

Excerpts from ETS Inc.'s study are presented below:

> *"The final estimates of SOx reductions for the Module 3A BARCT-designated measures are tabulated below:*

Module 3A Forecasted SOx Reductions (tons/day) by Refinery

Refinery:	*1*	*2*	*3*	*4*	*5*	*6*	*Total*
Equipment Type FCCU	*0.58*	*0.19*	*0.28*	*0.20*	*0.87*	*0.94*	*3.07*

> *The following table gives a summary of the Module 3A cost effectiveness ratios by refinery following implementation of the respective measures selected by ETS/AEC:*

Module 3A Cost Effectiveness ($/ton of SOx) by Refinery

Refinery:	*1*	*2*	*3*	*4*	*5*	*6*	*Avg. for All*
Equipment Type FCCU	*$14.4k*	*$76.2k*	*$36.6k*	*$42.1k*	*$11.6k*	*$12.8k*	*$24.6k*

[15] ETS, Inc. team in this project included John McKenna, Ph.D., Robert Kunz, Ph.D., P.E., James Turner, Ph.D., Christina Clark and Jeff Smith. The consultants' biographies are attached in Appendix II-B of this report.

[16] SOx RECLAIM Study - Final Report – Module 3-A: Wet/Dry Scrubbing Technology for Refinery Fluid Catalytic Cracking Units (FCCUs), Refinery Boilers/Heaters, and Refinery Sulfur Recovery Units (SRUs) and Tail Gas Treatment Processes, AEC Engineering Inc./ETS, Inc., April 20, 2009.

[17] AEC Engineering, Inc. team in this project included Tav Heistand, P.E., Kristie Williams, P.E., Jason Sowards, Jesse Pikturna, Ph.D., and Britton Miller, P.E.

[18] The estimated emission reductions 3.07 tpd were the reductions calculated from the 2005 baseline described in Part 1 of the Staff Report for all six FCCUs in the District. Note that this 3.07 tpd estimated reductions from ETS/AEC was not the same as the RTC reductions estimated in Staff Report for FCCUs.

[19] The cost effectiveness of $24.6 K is an average for five refineries. One refinery in the District already installed and has operated a wet gas scrubber to meet the particulate emission standards in Rule 1105.1, and this gas scrubber also meet the limeit of 5 ppmv proposed by ETS/AEC.

5.2 Control Technology & Costs

5.2.1 Control Technology

'To arrive at the conclusions presented above, ETS Inc. and AEC Engineering Inc. conducted an independent literature research on wet and dry scrubbing technologies including non-regenerative, regenerative, and sea water. After that, ETS/AEC contacted vendors for feasibility and cost information. As indicated by ETS/AEC:

> "*Insofar as the wet and dry gas scrubbing technologies are concerned, information provided by SCAQMD was very helpful in identifying some of the vendors that were considered in this study. Contact was made with all vendors listed in the SCAQMD preliminary report and a number of vendors that were not listed. After initial discussions with vendors, careful reviews of various resources were conducted: literature provided by vendors; the April 2008 Preliminary Draft Staff Report; in-house files; public domain articles and reports; and conversations with industry experts. At that point, five different technology providers were selected for detailed analysis of installation and operation economics…."*

The technologies and vendors that ETS/AEC concentrated for further analysis (e.g. costs) for FCCUs were:

- BELCO (non-regenerative wet gas scrubber)
- MECS (non-regenerative wet gas scrubber)
- Hamon (dry scrubber)
- Alstom (sea water scrubber)

Regarding BELCO technology, ETS/AEC stated that:

> "*BELCO (DuPont) has more than 65 EDV wet scrubbing systems in refineries, at least 61 of which are in FCCU applications and 156 EDV [20] wet scrubbing systems in other applications. BELCO also has examples of EDV applications for SRU/TGTU and refinery boilers and heaters (DuPont Power Point Presentation, 2008). In a letter sent to ETS from Nick Confuerto, Vice President, Technology, Sales & Marketing of BELCO, it was confirmed that the guaranteed SOx outlet concentration based on the refinery-specific information provided would be 5 ppmv. The EDV utilizes a Purge Treatment System to decrease the COD [21] and suspended solid content of the effluent. A clarifier is used to collect the solids and then they are filter-pressed and disposed. The oxidation is facilitated*

[20] EDV® is a trademark wet gas scrubber manufactured and supplied by BELCO (Dupont).

[21] COD stands for Chemical Oxygen Demand, a commonly used measurement for water quality. It measures the capacity of water to consume oxygen during the decomposition of organic matter and the oxidation of inorganic chemicals such as ammonia and nitrite. It is an indirect measurement of the organic compounds (microorganisms) that survive in the waste water samples.

in a tower with air forced through the effluent to convert all sulfites to sulfates. After these two steps the effluent is safely discharged to the waste water treatment plant."

Regarding MECS technology, ETS/AEC stated that:

"*….MECS developed their DynaWave technology in the 1970s and has over 300 installations worldwide (Kixmiller, 2008). Specific examples are two Sinclair oil refineries in Wyoming. According to a published paper titled, "DynaWave Wet Gas Scrubbing: A New Alternative for Claus Unit Tail Gas Clean-Up", written by Steven F. Meyer, Ed Juno, Nick Watts, and Cristina Kulczycki, each refinery installed a DynaWave scrubber for SRU/TGTU stack treatment. The results of stack testing was a 99.99% sulfur removal. The DynaWave mitigates the effluent COD by injecting air into the sump of the vessel in order to oxidize the sulfites. The sump is also designed to allow adequate retention time for the oxidation to take place. As a result, the effluent water can be discharged directly to the wastewater treatment plant, provided the COD levels are continuously monitored and maintained within an acceptable range. According to the paper, the COD at the Casper, WY refinery ranged between 50 and 150 mg/l.*"

Regarding dry scrubbing technology provided by Hamon, ETS/AEC stated that:

"*The dry scrubbing technology evaluated in this study is Hamon's. It was evaluated for both FCCU and heater and boiler applications. According to information on its website, Hamon FGD technologies are installed in twenty countries and treat over 65,000 MW of power generation capacity. Hamon also has a long standing relationship with refineries world wide with over 100 ESP installations on FCCUs. There is no example of a dry scrubber installation in a refinery. However, the level of experience in FGD and general refinery applications is adequate to describe the technology as field demonstrated. In an email sent to AEC, a Hamon Research employee quoted a 90+% removal efficiency for streams with 300-400 ppmv SOx. Because flue gases in the South Coast refineries are typically below this range, the removal percentage is expected to be below 90% in most cases. Typically, it is governed by the SOx outlet concentration, which is not forecasted to fall below 10 ppmv on a guaranteed basis. Hence, the removal percentage for Hamon's dry gas scrubber is application-specific in these refineries and generally will be below 90%. One additional consideration for all types of dry scrubbers is the issue of solids handling. The effluent gas will have considerable particulate matter that must be removed. Therefore it is necessary to install some type of an ESP or baghouse downstream from the scrubber. The solids handling equipment will need to collect both dry particulate matter from the scrubber and particulate from the FCC. This introduces additional complexity with respect to available plot space and capital expenditure.*"

After several months of technical analysis and couple weeks visiting the refineries, ETS/AEC concluded that wet gas scrubbing was an aged-old technology which should be very familiar to all six refineries in the District:

"One WGS vendor, Belco Technologies Corporation (BELCO), has provided a lengthy application list…, with contracts awarded on as many as sixty-one (61) FCCU units and two (2) fluid cokers. Total FCCU capacity treated by BELCO scrubbers is noted as 3,228,700 bbl/day. The concept of using a WGS on an FCCU should be familiar to four (4) of the six (6) refining companies operating the Los Angeles, CA area since they are listed as customers employing BELCO WGS technology on the FCCUs at their other refineries……..

Another vendor of WGS technology, Exxon (Now ExxonMobil), has also developed WGS technology. It is used in their own refineries and at others under license…... As of 1999, they cite a total of fourteen (14) such installations. One of the Exxon papers …. pictures a number of FCCU scrubbers located in tight spots because the required plot space was not otherwise available, including a photograph of a creative solution in which the scrubber is mounted on stilts above a road."

Regarding vendors' guarantee, ETS/AEC indicated that BELCO and MECS were willing to provide guarantee on 5 ppmv:

"BELCO has provided numerous wet gas scrubbers for FCCUs in the United States and on a worldwide basis. Based on that experience, BELCO has given a guarantee of 5 ppm SO_2 from a wet scrubber if installed on any of the FCCUs in the District. MECS DynaWave, with at least three installations on FCCU regenerator flue gas, will also guarantee 5 ppmv SO_2. BELCO has indicated that most of their units operate in the near zero ppm range, with the most recent performance test from one of these at a fraction of a ppm (corrected to 0% O_2)…."

In addition, ETS/AEC cited one full-scale installation that they were aware of:

"…. The study team is aware of another full-scale wet gas scrubber operating on an FCCU in a petroleum refinery at an SO_2 emission level of 5 ppmv or less on a long-term basis."

To be conservative in their BARCT recommendation, ETS/AEC recommended BARCT to be set at 5 ppmv. The vendors and ETS/AEC did not recommend lower levels just to avoid CEMS measurement uncertainty:

….. the recommended BARCT level for fluid catalytic cracking unit (FCCU) SOx emissions is 5 ppmv on a dry basis. This is derived from an achievable concentration when employing wet gas scrubbing (WGS), a proven technology demonstrated in practice on this type of emission source. It is believed that a lower outlet concentration is indeed possible. However, a lower concentration may not be reliably measurable because of unavoidable accumulated error in the source test reference methods and/or the permissible tolerance in continuous emission monitoring system (CEMS) measurements."

"…After careful consideration of the various scrubbing approaches and review of the technical responses and guarantee statements offered by the suppliers of these

technologies, it is the recommendation of the ETS team that non-regenerative wet scrubbing be considered on a purely technical basis as BARCT for the FCCUs, Refinery Boiler/Heaters, and SRU/TGTU processes under study in Module 3A, with an overall BARCT level of 5 ppmv."

5.2.2 Costs

To gather budgetary quotes from vendors on costs and sizing information, ETS/AEC provided the vendors important critical information (e.g. gas flow rate, inlet SOx concentration, flue gas temperature) for a generic scenario. ETS/AEC adjusted the vendors' quotes information to match each refinery specific conditions. ETS/AEC claimed that their approach would ultimately generate cost information within +/- 40% range of the expected actual costs. As ETS/AEC stated that:

"*The methodology and techniques utilized during this project in the sizing of equipment for a new application ..... are exactly those used in any engineering endeavor. First, of course, we obtained a full understanding of how the existing system is configured and operates; those things are known by means of the site visit, underlying industry knowledge, interviews of refinery personnel, refinery-submitted data and drawings, etc. The second step was to conceptualize how the equipment under consideration is to be installed. This step also includes identifying the performance parameters to be achieved. In doing so, we quantified the expected ranges of service and efficiency, so that an appropriate over-design allowance could be applied (the purpose of which is to ensure that the performance objectives will reliably be met even if the underlying process is running at one extreme or another of its normal range). Next, all the pertinent information was communicated to the equipment representative, usually for pricing determination, but sometimes also to confirm the sizing exercise. In all cases, evaluating specific technology options required eventual coordination with the manufacturer or licensor to get verification of critical assumptions and/or conclusions.*

Since the study encompassed multiple facilities and systems with widely different process flows and arrangements, and because, furthermore, there were several optional technologies looked at for each installation, the total collection of potential measures was extraordinarily large. Thus, it was impossible—in the timeframe available—to address every one of the individual cases with a full set of vendor inquiries. Instead, the team made use of generic, but representative budgetary quotations and published cost studies for the various technologies. Each such "reference point" (i.e., package cost and performance data for a prescribed process operating condition) was then used as a basis for extrapolation to other locations and design conditions. For a specific application, the key sizing criterion (typically the process throughput—e.g., SCFM of gas) is determined or calculated from the relevant operational data. Then, to generate the probable capital purchase cost ($PC), that criterion value (V) is divided by the comparable numerical capacity (Cr) from the "reference point" package. Using the baseline capital cost ($BCr) for that "reference point", the desired capital cost is mathematically calculated via a conventional power curve relationship:

$PC = $BCr x (V/Cr) ^ n
where n is an appropriate exponent between .5 and 1.0

This approach is commonly used in engineering studies, and has been widely described in reference books such as Marks Standard Handbook for Mechanical Engineers and Perry's Chemical Engineers' Handbook. For our studies, the exponent value, n, was normally assigned a value between 0.6 and 0.7, a range that historically has given good estimates for industrial equipment packages.

In so far as the pertinent sizing criteria were concerned, they were compared to nameplate duties for other, similar units for rough verification purposes. Also, input was sought directly from the manufacturers' representatives, as well as public domain literature and published case studies. In the end, the checking procedures employed by the team members helped us to achieve rough, budgetary purchase costs, knowing that any loss in precision in arriving at those costs would be adequately covered by the very broad overall cost ranges (i.e., +/- 40%) expected for the ultimate results."

Regarding estimates for capital costs, ETS/AEC indicated that:

"*AEC worked as closely as possible with the technology suppliers to gather the direct capital cost estimates for this project. (Where available, too, we compiled net installation costs which had been reported by the manufacturers for "reference points", as described in the preceding section. Those "turn-key" costs were used to check the built-up cost estimates assembled by the project team.) Also, we took advantage of our relevant and extensive corporate knowledge base for similar projects. Every valid method was employed to give the best possible output. (In addition, as mentioned in Section A, above, indirect costs for impacts to utilities and infrastructure were estimated and included.)....*

...Owing to the fact that all the cost estimating tasks were conducted in a very preliminary, conceptual fashion, the overall accuracy of the capital cost determinations is no better than +/- 40%. Considerable engineering study would be required to refine the cost estimates and arrive at narrower accuracy ranges."

Regarding annual operating costs, ETS/AEC explained their approach as follows:

"*Unit rates for the principal cost-incurring utilities were requested from the refineries at the outset of the study. In several cases, explicit values were provided in response to the requests; those values were used as reported to us. For all other instances, generic estimates—obtained from other work by AEC at various U.S. refineries—of the unit rates were utilized...*

…The majority of the suggested control technologies or upgrades include the need not only for additional utilities but also raw materials, such as a scrubbing agent or catalyst. Costs for those items were estimated through consultation with a technology supplier or in-house expert. The appropriate third party resource or corporate engineer(s) based the quantity determinations on the specific characteristics of the technology under study. Once a quantity was determined, a local material cost was obtained for use in the calculations…

…Early in the project, AEC had requested from the refineries the average hourly costs for various labor classifications on typical capital projects. When plant-specific values were not provided, we used generic labor rates that are intended to reflect average fully-burdened costs for jobs inside a South Coast refinery

…The computation of chemical (such as NaOH) quantities used by the various measures, and the amounts of waste products generated by them, were very straightforward. In almost all instances, the manufacturers' literature provided guidelines and/or explicit case studies. That information was used via direct "scale-up" multipliers, based on the key parameter(s) involved..."

ETS/AEC applied their engineering knowledge and judgment to reconcile all vendors' costs to the same basis. Regarding the capital costs, ETS Inc. included the following categories in estimating the costs:

"*Demolition and decommissioning*
Civil/concrete
Structure
Equipment
Piping and Mechanical
Electrical and controls
Miscellaneous indirect costs include:
Contractor overhead, typically 8 % of direct field labor (DFL)
Contractor field supervision, typically 12 % of DFL
Mobilization/demobilization, typically 10 % of DFL
Overtime/productivity factor, typically 12 % of DFL
Freight and shipping, typically 8 %, of materials
Sales tax, typically 7 % of materials
Commissioning and operating spares, typically 5 % of materials
Startup/initial fill material, typically 2 % of materials
On-site training/startup assistance, depends on project
Front-end engineering design, depends on project size
Project management, depends on project size

Design development allowance, 10% of total
Contingency, 25-40% applied against the bottom-line capital cost estimate"

ETS, Inc. included the following categories in estimating the annual operating and maintenance costs:

"*Annual Maintenance Costs*
Periodic Maintenance Costs
Additional Operating Costs
Utilities:
Natural Gas
Electricity
Water
Wastewater
Cooling Water
Compressed Air
Solid Waste Disposal"

A list of assumptions used by ETS/AEC for cost estimation was summarized in Table 4-1 of the ETS/AEC's final report for Module 3-A.

5.3 Emission Reductions & Cost Effectiveness

A summary of emission reductions, cost estimates, and cost effectiveness assuming 90% control (5ppmv), 25-year life for a wet gas scrubber, and 4% interest rate estimated by ETS/AEC is shown below:

SOx Reductions (tons/day) for FCCUs by Refinery (5 ppmv)

Refinery:	*1*	*2*	*3*	*4*	*5*	*6*	*Total*
Equipment FCCU	*0.58*	*0.19*	*0.28*	*0.20*	*0.87*	*0.94*	*3.07*

Cost Effectiveness ($/ton of SOx) for FCCUs by Refinery (5 ppmv)

Refinery:	*1*	*2*	*3*	*4*	*5*	*6*	*Avg. for All*
Equipment FCCU	*$14.4k*	*$76.2k*	*$36.6k*	*$42.1k*	*$11.6k*	*$12.8k*	*$24.6k*

In addition, ETS/AEC provided an estimate for the following emission reductions and cost effectiveness associated with the most stringent, but feasible level of control (98%) in Table A-3 and A-4 of their final report:

SOx Reductions (tons/day) for FCCUs by Refinery (98%)

Refinery:	*1*	*2*	*3*	*4*	*5*	*6*	*Total*
Equipment FCCU	*0.60*	*0.30*	*0.35*	*0.24*	*0.94*	*1.01*	*3.45*

Cost Effectiveness ($/ton of SOx) for FCCUs by Refinery (98%)

Refinery:	*1*	*2*	*3*	*4*	*5*	*6*	*Avg. for All*
Equipment FCCU	*$14.0k*	*$48.0k*	*$29.5k*	*$35.2k*	*$10.7k*	*$11.9k*	*$21.5k*

Regarding the average cost effectiveness, ETS/AEC indicated that:

> "*One refinery has already installed a wet gas scrubber on its FCCU regenerator…. the cost effectiveness ratio for this refinery was not included in any of the average cost effectiveness calculations.*"

14.4 Plot Space

ETS/AEC conducted an analysis for plot space at the refineries to accommodate the wet gas scrubber and its associated equipment (e.g. additional fan, waste water handling system, plume mitigation system), presented their analysis in the confidential portion of the report, and concluded that space was available at all five refineries for additional control:

> "*Wet gas scrubber equipment footprints and space requirements for the FCCUs and the SRU/TGTUs are shown in the confidential appendices for each refinery where measures have been selected. These specifications have been compared with the plot plans provided by the respective refineries, and where applicable, are presented in the costing workbooks*."

5.5 Project Timing

AEC/ETS estimated that startup of the control equipment could occur within 3 calendar years after the project begins:

> *"ETS believes that it is conceivable that ….emission reduction ….. can be achieved from the refineries implementing the commercially available measures described in this project within a construction time frame of approximately 3 calendar years or less following the completion of study designs and engineering."*

Chapter 6 – ETS/AEC's Analysis for SRU/Tail Gas Systems

6.1 Recommended BARCT Levels

Through the data provided to ETS/AEC by the refineries, there was one refinery regularly vented the flue gas to the atmosphere, and the remaining refineries treated or incinerated the tail gas from their SRU/TG systems. Because of this distinction in the refinery's operations, ETS divided their recommendations for SRU/TG into two areas: the first recommendation is for the uncombusted tail gas:

> *"For uncombusted tail gas, the limits of Subpart J (Ja), namely 10 ppm H2S and 300 ppm reduced sulfur species (total of H2S, COS, and CS2), should continue to apply. Refineries should be encouraged to reduce emissions so as to be able to vent rather than having to combust SRU / TGTU tail gas."*

The ETS's second recommendation for the combusted tail gas is as follows:

> *"For combusted / incinerated tail gas, 5 ppmv SOx @ 0% O2 should be defined as the overall BARCT level for all refineries, based on scrubbed flue gas, but permissible to achieve by whatever means possible. A level of 10 ppmv would allow a greater number of refineries to meet the overall BARCT level by the gas treatment methods of Module 2 without having to install a wet gas scrubber (Module 3A)"*

6.2 Control Technology & Costs

To arrive at the conclusions presented above, ETS Inc. and AEC Engineering Inc. conducted an independent literature research on wet and dry scrubbing technologies including non-regenerative and regenerative for Module 3A; and numerous technologies for Module 2 including expansion of Claus process, sub-dewpoint process, selective oxidation catalyst, TG-10 additives, and additional sulfur capture at the sulfur pit. After the literature search, ETS/AEC contacted vendors for feasibility and cost information.

The five technologies and vendors that ETS/AEC concentrated for further analysis (e.g. costs) for SRU/TG systems were:

- Lurgi (sub-dewpoint HydroSulfreen process)
- EmeraChem Power LLC (selective oxidation catalyst)
- Gas Spec (TG-10 additive)
- Cansolv & BELCO (regenerative wet gas scrubber)
- Tri-Mer (non-regenerative wet gas scrubber)

For Lurgi Hydrosulfreen process, ETS/AEC stated that:

"*The HydroSulfreen process is an improvement on Lurgi's Sulfreen process. It adds a hydrolysis step to this process. There are over 45 Sulfreen processes in operation worldwide. In August of 2000, there were four HydroSulfreen plants licensed.*

The HydroSulfreen® process is typically used for treatment of tail gas from refineries. The effluent from an existing Claus plant is first treated in a hydrolysis reactor, where species such as SOx, CS_2, and COS are hydrolyzed to form H_2S. The effluent from the hydrolysis reactor is typically sent to the Sulfreen® process, which operates at temperatures lower than the dew point of sulfur. Operating the converters at these temperatures increases the conversion to elemental sulfur, thereby increasing the overall efficiency of the unit."

ETS/AEC estimated that the costs of conversion from normal Claus unit to HydroSulfreen were high and the cost effectiveness was in a range of $37,000 - $600,000 per ton of SOx reduced. This technology was not recommended by ETS/AEC at the final selection stage.

Regarding EmeraChem Power LLC's catalyst oxidation process, ETS/AEC stated that:

"*EmeraChem ESx catalyst can capture multiple sulfur species, including SO_2, SO_3, and H_2S. In addition to sulfur capture, the catalyst will destroy CO, VOC, and Particulate Matter (PM_{10}). These units are typically used to treat combustion exhaust gases from incinerators, heaters, turbines and boilers.*

EmeraChem does not appear to have its ESx technology installed as a stand-alone SOx control technology at any refinery……EmeraChem has provided assurances that their technology works to reduce pollution in exhaust gases across many types of unit operations, including refinery processes, gas turbines, boilers, process heaters, and diesel engines."

EmeraChem platinum catalysts can be used to treat tail gas that has or has not been incinerated. The tail gas that has not been incinerated must be heated to the temperatures where the ESx catalyst is active (minimum at 600^{o}F). ETS/AEC estimated that the cost effectiveness for Emerachem catalysts was in a range of $10,000 - $60,000 per ton of SOx reduced.

EmeraChem provided ETS/AEC a letter specifically stated the following performance guarantee:

"*EMx System Emission Concentration:*

Parameter		*Percent Removal*
NOx at Catalyst Outlet (EMx)	*< 2.0 ppmvd*	*92% guaranteed*
CO at Catalyst Outlet	*< 3.0 ppmvd*	*98% guaranteed*
SO2 at System Outlet	*3.85 ppmvd*	*98% guaranteed*
H2S at System Outlet	*0 ppmvd*	*98% guaranteed*

The catalyst warranty period is 5 years. Expected life of the catalysts is 10-15 years."

Regarding TG-10 additives, ETS/AEC stated that:

"*TG-10 can be added to tail gas treating amine systems. TG-10 is a proprietary amine mixture offered by INEOS Gas/Spec. It has been designed to be highly selective for H_2S. INEOS Gas/Spec has published data, comparing the capabilities of TG-10 and MDEA in actual tail gas plants…….For many reasons similar to those in fuel gas treating, the effectiveness ratios for TG-10 can appear to be quite attractive.*"

ETS/AEC estimated that the cost effectiveness for TG-10 additives was between $2,000 and $3,000 per ton of SOx reduced, however the potential of emission reductions was quite small 0.04 tpd - 0.07 tpd, and most of the refineries already used TG-10 in some fashion. Therefore, this measure was not recommended by ETS/AEC at the final selection stage.

Regarding Cansolv and BELCO regenerative wet gas scrubbing technology, ETS/AEC stated that:

"*Regenerative wet gas scrubbing was studied as a potential measure to reduce emissions from the SRU/TGTUs. Two manufacturers were considered for RWGS: BELCO's Labsorb and Cansolv. Cansolv was chosen, in particular for SRU/TGTU stack treatment, because they had more experience with SRU/TGTU incinerator stack gas scrubbing."*

Regarding Tri-Mer non-regenerative wet gas scrubber, ETS/AEC stated that:

"*Non-regenerative wet gas scrubbing of the sulfur plant tail gas was also studied (Tri-Mer's Cloud Chamber Technology). These units are typically less expensive to install than a regenerative system, but they consume large volumes of water and produce waste water. However, they are very effective at reducing SOx emissions."*

Tri-Mer provided ETS/AEC a guaranteed letter specifically stated the inlet parameters (gas volume and temperature) provided to Tri-Mer and the following statement of guarantee:

"With regard to the specifications provided to Tri-Mer by ETS Inc., based on the design conditions, Tri-Mer will guarantee ≤330 ppmv inlet SO2 to ≤1.0 ppmv outlet for SO2."

ETS/AEC indicated with confidence:

"Guaranteed outlet SOx concentrations of 5 ppmv after scrubbing can be achieved, in the worst case at 95% SOx removal efficiency; in most cases, the required scrubbing

efficiency for a 5-ppmv SOx outlet is considerably less. BELCO has demonstrated experience in scrubbing the SOx from incinerated sulfur plant tail gas as well.

Besides wet scrubbing technology, ETS/AEC also indicated that flue gas treating techniques (e.g. EmeraChem) can possibly bring down the SOx to a level of 5 ppmv – 10 ppmv:

"…….it has been found possible in this study also to reduce SRU ppm SOx to the atmosphere by the gas treating techniques investigated. Those results are all below 10 ppmv, and in many cases below 5 ppmv"

To gather budgetary quotes from vendors on costs and sizing information, ETS/AEC provided the vendors important critical information (e.g. gas flow rate, inlet SOx concentration, flue gas temperature) for a generic scenario. ETS/AEC adjusted the vendors' quotes information to match each refinery specific conditions. ETS/AEC claimed that their approach would ultimately generate cost information within +/- 40% range of the expected actual costs. Please refer to section 14.2 for further information on ETS/AEC's approach.

6.3 Emission Reductions & Cost Effectiveness

For three refineries (Refinery #1, #3 and #4), ETS/AEC recommended to implement the control technologies described in Module 2 report. For these three refineries, ETS/AEC estimated the following emission reductions (estimated from the 2005 actual emissions) and cost effectiveness:

SOx Reductions (tons/day) for SRU/TG by Refinery

Refinery:	*1*	*3*	*4*	*Total*
Equipment SRU/TG	*0.13*	*0.15*	*0.04*	*0.31*

Cost Effectiveness ($/ton of SOx) for SRU/TG by Refinery

Refinery:	*1*	*3*	*4*	*Avg. for All*
Equipment SRU/TG	*$22.4k*	*$12.9k*	*$54.7k*	*$21.9k*

For the remaining three refineries (Refinery #2, #5 and #6), ETS/AEC recommended to implement wet gas scrubbers described in Module 3A report. For these three refineries, ETS/AEC's recommendations for the emission reductions (estimated from the 2005 actual emissions) and cost effectiveness are as follows:

SOx Reductions (tons/day) for SRU/TG by Refinery

Refinery:	*2*	*5*	*6*	*Total*
Equipment SRU/TG	*0.17*	*0.06*	*0.29*	*0.52*

Cost Effectiveness ($/ton of SOx) for SRU/TG by Refinery

Refinery:	*2*	*5*	*6*	*Avg. for All*
Equipment SRU/TG	*$39.0k*	*$123.2k*	*$36.3k*	*$46.8k*

The overall estimates for emission reductions (estimated from the 2005 actual emission levels) and average cost effectiveness for six SRU/TG systems are as follows:

SOx Reductions (tons/day) for SRU/TG by Refinery

Refinery:	*1*	*2*	*3*	*4*	*5*	*6*	*Total*
Equipment SRU/TG	*0.13*	*0.17*	*0.15*	*0.04*	*0.06*	*0.29*	*0.83*

Cost Effectiveness ($/ton of SOx) for SRU/TG by Refinery

Refinery:	*1*	*2*	*3*	*4*	*5*	*6*	*Avg. for All*
Equipment SRU/TG	*$22.4k*	*$39.0k*	*$12.9k*	*$54.7k*	*$123k*	*$36.3k*	*$37.4k*

6.4 Plot Space

With plot space information estimated directly by the vendors, ETS/AEC conducted an analysis for plot space at the refineries to accommodate the wet gas scrubber and its associated equipment (e.g. additional fan, waste water handling system, plume mitigation system). Their analysis was included in the confidential portion of the reports. ETS/AEC concluded that space was available at all refineries for this type of control:

> "*Wet gas scrubber equipment footprints and space requirements for the FCCUs and the SRU/TGTUs are shown in the confidential appendices for each refinery where measures have been selected. These specifications have been compared with the plot plans provided by the respective refineries, and where applicable, are presented in the costing workbooks*."

6.5 Project Timing

AEC/ETS estimated that startup of the control equipment could occur within 3 calendar years after the project begins:

> *"ETS believes that it is conceivable that ….emission reduction ….. can be achieved from the refineries implementing the commercially available measures described in this project within a construction time frame of approximately 3 calendar years or less following the completion of study designs and engineering."*

Chapter 7 – ETS/AEC's Analysis for Refinery Boilers/Heaters

7.1 Recommended BARCT Levels

For refinery boilers/heaters, ETS/AEC studied the technologies for pre-treatment of fuel gas prior to combustion in Module 2, and the technologies for post-treatment of flue gas after combustion in Module 3A.

Regarding the pre-treatment of fuel gas prior to combustion, ETS/AEC stated that:

> *"the present value of 40 ppmv total sulfur in refinery fuel gas be retained as the Best Available Retrofit Control Technology (BARCT) level",* and

Regarding the post-treatment of flue gas from boilers/heaters after combustion, ETS/AEC stated that:

> "*For the heaters and boilers, post-combustion emission control is often expensive due to the combination of the relatively low concentrations of SOx in flue gases and the division of the fuel gas stream among a number of heaters and boilers. Pre-combustion control, studied in Module 2, has been found to be more suitable for the majority of situations."*

ETS/AEC's conclusions on emission reductions (estimated from the 2005 actual emissions) and cost effectiveness for pre-treatment of fuel gas for boilers/heaters are:

> "*The measures recommended by AEC are the measures that gave the largest expected SOx reduction potential while also featuring the most reasonable cost effectiveness. The total overall emissions reduction is approximately 0.89 tons per day SOx.*
>
> *The overall cost effectiveness for refinery fuel gas, averaged over the commercially available measures that AEC recommended for the refineries in this study, is estimated to be $16,823 per ton SOx reduced. The study team estimates that any given cost effectiveness number has an expected range someplace within the band of -10% to +50%.*"

Since ETS/AEC does not recommend a new BARCT level for boilers/heaters, staff will not describe this portion of ETS/AEC analysis in details, however a summary is included in Appendix II-A of this report.

EDUCATION

1966 BS CHEMICAL ENGINEERING-CLEMSON UNIVERSITY

1968 MS CHEMICAL ENGINEERING- GEORGIA TECH

1994 EXECUTIVE MBA-CLAREMONT GRADUATE UNIVERSITY

Mr. Bell has a very strong background in refining and power technologies, and in plant operations and management. He has 41 years of refining and power experience, covering activities ranging from research and development to refinery operations and maintenance work; and has held the position of General Manager of Refining for a prototype heavy crude refinery. During his tenure as General Manager, the refinery achieved record levels of profitability, safety and environmental compliance. Mr. Bell provided much of the strategic planning for Conoco/Phillip's Wilmington Refinery, and helped develop and bring to the market several new refining technologies. He is currently President of Carson Industrial Steam Company, and is developing a large residual oil-fired cogeneration complex in southern California. Mr. Bell recently completed a three-year assignment as Owner's Engineer on a world-scale gasification project in North America.

EXPERIENCE

Mr. Bell's most recent job in refining was as Process Manager for Conoco/Phillips Petroleum Company's Wilmington, California refinery. While in this position, Mr. Bell worked as part of a project team assessing the technical and economic merits of building an 8,000 TPD IGCC plant at the refinery. He helped set the design basis, evaluated potential gasification technologies and assisted in developing the plant layout and coke handling systems. He also advised the development team on ways to maximize project returns, and on ways of meeting the very stringent air emission standards. During his tenure at this refinery, Mr. Bell helped develop, design and build the most sophisticated flue gas SO2 removal system in the refining industry. He also developed a novel approach to cracking jet fuel at low pressure to produce California-grade gasoline and isobutane.

Mr. Bell was previously Technology Manager for Petroleum Refining for Black & Veatch Pritchard (BVPI) in Overland Park, Kansas. In this role, he was responsible for all aspects of petroleum refining and petrochemical technologies. He assisted the Power Division in assessing the viability of several

direct-fired and IGCC power projects, and spent considerable time with the Power Group doing business development, both in the U.S. and overseas. Mr. Bell was involved in the training of engineers from major oil companies in the basics of power production using various technologies.

After leaving Conoco/Phillips, Mr. Bell began development of a 600 MWeq petroleum coke-fired cogeneration project in the Los Angeles basin. The project will burn petroleum coke in an ultra-supercritical steam boiler to generate power and process steam, while meeting the most stringent air quality standards in the world. The project will have the capability of removing 90 per cent of the CO2 in the boiler flue gas at less than $50 per tonne cost.

Mr. Bell also recently completed a three-year assignment as Owner's Engineer on a world-scale gasification project for a fertilizer plant in North America. The plant will gasify up to 15,000 TPD of coal or pet coke to make syngas for an IGCC unit, plus hydrogen for an ammonia/urea complex. Mr. Bell created the physical and economic model of the facility, as well as a pro forma model for various feedstocks and product offtakes. He provided novel ways of reducing capital and operating costs for the project, while increasing plant throughput.

Prior to joining BVPI, Mr. Bell was Product Line Manager for Refining for Brown and Root Braun in Alhambra, California. In this position, he was responsible for the basic designs of refining and petrochemical units, and the proper execution of process designs on refining projects. Mr. Bell's previous assignment with Brown and Root Braun was as Chief Process Engineer, where he supervised approximately 75 Process Engineers on numerous refining, petrochemical, ammonia and ethylene studies and projects.

Prior to joining Brown and Root, Mr. Bell was General Manager of Refining for Ultramar Refining Company's 75,000 BPD heavy crude refinery in Wilmington, California. Under his guidance, the refinery established the best refinery environmental record in the Los Angeles basin, and one of the best safety records in the refining industry. Mr. Bell also held Operations Manager and Technical Manager position with Champlin Petroleum Company, the predecessor to Ultramar at the Wilmington plant.

Prior to joining Champlin, Mr. Bell held a number of engineering and management positions with Chevron in their Richmond and El Segundo, California facilities, and was involved with two major expansions of both refineries.

Mr. Bell's first industrial job was as a Technical Services and Operations Engineer with Shell Chemical Company in Martinez, California.

ROBERT G. KUNZ, PH.D.

504 ALANBROOK COURT
HILLSBOROUGH, NC 27278-7733

RESIDENCE: (919) 245-1560
OFFICE: (919) 245-1569
E-MAIL: KUNZRG@AOL.COM

OBJECTIVE

Continuing participation in trend-setting environmental control activities utilizing proven strengths in planning, organization, analysis, and formulation of strategy to reduce costs, develop technology, and prevent downtime.

BACKGROUND SUMMARY

Professional with over 40 years experience and a consistent track record of completing projects on spec, on time, and on budget. Areas of accomplishments include leadership, negotiation skills, problem solving, and the ability to correlate diverse facts. Excellent communicator with the talent to instruct, train, and mentor others.

Earned both Ph.D. and M.B.A. degrees. Published technical author including book, journal articles, presentations, and one patent. Experienced team leader. Skills range from management to research and development, with awards received in both areas.

Expertise in petroleum refining and chemical / gas plants:

- Air emission control and testing
- Cooling water treatment and corrosion control
- Processes including fluid catalytic cracking
- Wastewater treatment
- Noise generation, control, and measurement
- Environmental permitting

SELECTED ACCOMPLISHMENTS

- Designed, built, and operated a pioneering pilot SO_2 and particulate flue-gas scrubber on fluid catalytic cracker (FCC) regenerator, allowing installation of full-scale scrubber at oil refinery to meet new air quality regulations.

- Led a team to respond quickly to pinpoint source of excessive particulate emissions from electrostatic precipitator treating cat cracker regenerator flue gas and others at California oil refinery.

- Co-authored U.S. patent while serving on elite task force to identify high-cost and missing technology necessary to comply with increasingly stringent environmental regulations in the refining industry.

- Over a 15-yr period, managed engineering group and supervised a team of environmental professionals responsible for negotiating environmental approvals needed for construction of new plants / projects. No capital project was ever delayed by failure to obtain permits in a timely manner.

- Served as member of "SWAT" team in discretionary siting of new $20M - $30M industrial gas plants to identify any fatal flaws which might prevent, delay, or jeopardize plant construction or unduly increase the cost.

- Supported sales of hydrogen gas to petroleum industry by providing expertise in environmental regulatory compliance.

- Developed a correlation to predict hydrogen reformer furnace NOx emissions (later extended to ethylene plants). Presented results at industry conferences and in the technical literature.

- Secured permits for and field-tested selective catalytic reduction (SCR) units, a post-combustion NOx control technique, located at / adjacent to several refineries / chemical plants. Published findings in *Journal of the Air & Waste Management Association.*

- Developed procedure for forecasting SCR catalyst life to prevent untimely shutdown of operations, presented at a petroleum industry conference and published in the literature (*Environmental Progress*).

- Presented technical paper on the successful application of SCR to FCC units at multiple locations. This presentation at a petroleum industry conference was co-authored by the SCR system manufacturer and a representative of a U.S refinery.

- Directed multi-location environmental site assessment for $65M acquisition, which was completed on schedule and at less than 50% of budget, allowing timely acquisition of new product line.

- Formulated the "Kunz Equation," which correlates system pH from alkalinity measurements in over 100 cooling towers to allow independent cooling water calculations, used as objective criteria to evaluate vendor proposals. These procedures were published in *Chemical Engineering* magazine and are now taught in college classrooms.

- Received Harrison Prescott Eddy Medal, a prestigious award given annually by the Water Pollution Control Federation, for noteworthy research in wastewater treatment.

PROFESSIONAL EXPERIENCE

RGK ENVIRONMENTAL CONSULTING, L.L.C., **Hillsborough, NC** 2003-Present
Independent Consultant / Author

CORMETECH, INC. ENVIRONMENTAL TECHNOLOGIES**, Durham, NC** 2001-2003
Technical Project Manager

AIR PRODUCTS AND CHEMICALS, INC.**, Allentown, PA** **1974-2000**
Senior Engineer / Manager / Senior Engineering Associate

1968-1974

ESSO RESEARCH AND ENGINEERING COMPANY**, Florham Park, NJ**
Engineer / Project Engineer

MILITARY SERVICE

Lieutenant, United States Air Force **-** Honorably separated from Active Duty and transferred to Retired Reserve.

Received Certificate of Outstanding Achievement from United States 17th Air Force for Communications Cost Reduction and Management Improvement Programs at conclusion of final assignment.

EDUCATION

Ph.D., Chemical Engineering, Rensselaer Polytechnic Institute, Troy, NY
M.B.A.., Executive Program, Temple University, Philadelphia, PA
M.S., Environmental Engineering, Newark College of Engineering, Newark, NJ
B.Ch.E. (with honors), Chemical Engineering, Manhattan College, Bronx, NY

Additional college courses in Psychology, Economics, Accounting, and Marketing

PROFESSIONAL LICENCES

Registered Professional Engineer NJ, PA, AL, TX, LA
Former Certified Community Noise Measurement Specialist, NJ

PROFESSIONAL ASSOCIATIONS

American Institute of Chemical Engineers (AIChE)
American Chemical Society (ACS)
Air & Waste Management Association (A&WMA)
Sigma Xi - The Scientific Research Society

JOHN D. MCKENNA
ETS, Inc.
1401 Municipal Road
Roanoke,VA 24012

jmck@etsi-inc.com

EDUCATION

B.S.Ch.E. - Manhattan College - 1961
M.S.Ch.E. - New Jersey Institute of Technology - 1968
M.B.A. - Rider University - 1974
Ph.D. - Walden University - 1991

Doctoral Thesis Topic: A Study of Factors Underlying Growth for Industrial Firms During Their Early Years After Startup

Master Thesis Topic: The Effect of Nitrilotriacetic Acid Upon the Biodegradability of Synthetic Detergents

Certified On-line Trainer - Walden University - 2000

EXPERIENCE

Dr. McKenna has over forty years of technical and business management experience. His background includes a wide range of entrepreneurial activities including the start-up of six environmental firms, one of which he took public. His direct experience includes corporate acquisitions and mergers as well as the invention and commercialization of a flue gas desulphurization (FGD) system. In light of the weak USA market conditions, an office was established in Taiwan and thereby the initial FGD system sales were achieved. In 1996, ETS International Inc. was listed in "The Nations Fastest Growing Technology Companies," having recorded a 5-year revenue growth of 542%. In addition to business and technical management experience, he has also been providing international training for over 30 years. Currently he is a principal of ETS Inc. He has taught online business and environmental courses for the University of Phoenix.

2002-2007 Co-chair Southampton Corp
A private venture capital firm specializing in the environmental industry.

2002-2006 University of Phoenix
Teaching on-line: Management, Marketing, Environmental Ethics, Environmental Science

1999-present Principal ETS Inc.
A provider of environmental training, testing, troubleshooting and testimony.

Chairman/President, ETS International, Inc.
Responsible for general management and long range planning functions.
Program Manager – FGD (LEC) – Full Scale Commercial Systems.

President, ETS, Inc., June 1979 to June 1988.
Responsible for general management and R&D strategic planning/priorities
Program Manager – Pilot Plant FGD (LEC) Semi-Dry System.

President, January l, 1978 to June 1979.
Enviro-Systems & Research, Inc. and Environmental Testing Services, Inc. Director '72-'82.

Vice President, Enviro-Systems & Research.
Directed all application engineering, research and development related to air and water pollution control. Concentration of effort on fabric filters, mechanical collectors and scrubbers for a wide variety of industrial applications. Program manager for million dollar EPA contract.

1968-72 Research Cottrell, Projects Director of Environmental Systems Division.
Supervised the development of RC's wet limestone scrubber for SO_2 removal FGD Pilot Plant and first RC full scale FGD system at Arizona Public Service. Responsible for execution of all projects and laboratory activities for both air and water pollution control, including in-house research and development and industrial and EPA R&D contracts. Supervised technical services which encompassed stack and stream sampling, laboratory analytical determinations, bench analysis, pilot plant fabrication and research. Major R&D efforts, oriented to particulate control and SO_2 removal. Consulting included comprehensive pollution control studies for complete industrial plants.

1967-68 Princeton Chemical Research, Project Leader.
Assigned to execute industrial and government contracts for water and air pollution control, including a NAPCA contract concerned with SO_2 control by catalytic reduction.

1964-67 Eldib Engineering & Research, Inc., Technical Assistant to the President.
Senior Engineer for pollution control problem solving. Investigated industrial wastewater, municipal sewage and industrial air pollution problems.

PROFESSIONAL ACTIVITIES

Air and Waste Management Association Technical Council – AE Chair 2002-2005
Virginia Environmental Business Council – Board of Directors 2000-2004
Air and Waste Management Association Technical Program – Chairman, Specialty Conference Fabric Filter VII 1994
Air and Waste Management Association South Atlantic Section – Board of Directors 1993-1996
Virginia State Advisory Board of Air Pollution – 1992 Vice Chair, 1993 Chair
Advisory Board Member: Wiley Series in Chemical Engineering
Air and Waste Management Association Technical Program – Chairman, Specialty Conference Fabric Filter VI 1992
Technical Program Committee, Scientific Evaluation of the National Acid Precipitation Assessment Program's (NAPAP), Final Report – 1991
Technical Advisory Committee, Ohio Air Quality Development Authority (OAQDA) – 1991
Air and Waste Management Association Emission Control Technology - Division Chairman, 1988-1991
Air and Waste Management Association Technical Program – Chairman, Specialty Conference Fabric Filter V 1990
NSF Consultant for the College Faculty Workshop Program-Grant
EPA Fabric Filter Workshop Lecturer
Scientific Reviewer for EPA Publications
AIChE - Central VA Section – Chairman 1980-84
APCA Lecturer "Particulate Control Device Cost Optimization"
Member of National Association of Environmental Professionals
EPA Course 413 Lecturer, "Fabric Filters and Selection and Cost of Control Equipment." – Presented at Rutgers University, March 18-19, 1987.

LISTINGS AND AWARDS

Distinguished Alumni Medal for Outstanding Achievement - New Jersey Institute of Technology

Manhattan College School of Engineering Centennial Award - Outstanding Engineering Graduate

New York Xi, Chapter of Tau Beta Pi, National Honor Society of Engineering - Eminent Engineer

Fellow -- American Institute of Chemical Engineers
Fellow – Air and Waste Management Association.
Who's Who in Engineering
Who's Who Environmental Registry
Who's Who in Finance and Industry
Who's Who in Technology Today
Who's Who in the World
Who's Who in Science and Engineering
Appointed by VA Governor G. Allen 97-01 World Trade Alliance of the Blue Ridge

COMMUNITY ACTIVITIES

Chairman, Roanoke Catholic School Board, 1984-1986
Roanoke Memorial Hospital Pastoral Care Visitor 1988-1992

TRAINING COURSES DELIVERED

Domestic
Fine Particle Emission Measurement & Control
Toxic Air Pollutants - Prevention and Control
Particulate Emission Control Cost Optimization
Introduction to Air Pollution Control
Introduction to Water Pollution Control
Incineration
Regulatory and Permitting Policies
Particulate Emission Control
Gaseous Emission Control
Baghouse Operation and Maintenance
Project Costs and Financing
Project Management
Public Involvement in Large-Scale Development Projects with Significant Environmental Impacts - AED/USAID for Russian Group
Pollutant Release and Transfer Registers Program - AED/USAID for Ukrainian Group

Foreign
Developing and Implementing Emission Inventories - Saudi Arabia/SABIC
Energy and the Environment - Univ. of La Laguna - Canary Islands
Baghouse Technology - National Taiwan University - Taipei, Taiwan
Air Pollution Technology Workshop - Floreanopolis, Brazil - IIE/USAEP
Methods of Effective Environmental PR - AED/USAID Kazakhstan
National Park Management Capacity Building - AED/USAID Armenia

PROJECT MANAGEMENT EXPERIENCE

John D. McKenna has gained comprehensive technical project management experience over the past 40 years.

In 1967-1968, while at Princeton Chemical Research, Dr. McKenna was the Program Manager of a research project funded by the National Air Pollution Control Agency (NAPCA) to evaluate SO_2 control by catalytic reduction.

While at Research Cottrell, during 1968-1972, he was the Program Manager on an EPA/HEW project which dealt with the design, installation, operation and testing of a wet scrubbing pilot plant for SO_2 control. Managed pilot wet scrubber FGD testing at AEP (Tidd Station) and RC's first full scale SO_2 FGD system at Arizona Public Service (Cholla Station).

During this time, he was also the technical manager of a program funded by Research Cottrell to acquire and develop the RC/Bacho system for SO_2 removal.

In 1973, Dr. McKenna was the Program Manager of EPA 68-02-1093. The purpose of this ETS contract was to conduct a preliminary techno-economic evaluation of the application of fabric filters to coal-fired industrial boilers. The success of this project led to a larger scale demonstration program (EPA 68-02-2148) and a subsequent follow on program (EPA 68-02-3674) both managed by Dr. McKenna.

In 1976, he managed a program to install, operate and test a fabric filter pilot plant on the slipstream of a refuse-fired boiler. The study, EPA R804223, was initiated to determine if a fabric filter was a viable control alternative for this application.

In 1981, Dr. McKenna managed an ETS contract received from EPA Region 5 (EPA task order 116) to execute an air pollution control engineering study. The purpose of this study was to settle a dispute between a federal agency and state government. In this effort, ETS technical personnel successfully executed 12 major tasks both within budget and on schedule.

In 1982, he managed a major ETS environmental engineering contract funded by the Government of Mexico. The program objectives were to design and specify a continuous ambient monitoring network for a developing industrial port and surrounding residential towns on the west coast of Mexico. Not only did the program involve the management of ETS technical personnel, but also the coordination of activities between ETS and several consulting subcontractors, Mexican authorities and various Mexican industrial representatives.

In 1983, ETS received a contract (EPA 68-02-3649) to characterize the performance of fabric filters on three large utility boilers. This program not only demonstrated the field testing and other technical capabilities of ETS, but also Dr. McKenna's program management abilities since two major subcontractors were involved (RTI and TRC) and field teams of over 20 engineers, scientists and technicians were mobilized.

In 1985, he was the ETS manager in a program in which ETS was subcontractor to Malcolm Pirnie. The program was funded by the Power Authority of the State of New York (PASNY). The purpose was to evaluate the techno-economic feasibility of applying fabric filtration and dry scrubbing to control MSW emissions. The major outputs of the study included capital and operating costs estimates and recommended design specifications for the subject control techniques.

Dr. McKenna has managed an ETS program funded by the Ohio Coal Development Office. The program initiated in 1987, evaluates an approach to control acid rain precursors. In this program, he has been responsible for the coordination of all activities between ETS and the prime contractor, Ohio University.

In the 1990s managed EPA Contract No. 68D20029, "Source Testing and Method Evaluation for Stationary Source Emissions."

From 1998 to present via an ETS subcontract from RTI, he has been the manager of the Air Pollution Control Technology (APCT) Business and Marketing Planning activity for EPA's Environmental Technology Verification Program (EPA Coop. Agreement CR826152-01-0). He has also provided the coordination and technical support of the APCT's Baghouse Filtration Products (BFP) Verification Program. This activity includes the preparation of generic protocols and test Q/A plans, review and coordination of recommended modifications to existing generic protocols and test Q/A plans, and continued review and commentary of the BFP verification process.

In 2008-2009 Dr. McKenna managed an ETS contract received from the South Coast Air Quality Management District (SCAQMD) for the evaluation of emission control technologies for further reducing sulfur oxide emissions from stationary sources in the SCAQMD's RECLAIM program. The purpose was to identify the Best Available Retrofit Control Technologies (BARCT) that could be implemented within the 2011-2014 timeframe to help South Coast Basin attain the PM2.5 ambient air quality standards. The industries covered included refineries, cement manufacturing, and container glass manufacturing.

James P. Norton, P.E.

Mr. Norton is a Principal Engineer and President of Norton Engineering Consultants, Inc. (NEC), which he founded in 1993. He has 30+ years experience in the petroleum process, specialty chemicals, lubricants, energy and environmental fields.

Mr. Norton has had a broad range of experience in petroleum refining and petrochemicals including:

- Fired heaters, boilers, CO boilers, incinerators, burners, and other solids, liquid and gas fueled combustion equipment and ancillary systems,
- Process development for reactive extrusion, polymer processing, and selective non-catalytic NOx reduction processes,
- Polymer Processing specialist (synthetic rubber and silanes),
- Process Design – solution polymerization plants, synthetic rubber dewatering and drying facilities, direct polymer devolatilization systems, reactive extrusion systems for polymer modification, lube blending, lubricant additive manufacturing, environmental control systems (SOx, NOx, PM, HAPs), fired heaters, steam generators, heat exchangers, pneumatic conveying systems, wet gas scrubbing systems, water treating facilities, off-sites/utilities, steam boilers, waste heat recovery facilities, etc.
- Planning – lube blending, lubricant additives, flue gas desulfurization and particulate control systems, environmental control facilities for polymer manufacturing plants, water slurry polymer finishing, direct devolatilization of solution polymers, solvent recovery and purification systems, delayed coker debottlenecking, fluid coker, and flexicoker projects.

Selected Career Highlights

1993 to Present: Norton Engineering Consultants, Inc., Boonton, NJ

- Refinery steam system optimization and boiler upgrade project planning, design and execution support (HOVENSA – 2008)
- Refinery boiler house ULNB conversion, economizer replacement and flue gas recirculation system design (Sunoco – 2008)
- Replacement Atmospheric and Vacuum Crude Heater designs (CO Heaters on FCCU) (Valero – 2007-08)
- Naptha Hydrotreater and Catalytic Reformer Heater UNLB Conversion Project Design (ConocoPhillips 2007-08).
- CO Boiler upgrade design and field supervision (ConocoPhillips – 2007 - 2009).
- Crude Unit Heater SIS System Design & Start-up (ConocoPhillips – 2007-08).

- FCCU/FCU Emissions Control Project consulting (Valero – 2001-2007).
- FCC CO Boiler evaluation for installation of emissions control facilities (ConocoPhillips – 2007).
- FCCU wet gas scrubbing system troubleshooting (ConocoPhillips – 2007).
- FCCU wet gas scrubbing project design review (ConocoPhillips – 2007).
- FCCU wet scrubbing system project assistance (cold-eyes reviews) (ConocoPhillips – 2007).
- NHT fired reboiler design and design of retrofit SIS system for NHT pre-heater furnace (Valero - 2006)
- Troubleshooting – LABSORB Regenerative Scrubbing System (Valero – 2006)
- Consulting – FCCU scrubber expansions (Various Clients - 2002, 2006, 2007)
- Lead Investigator for US DOE Advanced Fired Heater Development Project (2001 – 2005)
- Assessment of commercial technologies for the direct devolatilization of solution polymers (EP/EPDM) (2004-05)
- Solution polymer blending and devolatilization facilities for toll processor (2003)
- Jet Ejector Venturi Wet Gas Scrubbing System Design including assessment of regenerator overhead circuit including flue gas expander and back pressuring existing CO Boiler – EM R&S (2000-2001)
- Flue Gas Desulfurization Technology Evaluation – EM R&S (1999)
- Wet Gas Scrubbing System Designs – ExxonMobil Licensees (1996, 1997, 2001, 2004)
- FCCU Regenerator O/H Modifications for Electrostatic Precipitator Installation On-the-Run – Ultramar Diamond Shamrock (Quebec, 1996)
- Turnaround support and operations consulting for combined FCCU and FCU CC Boiler
- Boiler fired petroleum coke, waste CO gas from the FCCU and FCU and had supplemental RFG capability. (Alberta - 1994)
- Lubricant Additives Plant (solution polymerization facility) – Process Design and Planning (Infineum France SA, 1999 – 2000)
- Start-up support for SRP section of client's synthetic rubber plant (1995).
- Dispersants Plant - Process, Environmental Control and Offsites Design (ECC, 1995 – 1996)
- Lubricants Blending Plant Operations Consulting and Design Services (EUSA, Continuing)
- Hazardous Material Control Systems Development and Implementation (Lockheed Martin Aerospace, 1994 – 1996)
- Boiler Emissions Control Technology Selection (SOx & PM) for Bitumen Fired Steam Generators – IOR (2001)
- Reactive Extrusion Process Development - ExxonMobil Chemical / Dow Corning (1999 - 2000)
- CO Heater Encon & SCR NOx Control Study – Exxon Benicia Refinery (1992).
- SNCR DeNOx Utility Boiler Design – Exxon Research & Engineering (1993-94)
- ExxonMobil WGS Licensing Support & Process Development (1996 -2005)

1990 – 1993 Martech Industries, Inc.

- Process Development for Continuous Polymer Dissolving Process – Exxon Chemical Polymers Group.
- Operations and Maintenance Consulting – Exxon, Bayonne Lubricants Plant
- Selective Non-catalytic NOx Reduction Facilities Design – Exxon Research & Engineering.
- Lead Designer – Steam Plant Upgrade Project – Exxon, Pittsburgh PA
- Various Process Planning Activities for client's worldwide petroleum and petrochemical operations (Exxon Chemical & Exxon Res & Engr).

1984 – 1990 Exxon Chemical Company, Polymers Group

- Elastomer Extrusion Specialist
- Elastomer drying and direct devolatilization process development engineer
- Elastomers manufacturing support
- Process designer & planner for solution and slurry elastomer manufacturing facilities – primary focus on product finishing and stripping areas of plant.

1978 – 1984 Exxon Research & Engineering Co.

- CO Boiler Specialist – Design, Troubleshooting & Operations Consulting
- Steam Cracker & Steam Reformed Design
- Fired Heater, Steam Generator and Incinerator Designs
- Technology Commercialization – Materials of Construction, Burners, Air Preheat Systems, Advanced Fired heater and Boiler Controls, Energy Conservation Strategies.
- Plant Automation including Artificial Intelligence Systems Design and Testing
- Synthetic Fuels Planning, Process Development and Design
- Start-up Support and Plant Troubleshooting.
- Hydrocracker Heater Rebuild.
- Delayed Coking Heater Troubleshooting
- Delayed Coker Operations Consulting and Cycle Time Optimization

Process Simulation Tools

- PRO II (Proprietary and Commercial Thermodynamic Packages)
- HYSYS (Continuous and Batch Simulations)
- HEXTRAN
- Proprietary Plant and Process Evaluation Tools

Education

- Bachelor of Mechanical Engineering, Manhattan College, Bronx NY, 1978
- Master of Mechanical Engineering, Manhattan College, Bronx NY, 1981

Professional Accreditation

- Licensed Professional Engineer – State of New Jersey – GE28615 (1983)

Patents & Publications

- US Patent (1984) Steam Generating Solids Cooler for Spent Shale, Hot Catalyst and Fluid Coke.
- US Patent (1988) Method for Agglomerating and Dewatering Polymeric Materials
- US Patent (1991) Centrifugal Solids Cooler for Pneumatic Conveying Systems
- Patent Pending (2007) – Advanced Fired Heater
- Patent Pending (2007) – Zero Plugging Slurry Distribution Headers and Onstream Descaling System

PREFACE

This document constitutes the Final Program Environmental Assessment (PEA) for Proposed Amended Regulation XX – Regional Clean Air Incentives Market (RECLAIM). An Initial Study was released for a 30-day public review and comment period from June 19, 2009 to July 21, 2009 which identified the environmental topics of aesthetics, air quality, energy, hydrology and water quality, hazards and hazardous materials, and transportation and traffic, as potentially being significantly adversely affected by the project. Three comment letters were received from the public regarding the preliminary analysis in the Initial Study. These comment letters and responses to individual comments are included in Appendix D of this document.

The Draft PEA was released for a 45-day public review and comment period from August 18, 2010 to October 1, 2010 which identified the topics of air quality and hydrology (water demand) as exceeding the SCAQMD's significance thresholds associated with implementing the proposed project. Three comment letters were received from the public regarding the analysis in the Draft PEA. These comment letters and responses to individual comments are included in Appendix E of this document. No comment letters were received that identified other potentially significant adverse impacts from the proposed project.

In addition, subsequent to release of the Draft PEA, minor modifications were made to the proposed project. To facilitate identification, modifications to the document are included as underlined text and text removed from the document is indicated by ~~strikethrough~~. Staff has reviewed the modifications to the proposed project and concluded that none of the modifications alter any conclusions reached in the Draft PEA, nor provide new information of substantial importance relative to the draft document. As a result, these minor revisions do not require recirculation of the document pursuant to CEQA Guidelines §15088.5. Therefore, this document now constitutes the Final PEA for the proposed project.

WCI = Western Climate Incentive
WDR = waste discharge requirements
WGS = wet gas scrubber

CHAPTER 1

EXECUTIVE SUMMARY

INTRODUCTION

The California Legislature created the South Coast Air Quality Management District (SCAQMD) in 1977[1] as the agency responsible for developing and enforcing air pollution control rules and regulations in the South Coast Air Basin (Basin) and portions of the Salton Sea Air Basin and Mojave Desert Air Basin, referred to herein as the District. By statute, the SCAQMD is required to adopt an air quality management plan (AQMP) demonstrating achievement and maintenance of all federal and state ambient air quality standards for the District[2]. Furthermore, the SCAQMD must adopt rules and regulations that carry out the AQMP, including requiring Best Available Retrofit Control Technology (BARCT) for existing sources[3]. The 2007 AQMP concluded that major reductions in emissions of volatile organic compounds (VOCs), oxides of sulfur (SOx) and oxides of nitrogen (NOx) are necessary to attain the air quality standards for ozone (the key ingredient of smog) and particulate matter (PM10 and PM2.5). Ozone, a criteria pollutant which has been shown to adversely affect human health, is formed when VOCs react with NOx in the atmosphere. VOCs, NOx, SOx (especially sulfur dioxide) and ammonia also contribute to the formation of PM10 and PM2.5.

The Basin is designated by the United States Environmental Protection Agency (USEPA) as a non-attainment area for PM2.5 emissions because the federal PM2.5 standards have been exceeded. For this reason, the SCAQMD is required to evaluate all reasonably available control measures in order to reduce direct PM2.5 emissions, as well as PM2.5 precursors, such as NOx and SOx. Because NOx and SOx are major building blocks of PM2.5 formation, reducing NOx and SOx emissions is highly effective in reducing ambient PM2.5 levels as compared to other primary and secondary contributors to PM2.5 formation. For example, the reduction of one ton of SOx is equal to 1.5 tons of directly emitted PM2.5 or 15 tons of NOx. Further, chemical speciation of PM2.5 samples indicates that in the South Coast Air Basin, 25 percent of the ambient PM2.5 is attributed to contribution from sulfates (a component of SOx). Thus, the 2007 AQMP contains a multi-pollutant control strategy to achieve attainment with the federal annual average PM2.5 standard with NOx and SOx reductions identified as the two most effective tools in reaching attainment with the PM2.5 standards.

As part of this ongoing PM2.5 reduction effort and to implement the BARCT requirement for existing sources, SCAQMD staff is proposing amendments to Regulation XX – Regional Clean Air Incentives Market (RECLAIM) to achieve additional SOx emission reductions as outlined in the 2007 AQMP in Control Measure (CM) CMB-02: Further SOx Reduction for RECLAIM (CM #2007CMB-02). Amendments are proposed to Rule 2002 – Allocations for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx), to address BARCT requirements, which may require installation or modification of SOx emission control equipment. Other changes proposed are administrative in nature and include minor clarifications for continuity.

The primary focus of the proposed project is to bring the SOx RECLAIM program up-to-date with the latest BARCT requirements to achieve, if feasible, the proposed SOx emission reductions in CM #2007CMB-02 (at least 2.9 tons per day) and to achieve the maximum feasible reductions. The proposed project may actually achieve additional SOx emission reductions beyond 2.9 tons per day depending on the actual BARCT SOx emission control efficiencies. The proposed project will affect the following types of equipment and processes at SOx

[1] The Lewis-Presley Air Quality Management Act, 1976 Cal. Stats., ch 324 (codified at Health & Safety Code, §§40400-40540).
[2] Health & Safety Code, §40460 (a).
[3] Health & Safety Code, §40440 (a).

RECLAIM facilities: 1) petroleum coke calciners; 2) cement kilns; 3) coal-fired boiler (cogeneration); 4) container glass melting furnace; 5) diesel combustion[4]; 6) fluid catalytic cracking units; 7) refinery boilers/heaters; 8) sulfur recovery units/tail gas treatment units; and, 9) sulfuric acid manufacturing. Additional amendments are proposed to establish procedures and criteria for reducing RECLAIM Trading Credits (RTCs) and RTC adjustment factors for year 2013 and later. Other minor changes are proposed for clarity and consistency throughout the proposed amended rule.

The proposed project is estimated to reduce at least 2.9 tons per day of SOx emissions or more by 2014. Despite this projected environmental benefit to air quality, the Initial Study, prepared pursuant to the California Environmental Quality Act (CEQA), identified the following environmental topics as areas that may be adversely affected by the proposed project: aesthetics, air quality, energy, hydrology and water quality, hazards and hazardous materials, and transportation/traffic. This ~~Draft~~ Final Program Environmental Assessment (PEA) has been prepared to analyze further whether the potential impacts to these environmental topics are significant. Any other potentially significant environmental impacts identified in the Notice of Preparation/Initial Study have also been analyzed in this ~~Draft~~ Final PEA.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

The proposed amendments to Regulation XX are considered a "project" as defined by CEQA. CEQA requires that the potential adverse environmental impacts of proposed projects be evaluated and that methods to reduce or avoid identified significant adverse environmental impacts of these projects be implemented if feasible. The purpose of the CEQA process is to inform the SCAQMD's Governing Board, public agencies, and interested parties of potential adverse environmental impacts that could result from implementing the proposed project and to identify feasible mitigation measures or alternatives, when an impact is significant.

California Public Resources Code §21080.5 allows public agencies with regulatory programs to prepare a plan or other written documents in lieu of an environmental impact report once the Secretary of the Resources Agency has certified the regulatory program. The SCAQMD's regulatory program was certified by the Secretary of Resources Agency on March 1, 1989, and is codified as SCAQMD Rule 110 (the rule which implements the SCAQMD's certified regulatory program). CEQA and Rule 110 require that potential adverse environmental impacts of proposed projects be evaluated and that feasible methods to reduce or avoid significant adverse environmental impacts of these projects be identified.

The SCAQMD as Lead Agency for the proposed project, prepared a Notice of Preparation/Initial Study (NOP/IS) which identified environmental topics to be analyzed in a Draft Environmental Assessment (EA). The NOP/IS provided information about the proposed project to other public agencies and interested parties prior to the intended release of the Draft EA. The NOP/IS was distributed to responsible agencies and interested parties for a 30-day review and comment period from June 19, 2009, to July 21, 2009. The initial evaluation in the NOP/IS identified the topics of aesthetics, air quality, energy, hydrology and water quality, hazards and hazardous materials, and transportation and traffic as potentially being adversely affected by the proposed project. During that public comment period, the SCAQMD received three comment letters.

[4] The proposed project does not establish a new BARCT level for diesel combustion. The BARCT level for this source category is incorporated into the proposed project for consistency with the existing 15 ppmv SOx requirement in SCAQMD Rule 431.2. For this reason, the diesel combustion source category is not included in this analysis.

These letters and their responses can be found in Appendix D of this document. In addition, the NOP/IS, is attached to this PEA as Appendix C, and can also be obtained by visiting the following website at: http://www.aqmd.gov/ceqa/documents/2009/aqmd/is_nop/RegXX.pdf.

Of the comment letters received relative to the NOP/IS, in particular, Comment 2-4 from Comment Letter #2 suggested that a Program Environmental Assessment (PEA) be prepared for the proposed project. In response to this comment, in accordance with CEQA Guidelines §15168, SCAQMD has prepared this ~~Draft~~ Final PEA to evaluate potential adverse impacts from the proposed project. The decision to prepare a ~~Draft~~ PEA is based on the proposed project: 1) being connected to the issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program (CEQA Guidelines §15168 (a)(3)); and, 2) containing a series of actions that can be characterized as one large project and the series of actions are related as individual activities that would be carried out under the same authorizing regulatory authority and having similar environmental effects which can be mitigated in similar ways (CEQA Guidelines §15168 (a)(4)). This ~~Draft~~ PEA is a public disclosure document intended to: (a) provide the lead agency, responsible agencies, decision makers and the general public with information on the environmental impacts of the proposed project; and, (b) be used as a tool by decision makers to facilitate decision making on the proposed project.

The Draft PEA was released for a 45-day public review and comment period from August 18, 2010 to October 1, 2010. The ~~Thus, this~~ Draft PEA, prepared pursuant to CEQA, identifieds aesthetics, air quality, energy, hydrology and water quality, hazards and hazardous materials, and transportation and traffic as areas that may be adversely affected by the proposed project. Based on the conclusions in the NOP/IS prepared for the proposed project, the~~is~~ Draft PEA further analyzeds whether or not the aesthetics, air quality, energy, hydrology and water quality, hazards and hazardous materials, and transportation and traffic impacts are significant. The Draft PEA concluded that only the topics of air quality and hydrology (water demand) would have significant adverse impacts.

Three~~Any~~ comment letters were received during the public comment period on the analysis presented in the~~is~~ Draft PEA. Responses to these comment letters have been prepared. The comment letters along with the responses are ~~will be responded to and~~ included in Appendix E of this~~e~~ Final PEA. Thus, this Final PEA, prepared pursuant to CEQA Guidelines §15132, identifies air quality and hydrology (water demand) as areas that may be adversely affected by the proposed project. Prior to making a decision on the proposed amendments to Regulation XX, the SCAQMD Governing Board must review and certify the Final PEA as providing adequate information on the potential adverse environmental impacts of the proposed amendments to Regulation XX.

PREVIOUS CEQA DOCUMENTATION FOR REGULATION XX

This ~~Draft~~ Final PEA is a comprehensive environmental document that analyzes potential environmental impacts from the proposed amendments to Regulation XX. SCAQMD rules, as ongoing regulatory programs, have the potential to be revised over time due to a variety of factors (e.g., regulatory decisions by other agencies, new data, and lack of progress in advancing the effectiveness of control technologies to comply with requirements in technology forcing rules, etc.). Several previous environmental analyses have been prepared to analyze past amendments to the rules that comprise Regulation XX. The following paragraphs summarize these previously prepared CEQA documents and are included for informational purposes only. The current ~~Draft~~ Final PEA focuses on the currently proposed amendments to Regulation XX and does not rely on these previously prepared CEQA documents. The following documents can

be obtained by submitting a Public Records Act request to the SCAQMD's Public Records Unit. In addition, a link for downloading files from the SCAQMD's website is provided for those CEQA documents prepared after January 1, 2000. The following is a summary of the contents of these documents.

Notice of Exemption From CEQA for Proposed Amended Regulation XX – Regional Clean Air Incentives Market (RECLAIM); April 2007: The amendments to Regulation XX – RECLAIM were administrative in nature and focused on the following rules: Rule 2004 – Requirements; Rule 2007 – Trading Requirements; and Rule 2010 – Administrative Remedies and Sanctions. The amendments to Rule 2004 provided an exemption from submitting Quarterly Certification Emission Reports for facilities that do not have any NOx or SOx emitting equipment located on site. The amendments to Rule 2007 clarified the trading requirements for foreign entities that are not residing or licensed to conduct business in California, and clarified reporting requirements for parties entering into a forward contract or a contingent right contract. Amendments to Rule 2010 specified liability for allocation violations when changes of ownership occur. Other minor administrative changes were included that improved the clarity of these rules. The SCAQMD concluded that the amendments would not have an effect on emissions and that there was no possibility that the project would have the potential to have a significant adverse effect on the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared. This document can also be obtained by visiting the following website at: http://www.aqmd.gov/ceqa/notices/2007/noe/RegXX_NOE.pdf

Notice of Exemption From CEQA for Proposed Amended Regulation XX – Regional Clean Air Incentives Market (RECLAIM); May 2005: The amendments to Regulation XX – RECLAIM were administrative in nature and focused on the following rules and protocols: Rule 2000 – General; Rule 2001 – Applicability; Rule 2005 – New Source Review for RECLAIM; Rule 2007 – Trading Requirements; Protocol for Rule 2011 – Requirements for Monitoring, Reporting, and Recordkeeping for Oxides of Sulfur (SOx) Emissions; and Protocol for Rule 2012 – Requirements for Monitoring, Reporting, and Recordkeeping for NOx Emissions. Amendments to Rule 2000 and Protocols for Rules 2011 and 2012 were proposed for consistency with the new source requirements for non-RECLAIM sources and for clarification that mobile source emissions are part of the total RECLAIM pollutants emitted from a facility. Amendments to Rule 2005 clarified that emissions from affected sources shall include mobile source emissions and to include an alternative quarterly holding period for RTCs for offsetting emissions from a new source. Amendments to Rule 2007 reinstated the trading provision that would allow power producers to transfer NOx RECLAIM Trading Credits among facilities under common ownership which was inadvertently omitted during the January 7, 2005 amendments to Rule 2007. The SCAQMD concluded that the amendments would not have an effect on emissions and that there was no possibility that the proposed project would have the potential to have a significant adverse effect on the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared. This document can also be obtained by visiting the following website at: http://www.aqmd.gov/ceqa/notices/2005/noe/NOE_RegXX.doc

Final Environmental Assessment for Proposed Amended Regulation XX – Regional Clean Air Incentives Market (RECLAIM); December 2004 (SCAQMD No. 031104BAR): A Draft Environmental Assessment (EA) for amendments to Regulation XX (Rule 2001 – Applicability; Rule 2002 – Allocations for NOx and SOx; Rule 2007 – Trading Requirements; Rule 2009 – Compliance Plans for Power Producing Facilities; Rule 2010 – Administrative Remedies and

Sanctions; Rule 2011 – Requirements for Monitoring, Reporting, and Recordkeeping for SOx Emissions; and, Appendix A – Protocol for SOx; and, Rule 2012 – Requirements for Monitoring, Reporting, and Recordkeeping for NOx Emissions; and, Appendix A – Protocol for NOx) was released for a 45-day public review period from October 22, 2004 to December 7, 2004. The amendments implemented control measure CMB-10 in the 2003 AQMP and addressed BARCT requirements to achieve additional NOx emission reductions. The Draft EA identified the topic of air quality as the only area that may be significantly adversely affected by the project. After circulation of the Draft EA, a Final EA was prepared and certified by the SCAQMD Governing Board on January 7, 2005. This document can be obtained by visiting the following website at: http://www.aqmd.gov/ceqa/documents/2005/aqmd/finalEA/FEA_RegXX.doc .

Notice of Exemption From CEQA for Proposed Amended Rule 2007 – Trading Requirements; September 2004: The purpose of the amendments to Rule 2007 was to address CARB concerns regarding the reintroduction of power plants to the RECLAIM trading market. The proposal contained a provision that delayed the date when the trading restrictions would be lifted until such time that other RECLAIM rule amendments (scheduled for January 2005) were adopted that would decrease allocations to implement the 2003 AQMP Control Measure CMB-10 and to reflect BARCT in accordance with Health and Safety Code (HSC) §40440. The air quality objective was to ensure that BARCT adjustments are made to facility allocations prior to removal of power plant trading restrictions. The SCAQMD concluded that the amendments would not have an effect on emissions and that there was no possibility that the project would have the potential to have a significant adverse effect on the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared. This document can also be obtained by visiting the following website at:
http://www.aqmd.gov/ceqa/notices/2004/noe/NOE_2007.doc

Notice of Exemption From CEQA for Proposed Amended Rule 2015 – Backstop Provisions; June 2004: The purpose of the amendments to Rule 2015 was to address the USEPA's conditional approval of Regulation XX – RECLAIM, as amended May 11, 2001. The USEPA determined that the accounting procedures for and mitigations of excess emissions that occur during a breakdown in the current version of the RECLAIM program needed to be modified because these provisions conflict with USEPA's 1999 'Excess Emissions Policy' and §110 and Part D of the federal Clean Air Act (CAA). Specifically, the amendments to Rule 2015: 1) required the SCAQMD to monitor excess emissions occurring during breakdowns that are not covered by facility RTCs, and to compare that amount to the quantity of available, unused RTCs each year for the entire RECLAIM program; and, 2) required offsets for excess unmitigated breakdown emissions. The SCAQMD concluded that the amendments would not have an effect on emissions and that there was no possibility that the project would have the potential to have a significant adverse effect on the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared. This document can also be obtained by visiting the following website at: http://www.aqmd.gov/ceqa/notices/2004/noe/NOE_2015.doc

Addendum to May 2001 Final Environmental Assessment for Proposed Amended Rule 2007 – Trading Requirements; Proposed Amended Rule 2011 – Requirements for Monitoring, Reporting, and Recordkeeping for SOx Emissions; and, Proposed Amended Rule 2012 – Requirements for Monitoring, Reporting, and Recordkeeping for NOx Emissions; October 14, 2003 (SCAQMD No. 101403BAR): The amendments to Rule 2007 required the power producers to re-enter the RECLAIM trading market. Specifically, the power

producing facilities were brought back into the RECLAIM trading market and allowed to use RTCs to reconcile emissions, and to sell or transfer RTCs below the original allocation after compliance year 2003. The amendments to Rules 2011 and 2012 clarified that the 90-day recertification period for Continuous Emission Monitoring Systems (CEMS) applies when a new CEMS or a component of an existing CEMS is added to an existing or modified major RECLAIM source. An Addendum to the May 2001 Final EA for the amendments to Regulation XX (Rules 2007, 2011, and 2012) was prepared. The SCAQMD determined that an Addendum to the May 2001 Final EA was the appropriate document to prepare because none of the conditions described in CEQA Guidelines §15162 were triggered since the amendments did not contain new information of substantial importance and would not create any new significant adverse impacts or substantially increase the severity of the previously identified significant environmental effects in the original project. Further, the SCAQMD concluded that the amendments would not change the environmental analysis or conclusions in the previously certified May 2001 Final EA. Pursuant to CEQA Guidelines §15164 (c), it was not necessary to circulate the Addendum for public review. The Addendum to the May 2001 Final EA was certified by the SCAQMD Governing Board on December 5, 2003. This document can also be obtained by visiting the following website at: http://www.aqmd.gov/ceqa/2003/aqmd2003.html.

Final Environmental Assessment for Proposed New and Amended Rules, Regulation XX – RECLAIM; Rule 1631 – Pilot Credit Generation Program for Marine Vessels; Rule 1632 – Pilot Credit Generation Program for Hotelling Operations; Rule 1633 – Pilot Credit Generation Program for Truck/Trailer Refrigeration Units; and Rule 2507 – Pilot Credit Generation Program for Agricultural Pumps; May 2001 (SCAQMD No. 010201JDN): An integrated group of new and amended rules were adopted to help ensure compliance with emission allocations contemplated during initial RECLAIM program design while reducing impacts of California's electricity crisis on the RECLAIM market. The project included proposed new and amended RECLAIM rules and four voluntary mobile and area source NOx pilot credit generation rules. The project components were designed to work together to lower and stabilize RTC prices by increasing supply, reducing demand, and increasing RTC trading information availability and accuracy. A Draft EA for the amendments to Regulation XX plus proposed Rules 1631, 1632, 1633 and 2507 (which established pilot NOx credit generation rules as a means of creating additional NOx RTCs) was released for a 30-day public review period from March 27, 2001 to April 25, 2001. The analysis showed that there were potential adverse environmental effects that may result from implementing the amendments (primarily removing power producers from the trading market). The Draft EA identified "air quality" and "hazards and hazardous materials" as the only areas that may be significantly adversely affected by the project. After circulation of the Draft EA, a Final EA was prepared and certified by the SCAQMD Governing Board on May 11, 2001. This document can be obtained by visiting the following website at: http://www.aqmd.gov/ceqa/2001/aqmd2001.html.

Final Environmental Assessment for Proposed Amended Rules 1303 – Requirements, 2005 – New Source Review for RECLAIM, 1302 - Definitions and 1309.1 - Priority Reserve; April 9, 2001 (SCAQMD No. 021401MK): The amendments to Rules 1303 and 2005 revised the modeling standard for sources locating in an attainment sub-region of the district so that any proposed new emissions plus the measured background could not create a violation of any applicable ambient air quality standard. In sub-regions designated as nonattainment areas for specified criteria pollutants, the modeling criteria remained the same, but emissions from new or modified sources were not allowed to exceed the allowable change in concentration thresholds as set forth in Rule 1303, Table A-2. The amendments to Rule 1309.1 allowed temporary access to the SCAQMD's Priority Reserve PM10 account for new electric generating facilities (EGF) for

applications deemed complete between 2001 and 2003, provided that all the other requirements were met and the appropriate mitigation fee was paid. The Draft EA was released for a 30-day public review and comment period from February 14, 2001 to March 15, 2001. The Draft EA concluded that the project would not have any significant or potentially significant effects on the environment. After circulation of the Draft EA, a Final EA was prepared and certified by the SCAQMD Governing Board on April 20, 2001. This document can be obtained by visiting the following website at: http://www.aqmd.gov/ceqa/2001/aqmd2001.html.

Notice of Exemption From CEQA for Proposed Amended Rule 2011 – Requirements for Monitoring, Reporting, and Recordkeeping for Oxides of Sulfur (SOx) Emissions; and, Proposed Amended Rule 2012 – Requirements for Monitoring, Reporting, and Recordkeeping for Oxides of Nitrogen (NOx) Emissions; March 2001: Because the substantive components of the project involved the addition of an alternative recordkeeping option, the SCAQMD concluded that the amendments would not have an effect on emissions and that there was no possibility that the project would have the potential to have a significant adverse effect on the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared. This document can also be obtained by visiting the following website at: http://www.aqmd.gov/hb/2001/010337a.html.

Final Environmental Assessment for Proposed Amended Rules 1302 – Definitions, 1303 – Requirements, 1306 – Emissions Calculations, 2000 – General; and BACT Guidelines; August 23, 2000 (SCAQMD No. 33100JDN): The amendments bifurcated the New Source Review (NSR) control technology requirements into Lowest Achievable Emission Rate (LAER) for federal major polluting facilities and Minor Source Best Available Control Technology (MSBACT) for all others. Unlike federal LAER, state law allows the cost of the control equipment to be taken into consideration when making a BACT determination. All major polluting facilities, as defined in the federal CAA, would continue to be required to employ LAER for a new or relocated source and any emission increase from a modified source. All other facilities would be required to employ MSBACT. The amendments applied to both RECLAIM and non-RECLAIM sources. Additionally, the amendments allowed relocations of non-major polluting facilities that meet certain conditions, including no emission increases upon relocation and for two years thereafter, to maintain the existing control level from the prior location instead of requiring the installation of new BACT controls. The Draft EA was released for a 30-day public review and comment period from July 11, 2000 to August 9, 2000. The Draft EA concluded that the project would not have any significant or potentially significant effects on the environment. After circulation of the Draft EA, a Final EA was prepared and certified by the SCAQMD Governing Board on October 20, 2000. This document can be obtained by visiting the following website at: http://www.aqmd.gov/hb/2000/001037a.html.

Notice of Exemption for Proposed Amended Rule 2005 - New Source Review for RECLAIM, Rule 2011 - Requirements for Monitoring, Reporting, and Recordkeeping for SOx Emissions, and Rule 2012 - Requirements for Monitoring, Reporting, and Recordkeeping for NOx Emissions; April 1999: The amendments included clarifications to New Source Review requirements for change of operator and modifications to new facilities. For major sources, the amendments clarified monitoring requirements and added calculation methods for cases currently not addressed. For large sources, the amendments added monitoring and calculations methods for cases currently not addressed and clarified source testing requirements. For process units, the amendments established concentration limits for determining emissions and added guidelines for category specific emission rates. The

amendments also corrected rule references, extended deadlines for monthly emissions reporting, and added clarifying language to enhance enforcement and consistency. The amendments were necessary to clarify rule requirements and improve enforceability. The amendments also increased flexibility for RECLAIM facilities. The SCAQMD concluded that the amendments would not have an effect on emissions and that there was no possibility that the project would have the potential to have a significant adverse effect on the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared. This document can be obtained by visiting the following website at: http://www.aqmd.gov/hb/1999/990432a.html.

Notice of Exemption for Proposed Amended Rule 2000 - General, Rule 2011 - Requirements for Monitoring, Reporting and Recordkeeping for SOx Emissions and Rule 2012 - Requirements for Monitoring, Reporting, and Recordkeeping for NOx Emissions; April 1997: The amendments clarified the rule requirements for emissions from contractors' equipment at RECLAIM facilities by: 1) adding a definition for contractor; 2) specifying that emissions from contractors' equipment should be accounted for by the RECLAIM facility in the same manner as emissions from rental equipment, with the exception of specific processes that do not contribute to a facility's manufacturing process; and, 3) excluding emissions from certain contractors' equipment at a Super Compliant facility. The SCAQMD concluded that the amendments would not have an effect on emissions and that there was no possibility that the project would have the potential to have a significant adverse effect on the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared. This document can be obtained by visiting the following website at: http://www.aqmd.gov/hb/1997/970436a.html.

Notice of Exemption for Proposed Amended Rule 2000 - General, Rule 2001 - Applicability, Rule 2002 - Allocations for NOx and SOx, Rule 2005 - New Source Review for RECLAIM, Rule 2011 - Requirements for Monitoring, Reporting and Recordkeeping for SOx Emissions, Rule 2012 - Requirements for Monitoring, Reporting, and Recordkeeping for NOx Emissions and Rule 2015 - Backstop Provisions; February 1997: The amendments modified requirements for non-operating and infrequently-operated major sources, exemption provisions, emission factors, and certain monitoring, reporting, and recordkeeping (MRR) requirements. The SCAQMD concluded that the amendments would not have an effect on emissions and that there was no possibility that the project would have the potential to have a significant adverse effect on the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared. This document can be obtained by visiting the following website at: http://www.aqmd.gov/hb/1997/970238a.html.

Final Supplemental Environmental Assessment for Proposed Amended Rule 2002 - Allocations for NOx and SOx, Rule 2004 - Requirements, Rule 2005 - New Source Review for RECLAIM, Rule 2011 - Requirements for Monitoring, Reporting, and Recordkeeping for SOx Emissions, Rule 2012 - Requirements for Monitoring, Reporting, and Recordkeeping for NOx Emissions, and Rule 2015 - Backstop Provisions; June 1996: The amendments clarified rule requirements and improved monitoring, reporting, and recordkeeping flexibility for RECLAIM facilities. The amendments provided: 1) procedures consistent with Rule 430 - Breakdown Provisions; 2) procedures for reporting equipment breakdowns affecting RECLAIM pollutants; 3) more accurate emission factors; 4) clarifications of RTC allocations after year 2010; 5) consolidated requirements for reports on RECLAIM issues; 6) clarified

requirements for Super Compliance facilities; 7) a period of time for CEMS repairs; 8) clarifications of monitoring, reporting, recordkeeping, and other requirements; and, 9) an alternative to the NOx ending emission factor for cement kilns based on a demonstration plan. Pursuant to CEQA, the SCAQMD prepared a Draft Supplemental Environmental Assessment (SEA) for the amendments to Regulation XX - RECLAIM. The Draft SEA was a supplement to the October 1993 Final EA for Regulation XX (SCAQMD No. 930524SS) and was circulated for a 45-day public review and comment period that ended May 10, 1996. The Final SEA was certified by the SCAQMD Governing Board on July 12, 1996. This document can be obtained by visiting the following website at: http://www.aqmd.gov/hb/1996/960731a.html.

Notice of Exemption for Proposed Amended Rule 1303 - Requirements (New Source Review) and Rule 2005 - New Source Review for RECLAIM; May 1996: The amendments incorporated protection of visibility for Federal Class I areas into Regulations XIII and XX. Protection of visibility for Federal Class I areas and notification of Federal Land Managers are requirements of federal law. The SCAQMD determined that the amendments were exempt from CEQA pursuant to CEQA Guidelines §15308 - Action by Regulatory Agencies for the Protection of the Environment, since the activity was covered by this Class 8 exemption for actions to assure the maintenance, restoration, enhancement, or protection of the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared. This document can be obtained by visiting the following website at: http://www.aqmd.gov/hb/1996/960538a.html.

Final Supplemental Environmental Assessment for Proposed Amended Regulation XX – RECLAIM; December 1995: The Final Supplemental EA for Regulation XX addressed the potential air quality, energy and risk of upset impacts associated with the exemption of two facilities from the RECLAIM program, State Implementation Plan (SIP) approvability issues and the allocation revision for one facility participating in the program. Air quality was the only environmental area determined to be adversely impacted from the amendments. The air quality impacts resulted from removing two facilities from the RECLAIM program and the loss of anticipated NOx emission reductions from the allocation revisions. A Statement of Findings and Overriding Considerations were prepared for the project.

Notice of Exemption for Proposed Amended Rule 2011 - Requirements for Monitoring, Reporting and Recordkeeping for SOx Emissions, and Rule 2012 - Requirements for Monitoring, Reporting, and Recordkeeping for NOx Emissions; September 1995: The SCAQMD concluded that the amendments would not have an effect on emissions and that there was no possibility that the project would have the potential to have a significant adverse effect on the environment. Therefore, pursuant to CEQA Guidelines §15061(b)(3) - Review for Exemption, the project was determined to be exempt from CEQA and a Notice of Exemption was prepared.

Final Supplemental Environmental Assessment for Proposed Amended Rule 2002 - Allocations for NOx and SOx; March 1995: The Final EA for Rule 2002 addressed the potential air quality and energy impacts from adjusting the years 2000 and 2003 Allocations for the petroleum coke calcining industry. Air quality was the only area determined to be adversely impacted from the amendments due to the loss of future emission reductions. A Statement of Finding and Overriding Considerations was prepared for the amendments.

Final Environmental Assessment for the Proposed Adoption of Regulation XX - RECLAIM; October 1993: A Draft EA for the proposed NOx and SOx RECLAIM program,

comprised of three volumes: Volume I - Development Report and Proposed Rules, Volume II - Supporting Documentation and Volume III - Socioeconomic and Environmental Assessments, was released for a 30-day public review and comment period on May 24, 1993. In response to comments received regarding the Draft EA, some components of the proposed project were modified. Subsequently, a Revised Draft EA was prepared and re-circulated for an additional public review and comment period of 45 days on July 22, 1993 The SCAQMD concluded that the changes in the Revised Draft EA did not alter the significance determination for any environmental impact areas analyzed in the May 1993 version of the Draft EA. After circulation of the Revised Draft EA, a Final EA was prepared and certified by the SCAQMD Governing Board at its hearing in October 1993.

Notice of Preparation/Initial Study of Draft Environmental Assessment for the Proposed Adoption of Regulation XX - RECLAIM; October 1992: The NOP/IS of a Draft EA for the proposed adoption of the NOx and SOx RECLAIM program was released for a 30-day public review and comment period on October 23, 1992. The NOP/IS identified "air quality," "energy," and "hazards and hazardous materials" as the key areas that may be adversely affected by the proposed project.

INTENDED USES OF THIS DOCUMENT

In general, a CEQA document is an informational document that informs a public agency's decision-makers and the public generally of potentially significant adverse environmental effects of a project, identifies possible ways to avoid or minimize the significant effects, and describes reasonable alternatives to the project (CEQA Guidelines §15121). A public agency's decision-makers must consider the information in a CEQA document prior to making a decision on the project. Accordingly, this ~~Draft~~ Final PEA is intended to: (a) provide the SCAQMD Governing Board and the public with information on the environmental effects of the proposed project; and, (b) be used as a tool by the SCAQMD Governing Board to facilitate decision making on the proposed project.

Additionally, CEQA Guidelines §15124(d)(1) requires a public agency to identify the following specific types of intended uses of a CEQA document:

1. A list of the agencies that are expected to use the PEA in their decision-making;
2. A list of permits and other approvals required to implement the project; and,
3. A list of related environmental review and consultation requirements required by federal, state, or local laws, regulations, or policies.

There are no permits or other approvals required to implement the project. Moreover, the project is not subject to any other related environmental review or consultation requirements.

To the extent that local public agencies, such as cities, county planning commissions, et cetera, are responsible for making land use and planning decisions related to projects that must comply with the requirements in the proposed project, they could possibly rely on this PEA during their decision-making process. Similarly, other single purpose public agencies approving projects at facilities complying with the proposed project may rely on this PEA.

AREAS OF CONTROVERSY

CEQA Guidelines §15123(b)(2) requires a public agency to identify the areas of controversy in the CEQA document, including issues raised by agencies and the public. Over the course of developing the proposed project, the predominant concerns expressed by representatives of

industry and environmental groups, either in public meetings or in written comments, regarding the proposed project are highlighted in Table 1-1.

Table 1-1
Areas of Controversy

	Area of Controversy	Topics Raised by the Public	SCAQMD Evaluation
1.	BARCT analysis versus potentially adverse environmental impacts	Industry representatives expressed concern that the CEQA process gives a "back door" from properly conducting the BARCT analysis because CEQA can be used to justify adverse significant impacts by the Statement of Findings and Statement of Overriding Considerations.	The process of conducting a BARCT analysis is separate from the CEQA analysis. For a market-based incentive program, SCAQMD staff is required by the Health and Safety Code to conduct periodic BARCT reassessments and demonstrate equivalency with command-and-control rules which would otherwise be developed as a result of BARCT reassessment. The purpose of CEQA is to disclose the environmental effects of a project, in this case, the implementation of BARCT. Both the adverse and beneficial environmental effects of the proposed amendments to SOx RECLAIM are analyzed in this CEQA document. Because the proposed project will have some significant adverse impacts, a Statement of Findings and a Statement of Overriding Considerations will be required.
2.	Shortcomings with analysis prepared by consultants.	Industry representatives expressed concern that the consultants did not consider all of the compliance options and their analyses did not properly include the cost of credits and the true cost of regulatory compliance.	SCAQMD staff has hired a consultant to provide a second opinion on the previously prepared cost analysis.
3.	Amount of SOx shave	Industry representatives expressed concern that reducing the available SOx RTCs could kill the SOx RECLAIM program because there will not be enough SOx RTCs to trade.	Contrary to the comment, the rule analysis shows that after the shave is imposed, there will be sufficient SOx RTCs available to maintain trading within the SOx RECLAIM program.

Table 1-1
Areas of Controversy (continued)

	Area of Controversy	Topics Raised by the Public	SCAQMD Evaluation
4.	Equity of the Proposed SOx shave	SOx reductions should be based on facility-specific and technology-specific data. Many facilities are super-compliant and cannot reduce SOx further. Other facilities do not have equipment subject to BARCT.	The proposed shave is based on source categories for which additional SOx reductions can be achieved.
5.	Space limitations	Industry representatives indicated that the affected facilities may not have enough available land or space to install additional SOx controls.	According to both of the consultants' reports, a facility-by-facility evaluation was conducted which included an analysis of plot space availability. The analysis does not support the claim that there is not adequate plot space available to install SOx controls.
6.	Equipment installed as part of complying with SCAQMD Rule 1105.1 will be stranded investments.	Industry representatives indicated that the installation of dry electrostatic precipitators (ESPs) to comply with SCAQMD Rule 1105.1 and control PM and ammonia will have been a wasted investment since the equipment that would need to be installed to control SOx (e.g., wet gas scrubber) could also be used to control PM and ammonia.	The dry ESPs selected as the control technology by most but not all local operators to comply with the PM requirements in Rule 1105.1 will not be wasted and can continue to be effectively utilized in the event that wet gas scrubbers are installed as part of this proposal because the wet gas scrubbers are predominantly for reducing SOx emissions. While it is true that all scrubbers provide some PM reduction benefit as well, only the very sophisticated ones such as ones equipped with a wet ESP, however, can control PM at the levels required by Rule 1105.1. Thus, for any facility that already has dry ESPs in operation, it may not be necessary to install a scrubber that also controls the full amount of PM reductions required by Rule 1105.1. Scrubbers that can achieve the required SOx and PM emission levels per SOx RECLAIM, and Rule 1105.1, respectively, are much more expensive than the ones considered for this analysis.

Table 1-1
Areas of Controversy (continued)

	Area of Controversy	Topics Raised by the Public	SCAQMD Evaluation
7.	SOx controls for cement kilns.	Industry representatives indicated that the BARCT assessment as it applies to the cement industry is incorrect in that the cement kiln, by the nature of its design, acts as a SOx scrubber, and that any attempt to further control SOx will cause the NOx emissions to increase beyond allowable levels.	Contrary to the claim that installation of SOx controls on cement kilns will increase NOx emissions, there are other installations of dry scrubbers on cement kilns worldwide which demonstrate that both SOx and NOx emissions can be effectively reduced.
8.	Impacts from wet gas scrubber technology.	Industry representatives indicated that there are too many potentially significant adverse environmental impacts from wet gas scrubber technology, especially aesthetics and water impacts.	The analysis shows that the aesthetics impacts from the proposed project would be less than significant. With regard to water demand impacts, SCAQMD staff recognizes that wet gas scrubber technology is water intensive. However, recycled water can be used in lieu of potable water. Specifically, up to 75 percent of the estimated increase in water demand due to the wet gas scrubbers under Option 1 of the proposed project can be satisfied with recycled water. With regard to the potential increases in wastewater processing, none of the affected facilities is anticipated to need to increase their wastewater discharge in excess of 25 percent of their currently allowed levels. Thus, no modifications to any existing wastewater discharge permits are anticipated.

Table 1-1
Areas of Controversy (concluded)

	Area of Controversy	Topics Raised by the Public	SCAQMD Evaluation
9.	Availability of Wet Gas Scrubbers	Industry representatives indicated that there may be a shortfall of available wet gas scrubbers if there are multiple units being bought and assembled simultaneously at multiple facilities.	Implementation of the proposed project is expected to span over seven years, which should be adequate time for purchasing and installing wet gas scrubbers.

Pursuant to CEQA Guidelines §15131(a), "Economic or social effects of a project shall not be treated as significant effects on the environment." CEQA Guidelines §15131(b) states further, "Economic or social effects of a project may be used to determine the significance of physical changes caused by the project." Physical changes caused by the proposed project have been evaluated in Chapter 4 of this PEA. No direct or indirect physical changes resulting from economic or social effects have been identified as a result of implementing the proposed project.

Of the topics discussed to address the concerns raised relative to CEQA and the secondary impacts that would be associated with implementing the proposed project, to date, no other controversial issues were raised as a part of developing the proposed project.

EXECUTIVE SUMMARY

CEQA Guidelines §15123 requires a CEQA document to include a brief summary of the proposed actions and their consequences. In addition, areas of controversy including issues raised by the public must also be included in the executive summary (see preceding discussion). This ~~Draft~~ Final PEA consists of the following chapters: Chapter 1 – Executive Summary; Chapter 2 – Project Description; Chapter 3 – Existing Setting, Chapter 4 – Potential Environmental Impacts and Mitigation Measures; Chapter 5 – Project Alternatives; Chapter 6 - Other CEQA Topics and various appendices. The following subsections briefly summarize the contents of each chapter.

Summary of Chapter 1 – Executive Summary

Chapter 1 includes a discussion of the legislative authority that allows the SCAQMD to amend and adopt air pollution control rules, identifies general CEQA requirements and the intended uses of this CEQA document, and summarizes the remaining five chapters that comprise this ~~Draft~~ Final PEA.

Summary of Chapter 2 - Project Description

The proposed project would affect the following types of equipment and processes at SOx RECLAIM facilities: 1) petroleum coke calciners; 2) cement kilns; 3) coal-fired boiler (cogeneration); 4) container glass melting furnace; 5) diesel combustion; 6) fluid catalytic cracking units; 7) refinery boilers/heaters; 8) sulfur recovery units/tail gas treatment units; and, 9) sulfuric acid manufacturing. The following is a summary of the key proposed amendments to Rule 2002. Other minor changes are also proposed for clarity and consistency throughout the rule. A copy of Proposed Amended Rule (PAR) 2002 can be found in Appendix A.

Proposed Amended Rule 2002 – Allocations for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx)

Annual Allocations for NOx and SOx and Adjustments to RTC Holdings - subdivision (f)
In accordance with the analysis prepared for Control Measure #2007CMB-02 in the 2007 AQMP which estimates an additional reduction in SOx RECLAIM emissions of 2.9 tons per day, new criteria, procedures, adjustment factors and equations for adjusting tradable/usable and non-tradable/non-usable SOx RTC holdings have been added to subdivision (f), specifically, subparagraphs (f)(1)(I-L) in order to achieve at least these projected emission reductions from SOx RTC holders beginning in compliance year 2012 through compliance year 2019 and after. The actual amount of reductions varies and depends on the compliance year.

New subparagraph (f)(1)(M) establishes procedures for publishing SOx RTC adjustment factors. New subparagraph (f)(1)(N) establishes procedures for calculating a 12-month rolling average of SOx RTC prices. Subparagraph (f)(1)(O) contains new procedures for holding a public hearing in the event that SOx RTC prices exceed $50,000 per ton based on a 12-month rolling average.

New subparagraph (f)(1)(P) contains criteria for submitting the emission reductions obtained via the RTC Holdings adjustments to the SIP.

New subparagraph (f)(1)(Q) contains procedures for assigning SOx allocations to facilities that enter the RECLAIM program after the date of adoption of the proposed rule amendments.

Paragraph (f)(1) contains two clarifications: 1) that SOx Allocations for 2004 through 2011 are equal to the facility's 2003 Allocation; and, 2) that NOx RTC Allocations and holdings subsequent to the year 2006 and SOx Allocations and holdings subsequent to the year 2011 shall be adjusted to the nearest pound. Lastly, subparagraph (f)(1)(B) contains a clarification to include RTC swap transactions into the computation of rolling average prices.

RECLAIM NOx 2011 Ending Emission Factors – Table 3
Table 3 has been revised to extend the RECLAIM NOx ending emission factors from 2010 to 2011. This revision is an administrative change for consistency and continuity with the changes adopted in the January 2005 amendments to the NOx RECLAIM program.

RECLAIM SOx Tier III Emission Factors – Table 4
New Table 4 has been added to Rule 2002 to establish BARCT for petroleum coke calciners, cement kilns, coal-fired boilers, container glass melting furnaces, diesel combustion, fluid catalytic cracking units, refinery boilers and heaters, sulfur recovery units/tail gas treatment units, and sulfuric acid manufacturing.

List of SOx RECLAIM Holders – Table 5
New Table 5 has been added to Rule 2002 to identify the list of holders of SOx RECLAIM RTCs.

Summary of Chapter 3 - Existing Setting
Pursuant to the CEQA Guidelines §15125, Chapter 3 – Existing Setting, includes descriptions of those environmental areas that could be adversely affected by the proposed project as identified in the NOP/IS (Appendix C). The following subsection briefly highlights the existing setting for the following environmental areas identified that could potentially be adversely affected by

implementing the proposed project: aesthetics, air quality, energy, hazards and hazardous materials, hydrology and water quality, and, transportation and traffic.

Aesthetics

Implementation of the proposed project has the potential for the installation of new air pollution control devices or the modification of existing air pollution control devices at the 11 affected facilities. Ten facilities are located within Los Angeles County and consist of six oil refineries (BP Carson, ExxonMobil, Chevron, ConocoPhillips, Tesoro, and Ultramar/Valero), one petroleum coke calciner plant (BP Wilmington), two sulfuric acid manufacturing plants (Rhodia and ConocoPhillips) and one container glass manufacturing facility (Owens-Brockway). The remaining facility, California Portland Cement Company (CPCC) is located in the City of Colton in San Bernardino County. The aesthetic setting for each of these facilities is briefly described in Chapter 3.

Air Quality

Air quality in the area of the SCAQMD's jurisdiction has shown substantial improvement over the last two decades. Nevertheless, some federal and state air quality standards are still exceeded frequently and by a wide margin. Of the National Ambient Air Quality Standards (NAAQS) established for seven criteria pollutants (ozone, lead, sulfur dioxide, nitrogen dioxide, carbon monoxide, PM10 and PM2.5), the area within the SCAQMD's jurisdiction is only in attainment with carbon monoxide, sulfur dioxide, and nitrogen dioxide standards. Air monitoring for PM10 indicates that SCAQMD has attained the NAAQS but USEPA has not yet approved the SCAQMD's request for re-designation. The Los Angeles County portion of the SCAQMD is proposed to be designated as non-attainment for the new federal standard for lead, based on emissions from two specific facilities. Chapter 3 provides a brief description of the existing air quality setting for each criteria pollutant, as well as the human health effects resulting from exposure to each criteria pollutant. In addition, this section includes a discussion on greenhouse gases (GHGs), climate change and toxic air contaminants.

Energy

Federal and state agencies regulate energy use and consumption through various means and programs. On the federal level, the United States Department of Transportation (DOT), the United States Department of Energy (DOE), and the USEPA are three agencies with substantial influence over energy policies and programs. On the state level, the California Public Utilities Commission (CPUC) and California Energy Commission (CEC) are two agencies with authority over different aspects of energy.

The CEC collects and analyzes energy-related data, prepares statewide energy policy recommendations and plans, promotes and funds energy efficiency programs, and regulates the power plant siting process. Recent energy use figures show that in 2008, 38.12 percent of the crude oil came from in-state, with 13.41 percent coming from Alaska, and 48.46 percent being supplied by foreign sources. Also in 2008, 73.2 percent of the electricity came from in-state sources, while 26.8 percent was imported into the state. The total electricity imported in 2008 was 306,577 gigawatt-hours (gWh), with 23,945 gWh coming from the Pacific Northwest and 74,113 gWh from the Southwest (CEC, 2009)[5]. (Note: One gW is equal to one million kilowatts (kW)). For natural gas in 2007, 40.8 percent came from the Southwest, 22.1 percent from Canada, 12.9 percent from in-state, and 24.2 percent from the Rockies (CEC, 2008).

[5] http://www.energy.ca.gov/2009publications/CEC-200-2009-010/CEC-200-2009-010.PDF

One of the key areas of concern in the energy sector is reducing the amount of petroleum-based fuels in the District. Consumption of these fuels is a major factor in the amount of criteria pollutants in southern California. Alternative fuels play an important role in the strategy to reach attainment in the region. Renewable energy resources include: biomass, hydro, geothermal, solar and wind.

Hazards and Hazardous Materials

Potential hazard impacts may be associated with the production, use, storage, and transport of hazardous materials. For the purposes of this ~~Draft~~ Final PEA, the term "hazards" refers to both hazardous materials and hazardous wastes. Specifically, implementation of the proposed project is expected to result in potentially increased use of catalysts, caustic solutions, additives and other scrubbing agents that may contain TACs that are either chronic or acutely hazardous materials (or both), for SOx control purposes. In general, hazards can occur due to natural events, such as earthquake, and non-natural events, such as mechanical failure or human error. The risk associated with each affected facility is defined by the probability of an event and the consequence (or hazards) should the event occur. This section discusses existing hazards to the community from potential upset conditions at the affected facilities, to provide a basis for evaluating the changes in hazards posed by the proposed project.

The major types of public safety risks at the affected facilities consist of risk from releases of hazardous substances and from major fires and explosions. The shipping, handling, storage, and disposal of hazardous materials inherently pose a certain risk of a release to the environment. The hazards that are likely to exist are identified by the physical and chemical properties of the materials being handled and their process conditions, including toxic gas clouds, torch fires, flash fires, pool fires, and vapor cloud explosions, thermal radiation and explosion/overpressure.

The use, storage and transport of hazardous materials are subject to numerous laws and regulations at all levels of government. The most relevant existing hazardous materials laws and regulations include hazardous materials management planning, hazardous materials transportation, hazardous materials worker safety requirements, hazardous waste handling requirements and emergency response to hazardous materials and waste incidents. Potential risk of upset is a factor in the production, use, storage and transportation of hazardous materials. Risk of upset concerns are related to the risks of explosions or the release of hazardous substances in the event of an accident or upset conditions.

Releases of hazardous materials have the potential for harmful effects on workers and the public. Causes of these releases may include plant upsets; leaks in seals, pipeline failures; vehicular traffic accidents; and failures during delivery, such as hose leaks.

Hydrology and Water Quality

The Federal Safe Drinking Water Act, enacted in 1974 and implemented by the USEPA, imposes water quality and infrastructure standards for potable water delivery systems nation-wide. The California Safe Drinking Water Act was enacted in 1976. Potable water supply is managed through local agencies and water districts, the State Department of Water Resources (DWR), the Department of Health Services (DHS), the State Water Resources Control Board (SWRCB), the USEPA, and the United States Bureau of Reclamation. The DWR manages the State Water Project (SWP), and compiles planning information on supply and demand within California.

The DWR divides the state into ten hydrologic regions. Some regions contain a great deal of water, while other regions are very dry and must have their water imported by aqueducts. The South Coast Air Basin lies within the South Coast Hydrologic Region. The cities of Los Angeles, Long Beach, Santa Ana, and Riverside are among the many urban areas in this hydrologic region. The Santa Clara, Los Angeles, San Gabriel, and Santa Ana Rivers are among the area's hydrologic features. Most lakes in this area are actually reservoirs, made to hold imported water.

Imported sources of water (including the Colorado River Aqueduct (CRA), the State Water Project's California Aqueduct, and the Los Angeles Aqueduct) have, in previous years, supplied more than six million acre-feet[6] or two trillion gallons of water to the southern California region annually. Imported sources have accounted for approximately 74 percent of the total water used in the region.

However, back-to-back dry years and low reservoir levels have put California in a statewide drought. In late 2008, the state's major reservoirs were at about one-third of capacity, at a time when they would typically be at about two-thirds. As a result, the DWR has allocated only 15 percent of requested amounts of water to be delivered to the SWP in 2009. This allocation is the second lowest in the history of the project. Adding to California's water difficulties is a federal judge's restrictions on pumping in the Delta, ordered in 2007 to protect the threatened Delta smelt. These restrictions reduced water deliveries by as much as 30 percent in 2008 to 25 million Californians in the San Francisco Bay Area, the Central Coast, the San Joaquin Valley, and Southern California. Because of the drought, local water resources, which include groundwater and captured surface water runoff, are not expected to be stable in the future on a region-wide basis. Further, several groundwater basins in the region are threatened by overdraft conditions, increasing levels of salinity, and contamination by agricultural land to urban development, thereby reducing the land surface available for groundwater recharge. Increasing demand for groundwater may also be limited by water quality, since levels of salinity in sources currently used for irrigation could be unacceptably high for domestic use without treatment.

On June 4, 2008, Governor Arnold Schwarzenegger issued Executive Order S-06-08 and declared an official drought for California[7]. Further, California Water Code §71460 et seq. states that a water district may restrict the use of water during any emergency caused by drought, or other threatened or existing water shortage, and may prohibit the use of water during such periods for any purpose other than household uses or such other restricted uses as determined to be necessary. The water district may also prohibit the use of water during such periods for specific uses which it finds to be nonessential. On February 27, 2009, Governor Schwarzenegger proclaimed a state of emergency regarding the drought and the availability and future sustainability of California's water resources[8]. The proclamation directed all state government agencies to utilize their resources, implement a state emergency plan and provide assistance for people, communities and businesses impacted by the drought. The proclamation further requested that all urban water users immediately increase their water conservation activities in an effort to reduce their individual water use by 20 percent.

[6] One acre-foot is equivalent to 325,851 gallons.
[7] http://gov.ca.gov/press-release/9796
[8] http://gov.ca.gov/press-release/11556/

In response to the Governor's proclamation, the California legislature has proposed Assembly Bill (AB) 49 – Water Efficiency[9] and Senate Bill (SB) 261 – Urban Water Efficiency[10]. These proposed bills will require a 10 percent reduction of urban water use by 2015 and 20 percent by 2020. However, these proposed bills will allow the use of non-potable or recycled water to count towards the progress in meeting these targets.

Water districts, in response to the drought, have also taken actions throughout the state such as: 1) asking for voluntary reductions; 2) imposing mandatory restrictions or declaring a local emergency; 3) imposing agricultural rationing; 4) imposing drought rates, surcharges and fines; 5) limiting new development and requiring water efficient landscaping; and, 6) implementing a conservation campaign. In addition, water shortages have prompted cities to begin infrastructure improvements to secure future water supplies. For example, the Los Angeles Department of Water and Power (LADWP), in conjunction with the West Basin Municipal Water District (WBMWD), is constructing the Harbor Refineries Recycled Water Pipeline Project (HRRWPP) to conserve potable water and instead produce and convey recycled water to multiple industrial and irrigation customers in the Los Angeles Harbor area[11].

The SWRCB, and the nine regional water quality control boards (RWQCB), are responsible for protecting surface and groundwater supplies in California. In particular, the SWRCB establishes water-related policies and approves water quality control plans, which are implemented and enforced by RWQCBs. Five RWQCBs have jurisdiction over areas within the boundaries of the SCAQMD. These agencies also regulate discharges to state waters through federal pre-treatment requirements enforced by the publicly-owned treatment works (POTWs).

Water quality of regional surface water and groundwater resources is affected by point source and non-point source discharges occurring throughout individual watersheds. Regulated point sources, such as wastewater treatment effluent discharges, usually involve single discharge into receiving waters. Non-point sources involve diffuse and non-specific runoff that enters receiving waters through storm drains or from unimproved natural landscaping. Within the regional Basin Plans, the RWQCBs establish water quality objectives for surface water and groundwater resources and designate beneficial uses for each identified body of water.

Much of the urbanized areas in Los Angeles County, where the majority of the facilities affected by the proposed project are located, is serviced by two large POTWs operating on the coast as follows: the City of Los Angeles Bureau of Sanitation Hyperion Facility and the Joint Outfall System of the Los Angeles County Sanitation District (LACSD). Each of these facilities discharges an average of over 250 million gallons per day (MMgal/day).

The City of Colton, where one facility (CPCC) affected by the proposed project is located[12], owns, operates and maintains a wastewater collection, pumping and treatment system referred to as the Colton Water Reclamation Facility (CWRF). The CWRF also serves the City of Grand Terrace and unincorporated County areas. The plant utilizes a conventional and extended aeration secondary treatment process to product-treated effluent in compliance with RWQCB regulations. In addition, a regional tertiary treatment plant serving both the Cities of Colton and

[9] http://info.sen.ca.gov/pub/09-10/bill/asm/ab_0001-0050/ab_49_bill_20090909_proposed.html

[10] http://info.sen.ca.gov/pub/09-10/bill/sen/sb_0251-0300/sb_261_bill_20090713_amended_asm_v93.html

[11] The EIR for HRRWPP, SCH No. 2008121093, was certified by the LADWP Board of Harbor Commissioners on October 20, 2009.

[12] CPCC, located in San Bernardino County, does not discharge wastewater offsite.

San Bernardino treats the effluent from the wastewater treatment plant and returns the water to the Santa Ana River. The average daily flows at the CWRF are approximately 5.6 MMgal/day.

Transportation and Traffic

The transportation system in Southern California is a complex intermodal network designed to carry both people and goods. It consists of roads and highways, public transit, paratransit, bus and rail, freight railroads, airports, seaports and intermodal terminals. The regional highway system consists of an interconnected network of local streets, arterial streets, freeways, carpool lanes and toll roads. This highway network allows for the operation of private autos, carpools, private and public buses, and trucks. Non-motorized transportation modes, such as bicycles share many of these facilities. The regional public transit system includes local shuttles, municipal and area-wide public bus operations, rail rapid transit operations, regional commuter rail services, and inter-regional passenger rail service. The freight railroad network includes an extensive system of private railroads and several publicly owned freight rail lines serving industrial cargo and goods. The airport system consists of commercial, general, and military aviation facilities serving passenger, freight, business, recreational, and defense needs. The region's seaports support substantial international and interregional freight movement and tourist travel. Intermodal terminals consisting of freight processing facilities serve the function of transfer, storage and distribution of goods. The transportation system supports the region's economic needs as well as the demand for personal travel.

The regional transportation system is currently at capacity operations during peak periods. The highway system shows substantial freeway congestion in the morning and evening peak period, with random episodes of incident-related (e.g., accident) congestion throughout the day. The transit system is experiencing substantial overcrowding on a number of core urban bus routes with significant excess capacity on most off-peak and peripheral routes. Rail transit is very close to capacity during peak hours on the Metro Blue Line, Metro Red Line, and Metro Gold Line, while the Metro Green Line generally has some capacity available. Commuter rail service is at or near capacity during peak periods as the routes approach Union Station in downtown Los Angeles, but suburb-to-suburb capacity is available on most lines.

Summary of Chapter 4 - Environmental Impacts

CEQA Guidelines §15126(a) requires that a CEQA document shall identify and focus on the "significant environmental effects of the proposed project." Direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects.

The Initial Study identified and described those environmental topics where the proposed project could cause significant adverse environmental impacts (i.e., aesthetics, air quality, energy, hazards and hazardous materials, hydrology and water quality, and, transportation and traffic). Analysis of these environmental topics revealed that potentially significant air quality impacts may result from construction activities resulting from installing new air pollution control equipment.

The type of emission reduction projects that may be undertaken to comply with PAR 2002 are the main focus of the analysis in this PEA. There are multiple source categories with multiple approaches to reducing SOx. With so many possibilities or permutations of how operators of SOx RECLAIM facilities could achieve actual SOx reductions, there is no way to predict what each facility operator will do. For this reason, the proposed project analysis is bifurcated into two options to illustrate the worst-case effects of applying the various SOx control technologies

along with demonstrating the flexibility that is provided by the RECLAIM program to facility operators when it comes to choosing the methods for reducing SOx emissions. Both options focus on the installation and operation of SOx control technologies for FCCUs, SRU/TGUs, sulfuric acid plants, coke calciners, glass melting furnaces, cement manufacturers, and refinery boilers and heaters. The main differences between Option 1 and Option 2 are: 1) the type of SOx control technique that may be applied to the FCCU source category; and, 2) the environmental impacts that may result from having different SOx control techniques applied to the FCCU source category. However, the type of SOx controls and associated environmental impacts for the remaining source categories will be the same for both Option 1 and Option 2.

The following subsections briefly summarize the analysis of potential adverse environmental impacts from the implementation of the proposed project.

Aesthetics

Physical modifications may result as part of implementing the proposed project and will vary depending on the equipment source category/process. The analysis in this CEQA document is based on the assumption that new air pollution control equipment is expected to be installed and existing air pollution control equipment is expected to be modified as part of implementing the proposed project at 11 affected facilities. Aesthetic impacts associated with the installation of new SOx control equipment, in particular, wet gas scrubbers (WGSs), were determined in the NOP/IS to be potentially significant and, as such, are evaluated in this PEA. Specifically, for any installation of a WGS, operational aesthetic impacts resulting from a substantial visible steam (water vapor) plume that would emanate from the WGS stack were evaluated in this PEA. The size of each WGS and the height needed for the associated stack were also considered in the evaluation.

The analysis will show that if any WGS is installed as part of the proposed project at any of the affected facilities, the steam plume, though visible, is not expected to significantly adversely affect the visual continuity of the surrounding area of each affected facility because no scenic highways or corridors exist within the areas of the refineries, the coke calciner, the sulfuric acid plants and the glass melting plant. Further, the visual continuity of the surrounding area is not expected to be adversely impacted because each WGS, if constructed, will be built within the confines of industrial areas and would be visually consistent with the profiles of the existing affected facilities. Thus, even if each WGS could be visible, depending on the location within each property boundary, the aesthetic significance criteria would not be exceeded. Further, the analysis shows that the proposed project is not expected to create a new source of substantial light or glare that would adversely affect day or nighttime views in the area. For these reasons, less than significant aesthetics impacts during operation are expected from the proposed project.

In addition, implementation of the proposed project is expected to result in construction activities at some or all of the affected facilities, which are complex industrial facilities. Due to the large size profiles of the affected equipment, the construction activities associated with installing control equipment are expected to require the use of heavy-duty construction equipment, such as cranes, which may temporarily change the skyline of the affected facilities, depending on where they are located within each facility's property. However, because each affected facility is located in a heavy industrial area, the construction equipment is not expected to be substantially discernable from what would be needed for routine operations and maintenance activities. For these reasons, the construction activities are expected to blend in with the existing industrial environment and thus, are not expected to affect the visual continuity of the surrounding areas.

Overall, the aesthetics impacts were determined to be less than significant during both construction and operation for the proposed project.

Air Quality

The proposed project is expected to result in anticipated reductions of at least 2.9 tons per day of SOx emissions by 2014 from 11 facilities. In order to achieve the overall net air quality benefit from implementing the proposed project, some of the affected facilities may choose to modify existing equipment by retrofitting with air pollution control technologies in order to comply with the shave of SOx RTCs.

The physical changes involved that may occur as a result of implementing the proposed project focus on the installation of new or the modification of existing control equipment on the following types of equipment and processes at SOx RECLAIM facilities: 1) petroleum coke calciner; 2) cement kilns; 3) coal-fired boiler (cogeneration); 4) container glass melting furnaces; 5) fluid catalytic cracking units (FCCUs); 6) refinery boilers/heaters[13]; 7) sulfur recovery units/tail gas treatment units; and, 8) sulfuric acid manufacturing. Table 1-2 summarizes the potential control technologies that may be considered as part of implementing the proposed project.

Construction activities associated with installing or modifying existing air pollution control equipment are expected and have the potential to generate significant adverse air quality impacts. In addition, operational activities due to periodic truck trips such as the delivery of supplies to support the operations of the various control technologies, the removal of waste, or the sale of elemental sulfur recovered from the control processes are also expected and have the potential to generate significant adverse air quality impacts for greenhouse gases.

Table 1-2
Potential Control Technologies per Equipment/Source Category

Equipment/Source Category	Potential Control Technology
FCCU	WGS or SOx Reducing Additives
Sulfur Recovery Units/ Tail Gas Treatment Units	WGS or Selective Oxidation Catalyst
Refinery Boilers/Heaters	FGT
Sulfuric Acid Manufacturing	WGS or Upgrade Existing Controls
Petroleum Coke Calciner	WGS
Container Glass Melting Furnace	WGS
Cement Kiln	DGS (Absorber)
Coal-fired Boiler (cogeneration)	DGS (Absorber)

Key: WGS = wet gas scrubber; FGT = fuel gas treatment; DGS = dry gas scrubber

Cumulative air quality impacts from the proposed project and all other AQMP control measures considered together are not expected to be significant because the amount of emission reductions to be achieved by the proposed project for SOx are expected to meet the emission reduction projections and commitments made by control measures in the 2007 AQMP. Even though the proposed project may cause a temporary and significant adverse increase in emissions during

[13] Although the proposed project does not establish a new BARCT level for refinery boilers/heaters, it is conceivable that certain existing refinery boilers/heaters that are not meeting current BARCT levels could be retrofit candidates for future reductions. Therefore, the refinery boiler/heater source category is included in this analysis.

construction, the temporary net increase in emissions combined with the total net accumulated emission reductions projected overall would not interfere with the air quality progress and attainment demonstration projected in the AQMP. Indeed, the 2007 AQMP indicated that, based on future anticipated overall reduction in emissions, the Basin would achieve the federal ozone ambient air quality standard by the year 2024 and the PM2.5 standard by 2015 (SCAQMD, 2007). Further, in accordance with the 2007 AQMP emission inventory trends, average annual daily CO and VOC emissions are projected to be reduced, which in spite of significant CO and VOC construction emissions for the proposed project, implementing the control measures in the 2007 AQMP will result in an overall net reduction in CO and VOC emissions. Therefore, cumulative air quality impacts from the proposed project and all other AQMP control measures, when considered together, are not expected to be significant because implementation of all AQMP control measures is expected to result in net emission reductions and overall air quality improvement.

With regard to GHG emissions, the proposed project involves combustion processes which could generate GHG emissions such as CO2, CH4, and N2O. However, the proposed project does not affect equipment or operations that have the potential to emit other GHGs such as SF6, HFCs or PFCs. Implementing the proposed project is expected to increase GHG emissions that exceed the SCAQMD's GHG significance threshold for industrial sources. In addition, implementing the proposed project is expected to generate significant adverse cumulative GHG air quality impacts.

Energy

Implementation of the proposed project is expected to increase the amount of energy needed to both construct and operate the new and modified air pollution control devices associated with the existing facilities affected by the proposed project. During construction, increased use of electricity, plus gasoline and diesel fuels are expected from on- and off-road vehicle and equipment use. Operational activities of the new and modified air pollution control equipment are expected to result in an overall decrease in the use of natural gas (a benefit), but an increase in electricity. In addition, an increased use of diesel fuel associated with supply delivery trips and waste removal trips is expected as part of day-to-day operations. Despite the potential increases in energy use overall as part of implementing the proposed project, the increases are not expected to exceed the energy significance thresholds.

Hazards and Hazardous Materials

Implementation of the proposed project may alter the hazards and hazardous materials associated with the existing facilities affected by the proposed project. Air pollution control equipment and related devices are expected to be installed or modified at affected facilities such that their operations may increase the quantity of materials used in the control equipment, some of which are hazardous. For example, the proposed project could result in the increased use of catalysts and SOx reducing additives, amine additives, and caustic agents; some of these materials are hazardous while others are not. Thus, the routine transport of hazardous materials, use, and disposal of hazardous materials may increase as a result of the proposed project. The hazards analysis focuses on the materials used that may be hazardous.

In addition, because operation of the new or modified air pollution control equipment, by design, is also expected to reduce SOx, which is an amalgam of multiple hazardous materials, the proposed project is expected to result in a corresponding reduction of hazardous materials. Thus, the hazards analysis also considers the benefits (i.e., the capture of more hazardous materials) of

implementing the proposed project. The overall analysis concluded that the proposed project would generate less than significant adverse hazards/hazardous materials impacts.

Hydrology and Water Quality

Implementation of the proposed project may cause hydrology and water quality impacts associated with the existing facilities affected by the proposed project. Specifically, the installation of WGSs and DGSs (limestone absorbers), the installation of new or modification of existing FGT systems, and upgrading existing sulfuric acid plant controls all involve an increased demand for water and an increased amount of wastewater discharge. However, the use of selective oxidation catalyst and/or SOx reducing catalysts as part of implementing the proposed project, do not utilize water or generate wastewater and, therefore, are not expected to create hydrology and water quality impacts.

For water demand, there are three significance thresholds based on whether: 1) the total water demand of the proposed project is less than five million gallons per day; 2) the existing water supply has the capacity to meet the increased demands of the proposed project; and, 3) the potable water demand is a substantial use of water. The analysis shows that the increased potential demand for total water that may result from implementing the proposed project is not expected to exceed the significance threshold of five million gallons of total water demand per day. Further, based on discussions with the local water suppliers, the existing water supply is expected to have the capacity to meet the increased demands of the proposed project. However, because the entire state of California is in the midst of a severe drought, a water supply analysis relative to the current and future availability of potable water and the use of recycled water and industrial-use groundwater to satisfy some of the water demand needs of the proposed project was conducted. While the total water demand for the proposed project will not exceed the significance thresholds for total water, based on the definition of "water demand project" in CEQA Guidelines §15155, the potential increase in potable water demand may be considered a substantial use of potable water. Therefore, the proposed project may cause significant potable water demand impacts.

Relative to water quality, the analysis will also show that implementing the proposed project may increase the amount of wastewater discharged from certain affected facilities. However, the potential increases will not cause a permit revision to any affected facility's wastewater permit and as such, will not exceed the wastewater significance threshold. For this reason, the wastewater impacts from the proposed project are expected to be less than significant.

Transportation and Traffic

Implementation of the proposed project may cause adverse transportation and traffic impacts associated with the existing facilities affected by the proposed project. Specifically, construction-based traffic associated with the installation of WGSs and DGSs, the installation of new or modification of existing fuel gas treatment (FGT) systems, and upgrading existing sulfuric acid plant controls are expected from construction workers, delivery trucks and haul trucks. During operation of the proposed project, regular deliveries and waste disposal activities are expected to increase at each of the affected facilities. Despite the increases, the analysis shows that the transportation and traffic impacts, though adverse, are less than significant for the proposed project.

Potential Environmental Impacts Found Not To Be Significant

The Initial Study for the proposed project includes an environmental checklist of approximately 17 environmental topics to be evaluated for potential adverse impacts from a proposed project.

Review of the proposed project at the NOP/IS stage identified six topics, aesthetics, air quality, energy, hazards and hazardous materials, hydrology and water quality, and, transportation and traffic, for further review in the ~~Draft~~ Final PEA. Where the Initial Study concluded that the project would have no significant direct or indirect adverse effects on the remaining environmental topics, of the comments received on the NOP/IS or at the public meetings, none of the comments changed this conclusion. The screening analysis concluded that the following environmental areas would not be significantly adversely affected by the proposed project:

- agriculture resources
- biological resources
- cultural resources
- geology/soils
- land use and planning
- mineral resources
- noise
- population and housing
- public services
- recreation
- solid/hazardous waste

The NOP/IS for the proposed project was circulated for a 30-day review and comment period from June 19, 2009, to July 21, 2009. At the time the NOP/IS was circulated, the environmental checklist did not include impacts to forest lands as a topic to be evaluated as part of a CEQA document. However, subsequent to the release of the NOP/IS, amendments to the CEQA Guidelines adopted by the Natural Resources Agency became effective on March 18, 2010. These amendments also contained revisions to the environmental checklist, Appendix G; these revisions included the consideration of impacts to forestry lands in the environmental analysis. Specifically, the topic of "Agriculture Resources" in the checklist was revised and renamed as "Agriculture and Forest Resources" and questions were added to address the consideration of impacts to forest resources.

Although the NOP/IS did not include a preliminary analysis of forest resources, to make the analysis of environmental impacts consistent with the recent changes to the environmental checklist, a discussion of indirect impacts from the proposed project that could conflict with, or cause rezoning of forest land has been included in this section of the ~~Draft~~ Final PEA. No significant impacts on forest resources were identified.

Consistency

The Southern California Association of Governments (SCAG) and the SCAQMD have developed, with input from representatives of local government, the industry community, public health agencies, the USEPA-Region IX and the California Air Resources Board (CARB), guidance on how to assess consistency within the existing general development planning process in the Basin. Pursuant to the development and adoption of its Regional Comprehensive Plan Guide (RCPG), SCAG has developed an Intergovernmental Review Procedures Handbook (June 1, 1995). The SCAQMD also adopted criteria for assessing consistency with regional plans and the AQMP in its CEQA Air Quality Handbook. The proposed project is considered to be consistent with SCAG's RCPG because it does not interfere with achieving any of the goals identified in any of the RCPG policies.

Other CEQA Topics

CEQA documents are required to address the potential for irreversible environmental changes, growth-inducing impacts and inconsistencies with regional plans. Consistent with the Final Program Environmental Impact Report (EIR) prepared for the 2007 AQMP, additional analysis of the proposed project confirms that it would not result in irreversible environmental changes or the irretrievable commitment of resources, foster economic or population growth or the construction of additional housing, or be inconsistent with regional plans.

Summary Chapter 5 - Alternatives

Three alternatives to the proposed project are summarized in Table 1-3: Alternative A (No Project), Alternative B (AQMP), and Alternative C (Intermediate SOx Reductions). Pursuant to the requirements in CEQA Guidelines §15126.6 (b) to mitigate or avoid the significant effects that a project may have on the environment, a comparison of the potentially significant adverse air quality and hydrology (water demand) impacts from each of the project alternatives for the individual rule components that comprise the proposed project is provided in Table 1-4. The alternatives comparison in Table 1-4 also addresses the topics of aesthetics, energy, hazards and hazardous materials, water quality, and transportation/traffic. Aside from these topics, no other potentially significant adverse impacts were identified for the proposed project or any of the project alternatives. The proposed project is considered to provide the best balance between emission reductions and the adverse environmental impacts due to construction and operation activities while meeting the objectives of the project. Therefore, the proposed project is preferred over the project alternatives.

Table 1-3
Summary of PAR 2002 & Project Alternatives

Rule Components									
Basic Equipment	**BARCT**	**Proposed Project**	**SOx Reduction Potential** (tons/day)	**Alternative A:** No Project	**SOx Reduction Potential** (tons/day)	**Alternative B:** AQMP	**SOx Reduction Potential** (tons/day)	**Alternative C:** Intermediate SOx Reductions	**SOx Reduction Potential** (tons/day)
FCCU	WGS or SOx Reducing Additive	5 ppm SOx (3.25 lbs SOx/1000 bbl)	2.88[14]	No SOx limit	0	Same as Alternative A: No Project	0	Same as Proposed Project	2.88~~[12]~~[14]
SRU/TGU	WGS or Selective Oxidation Catalyst	5 ppm SOx (combusted tail gas) & 10 ppm H2S / 300 ppm non-H2S (non-combusted tail gas) (5.28 lbs SOx/hr)	0.73[15]	No SOx limit	0	Same as Alternative A: No Project	0	Same as Alternative A: No Project	0
Sulfuric Acid Mfg.	WGS or upgrade existing controls	10 ppm SOx (0.14 lbs SOx/ton acid)	1.03	No SOx limit	0	Same as Proposed Project	1.03	Same as Proposed Project	1.03
Coke Calciner	WGS	10 ppm SOx (0.07 lbs SOx/ton coke)	0.28	No SOx limit	0	Same as Proposed Project	0.28	Same as Proposed Project	0.28
Glass Melting Furnace	WGS	5 ppm SOx (0.03 lbs SOx/ton glass)	0.19	No SOx limit	0	Same as Proposed Project	0.19	Same as Proposed Project	0.19
Cement Kiln	Limestone Absorber	5 ppm SOx (0.04 lbs SOx/ton clinker)	0.25	No SOx limit	0	Same as Alternative A: No Project	0	Same as Proposed Project	0.25
Coal-fired Boiler	DGS or Limestone Absorber	5 ppm SOx	0[16]	No SOx limit	0	Same as Alternative A: No Project	0	Same as Alternative A: No Project	0
Refinery Boilers/ Heaters	FGT	40 ppm SOx (6.76 lbs SOx/mmscf)	0.85[17]	No SOx limit	0	Same as Alternative A: No Project	0	Same as Proposed Project	0.85[17]
Potential SOx Emission Reductions			**6.21**		**0**		**1.50**		**5.48**
Proposed RTC Shave			6.14		0		3.00		5.32
2005 Excess SOx RTCs			1.75		0		1.75		1.75
Minimum SOx Emission Reductions Needed[12]			**4.39**		**0**		**1.25**		**3.57**

Key: WGS = Wet Gas Scrubber; DGS = Dry Gas Scrubber; FGT = Fuel Gas Treatment

[14] The estimated amount of SOx potentially reduced excludes the data for Facility D because installing a WGS is not cost-effective for this facility. However, the estimated amount of SOx potentially reduced includes the data for Facility C because a WGS is already installed.

[15] The estimated amount of SOx potentially reduced excludes the data for Facility E and Facility G because installing a WGS or Emerachem unit is not cost-effective for these facilities.

[16] This equipment is currently not operating at Facility K.

[17] The proposed project neither establishes a new BARCT level for refinery boilers/heaters nor requires additional reductions from this source category. However, cost-effective emission reductions in the amount of 0.85 tons per day are potentially available from future retrofits in this source category and the environmental impacts from such controls are evaluated in this analysis but the potential emission reductions are excluded from the proposed RTC shave.

Table 1-4
Comparison of Adverse Environmental Impacts of the Alternatives

Category	Proposed Project – Option 1	Proposed Project – Option 2	Alternative A: No Project	Alternative B: AQMP	Alternative C: Intermediate SOx Reductions – Option 1	Alternative C: Intermediate SOx Reductions – Option 2
Aesthetics	Visible steam plumes and new, tall stacks from installing/operating 11 WGSs as follows: FCCU: 4 WGSs SRU/TGU: 3 WGSs Sulfuric Acid: 1 WGS Coke Calciner: 1 WGS Glass Melting: 2 WGSs	Visible steam plumes and new, tall stacks from installing/operating 7 WGSs as follows: SRU/TGU: 3 WGSs Sulfuric Acid: 1 WGS Coke Calciner: 1 WGS Glass Melting: 2 WGSs	No installation of WGS (i.e., no visible steam plumes and no new, tall stacks) expected.	Visible steam plumes and new, tall stacks from installing/operating 4 WGSs as follows: Sulfuric Acid: 1 WGS Coke Calciner: 1 WGS Glass Melting: 2 WGSs	Visible steam plumes and new, tall stacks from installing/operating 8 WGSs as follows: FCCU: 4 WGSs Sulfuric Acid: 1 WGS Coke Calciner: 1 WGS Glass Melting: 2 WGSs	Visible steam plumes and new, tall stacks from installing/operating 4 WGSs as follows: Sulfuric Acid: 1 WGS Coke Calciner: 1 WGS Glass Melting: 2 WGSs
Aesthetics Impacts Significant?	Less than significant, but more than the proposed project- Option 2.	Less than significant, but less than the proposed project - Option 1.	Not Significant	Less than significant, and less than the proposed project for both Options 1 and 2.	Less than significant, and less than the proposed project Option 1 and more than the proposed project Option 2.	Less than significant, and less than the proposed project for both Options 1 and 2.
Air Quality	• Decreases total operational SOx emissions by 6.21 tons/day (tpd) as follows: FCCU: 2.88 tpd SRU/TGU: 0.73 tpd Sulfuric Acid: 1.03 tpd Coke Calciner: 0.28 tpd Glass Melting: 0.19 tpd Cement Kiln: 0.25 tpd Coal-fired Boiler: 0 tpd Refinery Boilers/Heaters: 0.85 tpd	• Decreases total operational SOx emissions by 6.21 tpd as follows: FCCU: 2.88 tpd SRU/TGU: 0.73 tpd Sulfuric Acid: 1.03 tpd Coke Calciner: 0.28 tpd Glass Melting: 0.19 tpd Cement Kiln: 0.25 tpd Coal-fired Boiler: 0 tpd Refinery Boilers/Heaters: 0.85 tpd	No decreases in total operational SOx emissions.	• Decreases total operational SOx emissions by 1.50 tpd as follows: Sulfuric Acid: 1.03 tpd Coke Calciner: 0.28 tpd Glass Melting: 0.19 tpd	• Decreases total operational SOx emissions by 5.48 tpd as follows: FCCU: 2.88 tpd Sulfuric Acid: 1.03 tpd Coke Calciner: 0.28 tpd Glass Melting: 0.19 tpd Cement Kiln: 0.25 tpd Refinery Boilers/Heaters: 0.85 tpd	• Decreases total operational SOx emissions by 5.48 tpd as follows: FCCU: 2.88 tpd Sulfuric Acid: 1.03 tpd Coke Calciner: 0.28 tpd Glass Melting: 0.19 tpd Cement Kiln: 0.25 tpd Refinery Boilers/Heaters: 0.85 tpd

Less than significant, but less than the proposed project for both Options 1 and 2.

CHAPTER 2

PROJECT DESCRIPTION

Project Location
Project Background
Project Objective
Project Description
Technology Overview

PROJECT LOCATION

The SCAQMD has jurisdiction over an area of 10,473 square miles (referred to hereafter as the District), consisting of the four-county South Coast Air Basin and the Riverside County portions of the Salton Sea Air Basin (SSAB) and the Mojave Desert Air Basin (MDAB). The Basin, which is a subarea of the SCAQMD's jurisdiction, is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The 6,745 square-mile Basin includes all of Orange County and the nondesert portions of Los Angeles, Riverside, and San Bernardino counties. The Riverside County portion of the SSAB and MDAB is bounded by the San Jacinto Mountains in the west and spans eastward up to the Palo Verde Valley. The federal nonattainment area (known as the Coachella Valley Planning Area) is a subregion of both Riverside County and the SSAB and is bounded by the San Jacinto Mountains to the west and the eastern boundary of the Coachella Valley to the east (Figure 2-1).

Figure 2-1
Boundaries of the South Coast Air Quality Management District

Of the 11 facilities affected by the proposed project, 10 facilities are located in Los Angeles County (in the cities of Los Angeles, Carson, Wilmington, El Segundo, Torrance, and Vernon) and one facility is located in San Bernardino county (in the city of Colton).

PROJECT BACKGROUND

Adopted in October 1993, Regulation XX – RECLAIM, is comprised of 11 rules which contain a declining cap and trade mechanism to reduce NOx and SOx emissions from the largest stationary sources in the Basin. The portion of Regulation XX that focuses on reducing NOx emissions is referred to as "NOx RECLAIM" while the portion that focuses on reducing SOx emissions is referred to as "SOx RECLAIM." Regulation XX contains applicability requirements, NOx and SOx facility allocations, general requirements, as well as monitoring, reporting, and recordkeeping requirements for NOx and SOx sources located at RECLAIM facilities. The

RECLAIM program started with 41 SOx facilities and 392 NOx facilities, but by the end of the 2005 compliance year, the program is populated with 33 SOx facilities and 304 NOx facilities. The reduction in the number of facilities participating in the RECLAIM program since inception has been primarily due to facility shutdowns.

Under the SOx RECLAIM program, the RECLAIM facilities were issued annual allocations of SOx emissions (also known as facility caps), which declined annually from 1993 until 2003 and remained constant after 2003. In 1993, annual allocations were issued to the RECLAIM facilities and the facility cap reflected BARCT in effect at that time. SCAQMD staff has since conducted a BARCT reassessment for NOx in 2005 which was incorporated into changes in facility allocations, but not for SOx. A BARCT reassessment is now necessary for SOx RECLAIM to assure that the participating facilities will continue to achieve emission reductions as expeditiously as possible. Under the RECLAIM program, the facilities have the flexibility to install air pollution control equipment, change method of operations, or purchase RTCs to meet BARCT levels.

PROJECT OBJECTIVE

There are four key goals of the proposed project. The primary focus of the proposed project is to bring the SOx RECLAIM program up-to-date with the latest BARCT requirements to achieve the maximum feasible reductions including, at a minimum, the proposed SOx emission reductions in CM #2007CMB-02 (at least 2.9 tons per day). Another objective of the proposed project is to establish procedures and criteria for reducing RTCs and RTC adjustment factors for year 2013 and later. The third objective is to comply with state law as promulgated in Health and Safety Code §39616 to provide equivalent or greater emission reductions with current command-and-control regulations. Lastly, a goal of the proposed project is to reduce SOx emissions to assist the SCAQMD with attaining and maintaining state and federal ambient air quality standards for PM10 and PM2.5.

PROJECT DESCRIPTION

The proposed project would affect the following types of equipment and processes at SOx RECLAIM facilities: 1) petroleum coke calciners; 2) cement kilns; 3) coal-fired boiler (cogeneration); 4) container glass melting furnace; 5) diesel combustion; 6) fluid catalytic cracking units; 7) refinery boilers/heaters; 8) sulfur recovery units/tail gas treatment units; and, 9) sulfuric acid manufacturing. The following is a summary of the key proposed amendments to Rule 2002. Other minor changes are also proposed for clarity and consistency throughout the rule. No other Regulation XX rules are affected by the currently proposed project. A copy of the proposed amended rule can be found in Appendix A.

Proposed Amended Rule 2002 – Allocations for Oxides of Nitrogen (NOx) and Oxides of Sulfur (SOx)

<u>Annual Allocations for NOx and SOx and Adjustments to RTC Holdings - subdivision (f)</u>

In accordance with the analysis prepared for Control Measure #2007CMB-02 in the 2007 AQMP which estimates an additional reduction in SOx RECLAIM emissions of 2.9 tons per day, new criteria, procedures, adjustment factors and equations for adjusting tradable/usable and non-tradable/non-usable SOx RTC holdings have been added to subdivision (f), specifically, subparagraphs (f)(1)(I-L) in order to achieve at least these projected emission reductions from

SOx RTC holders beginning in compliance year 2012 through compliance year 2019 and after. The actual amount of reductions varies and depends on the compliance year.

New subparagraph (f)(1)(M) establishes procedures for publishing SOx RTC adjustment factors. New subparagraph (f)(1)(N) establishes procedures for calculating a 12-month rolling average of SOx RTC prices. Subparagraph (f)(1)(O) contains new procedures for holding a public hearing in the event that SOx RTC prices exceed $50,000 per ton based on a 12-month rolling average.

New subparagraph (f)(1)(P) contains criteria for submitting the emission reductions obtained via the RTC Holdings adjustments to the SIP.

New subparagraph (f)(1)(Q) contains procedures for assigning SOx allocations to facilities that enter the RECLAIM program after the date of adoption of the proposed rule amendments.

Paragraph (f)(1) contains two clarifications: 1) that SOx Allocations for 2004 through 2011 are equal to the facility's 2003 Allocation; and, 2) that NOx RTC Allocations and holdings subsequent to the year 2006 and SOx Allocations and holdings subsequent to the year 2011 shall be adjusted to the nearest pound. Lastly, subparagraph (f)(1)(B) contains a clarification to include RTC swap transactions into the computation of rolling average prices.

RECLAIM NOx 2011 Ending Emission Factors – Table 3

Table 3 has been revised to extend the RECLAIM NOx ending emission factors from 2010 to 2011. This revision is an administrative change for consistency and continuity with the changes adopted in the January 2005 amendments to the NOx RECLAIM program.

RECLAIM SOx Tier III Emission Factors – Table 4

New Table 4 has been added to Rule 2002 to establish BARCT for petroleum coke calciners, cement kilns, coal-fired boilers, container glass melting furnaces, diesel combustion, fluid catalytic cracking units, refinery boilers and heaters, sulfur recovery units/tail gas treatment units, and sulfuric acid manufacturing.

List of SOx RECLAIM Holders – Table 5

New Table 5 has been added to Rule 2002 to identify the list of holders of SOx RECLAIM RTCs.

TECHNOLOGY OVERVIEW

SOx Emission Sources

The SOx RECLAIM program consists of 33 facilities as of the 2005 Compliance Year. Of these 33, 12 RECLAIM facilities represent the top emitters of SOx (i.e., emit 95 percent of the total SOx emissions from all RECLAIM facilities). However, one of the 12 facilities has permanently shutdown. For this reason, the analysis of the proposed project will focus on the 11 remaining facilities and reducing SOx emissions from these top emitters. The affected facilities are:

- Six refineries: BP (Carson location); ConocoPhillips (Wilmington and Carson locations); Chevron; ExxonMobil; Ultramar (also referred to as Valero); and, Tesoro (formerly referred to as Shell/Equilon/Texaco)
- Two sulfuric acid plants: Rhodia Inc. and ConocoPhillips (Wilmington location)

- One coke calciner plant: BP (Wilmington location)
- One cement manufacturing plant: CPCC[18]
- Two container glass manufacturing plants: Owens-Brockway Glass Container Inc. and Saint-Gobain Containers Inc.[19]

On an equipment/process basis, Table 2-1 shows the distribution of SOx emissions with respect to the equipment/processes at these top emitting SOx RECLAIM facilities. These source categories are responsible for 80 percent of the facility emissions.

Table 2-1
Distribution of SOx Emissions at RECLAIM Facilities By Equipment/Process

Equipment/Process	Percentage of Emissions
FCCUs	33%
Refinery Process Heaters and Boilers	31%
Sulfuric Acid Manufacturing	12%
Sulfur Recovery Units and Tail Gas Units	10%
Cement Kilns and Glass Melting Furnaces	7%
Other Miscellaneous Processes/Equipment	7%

Reference: Baseline emissions from Compliance Year 2005

Of the top emitting facilities, six refineries operate one FCCU each, one sulfur recovery and tail gas unit (SRU/TGU) each, and a multitude of refinery process heaters and boilers[20]. The quantity of SOx emissions from the six refineries alone comprise approximately 74 percent of the total SOx emitted from the top emitting RECLAIM facilities that will be affected by the proposed project. The remaining facilities emit 26 percent of the total.

To appreciate the mechanics of SOx control equipment and techniques, it is necessary to first understand how SOx emissions are generated from the equipment and processes listed in Table 1-1.

FCCUs

The purpose of an FCCU at a refinery is to convert or "crack" heavy oils (hydrocarbons), with the assistance of a catalyst, into gasoline and lighter petroleum products. Each FCCU consists of three main components: a reaction chamber, a catalyst regenerator and a fractionator. All six refineries each operate one FCCU.

The cracking process begins in the reaction chamber where fresh catalyst is mixed with pre-heated heavy oils (crude) known as the fresh feed. The catalyst typically used for cracking is a fine powder made up of tiny particles with surfaces covered by several microscopic pores. A high heat-generating chemical reaction occurs that converts the heavy oil liquid into a cracked hydrocarbon vapor mixed with catalyst. As the cracking reaction progresses, the cracked hydrocarbon vapor is routed to a distillation column or fractionator for further separation into

[18] On November 20, 2009, CPCC operators announced the shutdown of both cement kilns. CPCC operators indicated that the shutdown is not permanent to the extent that when the economy improves, they plan to bring the cement kilns back on-line.

[19] Saint-Gobain Glass Container has permanently shutdown their operations.

[20] There are approximately 300 refinery boilers and heaters operating at all of the refineries and approximately 15 of these units are considered top SOx emitters.

lighter hydrocarbon components than crude such as light gases, gasoline, light gas oil, and cycle oil.

Towards the end of the reaction, the catalyst surface becomes inactive or spent because the pores are gradually coated with a combination of heavy oil liquid residue and solid carbon (coke), thereby reducing its efficiency or ability to react with fresh heavy liquid oil in the feed. To prepare the spent catalyst for re-use, the remaining oil residue is removed by steam stripping. The spent catalyst is later cycled to the second component of the FCCU, the regenerator, where hot air burns the coke layer off of the surface of each catalyst particle to produce reactivated or regenerated catalyst. Subsequently, the regenerated catalyst is cycled back to the reaction chamber and mixed with more fresh heavy liquid oil feed. Thus, as the heavy oils enter the cracking process through the reaction chamber and exit the fractionator as lighter components, the catalyst continuously circulates between the reaction chamber and the regenerator.

During the regeneration cycle, large quantities of catalyst are lost in the form of catalyst fines or particulates thus making FCCUs a major source of primary particulate emissions at refineries. In addition, particulate precursor emissions such as SOx (because crude oil naturally contains sulfur) and NOx, additional secondary particulates (i.e., formed as a result of various chemical reactions), plus carbon monoxide (CO) and carbon dioxide (CO2) are produced due to coke burn-off during the regenerator process.

The potential available control technologies to reduce SOx emissions from a FCCU are:

1. Processing of low sulfur feed stocks;
2. Feed hydro-treating;
3. Flue gas scrubbing via wet gas scrubbers (WGSs);
4. Using SOx reducing catalyst; or,
5. Using a combination of these control technologies.

The type of SOx control option to be utilized in response to the proposed project for FCCUs will depend on each refinery's individual operations and the current control technologies and techniques in place. For example, all six refineries already process low sulfur feed stocks and utilize feed hydrotreating for their FCCUs. Thus, it is possible that each refinery may choose to rely on a WGSs or SOx reducing catalysts in order to comply with the BARCT requirements for the FCCU portion of the proposed project.

Refinery Process Heaters and Boilers

Refinery process heaters and boilers are used extensively throughout various processes in refinery operations such as distillation, hydrotreating, fluid catalytic cracking, alkylation, reforming, and delayed coking. There are approximately 300 refinery process heaters and boilers operating throughout the six aforementioned refineries and the top 16 emitters in this category collectively emitted about one ton per day of SOx in 2005. Refinery process heaters and boilers are primarily fueled by refinery gas, one of several products generated at a refinery. In addition, most refinery process heaters and boilers are designed to also operate on natural gas, but liquid or solid fuels are rarely used.

SOx is created from the combustion of fuel that contains sulfur or sulfur compounds. To reduce SOx emissions from these refinery process heaters and boilers, the refinery operators can opt to use lower sulfur-containing fuels to reduce the sulfur input on the front end (e.g., fuel gas treatment), or to install flue gas scrubber (wet scrubber) to reduce SOx emissions in the flue gas

after it exits the refinery process heaters and boilers on the back end. Because the Consultants' Reports determined that utilizing a flue gas scrubber was not cost-effective for this source category, this ~~Draft~~ Final PEA (in Chapter 4) will evaluate the possibility that each refinery may rely on the fuel gas treatment control option in order to comply with the refinery process heaters and boilers portion of the proposed project.

Sulfur Recovery Units and Tail Gas Units (SRU/TGUs)

Because sulfur is a naturally occurring and undesirable component of crude oil, refineries employ a sulfur recovery system to maximize sulfur removal. A typical sulfur removal or recovery system will include a sulfur recovery unit (e.g., Claus unit) followed by a tail gas treatment unit (e.g., amine treating) for maximum removal of hydrogen sulfide (H2S). A Claus unit consists of a reactor, catalytic converters and condensers. Two chemical reactions occur in a Claus unit. The first reaction occurs in the reactor, where a portion of H2S reacts with air to form sulfur dioxide (SO2) followed by a second reaction in the catalytic converters where SO2 reacts with H2S to form liquid elemental sulfur. Side reactions producing carbonyl sulfide (COS) and carbon disulfide (CS2) can also occur. These side reactions are problematic for Claus plant operators because COS and CS2 cannot be easily converted to elemental sulfur and carbon dioxide. Liquid sulfur is recovered after the final condenser. The combination of two converters with two condensers in series will generally remove as much as 95 percent of the sulfur from the incoming acid gas. To increase removal efficiency, some newer sulfur recovery units may be designed with three to four sets of converters and condensers.

To recover the remaining sulfur compounds after the final pass through the last condenser, the gas is sent to a tail gas treatment process such as a SCOT or Wellman-Lord treatment process. For example, the SCOT tail gas treatment is a process where the tail gas is sent to a catalytic reactor and the sulfur compounds in the tail gas are converted to H2S. The H2S is absorbed by a solution of amine in the H2S absorber, steam-stripped from the absorbent solution in the H2S stripper, concentrated, and recycled to the front end of the sulfur recovery unit. This approach typically increases the overall sulfur recovery efficiency of the Claus unit to 99.8 percent or higher. However, the fresh acid gas feed rate to the sulfur recovery unit is reduced by the amount of recycled stream, which reduces the capacity of the sulfur recovery unit. The residual H2S in the treated gas from the absorber is typically vented to a thermal oxidizer where it is oxidized to sulfur dioxide (SO2) before venting to the atmosphere.

The Wellman-Lord tail gas treatment process is when the sulfur compounds in the tail gas are first incinerated to oxidize to SO2. After the incinerator, the tail gas enters a SO2 absorber, where the SO2 is absorbed in a sodium sulfite (Na2SO3) solution to form sodium bisulfite (NaHSO3) and sodium pyrosulfate (Na2S2O5). The absorbent rich in SO2 is then stripped, and the SO2 is recycled back to the beginning of the Claus unit. The residual sulfur compounds in the treated tail gas from the SO2 absorber are then vented to a thermal oxidizer where they are oxidized to SO2 before venting to the atmosphere.

There are three main strategies that can be employed to further reduce SO2 emissions from each SRU/TGU operating at the six refineries: 1) increase the efficiency of the sulfur recovery unit; 2) improve the efficiency of the tail gas treatment process; and, 3) install a wet gas scrubber as an alternative to the thermal oxidizer[21]. The type of SOx control option to be utilized in response to this portion of the proposed project will depend on each refinery's individual operations and

[21] All six refineries have thermal oxidizers at the end of their tail gas treatment units.

the current control technologies and techniques in place. Thus, this ~~Draft~~ Final PEA (in Chapter 4) will evaluate the possibility that each refinery may rely on the SOx control strategies identified above in order to comply with the sulfur recovery/tail gas treatment unit portion of the proposed project.

Sulfuric Acid Manufacturing

Sulfuric acid is a commodity chemical that is used in manufacturing phosphate and nitrogen fertilizers, detergents, paper, and rust removers. It is also used extensively in automobile manufacturing, metal smelting, water treatment and oil refining processes. There are two facilities in the Basin that manufacture sulfuric acid. The sulfuric acid manufacturing process includes three basic operations. First, the sulfur in the feedstock is oxidized to sulfur dioxide (SO2) in a furnace. The SO2 is then catalytically oxidized (using vanadium as the catalyst) to sulfur trioxide (SO3) in a multi-staged catalytic reactor (or converter). Lastly, the sulfur trioxide is absorbed (e.g., combined with water) to create a strong sulfuric acid (H2SO4) solution.

In a dual or two-stage absorption process, the SO3 gas formed from the primary converter is sent to a first absorber where most of the SO3 is removed to form H2SO4. The remaining unconverted SO2 and SO3 are directed to a secondary converter and absorber set to further remove H2SO4.

The conversion of SO2 to H2SO4 is an incomplete, exothermic reaction which means that there is always one to two percent of SO2 that does not get converted to H2SO4. The success of conversion is affected by the number of stages in the catalytic converter, the amount of catalyst used, temperature and pressure, and the concentrations of the reactants, SO2 and elemental oxygen (O2). The remaining SO2 in the exhaust gas stream from the absorbers is vented to ESPs, scrubbers, and mist eliminators to remove SO2 and acid mist prior to venting to the atmosphere. Because the conversion of SO2 to H2SO4 is exothermic (e.g., produces a great deal of heat), the heat is recovered and converted into useful energy for operating steam-driven compressors, waste heat boilers, and heat exchangers. This ~~Draft~~ Final PEA (in Chapter 4) will evaluate the possibility that the operators of the sulfuric acid manufacturing facilities may consider installing a WGSs or upgrading existing controls in order to comply with the BARCT requirements for this portion of the proposed project.

Container Glass Melting Furnace

A container glass melting furnace is the main equipment used for manufacturing glass products, such as bottles, glass wares, pressed and blown glass, tempered glass, and safety glass. The manufacturing process consists of four phases: 1) preparation of the raw materials; 2) melting the mixture of raw materials in the furnace; 3) forming the desired shape; and, 4) finishing the final product. Raw materials, such as sand, limestone, and soda ash, are crushed and mixed with cullets (recycled glass pieces) to ensure homogeneous melting. The raw materials mixture is then conveyed to a continuous regenerative side-port melting furnace. As the mixture enters the furnace through a feeder, it melts and blends with the molten glass already in the furnace, and eventually flows to a refiner section, forming machine, and annealing ovens. The final products undergo inspection, testing, packaging and storage. Any damaged or undesirable glass is transferred back to be recycled as cullets.

SOx is generated from a container glass melting furnace in two ways: 1) during the decomposition of the sulfates in the raw materials; and, 2) from combusting fuel (that contains

sulfur) to generate high heating values in the furnace. The container glass melting furnace contributes over 99 percent of the total SOx emissions from a glass manufacturing plant.

SOx emissions from a container glass melting furnace are typically controlled by a scrubber followed by a dry electrostatic precipitator (ESP) to control particulates. Two glass melting facilities are in the SOx RECLAIM program, but only one of these facilities is currently operating. The type of SOx control option to be utilized in response to the proposed project will depend on this facility's individual operations and the current control technologies and techniques in place. Thus, this ~~Draft~~ Final PEA (in Chapter 4) will evaluate the possibility that operators of the glass melting facility may rely on WGS technology to further control SOx emissions in order to comply with the BARCT requirements for the FCCU portion of the proposed project.

Petroleum Coke Calciner

Petroleum coke, the heaviest portion of crude oil, cannot be recovered in the normal oil refining process. Instead, it is processed in a delayed coker unit to generate a carbonaceous solid referred to as "green coke," a commodity. To improve quality of the product, if the green coke has a low metals content, it will be sent to a calciner to make calcined petroleum coke. Calcined petroleum coke can be used to make anodes for the aluminum, steel, and titanium smelting industry. If the green coke has a high metals content, it is used as a fuel grade coke by the fuel, cement, steel, calciner and specialty chemicals industries.

The process of making calcined petroleum coke begins when the green coke feed from the delayed coker unit is screened and transported to the calciner unit where it is stored in a covered coke storage barn. The screened and dried green coke is introduced into the top end of a rotary kiln and is tumbled by rotation under high temperatures that range between 2,000 and 2,500 degrees Fahrenheit (^{o}F). The rotary kiln relies on gravity to move coke through the kiln countercurrent to a hot stream of combustion air produced by the combustion of natural gas or fuel oil. As the green coke flows to the bottom of the kiln, it rests in the kiln for approximately one additional hour to eliminate any remaining moisture, impurities, and hydrocarbons. Once discharged from the kiln, the calcined coke is dropped into a cooling chamber, where it is quenched with water, treated with de-dusting agents to minimize dust, and carried by conveyors to storage tanks. Eventually, the calcined coke is transported by truck to the Port of Long Beach for export, or is loaded onto railcars for shipping to domestic customers.

Because sulfur is a naturally occurring and undesirable component of crude oil, it remains a component of the green coke after it exits the delayed coking unit. As the green coke is processed under high heat conditions in the rotary kiln, SOx emissions are generated. SOx is also generated from combusting fuel oil (that contains sulfur) to generate high heating values in the rotary kiln.

There is only one petroleum coke calciner in the Basin and the SOx emissions from the unit are controlled by a dry scrubber. The existing control system also includes a spray dryer, a reverse-air baghouse, a slurry storage system, a slurry circulating system, and a pneumatic conveying system. Calcium hydroxide (CaOH) slurry is the absorbing medium for the existing SO2 control system. The type of SOx control option to be utilized in response to the proposed project will depend on this facility's individual operations and the current control technologies and techniques in place. Thus, this ~~Draft~~ Final PEA (in Chapter 4) will evaluate the possibility that operators of the petroleum coke calcining facility may rely on a WGS to better control SOx

emissions in order to comply with the BARCT requirements for the petroleum coke calcining portion of the proposed project.

Cement Kiln and Coal-Fired Boiler

Of the two Portland cement manufacturing facilities located in the Basin, CPCC and TXI Riverside Cement Company (TXI), the quantity of SOx emissions from CPCC at 100.5 tons per year is substantially greater than TXI's SOx emissions at 0.7 ton per year for compliance year 2005. Because the proposed project is directed at reducing emissions from the top SOx emitters, the following discussion is limited to reducing SOx emissions at the CPCC facility.

CPCC manufactures gray Portland cement in two cement kilns and follows a four-step process of: 1) acquiring raw materials; 2) preparing the raw materials to be blended into a raw mix; 3) pyroprocessing of the raw mix to make clinker; and, 4) grinding and milling clinker into cement. The raw materials used for manufacturing cement include calcium, silica, alumina and iron, with calcium having the highest concentration. These raw materials are obtained from a limestone quarry for calcium, sand for silica; and shale and clay for alumina and silica.

The raw materials are crushed, milled, blended into a raw mix and stored. Primary, secondary and tertiary crushers are used to crush the raw materials until they are about ¾-inch or smaller in size. Raw materials are then conveyed to rock storage silos. Belt conveyors are typically used for this transport. Roller mills or ball mills are used to blend and pulverize raw materials into fine powder. Pneumatic conveyors are typically used to transport the fine raw mix to be stored in silos until it is ready to be pyroprocessed.

The pyroprocess in a kiln consists of three phases during which clinker is produced from raw materials undergoing physical changes and chemical reactions. The first phase in a kiln, the drying and pre-heating zone, operates at a temperature between 70 ^{o}F and 1650 ^{o}F and evaporates any remaining water in the raw mix of materials entering the kiln. Essentially this is the warm-up phase which stabilizes the temperature of the refractory fire brick inside the mouth opening of the kiln. The second phase, the calcining zone, operates at a temperature between 1100 ^{o}F and 1650 ^{o}F and converts the calcium carbonate from the limestone in the kiln feed into calcium oxide and releases carbon dioxide. During the third phase, the burning zone operates on average at 2200 ^{o}F to 2700 ^{o}F (though the flame temperature can exceed 3400 ^{o}F) during which several reactions and side reactions occur. The first reaction is calcium oxide (produced during the calcining zone) with silicate to form dicalcium silicate and the second reaction is the melting of calcium oxide with alumina and iron oxide to form the liquid phase of the materials. Despite the high temperatures, the constituents of the kiln feed do not combust during pyroprocessing. As the materials move towards the discharge end of the kiln, the temperature drops and eventually clinker nodules form and volatile constituents, such as sodium, potassium, chlorides, and sulfates, evaporate. Any excess calcium oxide reacts with dicalcium silicate to form tricalcium silicate. The red hot clinker exits the kiln, is cooled in the clinker cooler, passes through a crusher and is conveyed to storage for protection from moisture. Since clinker is water reactive, if it gets wet, it will set into concrete.

Heat used in CPCC's kilns is supplied through the combustion of different fuels such as coal, coke, oil, natural gas, and discarded automobile tires. The combustion gases are vented to a baghouse for dust control, and the collected dust is returned to the process or recycled if they meet certain criteria, or is discarded to landfills. Post-combustion control for SOx is not currently used at CPCC.

In addition to the cement kilns, another potential source of SOx emissions at CPCC could be from the coal-fired steam boiler due to the high sulfur content in coal. CPCC reported that the coal-fired steam boiler has not been in operation since 2002. In addition on November 20, 2009, CPCC operators shut down both of their cement kilns due to the economic downturn. CPCC operators indicated that they could begin operating their equipment again in the future if circumstances with the nation's economy improve.

SOx emissions from the cement kilns and coal-fired boiler are generated from the following: 1) combustion of sulfur in the fuel; and, 2) oxidation of sulfides (e.g., pyrites) in the raw materials entering the cement kiln. Fuel switching, process alterations, dry and wet scrubbers are commercially available control technologies to reduce SOx emissions. The type of scrubber to be utilized in response to the proposed project will depend on this facility's individual operations and how it will function with the current control technologies and techniques in place at CPCC (e.g., the baghouse). The control equipment considered for this facility has been analyzed by a contracted consultant (ETS Inc.) as part of the SOx RECLAIM rule development process[22] and ETS Inc. recommended that operators of CPCC may rely on dry gas scrubber technology to further control SOx emissions in order to comply with the BARCT requirements for the cement kiln and coal-fired boiler portion of the proposed project. Thus, this ~~Draft~~ Final PEA (in Chapter 4) will evaluate the possibility that a dry gas scrubber technology may be installed at CPCC.

SOx Control Technologies

On an equipment/process basis, Table 2-2 shows the control technologies that will be considered as part of the BARCT analysis for the proposed project. The following discussions will elaborate on the various technologies listed in Table 2-2.

Table 2-2
BARCT Control Technologies Under Consideration
for SOx Emitting Equipment/Processes

Equipment/Process	BARCT Control Technology
FCCUs	1. WGS 2. SOx Reducing Additives
Sulfur Recovery Units/Tail Gas Units	1. WGS 2. Selective Oxidation Catalyst
Sulfuric Acid Manufacturing	WGS or Upgrade Existing Controls
Petroleum Coke Calciner	WGS
Cement Kilns and Coal-Fired Boiler	DGS (Limestone Absorber)
Container Glass Melting Furnaces	WGS
Refinery Process Heaters and Boilers	FGT

Wet Gas Scrubbers (WGSs)

Wet gas scrubbers are used to control both SOx and particulate emissions and can be installed on petroleum coke calciners, cement kilns and coal-fired boilers, container glass melting furnaces,

[22] On July 11, 2008, the SCAQMD Governing Board approved release of a Request for Proposal to obtain proposals from qualified contractors with technical expertise and experience in SOx emissions control technologies. Two qualified contractors, ETS Inc. and Nexidea Inc., were selected to conduct engineering evaluations and cost estimates on existing commercially viable control technologies to further reduce SOx emissions from 11 SOx RECLAIM facilities. These evaluations resulted in facility-specific information that assisted staff in identifying potential BARCT to be implemented to help the Basin attain the PM2.5 ambient air quality standards.

FCCUs, refinery process heaters and boilers, sulfuric acid manufacturing, and sulfur recovery units/tail gas units. There are two types of wet gas scrubbers: 1) caustic-based non-regenerative WGS; and, 2) regenerative WGS.

In non-regenerative wet gas scrubbing, caustic soda (sodium hydroxide - NaOH) or other alkaline reagents, such as soda ash, are used as an alkaline absorbing reagent (absorbent) to capture SO2 emissions. The absorbent captures SO2 and sulfuric acid mist (H2SO4) and converts it to various types of sulfites and sulfates (e.g., NaHSO3, Na2SO3, and Na2SO4). The absorbed sulfites and sulfates are later separated by a purge treatment system and the treated water, free of suspended solids, is either discharged or recycled.

One example of the caustic-based non-regenerative scrubbing system is the proprietary Electro Dynamic Venturi (EDV) scrubbing system offered by BELCO Technologies Corporation. An EDV scrubbing system consists of three main modules: 1) a spray tower module; 2) a filtering module; and, 3) a droplet separator module. The flue gas enters the spray tower module, which is an open tower with multiple layers of spray nozzles. The nozzles supply a high density stream of caustic water that is directed in a countercurrent flow to the gas flow and encircles, encompasses, wets, and saturates the flue gas. Multiple stages of liquid/gas absorption occur in the spray tower module and SO2 and acid mist are captured and converted to sulfites and sulfates. Large particles in the flue gas are also removed by impaction with the water droplets.

The flue gas saturated with heavy water droplets continues to move up the wet scrubber to the filtering module where the flue gas reaches super-saturation. At this point, water continues to condense and the fine particles in the gas stream begin to cluster together, to form larger and heavier groups of particles. Next, the flue gas, super-saturated with heavy water droplets, enters the droplet separator module causing the water droplets to impinge on the walls of parallel spin vanes and drain to the bottom of the scrubber.

The spent caustic water purged from the WGS is later processed in a purge treatment unit. The purge treatment unit contains a clarifier that removes suspended solids for disposal. The effluent from the clarifier is oxidized with agitated air to help convert sulfites to sulfates and also reduce the chemical oxygen demand (COD) so that the effluent can be safely discharged to a waste water system.

A regenerative WGS removes SO2 from the flue gas by using a buffer solution that can be regenerated. The buffer is then sent to a regenerative plant where the SO2 is extracted as concentrated SO2. The concentrated SO2 is then sent to a sulfur recovery unit (SRU) to recover the liquid SO2, sulfuric acid and elemental sulfur as a by-product. When the inlet SO2 concentrations are high, a substantial amount of sulfur-based by-products can be recovered and later sold as a commodity for use in the fertilizer, chemical, pulp and paper industries. For this reason, the use of a regenerative WGS is favored over a non-regenerative WGS.

One example of a regenerative scrubber is the proprietary LABSORB offered by BELCO Technologies Corporation [23, 24]. The LABSORB scrubbing process uses a patented non-organic

[23] *Evaluating Wet Scrubbers*, Edwin H. Weaver of BELCO Technologies Corporation, Petroleum Technology Quarterly, Quarter 3, 2006.

[24] *A Logical and Cost Effective Approach for Reducing Refinery FCCU Emissions.* S.T. Eagleson, G. Billemeyer, N. Confuorto, and E. H. Weaver of BELCO, and S. Singhania and N. Singhania of Singhania Technical Services Pvt., India, Presented at PETROTECH 6th International Petroleum Conference in India, January 2005.

aqueous solution of sodium phosphate salts as a buffer. This buffer is made from two common available products, caustic and phosphoric acid. The LABSORB system consists of: 1) a quench pre-scrubber; 2) an absorber; and, 3) a regeneration section which typically includes a stripper and a heat exchanger.

In the scrubbing side of the regenerative scrubbing system, the quench pre-scrubber is used to wash out any large particles that are carried over, plus any acid components in the flue gas such as hydrofluoric acid (HF), hydrochloric acid (HCl), and SO3. The absorption of SO2 is carried out in the absorber. The absorber typically consists of one single, high-efficiency packed bed scrubber filled with high-efficiency structural packing material. However, if the inlet SO2 concentration is low, a multiple-staged packed bed scrubber, or a spray-and-plate tower scrubber, may be used instead to achieve an ultra-low outlet SO2 concentration.

The third step in the regenerative wet gas scrubbing system is the regenerative section in which the SO2-rich buffer stream is steam heated to evaporate the water from the buffer. The buffer stream is then sent to a stripper/condenser unit to separate the SO2 from the buffer. The buffer free of SO2 is returned to the buffer mixing tank while the condensed-SO2 gas stream is sent back to the SRU for further treatment.

Dry Gas Scrubbers (DGS)

Dry gas scrubbers are used to control SOx emissions and can be installed to control emissions from cement kilns and coal-fired boilers, container glass melting furnaces, and refinery boilers and heaters. In dry gas scrubbers, a dry calcium- and sodium-based alkaline powdered sorbent is used to absorb SO2 from the flue (outlet) gas stream. There are two types of DGSs: 1) spray dryer scrubbers; and, 2) dry injection scrubbers.

A spray dryer scrubber is configured so that the reaction between SO2 in the flue gas and the dry sorbent takes place in a separate, dedicated reactor (or scrubber). A dry injection scrubber is configured so that the sorbent is injected directly via multiple injection ports into the SO2-producing equipment or ducting system. Spray dryer scrubbers can achieve about 80 percent to 90 percent SO2 removal efficiency, while dry injection scrubbers can achieve about 50 percent to 80 percent SO2 removal efficiency.

DGSs require high temperatures in the range of 1,800 ^{o}F to 2,000 ^{o}F in order to decompose the sorbent into porous solids with high adsorbing surface area to ensure efficient SO2 removal. Because particulates are formed during the dry gas scrubbing process, cyclones and ESPs are additional control equipment units that are typically installed downstream of a dry scrubber.

SOx Reducing Additives

To help reduce condensable particulate matter from sulfur, SOx reducing additives (catalysts) are used for reducing the production of SOx by-products in FCCUs. SOx reducing catalyst is a metal oxide compound such as aluminum oxide (Al2O3), magnesium oxide (MgO), vanadium pentoxide (V2O5) or a combination of the three that is added to the FCCU catalyst as it circulates throughout the reactor. In the regenerator of the FCCU, sulfur bearing coke is burned and SO2, CO, and CO2 by-products are formed. A portion of SO2 will react with excess oxygen and form SO3 which will either stay in the flue gas or react with the metal oxide in the SOx reducing catalyst to form metal sulfate. In the FCCU reactor, the metal sulfate will react with hydrogen to form either metal sulfide and water, or more metal oxide. In the steam stripper section of the FCCU reactor, metal sulfide reacts with steam to form metal oxide and hydrogen

sulfide. The net effect of these reactions is that the quantity of SOx in the regenerator is typically reduced between 40 to 65 percent while the quantity of hydrogen sulfide (H2S) in the reactor is increased. Generally, the increase in H2S is handled by sulfur recovery processes located elsewhere within the refinery.

FCCUs operate with a primary or base catalyst injection system that maintains a continuous or semi-continuous addition of fresh catalyst to the catalyst inventory circulating between the regenerator and the reactor. The catalyst injection system typically includes a main catalyst source but it can also accommodate the injection of other additives such as SOx reducing catalysts. The main catalyst feed lines and the additive catalyst feed lines are connected to the FCCU by a process line equipped with a blower or air compressor to provide pressurized fluid, such as air, that is utilized to inject all of the various powdered catalysts into the FCCU.

To introduce the SOx reducing catalyst into an FCCU, an intermittent catalyst addition system can be used. The addition system will automatically inject catalyst via an addition hopper which is periodically fed by gravity from a storage hopper which is sealed off from the supply line. The addition hopper is then pressurized with air to discharge its contents to the carrier gas line which feeds the catalyst into the hydrocarbon conversion unit in the regenerator section of the FCCU. The catalyst addition can be controlled by an electronic timer or pneumatic (pressurized) valve system so as to inject the precise amount of catalyst required as evenly as possible over the course of each day.

The size (capacity) of the additive injection system varies from refinery to refinery and can range from one ton capacity to over 50 tons. Many refineries already have silos to hold bulk fresh catalyst and some systems are sized and designed to operate with additive shipping containers and bulk trucks.

Fuel Gas Treatment (FGT)

Currently, SCAQMD Rule 431.1 – Sulfur Content of Gaseous Fuels, limits the sulfur content in refinery fuel gas to 40 ppmv sulfur. This limit has already been incorporated in the SOx RECLAIM allocations and resulted in an emission factor of 6.76 pounds of SOx per million cubic feet of refinery gas. However, the sulfur content in refinery fuel gas may be further reduced to a range between 25 ppmv and 35 ppmv and the outlet SOx concentrations from refinery boilers and process heaters may also be limited to less than 20 ppmv by implementing efficiency improvements to fuel gas treatment.

Refinery fuel gas, commonly used for operating refinery process heaters and boilers, is treated in various acid gas processing units such as an amine, Merox[25] or Sulfinol[26] treating unit for removal of sour components such as hydrogen sulfide (H2S), carbonyl sulfide (COS), mercaptan, and ammonia. Lean amine is generally used as an absorbent. At the end of the process, the lean amine is regenerated to form rich amine, and H2S is recovered in acid gas which is then fed to the SRU/TGU for more processing. By improving the efficiency of the amine treating unit to recover more sulfur from the inlet acid gas stream, the sulfur content in the

[25] Merox is an acronym for mercapatan oxidation and the treatment process is a proprietary catalytic chemical process used for removing mercaptans from refinery fuel gas by converting them to liquid hydrocarbon disulfides. Merox treatment is an alkaline process that typically uses an aqueous solution of sodium hydroxide (NaOH) or caustic.

[26] The Sulfinol process uses an industrial solvent called sulfolane to remove H2S, CO2, COS and mercaptans from natural gas as well as separating high purity aromatic compounds from hydrocarbon mixtures.

refinery fuel gas at the outlet, and subsequently the SOx emissions from boilers and heaters that use these refinery fuel gases can be reduced.

Selective Oxidation Catalyst

EmeraChem Power LLC markets a proprietary catalytic gas treatment called selective oxidation catalyst "ESx" that is typically used as a sulfur reducing agent in conjunction with its "EMx NOx trap" catalyst to treat combustion exhaust gases from incinerators, process heaters, turbines and boilers. The ESx catalyst can also be used as part of SOx reduction for sulfur recovery units/tail gas treatment units. The ESx catalyst can reduce multiple sulfur species, including SO2, SO3, and H2S from the tail gas stream while also removing CO, VOC, and PM10 emissions. ESx catalyst is a platinum group metal catalyst that stores sulfur species and simultaneously assists in the catalytic oxidation of CO and VOCs. The ESx units are typically outfitted with multiple chambers such that at least one chamber is always in regeneration while the other units are working to store SOx. In the storage process, SO2 is oxidized to SO3 and is stored by EmeraChem's sorber. The catalyst regeneration process releases sulfur as SO2.

CHAPTER 3

EXISTING SETTING

Introduction
Existing Setting
Aesthetics
Air Quality
Energy
Hazards and Hazardous Materials
Hydrology and Water Quality
Transportation and Traffic

INTRODUCTION

In order to determine the significance of the impacts associated with a proposed project, it is necessary to evaluate the project's impacts against the backdrop of the environment as it exists at the time the NOP/IS is published. The CEQA Guidelines define "environment" as "the physical conditions that exist within the area which will be affected by a proposed project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance" (CEQA Guidelines §15360; see also Public Resources Code §21060.5). Furthermore, a CEQA document must include a description of the physical environment in the vicinity of the project, as it exists at the time the NOP/IS is published, from both a local and regional perspective (CEQA Guidelines §15125). Therefore, the "environment" or "existing setting" against which a project's impacts are compared consists of the immediate, contemporaneous physical conditions at and around the project site (Remy, et al; 1996).

The following sections summarize the existing setting for aesthetics, air quality, energy, hazards and hazardous materials, hydrology and water quality, and transportation and traffic which are the only environmental areas identified in the NOP/IS that may be adversely affected by the proposed project. The Final Program EIR for the 2007 AQMP contains more comprehensive information on existing and projected environmental settings for all environmental areas discussed in this chapter. Copies of the referenced documents are available from the SCAQMD's Public Information Center by calling (909) 396-2039.

EXISTING SETTING

The proposed project will affect the following types of equipment and processes at the top emitting SOx RECLAIM facilities: 1) FCCUs; 2) SRU/TGUs; 3) sulfuric acid manufacturing; 4) petroleum coke calciners; 5) cement kiln and coal-fired boiler; 6) container glass melting furnace; and, 7) refinery boilers/heaters.

The SOx RECLAIM program consists of 33 facilities as of the 2005 Compliance Year. Of these 33, 11 RECLAIM facilities represent the top emitters of SOx (i.e., emit 95 percent of the total SOx emissions from all RECLAIM facilities). For this reason, the proposed project will focus on reducing SOx emissions from these top emitters. They are:

- Six FCCUs and six SRU/TGUs plus 15 refinery boilers and heaters operated at: BP Carson Refinery; ConocoPhillips; Chevron Refinery; ExxonMobil Refinery; Ultramar/Valero Refinery; Tesoro Refinery; and, ConocoPhillips Carson Plant.
- Two sulfuric acid plants: Rhodia Inc. and ConocoPhillips
- One coke calciner plant: BP Wilmington Plant
- One cement manufacturing plant (two cement kilns and one coal-fired boiler): CPCC
- One container glass manufacturing plant: Owens-Brockway Glass Container Inc.

On an equipment/process basis, Table 3-1 shows the distribution of SOx emissions with respect to the equipment/processes at these SOx RECLAIM facilities. These source categories are responsible for 80 percent of the facility emissions. Of the 11 affected facilities, the quantity of SOx emissions from all of the refineries comprise approximately 74 percent of the total SOx emitted from the RECLAIM facilities that will be affected by the proposed project. The remaining facilities emit 26 percent of the total. Table 3-2 summarizes on a facility-specific basis (referred to by facility identification number (ID) as Facilities A through K), the equipment or source category that may be potentially affected by the proposed project.

Table 3-1
Distribution of SOx Emissions at RECLAIM Facilities By Equipment/Process

Equipment/Process	Percentage of Emissions
FCCUs	33%
Refinery Process Heaters and Boilers	31%
Sulfuric Acid Manufacturing	12%
SRU/TGUs	10%
Cement Kilns and Glass Melting Furnaces	7%
Other Miscellaneous Processes/Equipment	7%

Reference: Baseline emissions from Compliance Year 2005

Table 3-2
Equipment/Source Category That May Be Affected by the Proposed Project

Facility ID	Potentially Affected Equipment/Source Category
A	1 FCCU 1 SRU/TGU 1 FGT
B	1 FCCU 1 SRU/TGU 1 FGT
C	1 FCCU 1 FGT 1 Sulfuric Acid Plant
D	1 FCCU 1 SRU/TGU 1 FGT
E	1 FCCU 1 SRU/TGU 1 FGT
F	1 FCCU 1 SRU/TGU 1 FGT
G	1 SRU/TGU 1 FGT
H	1 Calciner Plant
I	2 Glass Melting Furnaces
J	1 Sulfuric Acid Plant
K	2 Cement Kilns
11 facilities	6 FCCUs 6 SRU/TGUs 7 FGTs 2 Sulfuric Acid Plants 1 Calciner Plant 2 Glass Melting Furnaces 2 Cement Kilns

AESTHETICS

The following discussion describes the existing aesthetics setting for each of the affected facilities (refineries, sulfuric acid manufacturing plants, petroleum coke calcining plant, container glass manufacturing plant, and a Portland cement manufacturing plant) that are potentially affected by the proposed project:

1. BP Carson Refinery

The BP Carson Refinery is located at 1801 East Sepulveda Boulevard in the City of Carson, California. The BP Carson Refinery is bounded by Wilmington Avenue on the west, 223rd Street on the north, Alameda Street on the east, and Sepulveda Boulevard on the south (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=1801+East+Sepulveda+Boulevard,+Carson,+CA&sll=37.0625,-95.677068&sspn=44.388698,92.021484&ie=UTF8&ll=33.81777,-118.242073&spn=0.022855,0.044932&t=h&z=15&iwloc=A). The Dominguez Channel flows through the BP Carson Refinery, dividing the property into two sections: Northeastern and Southern. Industrial and commercial facilities and transportation corridors (e.g., 405 freeway and Alameda Corridor) surround the BP Carson Refinery. The BP Carson Refinery is comprised of large scale, industrial equipment that includes a FCCU, boilers, heaters, numerous above-ground storage tanks, process columns, and stacks reaching approximately 200 feet in height. The BP Carson Refinery is a 24-hour operation with existing light sources in place for nighttime operations.

To the east of the BP Carson Refinery is the Alameda Corridor and other industrial facilities including the BP Coke Barn, the Air Products Hydrogen Plant, and the Tesoro Sulfur Recovery Plant. Commercial and residential areas are located to the west. The ConocoPhillips Refinery, a cold storage warehouse facility and tank farms occupy the area south of the BP Carson Refinery. The BP Carson Refinery and all adjacent properties are zoned manufacturing heavy (MH). The closest residential area to the BP Carson Refinery is approximately 3,000 feet from the property line across Wilmington Avenue to the southwest of the Refinery.

2. ConocoPhillips Wilmington Refinery

The ConocoPhillips Wilmington Refinery occupies approximately 400 acres of land and is located at 1660 West Anaheim Street in Wilmington, California (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=1660+West+Anaheim+Street,+Wilmington,+Ca&sll=33.770729,-118.287048&sspn=0.023224,0.045276&ie=UTF8&ll=33.773618,-118.288829&spn=0.011612,0.022638&t=h&z=16). The City of Los Angeles has zoned the Wilmington Refinery property as M3 for heavy industrial land uses. The eastern part of the Wilmington Refinery borders a residential area, a roofing materials plant, and a portion of the Harbor 110 Freeway. The northern portion of the refinery borders Harbor Lake Park, Harbor College, Harbor Golf Course, and a small residential area. The western part of the refinery borders Gaffey Street which is adjacent to a gun firing range, vacant fields, recreational fields, and a United States Navy fuel storage facility. The southern portion of the site shares a border with warehouse facilities. The Wilmington Refinery is located on the eastern side of the Palos Verdes Peninsula, with the slope of the surrounding topography rising from east to west. To the west of the refinery, residential areas located on the hillsides above the facility have unobstructed views overlooking the Wilmington Refinery, port areas, and other portions of the Wilmington and Long Beach areas. The refinery is comprised of large scale, industrial equipment that includes a FCCU, boilers, heaters, numerous above-ground storage tanks, process columns, and

stacks reaching approximately 200 feet in height. The ConocoPhillips Wilmington Refinery is a 24-hour operation with existing light sources in place for nighttime operations.

3. Chevron Refinery

The Chevron Refinery, which was constructed over 90 years ago, is located at 324 West El Segundo Boulevard in the City of El Segundo, California (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=324+West+El+Segundo+Boulevard,+El+Segundo,+California&sll=33.81777,-118.242073&sspn=0.022855,0.044932&ie=UTF8&ll=33.907519,-118.407297&spn=0.022831,0.044932&t=h&z=15&iwloc=A). The Refinery is located within Los Angeles County in an urbanized area that includes a substantial amount of industrial development, due to the proximity of Los Angeles International Airport (LAX). The Chevron Refinery is comprised of large scale, industrial equipment that includes a FCCU, boilers, heaters, numerous above-ground storage tanks, process columns, and stacks reaching approximately 200 feet in height. The Chevron Refinery is a 24-hour operation with existing light sources in place for nighttime operations.

Specifically, the Chevron Refinery is bounded by El Segundo Boulevard to the north, Sepulveda Boulevard to the east, Rosecrans Avenue to the south, and Vista Del Mar to the west. The Chevron Refinery is located in an area of mixed land uses, with industrial, recreational, residential, and commercial zoned areas nearby. Land use to the north of the Chevron Refinery is primarily residential, with a mix of commercial and light industrial zoning mixed in. The predominant adjacent land uses west of the Refinery are nearly all heavy industrial, or open space, which includes: Dockweiler State Beach, Manhattan Beach, and the El Segundo Generating Station, although a small parcel of land at the southwest corner of the Chevron property is made up of commercial areas and multiple-family residences.

Directly south of the Refinery, there is a single-family residential area bordering the entire length of the Refinery separated by Rosecrans Avenue. The corridor immediately east of the Refinery is comprised of a golf course at the corner of Sepulveda Boulevard and El Segundo Boulevard, with light commercial and heavy industrial zoning for the rest of the tract.

4. ExxonMobil Refinery

The ExxonMobil Refinery is located in Los Angeles County at 3700 West 190th Street, in the City of Torrance, California (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=3700+West+190th+Street,+Torrance,+CA&sll=33.907519,-118.407297&sspn=0.022831,0.044932&ie=UTF8&ll=33.853773,-118.333826&spn=0.011422,0.022466&t=h&z=16). The ExxonMobil Refinery was built in 1929 and occupies approximately 750 acres over an irregularly-shaped parcel of land, between 190th Street to the north, Van Ness Avenue to the east, railroad tracks and Del Amo Boulevard to the south, and Prairie Avenue to the west. A small portion of the refinery is located on the west side of Prairie Avenue. The refinery property is zoned by the City of Torrance as Heavy Manufacturing (M-2). The ExxonMobil Refinery is comprised of large scale, industrial equipment that includes a FCCU, boilers, heaters, numerous above-ground storage tanks, process columns, and stacks reaching approximately 200 feet in height. The ExxonMobil Refinery is a 24-hour operation with existing light sources in place for nighttime operations.

The closest residential area is across 190th Street to the north. Columbia Regional Park is located immediately across from the refinery in the northwest corner. Other land uses to the north, east,

west, and south include industrial and commercial facilities, a BNSF railroad line, and a business park. The areas surrounding the refinery can be characterized as a blend of heavy and light industrial, commercial, medium and high-density residential, and industrial/manufacturing.

5. Ultramar/Valero Refinery

The Ultramar/Valero Refinery is located at 2402 East Anaheim Street, in the Wilmington district of the City of Los Angeles in the southern portion of Los Angeles County (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=2402+East+Anaheim+Street,+Los+Angeles,+ca&sll=33.853773,-118.333826&sspn=0.011422,0.022466&ie=UTF8&ll=33.786513,-118.230486&spn=0.011431,0.022466&t=h&z=16&iwloc=A). According to the Wilmington-Harbor City Plan (City of Los Angeles, 1999), the Ultramar/Valero Refinery is zoned heavy manufacturing (M3-1). The Wilmington district is generally urbanized and includes a substantial amount of industrial and port-related development. The Ports of Los Angeles and Long Beach are located along the coastal boundary of Wilmington. The Wilmington area is bordered by the Harbor Freeway (Interstate 110) on the west, the Long Beach Freeway (Interstate 710) on the east, the San Diego Freeway (Interstate 405) on the north and the Pacific Ocean on the south. The Dominguez Channel runs adjacent to the Refinery from the north to the south. Railroad tracks service the area along the western boundary of the Refinery and along Alameda Street. The Ultramar/Valero Refinery is comprised of large scale, industrial equipment that includes a FCCU, boilers, heaters, numerous above-ground storage tanks, process columns, and stacks reaching approximately 200 feet in height. The Ultramar/Valero Refinery is a 24-hour operation with existing light sources in place for nighttime operations.

The Ultramar/Valero Refinery is bounded to the north by Anaheim Street and industrial uses. Also northward of Anaheim Street is another major refinery complex. The Ultramar/Valero Refinery is bounded on the south by an area used previously for oil field production facilities and which is now developed for marine cargo transport and storage facilities and other Port of Long Beach related uses. A Hydrogen Plant is located adjacent to and immediately west of the Ultramar/Valero Refinery (west of the Dominguez Channel) on Henry Ford Avenue. To the west of Henry Ford Avenue are additional industrial and commercial uses and the Port of Los Angeles. To the east of the Ultramar/Valero Refinery are automobile storage yards, a cogeneration plant and a petroleum coke calcining plant (BP Wilmington Plant). The Terminal Island Freeway (State Route 103) runs through the Refinery's boundaries. Historically, there were oil production facilities scattered throughout this general area, none of which are currently producing. The closest residential area is about one mile northwest of the Refinery in the City of Wilmington.

6. Tesoro Refinery

The Tesoro Refinery is located at 2101 East Pacific Coast Highway in the Wilmington district of the City of Los Angeles, California (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=2101+East+Pacific+Coast+Highway,+Los+Angeles,+ca&sll=33.786513,-118.230486&sspn=0.011431,0.022466&ie=UTF8&ll=33.796357,-118.230679&spn=0.01143,0.022466&t=h&z=16). The Refinery occupies about 300 acres of land, with the larger portion located within the jurisdiction of the City of Los Angeles and the smaller portion located within the City of Carson. The Refinery is bounded to the north by Sepulveda Boulevard, to the west by Alameda Street, to the south by the Southern Pacific Railroad tracks, and to the east by the Dominguez Channel. The Refinery is bisected by Pacific

Coast Highway, with the larger portion of the Refinery to the north of Pacific Coast Highway and the smaller portion to the south.

The Tesoro Refinery is zoned for heavy industrial uses (M3-1). The land use in the vicinity of the Tesoro Refinery includes oil production facilities, refineries, hydrogen plants, coke handling facilities, automobile wrecking/dismantling facilities, and other industrial facilities. The nearest residential areas to the Refinery include a residential area in the City of Long Beach, about one-half mile east of the Refinery and residential areas of Wilmington about 0.17 mile west of the southern portion of the Refinery and about 0.25 mile west of the Refinery. The Alameda Corridor, a major port access arterial, is located west of the Refinery. Other industrial uses west of the Refinery include wrecking yards, storage tanks farms and container storage areas. Industrial facilities north of the Refinery include the BP Coke Barn, other refining activities, and storage tanks farms, and an intermodal container transfer facility (ICTF). Land to the east of the Refinery includes a rail yard, the Terminal Island Freeway, a residential neighborhood and light manufacturing facilities. Land uses south of the Refinery are predominately heavy industrial with wrecking yards, a truck terminal and storage tank facilities. No schools are located within 0.25 mile of the Refinery. The Tesoro Refinery is comprised of large scale, industrial equipment that includes a FCCU, boilers, heaters, numerous above-ground storage tanks, process columns, and stacks reaching approximately 200 feet in height. The Tesoro Refinery is a 24-hour operation with existing light sources in place for nighttime operations.

Tesoro also owns and operates a separate Sulfur Recovery Plant (SRP) north of the Refinery located at 23208 South Alameda Street in the City of Carson, California (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=23208+South+Alameda+Street,+carson,+ca&sll=33.796357,-118.230679&sspn=0.01143,0.022466&ie=UTF8&ll=33.810478,-118.230228&spn=0.011428,0.022466&t=h&z=16&iwloc=A). The SRP is zoned for heavy manufacturing uses (MH) by the City of Carson's Land Use element of its General Plan. Adjacent areas to the SRP are heavy industrial and include other refineries, a hydrogen plant, undeveloped lots, and container storage areas. The closest residential area is about 0.5 mile east of the SRP in the City of Long Beach. No schools are located within 0.25 mile of the SRP. The SRP is comprised of large scale, industrial equipment that includes numerous above-ground storage tanks, process columns, and stacks reaching approximately 200 feet in height. Like the Tesoro Refinery, the SRP is also a 24-hour operation with existing light sources in place for nighttime operations.

7. Rhodia Inc.

The Rhodia sulfuric acid plant is located at 20720 South Wilmington Avenue in the City of Carson, California (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=20720+South+Wilmington+Avenue,+carson,+ca&sll=33.810478,-118.230228&sspn=0.011428,0.022466&ie=UTF8&ll=33.843936,-118.230014&spn=0.011424,0.022466&t=h&z=16). The facility is bordered by South Wilmington Avenue on the west, East Dominguez Street to the south, East Del Amo Boulevard to the north, and South Alameda Street to the east. The Rhodia sulfuric acid plant is comprised of large scale, industrial equipment such as a reactor, scrubber, bulk loading and conveying, boilers, heaters, internal combustion (IC) engines, conveyors, and storage tanks. The Rhodia sulfuric acid plant is a 24-hour operation with existing light sources in place for nighttime operations. The Rhodia plant is 90 percent paved, and is located in an industrial and commercial area. The nearest residential neighborhoods are located 0.25 mile northwest and 0.5 mile southwest of the facility. The Dominguez Channel is located approximately 1.25 miles from the facility.

8. ConocoPhillips Carson Plant

The ConocoPhillips Carson Plant is located at 1520 East Sepulveda Boulevard in the City of Carson, California and occupies 245 acres (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=1520+East+Sepulveda+Boulevard,+carson,+ca&sll=33.843936,-118.230014&sspn=0.011424,0.022466&ie=UTF8&t=h&z=16). The Carson Plant is zoned for heavy manufacturing uses (MH). The Carson Plant is bounded on the north by Sepulveda Boulevard, on the west by Wilmington Avenue, on the south by a branch of the Atchison, Topeka and Santa Fe Railroad, and on the east by Alameda Street. Property to the north of the Carson Plant is occupied by the BP Carson Refinery. The western boundary of the plant borders a shipping and container facility. Property across Wilmington Avenue includes a residential neighborhood to the northwest and commercial uses to the southwest. Land uses to the south of the Carson Plant are designated as heavy industrial. Land south of Lomita Avenue is dominated by port-related activities. Land east of Alameda Street is occupied by a storage tank farm and the Tesoro Refinery. The ConocoPhillips Carson Plant is comprised of large scale, industrial equipment that includes numerous above-ground storage tanks, process columns, and stacks reaching approximately 200 feet in height. The ConocoPhillips Carson Plant is a 24-hour operation with existing light sources in place for nighttime operations.

9. BP Wilmington Calciner Plant

The BP Wilmington Calciner is located in Los Angeles County near the Port of Long Beach just north of Cerritos Channel, at 1175 Carrack Avenue in the City of Wilmington, California (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=1175+Carrack+Avenue,+Wilmington,+ca&sll=33.804192,-118.243762&sspn=0.011429,0.022466&g=1520+East+Sepulveda+Boulevard,+carson,+ca&ie=UTF8&ll=33.774028,-118.224864&spn=0.011433,0.022466&t=h&z=16). Pier B Street runs to the north and west of the Calciner Plant's boundaries. Pier A Way borders the south end of the Calciner Plant and Carrack Avenue borders the east side of the Calciner Plant. The BP Wilmington Calciner is comprised of large scale, industrial equipment that includes a long rotary kiln (13 feet, diameter x 270 feet, length), one of the largest of its kind, that produces approximately 400,000 (short) tons per year of calcined product. The BP Wilmington Calciner is a 24-hour operation with existing light sources in place for nighttime operations. There are no sensitive receptors within 1,000 feet or 0.25 mile radius of the BP Wilmington Calciner.

10. CPCC Plant

Currently, CPCC is the only company in the SCAQMD that manufactures Gray Portland Cement. The process involves injection of used tires into the cement kiln. CPCC is located in San Bernardino County at 695 South Rancho Avenue in the City of Colton, California (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=695+South+Rancho+Avenue,+Colton,+California&sll=33.774028,-118.224864&sspn=0.011433,0.022466&ie=UTF8&ll=34.061921,-117.338362&spn=0.011395,0.022466&t=h&z=16&iwloc=A). CPCC occupies 578 acres and is bounded by train tracks to the west operated by Union Pacific Railroads, the San Bernardino freeway (I-10) to the north, South Rancho Avenue to the east, and West Agua Mansa Road to the south. CPCC and adjacent properties to the north, east, west and southwest of CPCC are industrial zones. The adjacent property to the south of CPCC is open space that follows the Santa Ana River and is zoned as equestrian/agricultural. CPCC is a 24-hour operation with existing light sources in place for nighttime operations. CPCC operates two gray cement kilns, Kiln #1 and Kiln #2.

11. Owens-Brockway Glass Container Inc.

The Owens-Brockway Glass Container plant is located in Los Angeles County at 2901-23 Fruitland Avenue, in the City of Vernon, California (http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=2901-23+Fruitland+Avenue,+Vernon,+CA&sll=37.0625,-95.677068&sspn=44.388698,92.021484&ie=UTF8&ll=33.99825,-118.215841&spn=0.005702,0.011233&t=h&z=17). The facility is bordered by South Soto Street on the west, Fruitland Avenue to the south, East 50th Street to the north, and State Street to the east. The Owens-Brockway Glass Container plant is comprised of large scale, industrial equipment such as glass melting kilns, glass forming machines, heat treating furnaces, scrubbers, bag houses, bulk loading, conveying and blending equipment, and storage tanks. The Owens-Brockway Glass Container plant is a 24-hour operation with existing light sources in place for nighttime operations.

AIR QUALITY

This section provides an overview of air quality in the District. A more detailed discussion of current and projected future air quality in the District, with and without additional control measures can be found in the Final Program EIR for the 2007 AQMP (Chapter 3).

It is the responsibility of the SCAQMD to ensure that state and federal ambient air quality standards are achieved and maintained in its geographical jurisdiction. Health-based air quality standards have been established by California and the federal government for the following criteria air pollutants: ozone, carbon monoxide (CO), nitrogen dioxide (NO2), particulate matter less than 10 microns (PM10), particulate matter less than 2.5 microns (PM2.5) sulfur dioxide (SO2) and lead. These standards were established to protect sensitive receptors with a margin of safety from adverse health impacts due to exposure to air pollution. The California standards are more stringent than the federal standards and in the case of PM10 and SO2, far more stringent. California has also established standards for sulfates, visibility reducing particles, hydrogen sulfide, and vinyl chloride. The state and national ambient air quality standards for each of these pollutants and their effects on health are summarized in Table 3-3. The SCAQMD monitors levels of various criteria pollutants at 34 monitoring stations. The 2008 air quality data from SCAQMD's monitoring stations are presented in Table 3-4.

Table 3-3
State and Federal Ambient Air Quality Standards

AIR POLLUTANT	STATE STANDARD	FEDERAL PRIMARY STANDARD	MOST RELEVANT EFFECTS
	CONCENTRATION, AVERAGING TIME		
Carbon Monoxide (CO)	20 ppm, 1-hour average > 9.0 ppm, 8-hour average >	35 ppm, 1-hour average > 9 ppm, 8-hour average >	(a) Aggravation of angina pectoris and other aspects of coronary heart disease; (b) Decreased exercise tolerance in persons with peripheral vascular disease and lung disease; (c) Impairment of central nervous system functions; and, (d) Possible increased risk to fetuses.
Ozone (O3)	0.09 ppm, 1-hour average > 0.07 ppm, 8-hour average >	0.12 ppm, 1-hour average > 0.075 ppm, 8-hour average >	(a) Short-term exposures: 1) Pulmonary function decrements and localized lung edema in humans and animals; and, 2) Risk to public health implied by alterations in pulmonary morphology and host defense in animals; (b) Long-term exposures: Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (c) Vegetation damage; and, (d) Property damage.
Nitrogen Dioxide (NO2)	0.18 ppm, 1-hour average > 0.030 ppm, annual average >	0.0534 ppm, AAM >	(a) Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; (b) Risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; and, (c) Contribution to atmospheric discoloration.
Sulfur Dioxide (SO2)	0.25 ppm, 1-hour average > 0.04 ppm, 24-hour average >	0.03 ppm, AAM > 0.14 ppm, 24-hour average > 0.50 ppm, 3-hour average >	(a) Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma.
Suspended Particulate Matter (PM10)	20 µg/m^3, AAM > 50 µg/m^3, 24-hour average >	150 µg/m^3, 24-hour average >	(a) Excess deaths from short-term exposures and exacerbation of symptoms in sensitive patients with respiratory disease; and, (b) Excess seasonal declines in pulmonary function, especially in children.
Suspended Particulate Matter (PM2.5)	12 µg/m^3, AAM >	15 µg/m^3, AAM > 35 µg/m^3, 24-hour average >	(a) Increased hospital admissions and emergency room visits for heart and lung disease; (b) Increased respiratory symptoms and disease; and, (c) Decreased lung functions and premature death.
Lead	1.5 µg/m^3, 30-day average >=	0.15 µg/m^3, rolling three-month average >	(a) Increased body burden; and, (b) Impairment of blood formation and nerve conduction.

KEY:

ppm = parts per million parts of air, by volume	AAM = Annual Arithmetic Mean
µg/m^3 = micrograms per cubic meter	

Table 3-3 (concluded)
State and Federal Ambient Air Quality Standards

AIR POLLUTANT	STATE STANDARD	FEDERAL PRIMARY STANDARD	MOST RELEVANT EFFECTS
	CONCENTRATION, AVERAGING TIME		
Sulfates (SOx)	25 µg/m^3, 24-hour average >=		(a) Decrease in ventilatory function; (b) Aggravation of asthmatic symptoms; (c) Aggravation of cardio-pulmonary disease; (d) Vegetation damage; (e) Degradation of visibility; and, (f) Property damage.
Visibility-Reducing Particles	Insufficient amount to give an extinction coefficient >0.23 inverse kilometers (visual range to less than 10 miles) with relative humidity less than 70 percent, 8-hour average (10am – 6pm PST)		Nephelometry and AISI Tape Sampler; instrumental measurement on days when relative humidity is less than 70 percent.
Vinyl Chloride	0.010 ppm, 24-hour average >=		Known carcinogen.
Hydrogen Sulfide	0.03 ppm, 1-hour average >=		Odor annoyance.

KEY:

ppm = parts per million parts of air, by volume	AAM = Annual Arithmetic Mean
µg/m^3 = micrograms per cubic meter

b) The federal 1-hour ozone standard was revoked and replaced by the 8-hour average ozone standard effective June 15, 2005. USEPA has revised the federal 8-hour ozone standard from 0.084 ppm to 0.075 ppm, effective May 27, 2008.

c) The 8-hour average California ozone standard of 0.070 ppm was established effective May 17, 2006.

l) - Federal lead standard is quarterly average > 1.5 µg/m³; and state standard is monthly average ≥ 1.5 µg/m³. USEPA has established the federal standard of 0.15 µg/m³, rolling 3-month average, as of October 15, 2008.

Criteria Pollutants

Carbon Monoxide

CO is a colorless, odorless, relatively inert gas. It is a trace constituent in the unpolluted troposphere, and is produced by both natural processes and human activities. In remote areas far from human habitation, carbon monoxide occurs in the atmosphere at an average background concentration of 0.04 ppm, primarily as a result of natural processes such as forest fires and the oxidation of methane. Global atmospheric mixing of CO from urban and industrial sources creates higher background concentrations (up to 0.20 ppm) near urban areas. The major source of CO in urban areas is incomplete combustion of carbon-containing fuels, mainly gasoline. In 2002, approximately 98 percent of the CO emitted into the Basin's atmosphere was from mobile sources. Consequently, CO concentrations are generally highest in the vicinity of major concentrations of vehicular traffic.

CO is a primary pollutant, meaning that it is directly emitted into the air, not formed in the atmosphere by chemical reaction of precursors, as is the case with ozone and other secondary pollutants. Ambient concentrations of CO in the Basin exhibit large spatial and temporal variations due to variations in the rate at which CO is emitted and in the meteorological conditions that govern transport and dilution. Unlike ozone, CO tends to reach high concentrations in the fall and winter months. The highest concentrations frequently occur on weekdays at times consistent with rush hour traffic and late night during the coolest, most stable portion of the day.

Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of worsening oxygen supply to the heart.

Inhaled CO has no direct toxic effect on the lungs, but exerts its effect on tissues by interfering with oxygen transport by competing with oxygen to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, conditions with an increased demand for oxygen supply can be adversely affected by exposure to CO. Individuals most at risk include patients with diseases involving heart and blood vessels, fetuses (unborn babies), and patients with chronic hypoxemia (oxygen deficiency) as seen in high altitudes.

Reductions in birth weight and impaired neurobehavioral development have been observed in animals chronically exposed to CO resulting in COHb levels similar to those observed in smokers. Recent studies have found increased risks for adverse birth outcomes with exposure to elevated CO levels. These include pre-term births and heart abnormalities.

Carbon monoxide concentrations were measured at 25 locations in the Basin and neighboring SSAB areas in 2008. Carbon monoxide concentrations did not exceed the standards in 2008. The highest one-hour average carbon monoxide concentration recorded (7.0 ppm in the South Central Los Angeles County area) was 20 percent of the federal one-hour carbon monoxide standard of 35 ppm. The highest eight-hour average carbon monoxide concentration recorded (4.3 ppm in the South Central Los Angeles County area) was 48 percent of the federal eight-hour carbon monoxide standard of 9.0 ppm. The state one-hour standard is also 9.0 ppm. The highest eight-hour average carbon monoxide concentration is 35 percent of the state eight-hour carbon monoxide standard of 20 ppm.

The 2003 AQMP revisions to the SCAQMD's CO Plan served two purposes: it replaced the 1997 attainment demonstration that lapsed at the end of 2000; and, it provided the basis for a CO maintenance plan in the future. In 2004, the SCAQMD formally requested the USEPA to re-designate the Basin from non-attainment to attainment with the CO National Ambient Air Quality Standards. On February 24, 2007, USEPA published in the Federal Register its proposed decision to re-designate the Basin from non-attainment to attainment for CO. The comment period on the re-designation proposal closed on March 16, 2007 with no comments received by the USEPA. On May 11, 2007, USEPA published in the Federal Register its final decision to approve the SCAQMD's request for re-designation from non-attainment to attainment for CO, effective June 11, 2007.

Ozone

Ozone (O3), a colorless gas with a sharp odor, is a highly reactive form of oxygen. High ozone concentrations exist naturally in the stratosphere. Some mixing of stratospheric ozone downward through the troposphere to the earth's surface does occur; however, the extent of ozone transport is limited. At the earth's surface in sites remote from urban areas ozone concentrations are normally very low (0.03-0.05 ppm).

While ozone is beneficial in the stratosphere because it filters out skin-cancer-causing ultraviolet radiation, it is a highly reactive oxidant. It is this reactivity which accounts for its damaging effects on materials, plants, and human health at the earth's surface.

The propensity of ozone for reacting with organic materials causes it to be damaging to living cells and ambient ozone concentrations in the Basin are frequently sufficient to cause health effects. Ozone enters the human body primarily through the respiratory tract and causes respiratory irritation and discomfort, makes breathing more difficult during exercise, and reduces the respiratory system's ability to remove inhaled particles and fight infection.

Individuals exercising outdoors, children and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible subgroups for ozone effects. Short-term exposures (lasting for a few hours) to ozone at levels typically observed in southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. In recent years, a correlation between elevated ambient ozone levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple sports and live in high ozone communities. Elevated ozone levels are also associated with increased school absences.

Ozone exposure under exercising conditions is known to increase the severity of the abovementioned observed responses. Animal studies suggest that exposures to a combination of pollutants which include ozone may be more toxic than exposure to ozone alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.

In 2008, the SCAQMD regularly monitored ozone concentrations at 29 locations in the Basin and SSAB. All areas monitored were below the stage 1 episode level (0.20 ppm), but the maximum concentrations in the Basin exceeded the health advisory level (0.15 ppm). Maximum

ozone concentrations in the SSAB areas monitored by the SCAQMD were lower than in the Basin and were below the health advisory level.

In 2008, the maximum ozone concentrations in the Basin continued to exceed federal standards by wide margins. Maximum one-hour and eight-hour average ozone concentrations were 0.176 ppm and 0.131 ppm (the maximum one-hour was recorded in Central San Bernardino Mountains area, the eight-hour maximum was recorded in Santa Clarita Valley). The federal one-hour ozone standard was revoked and replaced by the eight-hour average ozone standard effective June 15, 2005. USEPA has revised the federal eight-hour ozone standard from 0.84 ppm to 0.075 ppm, effective May 27, 2008. The maximum eight-hour concentration was 175 percent of the new federal standards. The maximum eight-hour concentration was 187 percent of the eight-hour state ozone standard of 0.070 ppm.

The objective of the 2007 AQMP is to attain and maintain ambient air quality standards. Based upon the modeling analysis described in the Program Environmental Impact Report for the 2007 AQMP implementation of all control measures contained in the 2007 AQMP is anticipated to bring the District into compliance with the federal eight-hour ozone standard by 2024 and the state eight-hour ozone standard beyond 2024.

Nitrogen Dioxide

NO2 is a reddish-brown gas with a bleach-like odor. Nitric oxide (NO) is a colorless gas, formed from the nitrogen (N2) and oxygen (O2) in air under conditions of high temperature and pressure which are generally present during combustion of fuels; NO reacts rapidly with the oxygen in air to form NO2. NO2 is responsible for the brownish tinge of polluted air. The two gases, NO and NO2, are referred to collectively as NOx. In the presence of sunlight, NO2 reacts to form nitric oxide and an oxygen atom. The oxygen atom can react further to form ozone, via a complex series of chemical reactions involving hydrocarbons. Nitrogen dioxide may also react to form nitric acid (HNO3) which reacts further to form nitrates, components of PM2.5 and PM10.

Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposures to NO2 at levels found in homes with gas stoves, which are higher than ambient levels found in southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO2 in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma and/or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups. More recent studies have found associations between NO2 exposures and cardiopulmonary mortality, decreased lung function, respiratory symptoms and emergency room asthma visits.

In animals, exposure to levels of NO2 considerably higher than ambient concentrations results in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of ozone exposure increases when animals are exposed to a combination of ozone and NO2.

In 2008, nitrogen dioxide concentrations were monitored at 25 locations. No area of the Basin or SSAB exceeded the federal or state standards for nitrogen dioxide. The Basin has not exceeded the federal standard for nitrogen dioxide (0.0534 ppm) since 1991, when the Los Angeles County portion of the Basin recorded the last exceedance of the standard in any county within the United

States. In 2008, the maximum annual average concentration was recorded at 0.0302 ppm in the Pomona/Walnut Valley area.

In addition, the nitrogen dioxide state one-hour standard was not exceeded at any SCAQMD monitoring location in 2008. Effective March 20, 2008, CARB has revised the nitrogen dioxide one-hour standard from 0.25 ppm to 0.18 ppm and established a new annual standard of 0.30 ppm. The highest one-hour average concentration recorded (0.13 ppm in South Coastal Los Angeles County) was 72 percent of the new state one-hour standard. NOx emission reductions continue to be necessary because it is a precursor to both ozone and PM (PM2.5 and PM10) concentrations.

Sulfur Dioxide

SO2 is a colorless gas with a sharp odor. It reacts in the air to form sulfuric acid (H2SO4), which contributes to acid precipitation, and sulfates, which are components of PM10 and PM2.5. Most of the SO2 emitted into the atmosphere is produced by burning sulfur-containing fuels.

Exposure of a few minutes to low levels of SO2 can result in airway constriction in some asthmatics. All asthmatics are sensitive to the effects of SO2. In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, is observed after acute higher exposure to SO2. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO2.

Animal studies suggest that despite SO2 being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract.

Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO2 levels. In these studies, efforts to separate the effects of SO2 from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically or one pollutant alone is the predominant factor.

No exceedances of federal or state standards for sulfur dioxide occurred in 2008 at any of the seven SCAQMD locations monitored. The maximum one-hour sulfur dioxide concentration was 0.09 ppm. The maximum 24-hour sulfur dioxide concentration was 0.012 ppm. The maximum annual average was 0.0022 ppm. All maximums were recorded in south Coastal Los Angeles County. The federal sulfur dioxide standards are 0.03 ppm for the annual arithmetic mean, 0.14 for the 24-hour average and 0.50 ppm for the three-hour average. The state standards are 0.25 ppm for the one-hour average and 0.04 ppm for the 24-hour average. Though sulfur dioxide concentrations remain well below the standards, sulfur dioxide is a precursor to sulfate, which is a component of fine particulate matter, PM10, and PM2.5. Standards for PM10 and PM2.5 were both exceeded in 2008. Sulfur dioxide was not measured at SSAB sites in 2008. Historical measurements showed concentrations to be well below standards and monitoring has been discontinued.

Particulate Matter (PM10 and PM2.5)

Of great concern to public health are the particles small enough to be inhaled into the deepest parts of the lung. Respirable particles (particulate matter less than about 10 micrometers in diameter) can accumulate in the respiratory system and aggravate health problems such as

asthma, bronchitis and other lung diseases. Children, the elderly, exercising adults, and those suffering from asthma are especially vulnerable to adverse health effects of PM10 and PM2.5.

A consistent correlation between elevated ambient fine particulate matter (PM10 and PM2.5) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the United States and various areas around the world. Studies have reported an association between long term exposure to air pollution dominated by fine particles (PM2.5) and increased mortality, reduction in life-span, and an increased mortality from lung cancer.

Daily fluctuations in fine particulate matter concentration levels have also been related to hospital admissions for acute respiratory conditions, to school and kindergarten absences, to a decrease in respiratory function in normal children and to increased medication use in children and adults with asthma. Studies have also shown lung function growth in children is reduced with long-term exposure to particulate matter.

The elderly, people with pre-existing respiratory and/or cardiovascular disease and children appear to be more susceptible to the effects of PM10 and PM2.5.

The SCAQMD monitored PM10 concentrations at 21 locations in 2008. The federal 24-hour PM10 standard (150 µg/m3) was not exceeded at any of the locations monitored in 2008. The maximum 24-hour PM10 concentration of 135 µg/m3 was recorded in Metropolitan Riverside County. The maximum 24-hour PM10 concentration in Metropolitan Riverside County is 90 percent of the federal standards. The much more stringent state 24-hour PM10 standard (50 µg/m3) was exceeded in all but two of the 21 monitoring stations. The maximum annual average PM10 concentration of 57.4 µg/m3 was recorded in Metropolitan Riverside County. The maximum annual average PM10 concentration in Metropolitan Riverside County is 478 percent of the state standard. The federal annual PM10 standard has been revoked.

In 2008, PM2.5 concentrations were monitored at 20 locations throughout the District. USEPA revised the federal 24-hour PM2.5 standard from 65 µg/m3 to 35 µg/m3, effective December 17, 2006. In 2008, the maximum PM2.5 concentrations in the Basin exceeded the new federal 24-hour PM2.5 standards in all but three locations. The maximum 24-hour PM2.5 concentration of 78.3 µg/m3 was recorded in Central Los Angeles, which represents 138 percent of the federal standard of 35 µg/m3. The maximum annual average concentration of 18.2 µg/m3 was recorded in Mira Loma, which represents 121 percent of the federal standard of 15 µg/m3 and 151 percent of the state standard of 12 µg/m3.

Similar to PM10 concentrations, PM2.5 concentrations were higher in the inland valley areas of San Bernardino and Metropolitan Riverside counties. However, PM2.5 concentrations were also high in Central Los Angeles County. The high PM2.5 concentrations in Los Angeles County are mainly due to the secondary formation of smaller particulates resulting from mobile and stationary source activities. In contrast to PM10, PM2.5 concentrations were low in the Coachella Valley area of SSAB. PM10 concentrations are normally higher in the desert areas due to windblown and fugitive dust emissions.

Lead

Lead in the atmosphere is present as a mixture of a number of lead compounds. Leaded gasoline and lead smelters have been the main sources of lead emitted into the air. Due to the phasing out

of leaded gasoline, there was a dramatic reduction in atmospheric lead in the Basin over the past 28 years.

Fetuses, infants, and children are more sensitive than others to the adverse effects of lead exposure. Exposure to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased lead levels are associated with increased blood pressure.

Lead poisoning can cause anemia, lethargy, seizures, and death. It appears that there are no direct effects of lead on the respiratory system. Lead can be stored in the bone from early-age environmental exposure, and elevated blood lead levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland), and osteoporosis (breakdown of bony tissue). Fetuses and breast-fed babies can be exposed to higher levels of lead because of previous environmental lead exposure of their mothers.

The federal and state standards for lead were not exceeded in any area of the SCAQMD in 2008. There have been no violations of the standards at the SCAQMD's regular air monitoring stations since 1982, as a result of removal of lead from gasoline. The maximum quarterly average lead concentration (0.02 $\mu g/m^3$ at monitoring stations in Central Los Angeles, South San Gabriel Valley, South Central Los Angeles County, and Central San Bernardino Valley No. 2) was 1.3 percent of the federal quarterly average lead standard (1.5 $\mu g/m^3$). The maximum monthly average lead concentration (0.03 $\mu g/m^3$ in South Central Los Angeles County), measured at special monitoring sites immediately adjacent to stationary sources of lead was two percent of the state monthly average lead standard. No lead data were obtained at SSAB and Orange County stations in 2008, and because historical lead data showed concentrations in SSAB and Orange County areas to be well below the standard, measurements have been discontinued.

On November 12, 2008, USEPA published new national ambient air quality standards for lead, which became effective January 12, 2009. The existing national lead standard, 1.5 $\mu g/m^3$, was reduced to 0.15 $\mu g/m^3$, averaged over a rolling three-month period. The new federal standard was not exceeded at any source/receptor location in 2008. Nevertheless, USEPA has proposed to designate the Los Angeles County portion of the Basin as non-attainment for the new lead standard, based on emissions from two battery recycling facilities. The proposed designation is expected to become final in October 2010. However, the SCAQMD is in the process of adopting Proposed Rule 1420.1 to ensure that lead emissions do not exceed the new federal standard.

Sulfates

Sulfates (SOx) are chemical compounds which contain the sulfate ion and are part of the mixture of solid materials which make up PM10. Most of the sulfates in the atmosphere are produced by oxidation of SO2. Oxidation of sulfur dioxide yields sulfur trioxide (SO3) which reacts with water to form sulfuric acid, which contributes to acid deposition. The reaction of sulfuric acid with basic substances such as ammonia yields sulfates, a component of PM10 and PM2.5.

Most of the health effects associated with fine particles and SO2 at ambient levels are also associated with SOx. Thus, both mortality and morbidity effects have been observed with an increase in ambient SOx concentrations. However, efforts to separate the effects of SOx from the effects of other pollutants have generally not been successful.

Clinical studies of asthmatics exposed to sulfuric acid suggest that adolescent asthmatics are possibly a subgroup susceptible to acid aerosol exposure. Animal studies suggest that acidic particles such as sulfuric acid aerosol and ammonium bisulfate are more toxic than non-acidic particles like ammonium sulfate. Whether the effects are attributable to acidity or to particles remains unresolved.

In 2008, the state 24-hour sulfate standard (25 $\mu g/m^3$) was not exceeded in any of the monitoring locations in the Basin. No sulfate data were obtained at SSAB and Orange County stations in 2008. Historical sulfate data showed concentrations in the SSAB and Orange County areas to be well below the standard; thus, measurements in these areas have been discontinued. There are no federal sulfate standards.

Visibility Reducing Particles

Since deterioration of visibility is one of the most obvious manifestations of air pollution and plays a major role in the public's perception of air quality, the state of California has adopted a standard for visibility or visual range. Until 1989, the standard was based on visibility estimates made by human observers. The standard was changed to require measurement of visual range using instruments that measure light scattering and absorption by suspended particles.

The visibility standard is based on the distance that atmospheric conditions allow a person to see at a given time and location. Visibility reduction from air pollution is often due to the presence of sulfur and nitrogen oxides, as well as particulate matter. Visibility degradation occurs when visibility reducing particles are produced in sufficient amounts such that the extinction coefficient is greater than 0.23 inverse kilometers (to reduce the visual range to less than 10 miles) at relative humidity less than 70 percent, 8-hour average (10am - 6pm) according to the state standard. Future-year visibility in the Basin is projected empirically using the results derived from a regression analysis of visibility with air quality measurements. The regression data set consisted of aerosol composition data collected during a special monitoring program conducted concurrently with visibility data collection (prevailing visibility observations from airports and visibility measurements from District monitoring stations). A full description of the visibility analysis is given in Technical Report V-C of the 1994 AQMP.

With future year reductions of PM2.5 from implementation of all proposed emission controls for 2015, the annual average visibility would improve from 12 miles (calculated for 2005) to over 20 miles at Rubidoux, for example. Visual range in 2021 at all other Basin sites is expected to equal or exceed the Rubidoux visual range. Visual range is expected to double from the 2005 baseline due to reductions of secondary PM2.5, directly emitted PM2.5 (including diesel soot) and lower nitrogen dioxide concentrations as a result of 2007 AQMP controls.

Vinyl Chloride

Vinyl chloride is a colorless compound that is highly toxic and a known carcinogen that causes a rare cancer of the liver (USEPA, 2001). At room temperature, vinyl chloride is a gas with a sickly sweet odor that is easily condensed. However, it is stored as a liquid. Due to the hazardous nature of vinyl chloride to human health there are no end products that use vinyl chloride in its monomer form. Vinyl chloride is a chemical intermediate, not a final product. It is an important industrial chemical chiefly used to produce polymer polyvinyl chloride (PVC). The process involves vinyl chloride liquid fed to polymerization reactors where it is converted from a monomer to a polymer PVC. The final product of the polymerization process is PVC in either a flake or pellet form. Billions of pounds of PVC are sold on the global market each year. From its flake or pellet form PVC is sold to companies that heat and mold the PVC into end products such

as PVC pipe and bottles. The SCAQMD does not monitor for vinyl chloride at their air monitoring stations.

Volatile Organic Compounds

It should be noted that there are no state or national ambient air quality standards for VOCs because they are not classified as criteria pollutants. VOCs are regulated, however, because limiting VOC emissions reduces the rate of photochemical reactions that contribute to the formation of ozone. VOCs are also transformed into organic aerosols in the atmosphere, contributing to higher PM10 and lower visibility levels.

Although health-based standards have not been established for VOCs, health effects can occur from exposures to high concentrations of VOCs because of interference with oxygen uptake. In general, ambient VOC concentrations in the atmosphere are suspected to cause coughing, sneezing, headaches, weakness, laryngitis, and bronchitis, even at low concentrations. Some hydrocarbon components classified as VOC emissions are thought or known to be hazardous. Benzene, for example, one hydrocarbon component of VOC emissions, is known to be a human carcinogen.

Non-Criteria Pollutants

Although the SCAQMD's primary mandate is attaining the State and National Ambient Air Quality Standards for criteria pollutants within the District, SCAQMD also has a general responsibility pursuant to HSC §41700 to control emissions of air contaminants and prevent endangerment to public health. Additionally, state law requires the SCAQMD to implement airborne toxic control measures (ATCM) adopted by CARB, and to implement the Air Toxics "Hot Spots" Act. As a result, the SCAQMD has regulated pollutants other than criteria pollutants such as TACs, greenhouse gases and stratospheric ozone depleting compounds. The SCAQMD has developed a number of rules to control non-criteria pollutants from both new and existing sources. These rules originated through state directives, CAA requirements, or the SCAQMD rulemaking process.

In addition to promulgating non-criteria pollutant rules, the SCAQMD has been evaluating AQMP control measures as well as existing rules to determine whether or not they would affect, either positively or negatively, emissions of non-criteria pollutants. For example, rules in which VOC components of coating materials are replaced by a non-photochemically reactive chlorinated substance would reduce the impacts resulting from ozone formation, but could increase emissions of toxic compounds or other substances that may have adverse impacts on human health.

The following sections summarize the existing setting for the two major categories of non-criteria pollutants: compounds that contribute to ozone depletion and global warming, and TACs.

Greenhouse Gases

The SCAQMD adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to the AQMP. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include the following directives:

- phase out the use and corresponding emissions of chlorofluorocarbons (CFCs), methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995;

- phase out the large quantity use and corresponding emissions of hydrochlorofluorocarbons (HCFCs) by the year 2000;
- develop recycling regulations for HCFCs;
- develop an emissions inventory and control strategy for methyl bromide; and,
- support the adoption of a California greenhouse gas emission reduction goal.

Gases that trap heat in the atmosphere are often called greenhouse gases (GHGs), comparable to a greenhouse, which captures and traps radiant energy. GHGs are emitted by natural processes and human activities. The accumulation of greenhouse gases in the atmosphere regulates the earth's temperature. Global warming is the observed increase in average temperature of the earth's surface and atmosphere. The primary cause of global warming is an increase of GHGs in the atmosphere. The six major GHGs are carbon dioxide (CO2), methane (CH4), nitrous oxide (N2O), sulfur hexafluoride (SF6), hydrofluorocarbons (HFCs), and perfluorocarbon (PFCs). The GHGs absorb longwave radiant energy emitted by the Earth, which warms the atmosphere. The GHGs also emit longwave radiation both upward to space and back down toward the surface of the Earth. The downward part of this longwave radiation emitted by the atmosphere is known as the "greenhouse effect." Emissions from human activities such as electricity production and vehicles have elevated the concentration of these gases in the atmosphere.

CO2 is an odorless, colorless natural greenhouse gas. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic (human caused) sources of CO2 are from burning coal, oil, natural gas, and wood. CO2 emissions in the Basin were determined for the year 2002, which was the base year used in determining GHG emissions for the 2007 AQMP. The total CO2 emissions in the SCAB were estimated to be about 153 million metric tons (SCAQMD, 2007 AQMP) of which:

- 48 percent was contributed by on-road mobile sources;
- 34 percent was contributed by point sources;
- 12 percent was contributed by area sources; and
- 6 percent was contributed off-road mobile sources.

CH4 is a flammable gas and is the main component of natural gas. N2O, also known as laughing gas, is a colorless greenhouse gas. Some industrial processes such as fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions also contribute to the atmospheric load of N2O. HFCs are synthetic man-made chemicals that are used as a substitute for chlorofluorocarbons (whose production was stopped as required by the Montreal Protocol) for automobile air conditioners and refrigerants. The two main sources of PFCs are primary aluminum production and semiconductor manufacture. SF6 is an inorganic, odorless, colorless, nontoxic, nonflammable gas. SF6 is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

Scientific consensus, as reflected in recent reports issued by the United Nations Intergovernmental Panel on Climate Change, is that the majority of the observed warming over the last 50 years can be attributable to increased concentration of GHGs in the atmosphere due to human activities. Industrial activities, particularly increased consumption of fossil fuels (e.g., gasoline, diesel, wood, coal, etc.), have heavily contributed to the increase in atmospheric levels of GHGs. As reported by the California Energy Commission (CEC), California contributes 1.4 percent of the global and 6.2 percent of the national GHGs emissions (CEC, 2006). The most

recent GHG inventory for California is presented in Table 3-5 (CARB, 2007). Approximately 80 percent of GHGs in California are from fossil fuel combustion and over 70 percent of GHG-CO2 equivalent emissions are CO2 emissions (see Table 3-5).

Table 3-5
California GHG Emissions and Sinks Summary
(Million MTCO2eq)

Categories Included in the Inventory	1990	2004
ENERGY	**386.41**	**420.91**
Fuel Combustion Activities	**381.16**	**416.29**
Energy Industries	157.33	166.43
Manufacturing Industries & Construction	24.24	19.45
Transport	150.02	181.95
Other Sectors	48.19	46.29
Non-Specified	1.38	2.16
Fugitive Emissions from Fuels	**5.25**	**4.62**
Oil and Natural Gas	2.94	2.54
Other Emissions from Energy Production	2.31	2.07
INDUSTRIAL PROCESSES & PRODUCT USE	**18.34**	**30.78**
Mineral Industry	4.85	5.90
Chemical Industry	2.34	1.32
Non-Energy Products from Fuels & Solvent Use	2.29	1.37
Electronics Industry	0.59	0.88
Product Uses as Substitutes for Ozone Depleting Substances	0.04	13.97
Other Product Manufacture & Use Other	3.18	1.60
Other	5.05	5.74
AGRICULTURE, FORESTRY, & OTHER LAND USE	**19.11**	**23.28**
Livestock	11.67	13.92
Land	0.19	0.19
Aggregate Sources & Non-CO_2 Emissions Sources on Land	7.26	9.17
WASTE	**9.42**	**9.44**
Solid Waste Disposal	6.26	5.62
Wastewater Treatment & Discharge	3.17	3.82
EMISSION SUMMARY		
Gross California Emissions	**433.29**	**484.4**
Sinks and Sequestrations	**-6.69**	**-4.66**
Net California Emissions	**426.60**	**479.74**

Source: CARB, 2007

In June 2005, Governor Schwarzenegger signed Executive Order #S-3-05 which established the following greenhouse gas reduction targets:

- By 2010, reduce GHGs to 2000 emission levels,
- By 2020, reduce GHGs to 1990 emission levels, and
- By 2050, reduce GHGs to 80 percent below 1990 emission levels.

On September 27, 2006, Assembly Bill (AB) 32, the California Global Warming Solutions Act, of 2006 was enacted by the State of California and signed by Governor Schwarzenegger. AB 32 expanded on Executive Order #S-3-05. The legislature stated that "global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment

of California." AB 32 represents the first enforceable state-wide program in the United States to cap all GHG emissions from major industries that includes penalties for non-compliance. While acknowledging that national and international actions will be necessary to fully address the issue of global warming, AB 32 lays out a program to inventory and reduce greenhouse gas emissions in California and from power generation facilities located outside the state that serve California residents and businesses.

AB 32 requires CARB to:

- Establish a statewide GHG emissions cap for 2020, based on 1990 emissions by January 1, 2008;
- Adopt mandatory reporting rules for significant sources of GHG by January 1, 2008;
- Adopt an emissions reduction plan by January 1, 2009, indicating how emissions reductions will be achieved via regulations, market mechanisms, and other actions; and
- Adopt regulations to achieve the maximum technologically feasible and cost-effective reductions of GHG by January 1, 2011.

The combination of Executive Order #S-3-05 and AB 32 will require significant development and implementation of energy efficient technologies and shifting of energy production to renewable sources.

Consistent with the requirement to develop an emission reduction plan, CARB prepared a Scoping Plan indicating how GHG emission reductions will be achieved through regulations, market mechanisms, and other actions. The Scoping Plan was released for public review and comment in October 2008 and approved by CARB on December 11, 2008. The Scoping Plan calls for reducing greenhouse gas emissions to 1990 levels by 2020. This means cutting approximately 30 percent from business-as-usual (BAU) emission levels projected for 2020, or about 15 percent from today's levels. Key elements of CARB staff's recommendations for reducing California's greenhouse gas emissions to 1990 levels by 2020 contained in the Scoping Plan include the following:

- Expansion and strengthening of existing energy efficiency programs and building and appliance standards;
- Expansion of the Renewables Portfolio Standard to 33 percent;
- Development of a California cap-and-trade program that links with other Western Climate Initiative (WCI) Partner programs to create a regional market system;
- Establishing targets for transportation-related greenhouse gases and pursuing policies and incentives to achieve those targets;
- Adoption and implementation of existing State laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard; and
- Targeted fees, including a public good charge on water use, fees on high global warming potential (GWP) gases and a fee to fund the state's long-term commitment to AB 32 administration.

In response to the comments received on the Draft Scoping Plan and at the November 2008 public hearing, CARB made a few changes to the Draft Scoping Plan, primarily to:

- State that California "will transition to 100 percent auction" of allowances and expects to "auction significantly more [allowances] than the Western Climate Initiative minimum;"
- Make clear that allowance set-asides could be used to provide incentives for voluntary renewable power purchases by businesses and individuals and for increased energy efficiency;

- Make clear that allowance set-asides can be used to ensure that voluntary actions, such as renewable power purchases, can be used to reduce greenhouse gas emissions under the cap;
- Provide allowances are not required from carbon neutral projects; and
- Mandate that commercial recycling be implemented to replace virgin raw materials with recyclables.

On August 24, 2007, Governor Schwarzenegger signed into law Senate Bill (SB) 97 – CEQA: Greenhouse Gas Emissions stating, "This bill advances a coordinated policy for reducing greenhouse gas emissions by directing the Office of Planning and Research (OPR) and the Resources Agency to develop CEQA guidelines on how state and local agencies should analyze, and when necessary, mitigate greenhouse gas emissions." Specifically, SB 97 requires OPR, by July 1, 2009, to prepare, develop, and transmit guidelines to the Resources Agency for the feasible mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions, as required by CEQA, including, but not limited to, effects associated with transportation or energy consumption. The Resources Agency would be required to certify and adopt those guidelines by January 1, 2010. The OPR would be required to periodically update the guidelines to incorporate new information or criteria established by the CARB pursuant to the California Global Warming Solutions Act of 2006. SB 97 also identifies a limited number of types of projects that would be exempt under CEQA from analyzing GHG emissions. Finally, SB 97 will be repealed on January 1, 2010.

Consistent with SB 97, on June 19, 2008, OPR released its "Technical Advisory on CEQA and Climate Change," which was developed in cooperation with the Resources Agency, the California Environmental Protection Agency (CalEPA), and the CARB. According to OPR, the "Technical Advisory" offers the informal interim guidance regarding the steps lead agencies should take to address climate change in their CEQA documents, until CEQA guidelines are developed pursuant to SB 97 on how state and local agencies should analyze, and when necessary, mitigate greenhouse gas emissions.

According to OPR, lead agencies should determine whether greenhouse gases may be generated by a proposed project, and if so, quantify or estimate the GHG emissions by type and source. Second, the lead agency must assess whether those emissions are individually or cumulatively significant. When assessing whether a project's effects on climate change are "cumulatively considerable" even though its GHG contribution may be individually limited, the lead agency must consider the impact of the project when viewed in connection with the effects of past, current, and probable future projects. Finally, if the lead agency determines that the GHG emissions from the project as proposed are potentially significant, it must investigate and implement ways to avoid, reduce, or otherwise mitigate the impacts of those emissions.

On July 30, 2008, USEPA released a draft Advance Notice of Proposed Rulemaking (ANPR) "Regulating Greenhouse Gas Emissions Under the Clean Air Act." The ANPR solicits public comments, which must be received on or before November 28, 2008, and presents the following relevant information:

- Reviews the various CAA provisions that may be applicable to regulate GHGs;
- Examines the issues that regulating GHGs under those provisions may raise;
- Provides information regarding potential regulatory approaches and technologies for reducing GHG emissions; and

- Raises issues relevant to possible legislation and the potential for overlap between legislation and CAA regulation.

The SCAQMD has established a policy, adopted by the SCAQMD Governing Board at its September 5, 2008 meeting, to actively seek opportunities to reduce emissions of criteria, toxic, and climate change pollutants. The policy includes the intent to assist businesses and local governments implementing climate change measures, decrease the agency's carbon footprint, and provide climate change information to the public. The SCAQMD will take the following actions:

1. Work cooperatively with other agencies/entities to develop quantification protocols, rules, and programs related to greenhouse gases;
2. Share experiences and lessons learned relative to the Regional Clean Air Incentives Market (RECLAIM) to help inform state, multi-state, and federal development of effective, enforceable cap-and-trade programs. To the extent practicable, staff will actively engage in current and future regulatory development to ensure that early actions taken by local businesses to reduce greenhouse gases will be treated fairly and equitably. SCAQMD staff will seek to streamline administrative procedures to the extent feasible to facilitate the implementation of AB 32 measures;
3. Review and comment on proposed legislation related to climate change and greenhouse gases, pursuant to the 'Guiding Principles for SCAQMD Staff Comments on Legislation Relating to Climate Change' approved at the Board Special Meeting in April 2008;
4. Provide higher priority to funding Technology Advancement Office (TAO) projects or contracts that also reduce greenhouse gas emissions;
5. Develop recommendations through a public process for an interim greenhouse gas CEQA significance threshold, until such time that an applicable and appropriate statewide greenhouse gas significance level is established. Provide guidance on analyzing greenhouse gas emissions and identify mitigation measures. Continue to consider GHG impacts and mitigation in SCAQMD lead agency documents and in comments when SCAQMD is a responsible agency;
6. Revise the SCAQMD's Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning to include information on greenhouse gas strategies as a resource for local governments. The Guidance Document will be consistent with state guidance, including CARB's Scoping Plan;
7. Update the Basin's greenhouse gas inventory in conjunction with each Air Quality Management Plan. Information and data used will be determined in consultation with CARB, to ensure consistency with state programs. Staff will also assist local governments in developing greenhouse gas inventories;
8. Bring recommendations to the Board on how the agency can reduce its own carbon footprint, including drafting a Green Building Policy with recommendations regarding SCAQMD purchases, building maintenance, and other areas of products and services. Assess employee travel as well as other activities that are not part of a GHG inventory and determine what greenhouse gas emissions these activities represent, how they could be reduced, and what it would cost to offset the emissions;
9. Provide educational materials concerning climate change and available actions to reduce greenhouse gas emissions on the SCAQMD website, in brochures, and other venues to help cities and counties, businesses, households, schools, and others learn about ways to reduce their electricity and water use through conservation or other

efforts, improve energy efficiency, reduce vehicle miles traveled, access alternative mobility resources, utilize low emission vehicles and implement other climate friendly strategies; and

10. Conduct conferences, or include topics in other conferences, as appropriate, related to various aspects of climate change, including understanding impacts, technology advancement, public education, and other emerging aspects of climate change science.

On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for projects where the SCAQMD is lead agency. SCAQMD's recommended interim GHG significance threshold proposal uses a tiered approach to determining significance. Tier 1 consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA. Tier 2 consists of determining whether or not the project is consistent with a GHG reduction plan that may be part of a local general plan, for example. Tier 3 establishes a screening significance threshold level to determine significance using a 90 percent emission capture rate approach, which corresponds to 10,000 metric tons of CO2 equivalent emissions per year (MTCO2eq/yr). Tier 4, to be based on performance standards, is yet to be developed. Under Tier 5 the project proponent would allow offsets to reduce GHG emission impacts to less than the proposed screening level. If CARB adopts statewide significance thresholds, SCAQMD staff plans to report back to the Governing Board regarding any recommended changes or additions to the SCAQMD's interim threshold.

On April 13, 2009, OPR submitted to the Natural Resources Agency its proposed amendments to the CEQA Guidelines for GHG emissions. The proposed amendments provided guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in draft CEQA documents. The Natural Resources Agency conducted a formal rulemaking process and on December 20, 2009, they adopted amendments to the CEQA Guidelines for GHG emissions as directed by SB97. On February 16, 2010, the Office of Administrative Law approved the amendments, and filed them with the Secretary of State for inclusion in the California Code of Regulations (CCR). The amendments became effective on March 18, 2010.

Climate Change

Global climate change is a change in the average weather of the earth, which can be measured by wind patterns, storms, precipitation, and temperature. Historical records have shown that temperature changes have occurred in the past, such as during previous ice ages. Some data indicate that the current temperature record differs from previous climate changes in rate and magnitude.

The United Nations Intergovernmental Panel on Climate Change constructed several emission trajectories of greenhouse gases needed to stabilize global temperatures and climate change impacts. It concluded that a stabilization of greenhouse gases at 400 to 450 ppm carbon dioxide-equivalent concentration is required to keep global mean warming below two degrees Celsius, which is assumed to be necessary to avoid dangerous climate change.

The potential health effects from global climate change may arise from temperature increases, climate-sensitive diseases, extreme events, and air quality. There may be direct temperature effects through increases in average temperature leading to more extreme heat waves and less extreme cold spells. Those living in warmer climates are likely to experience more stress and heat-related problems (i.e., heat rash and heat stroke). In addition, climate sensitive diseases may increase, such as those spread by mosquitoes and other disease carrying insects. Those diseases include malaria, dengue fever, yellow fever, and encephalitis. Extreme events such as flooding

and hurricanes can displace people and agriculture, which would have negative consequences. Drought in some areas may increase, which would decrease water and food availability. Global warming may also contribute to air quality problems from increased frequency of smog and particulate air pollution.

The impacts of climate change will also affect projects in various ways. Effects of climate change are specifically mentioned in AB 32 such as rising sea levels and changes in snow pack. The extent of climate change impacts at specific locations remains unclear. However, it is expected that California agencies will more precisely quantify impacts in various regions of the State. As an example, it is expected that the DWR will formalize a list of foreseeable water quality issues associated with various degrees of climate change. Once state government agencies make these lists available, they could be used to more precisely determine to what extent a project creates global climate change impacts.

Toxic Air Contaminants

On March 17, 2000, the SCAQMD Governing Board approved "An Air Toxics Control Plan for the Next Ten Years." The Air Toxics Control Plan identifies potential strategies to reduce toxic levels in the Basin over the ten years following adoption. To the extent the strategies are implemented by the relevant agencies, the plan will improve public health by reducing health risks associated with both mobile and stationary sources. Exposure to toxic air contaminants (TACs) can increase the risk of contracting cancer or result in other deleterious health effects which target such systems as cardiovascular, reproductive, hematological, or nervous. The health effects may be through short-term, high-level or "acute" exposure or long-term, low-level or "chronic" exposure.

Historically, the SCAQMD has regulated criteria air pollutants using either a technology-based or an emissions limit approach. The technology-based approach defines specific control technologies that may be installed to reduce pollutant emissions. The emission limit approach establishes an emission limit, and allows industry to use any emission control equipment, as long as the emission requirements are met. The regulation of toxic air contaminants (TACs) often uses a health risk-based approach, but may also require a regulatory approach similar to criteria pollutants, as explained in the following subsections.

Control of TACs Under the TAC Identification and Control Program

California's TAC identification and control program, adopted in 1983 as AB1807, is a two-step program in which substances are identified as TACs, and ATCMs are adopted to control emissions from specific sources. CARB has adopted a regulation designating all 188 federal hazardous air pollutants (HAPs) as TACs.

ATCMs are developed by CARB and implemented by the SCAQMD and other air districts through the adoption of regulations of equal or greater stringency. Generally, the ATCMs reduce emissions to achieve exposure levels below a determined health threshold. If no such threshold levels are determined, emissions are reduced to the lowest level achievable through the best available control technology unless it is determined that an alternative level of emission reduction is adequate to protect public health.

Under California law, a federal National Emission Standard for Hazardous Air Pollutants (NESHAP) automatically becomes a state ATCM, unless CARB has already adopted an ATCM for the source category. Once a NESHAP becomes an ATCM, CARB and each air pollution

control or air quality management district have certain responsibilities related to adoption or implementation and enforcement of the NESHAP/ATCM.

Control of TACs Under the Air Toxics "Hot Spots" Act

The Air Toxics Hot Spots Information and Assessment Act of 1987 (AB2588) establishes a state-wide program to inventory and assess the risks from facilities that emit TACs and to notify the public about significant health risks associated with the emissions. Facilities are phased into the AB2588 program based on their emissions of criteria pollutants or their occurrence on lists of toxic emitters compiled by the SCAQMD. Phase I consists of facilities that emit over 25 tons per year of any criteria pollutant and facilities present on the SCAQMD's toxics list. Phase I facilities entered the program by reporting their air TAC emissions for calendar year 1989. Phase II consists of facilities that emit between 10 and 25 tons per year of any criteria pollutant, and submitted air toxic inventory reports for calendar year 1990 emissions. Phase III consists of certain designated types of facilities which emit less than 10 tons per year of any criteria pollutant, and submitted inventory reports for calendar year 1991 emissions. Inventory reports are required to be updated every four years under the state law.

In October 1992, the SCAQMD Governing Board adopted public notification procedures for Phase I and II facilities. These procedures specify that AB2588 facilities must provide public notice when exceeding the following risk levels:

- Maximum Individual Cancer Risk: greater than 10 in 1 million (10×10^{-6})
- Total Hazard Index: greater than 1.0 for TACs except lead, or > 0.5 for lead

Public notice is to be provided by letters mailed to all addresses and all parents of children attending school in the impacted area. In addition, facilities must hold a public meeting and provide copies of the facility risk assessment in all school libraries and a public library in the impacted area.

The SCAQMD continues to complete its review of the health risk assessments submitted to date and may require revision and resubmission as appropriate before final approval. Notification will be required from facilities with a significant risk under the AB2588 program based on their initial approved health risk assessments and will continue on an ongoing basis as additional and subsequent health risk assessments are reviewed and approved.

Control of TACs With Risk Reduction Audits and Plans

Senate Bill (SB) 1731, enacted in 1992 and codified at HSC §44390 et seq., amended AB2588 to include a requirement for facilities with significant risks to prepare and implement a risk reduction plan which will reduce the risk below a defined significant risk level within specified time limits. SCAQMD Rule 1402 - Control of Toxic Air Contaminants From Existing Sources, was adopted on April 8, 1994, to implement the requirements of SB 1731.

In addition to the TAC rules adopted by SCAQMD under authority of AB 1807 and SB 1731, the SCAQMD has adopted source-specific TAC rules, based on the specific level of TAC emitted and the needs of the area. These rules are similar to the state's ATCMs because they are source-specific and only address emissions and risk from specific compounds and operations.

Cancer Risks from Toxic Air Contaminants

New and modified sources of toxic air contaminants in the District are subject to Rule 1401 - New Source Review of Toxic Air Contaminants and Rule 212 - Standards for Approving Permits. Rule 212 requires notification of the SCAQMD's intent to grant a permit to construct a significant project, defined as a new or modified permit unit located within 1000 feet of a school (a state law requirement under AB 3205), a new or modified permit unit posing an maximum individual cancer risk of one in one million (1×10^{-6}) or greater, or a new or modified facility with criteria pollutant emissions exceeding specified daily maximums. Distribution of notice is required to all addresses within a 1/4-mile radius, or other area deemed appropriate by the SCAQMD. Rule 1401 currently controls emissions of carcinogenic and non-carcinogenic (health effects other than cancer) air contaminants from new, modified and relocated sources by specifying limits on cancer risk and hazard index (explained further in the following discussion), respectively.

Health Effects

One of the primary health risks of concern due to exposure to TACs is the risk of contracting cancer. The carcinogenic potential of TACs is a particular public health concern because it is currently believed by many scientists that there is no "safe" level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of causing cancer. It is currently estimated that about one in four deaths in the United States is attributable to cancer. About two percent of cancer deaths in the United States may be attributable to environmental pollution (Doll and Peto 1981). The proportion of cancer deaths attributable to air pollution has not been estimated using epidemiological methods.

Non-Cancer Health Risks from Toxic Air Contaminants

Unlike carcinogens, for most TAC non-carcinogens it is believed that there is a threshold level of exposure to the compound below which it will not pose a health risk. CalEPA's Office of Environmental Health Hazard Assessment (OEHA) develops Reference Exposure Levels (RELs) for TACs which are health-conservative estimates of the levels of exposure at or below which health effects are not expected. The non-cancer health risk due to exposure to a TAC is assessed by comparing the estimated level of exposure to the REL. The comparison is expressed as the ratio of the estimated exposure level to the REL, called the hazard index (HI).

Baseline Emission Inventory

The SOx RECLAIM program started in 1993 with 41 facilities but by the end of the 2005 compliance year, participation in the program dropped to 33 facilities. The reduction in the number of facilities participating in the RECLAIM program since inception has been primarily due to facility shutdowns.

Under the SOx RECLAIM program, the RECLAIM facilities were issued annual allocations of SOx emissions (also known as facility caps), which declined annually from 1993 until 2003 and remained constant after 2003. In 2005, the top 11 SOx RECLAIM facilities reported approximately 7.5 tons of SOx emissions per day; 95 percent of these emissions were generated by the top 11 facilities belonging to the following seven source categories.

- Fluid catalytic cracking units (FCCUs);
- Sulfur recovery and tail gas treatment units (SRU/TGUs);
- Boilers and heaters using refinery gas;
- Sulfuric acid manufacturing plants;
- Container glass melting furnace;

- Petroleum coke calciner;
- Cement kilns and a coal steam boiler at a cement manufacturing facility.

These facilities were issued an overall allocation of approximately 9.82 tons per day for the 2000 compliance year and 6.41 tons per day for the 2003 compliance year as shown in Table 3-6.

Table 3-6
SOx RECLAIM Allocations and Reported Emissions for Top Seven Source Categories

Source Category	SOx RECLAIM Allocations (tons/day)		SOx Reported Emissions (tons/day)
	Compliance Year 2000	Compliance Year 2003	Compliance Year 2005
FCCUs	2.17	1.42	3.55
Refinery Boilers/Heaters	0.89 [1]	0.58 [1]	0.91 [2]
SRU/TGUs	1.61	1.05	0.96
Sulfuric Acid Manufacturing	2.53	1.65	1.16
Container Glass Manufacturing	1.01	0.66	0.32
Petroleum Coke Calciner	1.28	0.84	0.35
Portland Cement Manufacturing	0.33	0.22	0.27
Total	**9.82**	**6.41**	**7.53**

[1] Represents the emissions from all boilers and heaters operated at all of the refineries.
[2] Represents the top seven emitters at all of the refineries.

ENERGY

This section provides an overview of energy in the District. A more detailed discussion of current and projected future energy profile in the District can be found in the Final Program EIR for the 2007 AQMP (Chapter 3).

Statewide Energy Trends

Figure 3-1 shows California's major sources of energy (electricity data for 2008, natural gas data for 2007, and crude oil data for 2008)[27].

[27] http://www.energyalmanac.ca.gov/overview/energy_sources.html (Last updated April 7, 2009).

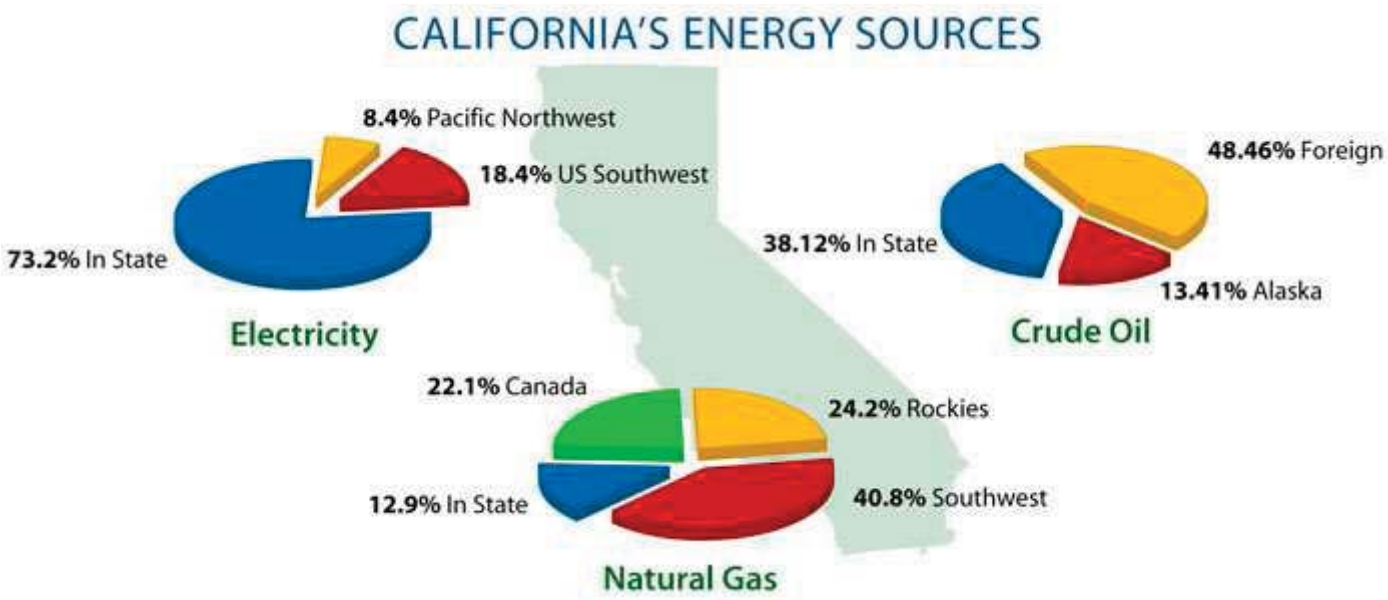

Figure 3-1

In 2008, 38.12 percent of the crude oil came from in-state, with 13.41 percent coming from Alaska, and 48.46 percent being supplied by foreign sources. Also in 2008, 73.2 percent of the electricity came from in-state sources, while 26.8 percent was imported into the state. The total electricity imported in 2008 was 306,577 gWh, with 23,945 gWh coming from the Pacific Northwest and 74,113 gWh from the Southwest (CEC, 2009)[28]. (Note: One gW is equal to one million kW). For natural gas in 2007, 40.8 percent came from the Southwest, 22.1 percent from Canada, 12.9 percent from in-state, and 24.2 percent from the Rockies (CEC, 2008).

Electricity

Power plants in California provided approximately 73.2 percent of the in-state electricity demand in 2008. Hydroelectric power from the Pacific Northwest provides another 8.4 percent, and power plants in the Southwestern United States provide another 18.4 percent. The relative contribution of in-state and out-of-state power plants depends upon, among other factors, the precipitation that occurred in the previous year and the corresponding amount of hydroelectric power that is available. Two of the largest power plants in California are located in southern California: Alamitos and Redondo Beach. Both of these plants consume natural gas to produce electricity. San Onofre, the state's largest power plant in terms of net capability, is nuclear powered and is located in San Diego County. In addition, in Southern California, a significant percentage of our imported power comes from plants that are generally coal-fired facilities.

Local electricity distribution service is provided to customers within southern California by one of two privately owned utilities – either Southern California Edison (SCE) or San Diego-based Sempra Energy – or by a publicly-owned utility, such as the LADWP.

SCE is the largest electricity utility in southern California with a service area that covers all or nearly all of Orange, San Bernardino, and Ventura counties, and most of Los Angeles and Riverside counties. SCE provides approximately 70 percent of the total electricity demand in southern California. SCE currently supplies electricity to six of the seven refineries affected by the proposed project and supplies more than 101,000 gWh per year of electricity to all of its

[28] http://www.energy.ca.gov/2009publications/CEC-200-2009-010/CEC-200-2009-010.PDF

customers. SCE expects that they will be able to annually increase its output and has made projections that over 121,000 megawatts (MW) will be available in 2012 (CEC, 2002).

The LADWP is the largest of the public-owned electric utilities in southern California and provides approximately 20 percent of the total electricity demand in the District and 15,063 million kilowatt-hours (kWh) to its nonresidential customers located in Los Angeles county.[29]

Table 3-7 shows the amount of electricity delivered to residential and nonresidential entities in Los Angeles and San Bernardino Counties in 2007 (CEC, 2009)[30].

Table 3-7
Electricity Utility Deliveries for Los Angeles and San Bernardino Counties in 2007[31]

County	RESIDENTIAL Electricity Delivered (kWh)[1]	NON-RESIDENTIAL Electricity Delivered (kWh)	TOTAL Electricity Delivered (kWh)
Los Angeles	20,636	47,484	68,120
San Bernardino	4,815	9,617	14,432

[1] The kilowatt-hour (kWh) is a commonly used unit of measure for describing the amount of electricity consumed over a period of time. One kWh is equal to 1000 watts of electricity supplied in one hour.

The following discussion describes the existing electricity gas setting for each of the affected facilities (refineries, sulfuric acid manufacturing plants, petroleum coke calcining plant, container glass manufacturing plant, and a Portland cement manufacturing plant) that are potentially affected by the proposed project:

1. BP Carson Refinery

The BP Carson Refinery receives almost all of its electrical power from its existing on-site Watson Cogeneration Plant. The Watson Cogeneration Plant has a generation capacity of over 320 MW and supplies the Refinery with approximately 727,000 MW-hours (MWh) per year. BP's operators also purchase approximately 257 MWh per year from SCE[32].

2. ConocoPhillips Wilmington Refinery

Most of the electricity supplied to the ConocoPhillips Wilmington Refinery is provided by an existing onsite 50 MW cogeneration plant that currently generates 43MW. However, the LADWP supplies additional electricity as needed to handle routing electricity fluctuations[33].

3. Chevron Refinery

The Chevron Refinery currently operates a multi-train cogeneration plant (three existing cogeneration units) to supply most of the electricity and steam used by refinery processing equipment. To supplement electrical needs, approximately 20 MW of electricity is purchased from SCE. Chevron is in the process of expanding their existing cogeneration facility by an

[29] California 2001 Electric Utility Retail Deliveries, California Energy Commission, 2001.
[30] Of the 11 facilities affected by the proposed project, 10 are located in Los Angeles County and one is located in San Bernardino County.
[31] California Energy Commission, Energy Consumption Data Management System, Electricity Consumption by County, http://www.ecdms.energy.ca.gov/elecbycounty.asp
[32] SCAQMD, Final Environmental Impact Report for the Proposed BP Carson Refinery – Safety, Compliance and Optimization Project (Appendix A: NOP/IS); SCH No. 2005111057; September 2006.
[33] SCAQMD, Final Environmental Impact Report for the ConocoPhillips Los Angeles Refinery PM10 and NOx Reduction Projects; SCH No. 2006111138; April 2007.

additional 49.9 MW. The new 49.9 MW Cogen Train D includes a natural gas and refinery gas-fired turbine electric generator, a new steam-driven turbine electrical generator, feed gas compressors, knockout and surge pots, waste heat boilers (including duct burners) to generate steam, a carbon monoxide (CO) oxidation catalyst unit, and a selective catalytic reduction (SCR) unit to control NOx emissions. Expansion of the cogeneration plant will decrease the Chevron's need for offsite sources of electricity[34]. The expansion of Chevron's cogeneration facility is expected to be completed by the end of 2010.

4. ExxonMobil Refinery

ExxonMobil derives its energy needs from a SCE sub-station that was specifically built to accommodate the electrical demands of the ExxonMobil Refinery and does not either contribute to other facilities, or rely upon other facilities in the area for electrical power[35].

5. Ultramar/Valero Refinery

Electricity is supplied to the Ultramar/Valero Refinery entirely by LADWP.

6. Tesoro Refinery

Tesoro currently operates a cogeneration system that supplies a portion of electricity and steam used by the process equipment at their refinery, while supplementing onsite generation by purchasing electricity from the LADWP. However, Tesoro has plans to upgrade the Refinery's cogeneration system and steam boilers[36]. Specifically, Tesoro is proposing to replace the two 30 MW existing cogeneration units (Cogens A and B) and their associated selective catalytic reduction (SCR) Units with one new 61.02 MW cogeneration system (Cogen C) (including NOx control technology such as an SCR Unit). A new emergency IC Engine will also be installed to supply power to the instruments and auxiliary equipment in the gas turbine which will allow the boilers to continue to operate and provide sufficient steam as necessary, and while maintaining a safe shutdown and start up of the Refinery during a power outage. The new emergency IC Engine will only be constructed as part of the installation of Cogen C. The proposed new cogeneration system would increase the maximum electrical generating capacity at their refinery by about one MW while reducing NOx emissions.

Currently the existing cogeneration systems and four steam boilers (Boilers 7, 8, 9, and 10) generate steam at a total rate of 734.16 million British Thermal Units per hour (mmBtu/hr) for multiple processes at the refinery. Tesoro will replace the four existing boilers with two new boilers (Boilers 11 and 12), each with total heat input rating of no more than 400 mmBtu/hr. The new boilers will burn refinery fuel gas or natural gas and will be equipped with new SCR Units to reduce NOx emissions.

7. Rhodia Inc.

Electricity is supplied to Rhodia by SCE.

8. ConocoPhillips Carson Plant

Electricity is supplied to the ConocoPhillips Carson Plant entirely by SCE.

[36] SCAQMD, Final Environmental Impact Report for the Tesoro Reliability Improvement and Regulatory Compliance Project; SCH No. 2008021099; April 2009.

9. BP Wilmington Calciner Plant

The BP Wilmington Calciner Plant operates a cogeneration facility with a maximum electrical design capacity of 35 MW but operates at 25 MW. The BP Wilmington Calciner Plant internally uses four MW for its operations and sells 21 MW back to SCE's grid. In addition, SCE provides supplementary power, backup power, maintenance power, and/or interruptible power service to the BP Wilmington Calciner Plant if the cogeneration plant is shutdown.

10. CPCC Plant

The majority of the electricity demand is supplied to CPCC Plant by Constellation New Energy. CPCC Plant also operates a cogeneration unit that supplies approximately four MW of electricity from their waste heat boilers for use elsewhere in the plant. Peak electrical demand at CPCC Plant is approximately 22 MW.

11. Owens-Brockway Glass Container Inc.

Electricity is supplied to Owens-Brockway Glass Container by the City of Vernon.

Natural Gas

Four regions supply California with natural gas. Three of these regions, the Southwestern United States, the Rocky Mountains, and Canada, supplied 87 percent of all the natural gas consumed in California in 2007. The remainder is produced in California. In 2006, approximately 43 percent of all the natural gas consumed in California was used to generate electricity. Residential consumption represented approximately 22 percent of California's natural gas use with the balance consumed by the industrial, resource extraction, transportation, and commercial sectors.

Southern California Gas Company, a privately-owned utility company, provides natural gas service throughout the District, except for the City of Long Beach, the southern portion of Orange County, and portions of San Bernardino County. The service area for the Long Beach Gas & Electric Department, a municipal utility owned and operated by the City of Long Beach, includes the cities of Long Beach and Signal Hill, and sections of surrounding communities, including Lakewood, Bellflower, Compton, Seal Beach, Paramount, and Los Alamitos. San Diego Gas & Electric Company provides natural gas service to the southern portion of Orange County. In San Bernardino County, Southwest Gas Corporation provides natural gas service to Victorville, Big Bear, Barstow, and Needles (SCAG, 2005) (CEC, 2006a).

Table 3-8 provides the estimated use of natural gas in California by residential, commercial and industrial sectors. In 2006, about 66 percent of the natural gas consumed in California was for industrial and electric generation purposes.

Table 3-8
California Natural Gas Demand in 2006[37]
(Million Cubic Feet per Day – MMcfd)

Sector	Demand (MMcfd)
Residential	1,300
Commercial	573
Industrial	1,392
Electric Generation	2,613
Transportation	25
Net Storage/Loss	129
Total	**6,032**

The following discussion describes the existing natural gas setting for each of the affected facilities (six refineries, two sulfuric acid manufacturing plants, one petroleum coke calcining plant, one container glass manufacturing plant, and one Portland cement manufacturing plant) that are potentially affected by the proposed project:

1. BP Carson Refinery

Natural gas is supplied from BP Carson's existing utility system.

2. ConocoPhillips Wilmington Refinery

Natural gas is supplied to the ConocoPhillips Wilmington Refinery by Southern California Gas Company.

3. Chevron Refinery

Natural gas is supplied to the Chevron Refinery by the Southern California Gas Company and is used in conjunction with refinery fuel gas generated on-site at the Chevron Refinery.

4. ExxonMobil Refinery

Natural gas is supplied to the ExxonMobil Refinery by the Southern California Gas Company.

5. Ultramar/Valero Refinery

Natural gas is supplied to the Ultramar/Valero Refinery by the Southern California Gas Company.

6. Tesoro Refinery

Natural gas is supplied to the Tesoro Refinery by the Southern California Gas Company.

7. Rhodia Inc.

Natural gas is supplied to Rhodia by Coral Energy Resources. In addition, the transmission and metering of the natural gas to the Rhodia plant is provided by the Southern California Gas Company.

8. ConocoPhillips Carson Plant

Natural gas is supplied to the ConocoPhillips Carson Plant by Southern California Gas Company.

[37] CEC, http://energyalmanac.ca.gov/naturalgas/demand_by_sector.html.

9. BP Wilmington Calciner Plant

Natural gas is supplied to the BP Wilmington Calciner Plant by Southern California Gas Company.

10. CPCC Plant

Natural gas is supplied to the CPCC Plant by Occidental Petroleum.

11. Owens-Brockway Glass Container Inc.

Natural gas is supplied to the Owens-Brockway Glass Container Inc. by Shell Energy.

Table 3-9 summarizes the sources of energy for each of the affected facilities.

Table 3-9
Facility-Specific Existing Setting Summary for Energy

Facility Name	ENERGY	
	Electricity Source	**Natural Gas Source**
BP Carson Refinery	1. Self-generates 727,000 MWh/yr from BP's on-site Watson Cogeneration Plant 2. Purchases approximately 257 MWh/yr from SCE	Self-generates from BP's existing utility system
ConocoPhillips Wilmington Refinery	1. Existing onsite cogeneration plant 2. Purchases additional electricity as needed from LADWP	Southern California Gas Company
Chevron Refinery	1. Existing onsite cogeneration plant[38] 2. Purchases additional electricity as needed from SCE	1. Self-generates refinery fuel gas 2. Purchases natural gas from Southern California Gas Company
ExxonMobil Refinery	Purchases electricity from SCE sub-station that solely serves ExxonMobil	Southern California Gas Company
Ultramar/Valero Refinery	LADWP	Southern California Gas Company
Tesoro Refinery	1. Existing onsite cogeneration plant[39] 2. Purchases additional electricity as needed from LADWP	Southern California Gas Company
Rhodia Inc.	SCE	1. Coral Energy Resources for natural gas 2. Southern California Gas Company for transmission/metering
ConocoPhillips Carson Plant	SCE	Southern California Gas Company
BP Wilmington Calciner Plant	1. Self-generates 25 MW from BP's on-site cogeneration plant and sells 21 MW to SCE 2. Purchases additional electricity as needed from SCE if cogeneration unit is offline	Southern California Gas Company
CPCC	1. Self-generates 4 MW from on-site cogeneration plant for use within plant 2. Purchases additional electricity from Constellation New Energy	Occidental Petroleum
Owens-Brockway Glass Container Inc.	City of Vernon	Shell Energy

[38] Chevron is in the process of expanding their existing cogeneration facility by an additional 49.9 MW to be completed by the end of 2010. Once the project is completed, the need for purchasing additional electricity may be reduced or eliminated.

[39] Tesoro has plans to upgrade their cogeneration system and steam boilers by replacing two 30 MW existing cogeneration units (Cogens A and B) with one new 61.02 MW cogeneration system (Cogen C).

Liquid Petroleum Fuels

California is currently ranked fourth in the nation among oil producing states, behind Louisiana, Texas, and Alaska, respectively. Crude oil production in California averaged 684,912 barrels per day (bpd) in 2008[40]. Statewide oil production has declined to levels not seen since 1943. In 2008, the total receipts to refineries of roughly 656 million barrels came from in-state oil production (38.1 percent), combined with oil from Alaska (13.4 percent), and foreign sources (48.4 percent)[41]. In 2006, California ranked second in the United States in petroleum consumption[42].

A large network of crude oil pipelines connect producing areas with refineries that are located in the San Francisco Bay area, Los Angeles area and the Central Valley. Major ports in northern and southern California receive Alaska North Slope and foreign crude oil for processing in many of the state's 20 operable refineries[43].

Most gasoline and diesel fuel sold in California for on-road motor vehicles is refined in California to meet state-specific formulations required by CARB. Major petroleum refineries in California are concentrated in three counties: Contra Costa County in northern California, Kern County in central California, and Los Angeles County in southern California. In Los Angeles County, petroleum refineries are located mostly in the southern portion of the county.

In 2006, Californians used nearly 42 million gallons of gasoline and eight million gallons of diesel every day[44]. California refineries produce these fuels and other products from crude oil and blending components. Transportation fuel production in California depends on the availability and quality of the crude oils used by refineries in the state. The supply of crude oil to California refineries has changed substantially in the last 10 years. Most notably, receipts of foreign crude oil have increased as production sources from California and Alaska have continued to decline.

In the last two decades, California refineries have been running increasingly closer to capacity levels. Southern California refineries have also shown an increasing level of crude oil imports during this same period. In addition, refineries are also required to meet new diesel regulations promulgated by the USEPA and CARB. The USEPA lowered the allowable amount of sulfur in on-road diesel fuel from less than 500 ppm to less than 15 ppm. This requirement became effective in 2006. The sulfur content and American Petroleum Institute (API) gravity of crude oil input to a refinery in conjunction with the complexity of process units will affect the quantity of ultra-low sulfur diesel (ULSD) produced by a refinery. The hydrocracking and hydrotreater units are utilized to recover sulfur during the oil refining process. Recovered sulfur is converted into elemental sulfur for commercial sale. Hydrocracking units also break hydrocarbon molecules into lighter compounds in the presence of hydrogen. Refineries throughout the United States. have upgraded their desulfurization processes in order to meet the new diesel sulfur standards. This upgrade typically involves techniques such as changing the catalyst in the hydrotreater or installing booster pumps to force more feedstock through the unit. Both hydrocrackers and hydrotreaters also remove heavy metals and aromatics from the feedstock.

[40] One barrel is equal to 42 gallons.
[41] http://www.energyalmanac.ca.gov/petroleum/statistics/crude_oil_receipts.html
[42] http://www.eia.doe.gov/emeu/states/sep_sum/plain_html/rank_use_per_cap.html
[43] http://tonto.eia.doe.gov/dnav/pet/pet_pnp_cap1_dcu_SCA_a.htm
[44] http://energyalmanac.ca.gov/gasoline/gasoline_by_county.html

This is particularly important in California where lower aromatic standards are required along with the new ULSD standards.

Regulatory Background

Federal and state agencies regulate energy use and consumption through various programs. On the federal level, the DOT, the DOE, and the USEPA are three agencies with substantial influence over energy policies and programs.

Generally, federal agencies influence transportation energy consumption through establishment and enforcement of fuel economy standards for automobiles and light trucks, through funding of energy related research and development projects, and through funding for transportation infrastructure projects. On the state level, the California Public Utilities Commission (CPUC) and the California Energy Commission (CEC) are two agencies with authority over different aspects of energy. The CPUC regulates privately-owned utilities in the energy, rail, telecommunications, and water fields. The CEC collects and analyzes energy-related data, prepares state-wide energy policy recommendations and plans, promotes and funds energy efficiency programs, and regulates the power plant siting process. California is preempted under federal law from setting state fuel economy standards for new on-road motor vehicles. Some of the more relevant federal and state transportation-energy-related laws and plans are discussed in the following subsections.

Federal Regulations

Energy Policy and Conservation Act

The Energy Policy and Conservation Act of 1975 sought to ensure that all vehicles sold in the United States would meet certain fuel economy goals. Through this Act, Congress established the first fuel economy standards for on-road motor vehicles in the United States. Pursuant to the Act, the National Highway Traffic and Safety Administration, which is part of the DOT, is responsible for establishing additional vehicle standards and for revising existing standards. Since 1990, the fuel economy standard for new passenger cars has been 27.5 miles per gallon (mpg). Since 1996, the fuel economy standard for new light trucks (gross vehicle weight of 8,500 pounds or less) has been 20.7 mpg. Heavy-duty vehicles (i.e., vehicles and trucks over 8,500 pounds gross vehicle weight) are not currently subject to fuel economy standards. Compliance with federal fuel economy standards is not determined for each individual vehicle model, but rather, compliance is determined on the basis of each manufacturer's average fuel economy for the portion of their vehicles produced for sale in the United States. The Corporate Average Fuel Economy (CAFE) program, which is administered by USEPA, was created to determine vehicle manufacturers' compliance with the fuel economy standards. The USEPA calculates a CAFE value for each manufacturer based on city and highway fuel economy test results and vehicle sales. Based on the information generated under the CAFE program, the DOT is authorized to assess penalties for noncompliance.

In late 2007, CAFE standards received their first overhaul in more than 30 years. On December 19, President Bush signed into law the Clean Energy Act of 2007, which requires in part that automakers boost fleetwide gas mileage to 35 mpg by the year 2020. This requirement applies to all passenger automobiles, including “light trucks.” The bill signed into law December 2007 was an 822-page document changing United States energy policy in many areas. Key provisions were:

- Improved vehicle fuel economy.

- Increased CAFE standards. Automakers are required to boost fleetwide gas mileage to 35 mpg (14.8 kilometers per liter) by 2020. This applies to all passenger automobiles, including "light trucks."
- Improved vehicle technology and transportation electrification. Incentives for the development of plug-in hybrids.
- New conservation requirements for federal vehicle fleets.
- Increased production of biofuels. The total amount of biofuels added to gasoline is required to increase to 36 billion gallons by 2022, from the 4.7 billion gallons in 2007. The Energy Act specifies that 21 billion gallons of the 2022 total must be derived from non-cornstarch products (e.g., sugar or cellulose).

Light-Duty Vehicle GHG Emission Standards and Corporate Average Fuel Economy (CAFE) Standards

On May 7, 2010, the USEPA and the National Highway Traffic and Safety Administration (NHTSA) published GHG and CAFE standards for light-duty vehicles. This program applies to passenger cars, light-duty trucks, and medium-duty passenger vehicles, covering model years 2012 through 2016. In addition, these vehicles are required to meet an estimated combined average emissions level of 250 grams per mile of CO2, equivalent to 35.5 miles per gallon (MPG) if the automobile industry were to meet this CO2 level solely through fuel economy improvements. Together, these standards will cut GHG emissions by an estimated 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program for model years 2012-2016.

Intermodal Surface Transportation Efficiency Act

The Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) promoted the development of inter-modal transportation systems to maximize mobility as well as address national and local interests in air quality and energy. ISTEA contained factors that Metropolitan Planning Organizations (MPOs), such as SCAG, were to address in developing transportation plans and programs, including some energy-related factors. To meet the new ISTEA requirements, MPOs adopted explicit policies defining the social, economic, energy, and environmental values that were to guide transportation decisions in that metropolitan area. The planning process for specific projects would then address these policies. Another requirement was to consider the consistency of transportation planning with federal, state, and local energy goals. Through this requirement, energy consumption was expected to become a decision criterion, along with cost and other values that determine the best transportation solution.

Transportation Equity Act for the 21st Century

The Transportation Equity Act for the 21st Century (TEA-21) was signed into law in 1998 and builds upon the initiatives established in the ISTEA legislation, discussed above. TEA-21 authorizes highway, highway safety, transit, and other surface transportation programs. TEA-21 continues the program structure established for highways and transit under ISTEA, such as flexibility in the use of funds, emphasis on measures to improve the environment, and focus on a strong planning process as the foundation of good transportation decisions. TEA-21 also provides for investment in research and its application to maximize the performance of the transportation system through, for example, deployment of Intelligent Transportation Systems, to help improve operations and management of transportation systems and vehicle safety. Congress is currently developing various amendments to continue surface transportation programs.

Clean Cities Program

The DOE's Clean Cities Program promotes voluntary, locally-based government/industry partnerships for the purpose of expanding the use of alternatives to gasoline and diesel fuel by accelerating the deployment of alternative fuel vehicles (AFVs) and building a local AFV refueling infrastructure. The Clean Cities Program has created more than 70 partnerships in communities throughout the country. Six of these partnerships have been established in the southern California region: Coachella Valley, Lancaster, Long Beach, Los Angeles, Northwest Riverside, and one administered by SCAG (SCAG, 2005).

State Regulations

State of California Integrated Energy Policy Report

In 2002, the Legislature reconstituted the state's responsibility to develop an integrated energy plan for electricity, natural gas, and transportation fuels. On November 1, 2003, and every two years thereafter, the CEC, in consultation with other State energy agencies, must provide an overview of the major energy trends and issues facing California, including supply, demand, price, reliability, and efficiency. It must assess the impacts of these trends and issues on public health and safety, the economy, resources, and the environment. Finally, it must make policy recommendations to the Governor and the Legislature that are based on an in-depth and integrated analysis of the most current and pressing energy issues facing California (SCAG, 2005).

Reducing California's Petroleum Dependence

The CEC and CARB produced a joint report "Reducing California's Petroleum Dependence" to highlight petroleum consumption and to establish a performance based goal to reduce petroleum consumption in California over the next thirty years. The report includes the following recommendations to the Governor and Legislature regarding petroleum:

- Adopt the recommended statewide goal of reducing demand for on-road gasoline and diesel to 15 percent below the 2003 demand level by 2020 and maintaining that level for the foreseeable future.
- Work with the California delegation and other states to establish national fuel economy standards that double the fuel efficiency of new cars, light trucks, and sport utility vehicles.
- Establish a goal to increase the use of non-petroleum fuels to 20 percent of on-road fuel consumption by 2020, and 30 percent by 2030.

The CEC will use these recommendations when developing its series of recommendations to the Governor and Legislature for the integrated energy plan for electricity, natural gas, and transportation fuels (SCAG, 2005).

Renewables Portfolio Standard

California's renewables portfolio standard (RPS) requires retail sellers of electricity to increase their procurement of eligible renewable energy resources by at least one percent per year so that 20 percent of their retail sales are procured from eligible renewable energy resources by 2014. If a seller falls short in a given year, they must procure more renewables in succeeding years to make up the shortfall. Once a retail seller reaches 20 percent, they need not increase their procurement in succeeding years. The CEC and the CPUC are jointly implementing the standard. In addition, California lawmakers are currently developing legislation to increase the

current 20 percent by 2010 RPS to 33 percent by 2020[45]. The CEC and CPUC have endorsed this change and it is a key GHG reduction strategy in the CARB's AB 32 Scoping Plan.

California Environmental Quality Act

Appendix F of the CEQA Guidelines describes the types of information and analyses related to energy conservation that are to be included in EIRs that are prepared pursuant to the CEQA. In Appendix F of the CEQA Guidelines, energy conservation is described in terms of decreased per capita energy consumption, decreased reliance on natural gas and oil, and increased reliance on renewable energy sources. To assure that energy implications are considered in project decisions, EIRs must include a discussion of the potentially significant energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful and unnecessary consumption of energy.

HAZARDS AND HAZARDOUS MATERIALS

The use, storage and transport of hazardous materials are subject to numerous laws and regulations at all levels of government. The most relevant existing hazardous materials laws and regulations include hazardous materials management planning, hazardous materials transportation, hazardous materials worker safety requirements, hazardous waste handling requirements and emergency response to hazardous materials and waste incidents. Potential risk of upset is a factor in the production, use, storage and transportation of hazardous materials. Risk of upset concerns are related to the risks of explosions or the release of hazardous substances in the event of an accident or upset conditions.

Hazardous Materials Management Planning

State law requires detailed planning to ensure that hazardous materials are properly handled, used, stored, and disposed of to prevent or mitigate injury to health or the environment in the event that such materials are accidentally released. Federal laws, such as the Emergency Planning and Community-Right-to-Know Act of 1986, also known as Title III of the Superfund Amendments and Reauthorization Act (SARA), Title III) impose similar requirements. These requirements are enforced by the California Office of Emergency Services.

The Hazardous Materials Release Response Plans and Inventory Law of 1985 (Business Plan Act) requires that any business or government agency that handles hazardous materials prepare a business plan, which must include the following (HSC §25504):

- details, including floor plans, of the facility and business conducted at the site;
- an inventory of hazardous materials that are handled or stored on the site;
- an emergency response plan; and
- a training program in safety procedures and emergency response for new employees, and an annual refresher course in the same topics for all employees.

These requirements are generally administered by the local fire departments.

Hazardous Materials Transportation

The DOT has the regulatory responsibility for the safe transportation of hazardous materials between states and to foreign countries. DOT regulations govern all means of transportation, except for those packages shipped by mail, which are covered by the United States Postal

[45] http://www.cpuc.ca.gov/PUC/energy/Renewables/hot/33implementation.htm

Service (USPS) regulations. DOT regulations are contained in the Code of Federal Regulations, Title 49 (49 CFR); USPS regulations are in 39 CFR.

Every package type used by a hazardous materials shipper must undergo tests which imitate some of the possible rigors of travel. While not every package must be put through every test, most packages must be able to meet the following generic test criteria: the ability to be (a) kept under running water for one-half hour without leaking; (b) dropped, fully loaded, onto a concrete floor; (c) compressed from both sides for a period of time; (d) subjected to low and high pressure; and (e) frozen and heated alternately.

Common carriers are licensed by the California Highway Patrol (CHP) pursuant to the California Vehicle Code, §32000, which requires licensing of every motor (common) carrier who transports, for a fee, in excess of 500 pounds of hazardous materials at one time and every carrier, if not for hire, who carries more than 1,000 pounds of hazardous material of the type requiring placards. Common carriers conduct a large portion of their business in the delivery of hazardous materials.

Under the federal Resource Conservation and Recovery Act (RCRA) of 1976, the USEPA set standards for transporters of hazardous waste. In addition, the State of California regulates the transportation of hazardous waste originating or passing through the state; state regulations are contained in the CCR, Title 13. Hazardous materials are regularly removed from generating sites by licensed hazardous waste transporters. Transported materials must be accompanied by hazardous waste manifests.

Two state agencies have primary responsibility for enforcing federal and state regulations and responding to hazardous materials transportation emergencies: the CHP and the California Department of Transportation (Caltrans).

The CHP enforces hazardous materials and hazardous waste labeling and packing regulations that prevent leakage and spills of material in transit and provide detailed information to cleanup crews in the event of an accident. Vehicle and equipment inspection, shipment preparation, container identification, and shipping documentation are all part of the responsibility of CHP, which conducts regular inspections of licensed transporters to assure regulatory compliance. Caltrans has emergency chemical spill identification teams at 72 locations throughout the state.

Hazardous Material Worker Safety Requirements

The California Occupational Safety and Health Administration (CalOSHA) and the Federal Occupational Safety and Health Administration (FedOSHA) are the agencies responsible for assuring worker safety in the handling and use of chemicals in the workplace. In California, CalOSHA assumes primary responsibility for developing and enforcing workplace safety regulations.

Under the authority of the Occupational Safety and Health Act of 1970, FedOSHA has adopted numerous regulations pertaining to worker safety (contained in 29 CFR – Labor). These regulations set standards for safe workplaces and work practices, including the reporting of accidents and occupational injuries. Some OSHA regulations contain standards relating to hazardous materials handling, including workplace conditions, employee protection requirements, first aid, and fire protection, as well as material handling and storage. Because California has a federally-approved OSHA program, it is required to adopt regulations that are at least as stringent as those found in 29 CFR.

CalOSHA regulations concerning the use of hazardous materials in the workplace (which are detailed in CCR, Title 8) include requirements for employee safety training, availability of safety equipment, accident and illness prevention programs, hazardous substance exposure warnings, and emergency action and fire prevention plan preparation. CalOSHA enforces hazard communication program regulations, which contain training and information requirements, including procedures for identifying and labeling hazardous substances as well as communicating hazard information related to hazardous substances and their handling. The hazard communication program also requires that MSDSs be available to employees and that employee information and training programs be documented. These regulations also require preparation of emergency action plans (escape and evacuation procedures, rescue and medical duties, alarm systems, and emergency evacuation training).

Both federal and state laws include special provisions for hazard communication to employees in research laboratories, including training in chemical work practices. The training must include methods in the safe handling of hazardous materials, an explanation of MSDSs, use of emergency response equipment and supplies, and an explanation of the building emergency response plan and procedures.

Chemical safety information must also be available. More detailed training and monitoring is required for the use of carcinogens, ethylene oxide, lead, asbestos, and certain other chemicals listed or defined in 29 CFR. Emergency equipment and supplies, such as fire extinguishers, safety showers, and eye washes, must also be kept in accessible places. Compliance with these regulations reduces the risk of accidents, worker health effects, and emissions.

National Fire Codes (NFC), Title 45 (published by the National Fire Protection Association) contains standards for laboratories using chemicals, which are not requirements, but are generally employed by organizations in order to protect workers. These standards provide basic protection of life and property in laboratory work areas through prevention and control of fires and explosions, and also serve to protect personnel from exposure to non-fire health hazards.

While NFC Standard 45 is regarded as a nationally recognized standard, the California Fire Code (24 CCR) contains state standards for the use and storage of hazardous materials and special standards for buildings where hazardous materials are found. Some of these regulations consist of amendments to NFC Standard 45. State Fire Code regulations require emergency pre-fire plans to include training programs in first aid, the use of fire equipment, and methods of evacuation.

Hazardous Waste Handling Requirements

The RCRA created a major new federal hazardous waste regulatory program that is administered by the USEPA. Under RCRA, the USEPA regulates the generation, transportation, treatment, storage, and disposal of hazardous waste from "cradle to grave."

RCRA was amended in 1984 by the Hazardous and Solid Waste Act (HSWA), which affirmed and extended the "cradle-to-grave" system of regulating hazardous wastes. HSWA specifically prohibits the use of certain techniques for the disposal of some hazardous wastes.

Under RCRA, individual states may implement their own hazardous waste programs in lieu of RCRA as long as the state program is at least as stringent as federal RCRA requirements. The USEPA approved California's program to implement federal regulations as of August 1, 1992.

The Hazardous Waste Control Law (HWCL) is administered by the CalEPA's DTSC. Under HWCL, the DTSC has adopted extensive regulations governing the generation, transportation, and disposal of hazardous wastes. HWCL differs little from RCRA; both laws impose "cradle to grave" regulatory systems for handling hazardous wastes in a manner that protects human health and the environment. Regulations implementing HWCL are generally more stringent than regulations implementing RCRA.

Regulations implementing HWCL list over 780 hazardous chemicals as well as 20 to 30 more common materials that may be hazardous; establish criteria for identifying, packaging and labeling hazardous wastes; prescribe management practices for hazardous wastes; establish permit requirements for hazardous waste treatment, storage, disposal and transportation; and identify hazardous wastes that cannot be disposed of in landfills.

Under both RCRA and HWCL, hazardous waste manifests must be retained by the generator for a minimum of three years. Hazardous waste manifests list a description of the waste, its intended destination and regulatory information about the waste. A copy of each manifest must be filed with DTSC. The generator must match copies of hazardous waste manifests with certification notices from the treatment, disposal, or recycling facility.

Emergency Response to Hazardous Materials and Wastes Incidents

Pursuant to the Emergency Services Act, the State has developed an Emergency Response Plan to coordinate emergency services provided by federal, state, and local government agencies and private persons. Response to hazardous materials incidents is one part of this plan. The Plan is administered by the state Office of Emergency Services (OES), which coordinates the responses of other agencies including USEPA, CHP, the Department of Fish and Game, the RWQCB, and local fire departments. (See *California Government Code* §8550.)

In addition, pursuant to the Hazardous Materials Release Response Plans and Inventory Law of 1985 (the Business Plan Law), local agencies are required to develop "area plans" for response to releases of hazardous materials and wastes. These emergency response plans depend to a large extent on the business plans submitted by persons who handle hazardous materials. An area plan must include pre-emergency planning of procedures for emergency response, notification and coordination of affected government agencies and responsible parties, training, and follow-up.

Existing Hazards and Hazardous Waste Setting

The following discussion describes the existing hazards and hazardous waste setting for the equipment/source categories that may be affected by the proposed project. Due to the heavy industrial nature of each affected facility, the existing hazards setting is widely varied and voluminous. Since the proposed project is focused on controlling SOx emissions from FCCUs, SRU/TGUs, refinery boilers/heaters, sulfuric acid manufacturing, petroleum coke calcining container glass manufacturing, and cement manufacturing, the existing setting for hazards/hazardous materials for these source categories will focus on the current hazardous materials used by the applicable source categories at the affected facilities.

1. BP Carson Refinery

There are three source categories at the BP Carson Refinery that may be affected by the proposed project: the FCCU, the SRU/TGU, and the FGT for amine absorbers in their fuel gas system. The materials used in these existing units and whether they are hazardous are identified in the following paragraphs.

FCCU: The ESP catalyst fines from the FCCU at the BP Carson Refinery are loaded into a truck and either transported to a local cement plant or transported to a landfill for disposal. The catalyst fines material is classified as non-hazardous waste. In 2008, the BP Carson Refinery disposed of approximately 1,700 tons of ESP catalyst fines. Hazardous waste generated by the BP Carson Refinery is regulated by the DTSC. However, the BP Carson Refinery is not subject to a solid waste discharge permit.

SRU/TGU: The Sulfur Plant currently converts H2S and ammonia-rich acid gases into elemental sulfur, water, and nitrogen via a partial combustion (Claus) reaction. The Sulfur Plant utilizes sour water strippers for removal of H2S and NH3 from water, Claus Units for the conversion of H2S to elemental sulfur and the destruction of NH3, and TGUs via amine absorbers to recover any unconverted H2S. The amine used in this process is methyl diethanol amine (MDEA). MDEA is not considered a TAC or hazardous compound per SCAQMD's Rule 1401 and California Accidental Release Prevention (CalARP) Program as published in the California Code of Regulations (CCR), Title 19, Division 2, Chapter 4.5. NH3 and H2S are TACs and hazardous compounds per SCAQMD Rule 1401 and CalARP. Commercial grade sulfur is not considered a TAC or hazardous compound per SCAQMD's Rule 1401 and CalARP, but it may form a flammable or explosive mixture if any sulfur particles (dust) are allowed to mix with air.

FGT: Fuel gas is treated by amine absorbers that use MDEA to remove H2S from fuel gas. While MDEA is not considered a TAC or hazardous compound per SCAQMD's Rule 1401 and CalARP, H2S is a TAC and hazardous compound per SCAQMD Rule 1401 and CalARP.

2. ConocoPhillips Wilmington Refinery

There are three source categories at the ConocoPhillips Wilmington Refinery that may be affected by the proposed project: the FCCU, FGT and sulfuric acid plant. The materials used in these existing units and whether they are hazardous are identified in the following paragraphs.

FCCU: The ESP catalyst fines from the FCCU at the ConocoPhillips Wilmington Refinery are loaded into a truck and transported to a local cement plant for use as an ingredient in the manufacture of cement. The approximate quantity of catalyst fines generated is 526 tons per year. The catalyst fines material is not classified as a hazardous waste since it is recycled. Hazardous waste generated by the ConocoPhillips Wilmington Refinery is regulated by the DTSC and the Los Angeles County Fire Department.

FGT: The amine absorbers use monoethanolamine (MEA) to remove sulfur compounds from the refinery fuel gas. MEA is not considered a hazardous compound per SCAQMD's Rule 1401 and CalARP.

Sulfuric Acid Plant: The sulfuric acid plant takes the sulfur in the feedstock (spent sulfuric acid from other processes plus fresh sulfur) and oxidizes it to SO2 in a furnace. The SO2 is then oxidized to SO3 in a catalytic converter. Lastly, the SO3 is combined with water to create a strong H2SO4 solution. H2SO4 and SO3 are regulated, hazardous compounds per SCAQMD's Rule 1401 and CalARP, under certain conditions.

3. Chevron Refinery

There are three source categories at the Chevron Refinery that may be affected by the proposed project: the FCCU, the SRU/TGU, and the FGT for amine absorbers in their fuel gas system. The materials used in these existing units and whether they are hazardous are identified in the following paragraphs.

FCCU: The ESP catalyst fines are comprised of base catalyst plus SOx reducing additives from the FCCU at the Chevron Refinery are loaded into a pneumatic tanker truck and transported to a local cement plant for use as an ingredient in the manufacture of cement. In 2008, the Chevron Refinery shipped approximately 409 tons for recycling. The catalyst fines material is not classified as a hazardous waste since it is recycled.

FGT: The absorbers use diethanolamine (DEA) to remove sulfur compounds (e.g., H2S) from the refinery fuel gas. H2S and DEA are TACs and are considered hazardous compounds per SCAQMD's Rule 1401 and CalARP.

SRU/TGU: The SRU/TGU uses catalyst to convert ammonia (NH3), H2S and nitrogen compounds from the sour water feed stream to commercial grade sulfur along with nitrogen and water that is exhausted to the atmosphere. NH3 and H2S are TACs and hazardous compounds per SCAQMD Rule 1401 and CalARP. Commercial grade sulfur is not considered a TAC or hazardous compound per SCAQMD's Rule 1401 and CalARP, but it may form a flammable or explosive mixture if any sulfur particles (dust) are allowed to mix with air. Similar to the catalyst used in the FCCU, the catalyst in the SRU/TGU is loaded into a pneumatic tanker truck and transported to a local cement plant for use as an ingredient in the manufacture of cement. The spent catalyst used in this process is not classified as a hazardous waste since it is recycled.

4. ExxonMobil Refinery

There are three source categories at the ExxonMobil Refinery that may be affected by the proposed project: the FCCU, the SRU/TGU, and the FGT. The materials used in these existing units and whether they are hazardous are identified in the following paragraphs.

FCCU: The ESP catalyst fines from the FCCU at the ExxonMobil Refinery are loaded into a truck and transported to a local cement plant for use as an ingredient in the manufacture of cement. The approximate quantity of catalyst fines generated is 150 tons per year. The catalyst fines material is not classified as a hazardous waste since it is recycled. Hazardous waste generated by the ExxonMobil Refinery is regulated by the DTSC and/or the local CUPA.

SRU/TGU: The Sulfur Plant currently converts H2S and ammonia-rich acid gases into elemental sulfur, water, and nitrogen via a partial combustion (Claus) reaction. The Sulfur Plant utilizes Claus Units for the conversion of H2S to elemental sulfur and the destruction of NH3, and TGUs via amine absorbers to recover any unconverted H2S. A proprietary amine is used in the TGU. NH3 and H2S are TACs and hazardous compounds per SCAQMD Rule 1401 and CalARP. Commercial grade sulfur is not considered a TAC or hazardous compound per SCAQMD's Rule 1401 and CalARP, but it may form a flammable or explosive mixture if any sulfur particles (dust) are allowed to mix with air.

FGT: To reduce mercaptans (ethyl- and methyl-), DEA is used to treat most of the refinery fuel gas, other than coker off-gas, which is treated with MEA and NaOH. NaOH and DEA are both TACs and are considered hazardous compounds per SCAQMD's Rule 1401 and CalARP. MEA is not considered a hazardous compound per SCAQMD's Rule 1401 and CalARP.

5. Ultramar/Valero Refinery

There are three source categories at the Chevron Refinery that may be affected by the proposed project: the FCCU, the SRU/TGU, and the FGT for amine absorbers in their fuel gas system. The materials used in these existing units and whether they are hazardous are identified in the following paragraphs.

FCCU: The ESP catalyst fines from the FCCU at the Ultramar/Valero Refinery are currently collected in hoppers below the ESP structure. The ESP catalyst fines, comprised of base catalyst and SOx reducing additives, are currently shipped to a local cement plant to be used as an ingredient in the manufacture of cement. The quantity of catalyst fines generated in 2008 was approximately 729 tons and it was classified as non-hazardous waste. The solid waste regulator for this facility is the Department of Toxic Substances Control (DTSC).

SRU/TGU: The Sulfur Plant currently converts H2S and ammonia-rich acid gases into elemental sulfur, water, and nitrogen via a partial combustion (Claus) reaction. The Sulfur Plant utilizes Claus Units for the conversion of H2S to elemental sulfur and the destruction of NH3, and TGUs via amine absorbers to recover any unconverted H2S. The amine used in the TGU is a hybrid mixture of MDEA and a special amine additive (TG-10). While MDEA, TG-10, and carbonyl sulfide are not considered TACs or hazardous compounds per SCAQMD's Rule 1401 and CalARP, H2S, NaOH and mercaptans are TACs and hazardous compounds per SCAQMD Rule 1401 and CalARP. Commercial grade sulfur is not considered a TAC or hazardous compound per SCAQMD's Rule 1401 and CalARP, but it may form a flammable or explosive mixture if any sulfur particles (dust) are allowed to mix with air.

FGT: Fuel gas is treated by amine absorbers to remove H2S from fuel gas. The FGT unit uses a fiber contactor system to treat fuel gas with a circulating stream of amine (MDEA) and caustic (NaOH) to remove H2S, carbonyl sulfide, and mercaptans. While MDEA and carbonyl sulfide are not considered TACs or hazardous compounds per SCAQMD's Rule 1401 and CalARP, H2S, NaOH and mercaptans are TACs and hazardous compounds per SCAQMD Rule 1401 and CalARP.

6. Tesoro Refinery

There are three source categories at the Chevron Refinery that may be affected by the proposed project: the FCCU, the SRU/TGU, and the FGT for amine absorbers in their fuel gas system. The materials used in these existing units and whether they are hazardous are identified in the following paragraphs.

FCCU: The ESP catalyst fines from the FCCU at the Tesoro Refinery, comprised of base catalyst and SOx reducing additives, are loaded into a truck and transported to a local cement plant CPCC for use as an ingredient in the manufacture of cement. The approximate quantity of catalyst fines generated is 360 tons per year. The catalyst fines material is not classified as a hazardous waste since it is recycled. Hazardous waste generated by the Tesoro Refinery is regulated by the DTSC.

SRU/TGU: The Sulfur Plant currently converts H2S and ammonia-rich acid gases into elemental sulfur, water, and nitrogen via a partial combustion (Claus) reaction. The Sulfur Plant utilizes Claus Units for the conversion of H2S to elemental sulfur and the destruction of NH3, and TGUs via MDEA amine absorbers to recover any unconverted H2S. Commercial grade sulfur is not considered a TAC or hazardous compound per SCAQMD's Rule 1401 and CalARP, but it may form a flammable or explosive mixture if any sulfur particles (dust) are allowed to

mix with air. MDEA is not considered a TAC or hazardous compound per SCAQMD's Rule 1401 and CalARP.

FGT: Fuel gas is treated by amine absorbers that use DEA to remove H2S from fuel gas. DEA is a TAC and is considered a hazardous compound per SCAQMD's Rule 1401 and CalARP.

7. Rhodia Inc.

Rhodia has only one source category, sulfuric acid manufacturing, that may be affected by the proposed project. The sulfuric acid plant takes the sulfur in the feedstock (spent sulfuric acid from other facilities plus fresh sulfur) and oxidizes it to SO2 in a furnace. The SO2 is then oxidized to sulfur trioxide (SO3) in a catalytic converter. Lastly, the SO3 is combined with water to create a strong sulfuric acid (H2SO4) solution. H2SO4 and SO3 are regulated, hazardous compounds per SCAQMD's Rule 1401 and CalARP, under certain conditions. In addition, Rhodia is a generator of hazardous waste and local oversight of this waste stream is under the jurisdiction of the Los Angeles County Fire Department as the Certified Unified Program Agency (CUPA). At the state level, hazardous waste generated by Rhodia is regulated by the DTSC and CalEPA and at the federal level, it is regulated by the USEPA.

8. ConocoPhillips Carson Plant

There are two source categories at the ConocoPhillips Carson Plant that may be affected by the proposed project: the SRU/TGU and the FGT for amine absorbers in their fuel gas system. The materials used in these existing units and whether they are hazardous are identified in the following paragraphs.

SRU/TGU: The Sulfur Plant currently converts H2S and ammonia-rich acid gases into elemental sulfur, water, and nitrogen via a partial combustion (Claus) reaction. The Sulfur Plant utilizes Claus Units for the conversion of H2S to elemental sulfur and the destruction of NH3, and TGUs via amine absorbers to recover any unconverted H2S. The amine used in the TGU is a hybrid mixture of MDEA and a special amine additive (TG-10). While MDEA, TG-10, and carbonyl sulfide are not considered TACs or hazardous compounds per SCAQMD's Rule 1401 and CalARP, H2S, NaOH and mercaptans are TACs and hazardous compounds per SCAQMD Rule 1401 and CalARP. Commercial grade sulfur is not considered a TAC or hazardous compound per SCAQMD's Rule 1401 and CalARP, but it may form a flammable or explosive mixture if any sulfur particles (dust) are allowed to mix with air.

FGT: The fuel gas is treated with MEA and NaOH to reduce mercaptans (ethyl- and methyl-) and carbonyl sulfur. NaOH is a TAC and is considered a hazardous compound per SCAQMD's Rule 1401 and CalARP. MEA is not considered a hazardous compound per SCAQMD's Rule 1401 and CalARP.

The ConocoPhillips Carson Plant is a generator of hazardous waste and local oversight of this waste stream is under the jurisdiction of the DTSC and the Los Angeles County Fire Department.

9. BP Wilmington Calciner Plant

The calciner at BP Wilmington is the only source category that may be affected by the proposed project. The SOx emissions from the unit are controlled by a dry scrubber. The existing control system also includes a spray dryer, a reverse-air baghouse, a slurry storage system, a slurry circulating system, and a pneumatic conveying system. Calcium hydroxide (CaOH) slurry is the absorbing medium for the existing SO2 control system. CaOH is not considered a hazardous compound per SCAQMD's Rule 1401 and CalARP.

The BP Wilmington Calciner Plant does not operate an FCCU so there are no catalyst fines from this type of equipment in their solid waste stream. However, approximately 175 tons per day of non-hazardous waste is produced by the dry scrubber and baghouse operated at the BP Wilmington Calciner Plant, which is sold and shipped to a local cement plant for recycling. Other non-hazardous wastes produced are sent to some waste facilities as either a waste or a commodity that is sold to the waste facility as a sludge solidifier.

The primary Certified Unified Program Agencies[46] (CUPAs) for the BP Wilmington Calciner Plant are the Long Beach Fire Department and the Los Angeles City Fire Department. In addition, the CUPA permits for the BP Wilmington Calciner Plant are specifically for hazardous waste and hazardous materials. The BP Wilmington Calciner Plant has an USEPA identification number and meets the criteria as a small quantity generator[47].

10. CPCC Plant

The two cement kilns operating at the CPCC Plant are the only units that may be affected by the proposed project. The raw materials used for manufacturing cement include calcium, silica, alumina and iron, with calcium having the highest concentration. These raw materials are obtained from a limestone quarry for calcium, sand for silica; and shale and clay for alumina and silica. None of these materials are considered hazardous per SCAQMD's Rule 1401 and CalARP. In addition, the CPCC Plant receives catalyst fines and other non-hazardous waste from several facilities to be used in the cement manufacturing process[48]. The solid waste regulators for the CPCC Plant are the California Integrated Waste Management Board and the County of San Bernardino Fire Department CUPA for hazardous wastes.

11. Owens-Brockway Glass Container Inc.

The two glass melting furnaces and corresponding scrubbers at Owens-Brockway Glass Container are the only equipment that may be affected by the proposed project. Limestone, soda ash, and glass cullet are the main feedstocks to the furnaces. The scrubbers use trona, a rare sodium-rich mineral, as a scrubbing agent. Trona is also the main component in the manufacture of soda ash. Limestone, soda ash, trona and glass cullet are not considered hazardous compounds per SCAQMD's Rule 1401 and CalARP.

Owens-Brockway Glass Container Inc. collects particulates in their electrostatic precipitators (ESPs) and re-uses a majority of the dust in the glass-making process. The amount of dust that cannot be recycled in this manner is sent to be disposed of as hazardous waste. Owens-Brockway Glass Container Inc. qualifies as a large quantity generator[49] of solid waste.

---

[46] Senate Bill 1082, passed in 1993, created the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program), which requires the administrative consolidation of six hazardous materials and waste programs (Program Elements) under one agency, a Certified Unified Program Agency.

[47] A small quantity generator is allowed to generate less than 2,200 pounds of hazardous waste in any calendar month. All hazardous waste generated by the small quantity generator that is not treated onsite must be manifested to an offsite treatment, storage and disposal facility permitted to handle hazardous waste or to an approved designated facility (e.g., recycling facility).

[48] On November 20, 2009, CPCC operators shutdown both of its cement kilns and as such, indicated to SCAQMD staff that they will not be receiving catalyst fines for recycling until further notice. CPCC operators indicated that catalyst fines will be diverted to another cement plant located outside of the jurisdiction of SCAQMD.

[49] A large quantity generator generates 2,200 pounds or more of hazardous waste or more than 2.2 pounds of acute hazardous waste per calendar month. All hazardous waste generated by the large quantity generator that is not treated onsite must be manifested and sent to an offsite treatment, storage and disposal facility permitted to handle hazardous waste, or sent to an approved designated facility (e.g., a recycling facility).

HYDROLOGY AND WATER QUALITY

Water Quality

The USEPA is the federal agency responsible for water quality management and administration of the federal Clean Water Act (CWA). The USEPA has delegated most of the administration of the CWA in California to the California State Water Resources Control Board (SWRCB). The SWRCB was established through the California Porter-Cologne Water Quality Act of 1969 and is the primary agency responsible for water quality management issues in California. Much of the responsibility for implementation of the SWRCB's policies is delegated to the nine RWQCBs. Section 402 of the CWA established the National Pollutant Discharge Elimination System (NPDES) to regulate discharges into "navigable waters" of the United States. The USEPA authorized the SWRCB to issue NPDES permits in the State of California in 1974. The NPDES permit establishes discharge pollutant thresholds and operational conditions for industrial facilities and wastewater treatment plants. For point source discharges (e.g., wastewater treatment facilities), the RWQCBs prepare specific effluent limitations for constituents of concern such as toxic substances, total suspended solids (TSS), bio-chemical oxygen demand (BOD), and organic compounds. The limitations are based on the Basin Plan objectives and are tailored to the specific receiving waters, allowing some discharges, for instance deep water outfalls in the Pacific Ocean, more flexibility with certain constituents due to the ability of the receiving waters to accommodate the effluent without significant impact.

Non-point source NPDES permits are also required for municipalities and unincorporated communities of populations greater than 100,000 to control urban stormwater runoff. These municipal permits include Storm Water Management Plans (SWMPs). A key part of the SWMP is the development of Best Management Practices (BMPs) to reduce pollutant loads. Certain businesses and projects within the jurisdictions of these municipalities are required to prepare Storm Water Pollution Prevention Plans (SWPPPs) which establish the appropriate BMPs to gain coverage under the municipal permit. On October 29, 1999, the USEPA finalized the Storm Water Phase II rule which requires smaller urban communities with a population less than 100,000 to acquire individual storm water discharge permits. The Phase II rule also requires construction activities on one to five acres to be permitted for storm water discharges. Individual storm water NPDES permits are required for specific industrial activities and for construction sites greater than five acres. State-wide general storm water NPDES permits have been developed to expedite discharge applications. They include the state-wide industrial permit and the state-wide construction permit. A prospective applicant may apply for coverage under one of these permits and receive Waste Discharge Requirements (WDRs) from the appropriate RWQCB. WDRs establish the permit conditions for individual dischargers.

Section 303(d) of the CWA requires the SWRCB to list impaired water bodies in the State and determine total maximum daily loads (TMDLs) for pollutants or other stressors impacting water quality. Even though the Section 303(d) list was completed in March 1999, TMDLs have yet to be determined for most of the identified impaired water bodies, although a priority schedule has been developed to complete the process in the region within 13 years. The RWQCBs will be responsible for ensuring that total discharges do not exceed TMDLs for individual water bodies as well as for entire watersheds.

The RWQCBs also coordinate the State Water Quality Certification program pursuant to Section 401 of the CWA. According to Section 401, states have the authority to review any federal permit or license that will result in a discharge or disruption to wetlands and other waters under state jurisdiction, to ensure that the actions will be consistent with the state's water quality

requirements. This program is most often associated with §404 of the CWA which obligates the United States Army Corps of Engineers to issue permits for the movement of dredge and fill material into and from "waters of the United States."

Water quality of regional surface water and groundwater resources is affected by point source and non-point source discharges occurring throughout individual watersheds. Regulated point sources, such as wastewater treatment effluent discharges, usually involve a single discharge into receiving waters. Non-point sources involve diffuse and non-specific runoff that enters receiving waters through storm drains or from unimproved natural landscaping. Common non-point sources include urban runoff, agriculture runoff, resource extraction (on-going and historical), and natural drainage. Within the regional Basin Plans, the RWQCBs establish water quality objectives for surface water and groundwater resources and designate beneficial uses for each identified body of water.

California Water Code, Division 7, Chapter 5.6 established a comprehensive program within the SWRCB to protect the existing and future beneficial uses of California's enclosed bays and estuaries. The Bay Protection and Toxic Cleanup Plan (BPTCP) has provided a new focus on the SWRCB and the RWQCBs' efforts to control pollution of the state's bays and estuaries by establishing a program to identify toxic hot spots and plan for their cleanup. In June 1999, the SWRCB published a list of known toxic hot spots in estuaries, bays, and coastal waters.

Other state-wide programs run by the SWRCB to monitor water quality include the California State Mussel Watch Program and the Toxic Substances Monitoring Program. The Department of Fish and Game collects water and sediment samples for the SWRCB for both these programs and provides extensive state-wide water quality data reports annually. In addition, the RWQCBs conduct water sampling for Water Quality Assessments required by the CWA and for specific priority areas under restoration programs such as the Santa Monica Bay Restoration Program.

Water Supply

The Federal Safe Drinking Water Act, enacted in 1974 and implemented by the USEPA, imposes water quality and infrastructure standards for potable water delivery systems nation-wide. The California Safe Drinking Water Act was enacted in 1976. Potable water supply is managed through local agencies and water districts, the State Department of Water Resources (DWR), the Department of Health Services (DHS), the State Water Resources Control Board (SWRCB), the USEPA, and the United States Bureau of Reclamation. The DWR manages the State Water Project (SWP), and compiles planning information on supply and demand within California.

The DWR divides the state into ten hydrologic regions. Some regions contain a great deal of water, while other regions are very dry and must have their water imported by aqueducts. The South Coast Air Basin lies within the South Coast Hydrologic Region. The cities of Los Angeles, Long Beach, Santa Ana, and Riverside are among the many urban areas in this hydrologic region. The Santa Clara, Los Angeles, San Gabriel, and Santa Ana Rivers are among the area's hydrologic features. Most lakes in this area are actually reservoirs, made to hold imported water.

Imported sources of water (including the Colorado River Aqueduct (CRA), the State Water Project's California Aqueduct, and the Los Angeles Aqueduct) have, in previous years, supplied more than six million acre-feet[50] or two trillion gallons of water to the southern California region

[50] One acre-foot is equivalent to 325,851 gallons.

annually. Imported sources have accounted for approximately 74 percent of the total water used in the region.

Local sources of water account for approximately 26 percent of the total volume consumed annually in the SCAG area. Local sources include surface water runoff and groundwater.

The largest surface water sources in the region are the Colorado, the Santa Ana, and the Santa Clara River systems. Major groundwater basins in the region include the Central, Raymond, San Fernando, and San Gabriel basins (Los Angeles County); the Upper Santa Ana Valley Basin system (San Bernardino and Riverside counties); the Coastal Plain Basin (Orange County); and the Coachella Valley Basin (Riverside County).

Local water resources are fully developed and historically have remained relatively stable on a region-wide basis. However, local water supplies may decline in certain localized areas and increase in others. Several groundwater basins in the region are threatened by overdraft conditions, increasing levels of salinity, and contamination by agricultural land to urban development, thereby reducing the land surface available for groundwater recharge. Increasing demand for groundwater may also be limited by water quality, since levels of salinity in sources currently used for irrigation could be unacceptably high for domestic use without treatment.

Available water supplies provided by the Metropolitan Water District (MWD) are diverse and include State Water Project (SWP) deliveries, Colorado River deliveries (according to Federal apportionments and guidelines), water transfers and exchanges, storage and groundwater banking programs, and State and Federal initiatives (such as the California Water Use Plan for the Colorado River and Delta Improvements) (MWD, 2002).

Historically, the demand forecasts and supply capabilities have been compared over the next 20 years and under varying hydrologic conditions. These comparisons determine the supplies that can be reasonably relied upon to meet projected supplemental demands and to provide resource reserves that can provide a margin of safety to mitigate against uncertainties in demand projections and risks in implementing supply programs (MWD, 2002). Current practices allow MWD to bring water supplies on-line at least ten years in advance of demand with a very high degree of reliability. If all imported water supply programs and local projects proceed as planned, with no change in demand projections, reliability could be assured beyond twenty years (MWD, 2002).

The SWRCB, and the nine Regional Water Quality Control Boards (RWQCB), are responsible for protecting surface and groundwater supplies in California. In particular, the SWRCB establishes water-related policies and approves water quality control plans, which are implemented and enforced by RWQCBs. Five RWQCBs have jurisdiction over areas within the boundaries of the SCAQMD. These agencies also regulate discharges to state waters through federal pre-treatment requirements enforced by the publicly-owned treatment works (POTWs).

However, back-to-back dry years and low reservoir levels have put California in a statewide drought. In late 2008, the state's major reservoirs were at about one-third of capacity, at a time when they would typically be at about two-thirds. As a result, the DWR has allocated only 15 percent of requested amounts of water to be delivered to the SWP in 2009. This allocation is the second lowest in the history of the project. Adding to California's water woes is a federal judge's restrictions on pumping in the Sacramento-San Joaquin Delta, ordered in 2007 to protect the threatened Delta smelt. These restrictions reduced water deliveries by as much as 30 percent

in 2008 to 25 million Californians in the San Francisco Bay Area, the Central Coast, the San Joaquin Valley, and Southern California. Because of the drought, local water resources, which include groundwater and captured surface water runoff, are not expected to be stable in the future on a region-wide basis. Further, several groundwater basins in the region are threatened by overdraft conditions, increasing levels of salinity, and contamination by agricultural land to urban development, thereby reducing the land surface available for groundwater recharge. Increasing demand for groundwater may also be limited by water quality, since levels of salinity in sources currently used for irrigation could be unacceptably high for domestic use without treatment.

On June 4, 2008, Governor Arnold Schwarzenegger issued Executive Order S-06-08 and declared an official drought for California[51]. Further, California Water Code §71460 et seq. states that a water district may restrict the use of water during any emergency caused by drought, or other threatened or existing water shortage, and may prohibit the use of water during such periods for any purpose other than household uses or such other restricted uses as determined to be necessary. The water district may also prohibit the use of water during such periods for specific uses which it finds to be nonessential. On February 27, 2009, Governor Schwarzenegger proclaimed a state of emergency regarding the drought and the availability and future sustainability of California's water resources[52]. The proclamation directed all state government agencies to utilize their resources, implement a state emergency plan and provide assistance for people, communities and businesses impacted by the drought. The proclamation further requested that all urban water users immediately increase their water conservation activities in an effort to reduce their individual water use by 20 percent.

In response to the Governor's proclamation, the California legislature has proposed Assembly Bill (AB) 49 – Water Efficiency[53] and Senate Bill (SB) 261 – Urban Water Efficiency[54]. These proposed bills will require a 10 percent reduction of urban water use by 2015 and 20 percent by 2020. However, these proposed bills will allow the use of non-potable or recycled water to count towards the progress in meeting these targets. On January 27, 2010, AB 49 was moved to the inactive file. On August 27, 2009, a hearing was set for SB 261 and then canceled. These are the last times any actions were taken on these bills.

Water districts, in response to the drought, have taken several actions throughout the state such as: 1) asking for voluntary reductions; 2) imposing mandatory restrictions or declaring a local emergency; 3) imposing agricultural rationing; 4) imposing drought rates, surcharges and fines; 5) limiting new development and requiring water efficient landscaping; and, 6) implementing a conservation campaign. In addition, water shortages have prompted cities to begin infrastructure improvements to secure future water supplies. For example, the LADWP, in conjunction with the WBMWD, are proposing the Harbor Refineries Recycled Water Pipeline Project (HRRWPP) to conserve potable water and instead produce and convey recycled water to multiple industrial and irrigation customers in the Los Angeles Harbor area[55].

Groundwater

Groundwater provides most of the region's local (i.e., non-imported) supply of fresh water. Many cities within the area augment imported water supplies with groundwater from underlying groundwater basins. Groundwater basins are recharged through local precipitation and through imported water applied through injection wells or percolation ponds. Groundwater basins in California are generally not managed by government authorities such that overlying property owners are allowed to extract water to the extent that other users are not impaired. However, through court decisions, several basins in the South Coast area have become adjudicated. Adjudicated groundwater basins are managed through a watermaster assigned by the court. The watermaster manages the distribution of extracted water and is responsible for maintaining water quality.

Recent efforts to store recycled water and surplus water in groundwater basins for use during drought periods have proven successful. These conjunctive use projects, in place of surface reservoirs, promise to play a major role in future water management planning.

The general quality of groundwater in the District has degraded substantially from historic levels. Much of the degradation has been attributed to land uses. For example, fertilizers and pesticides typically used on agricultural lands can infiltrate and degrade groundwater. Further, septic systems and leaking underground storage tanks can also impact groundwater quality. Urban runoff has been proven to be a significant source of pollutants. Pollutants in urban runoff include urban debris, suspended solids, bacteria, viruses, heavy metals, pesticides, petroleum hydrocarbons, and other organic compounds. In addition, when increased withdrawals from groundwater basins exceed safe yields, salt water intrusion from the ocean further degrades groundwater quality. Conversely, as impervious surfaces in urban areas increase, the rate of natural surface recharge declines.

Surface Runoff

Surface runoff augments groundwater and surface water supplies. However, the regional demand far surpasses the potential natural recharge capacity. The arid climate, drought, and increased urbanization contribute to the inadequate natural recharge. Urban and agricultural runoff can contain pollutants, which decrease the quality of local water supplies. Runoff captured in storage reservoirs varies widely from year to year depending on local precipitation, averaging 130,000 acre-feet per year within the MWD service area. Within the desert regions, the amount is considerably less, given the low annual rainfall and the relatively few surface reservoirs.

Water Demand

Estimating total water use in the District is difficult because the boundaries of supplemental water purveyors' service areas bear little relation to the boundaries of the District and there are dozens of individual water retailers within the District. Water demand in California can generally be divided between urban, agricultural, and environmental uses. In the SCAG area, 74 percent of potable water is provided from imported sources. Annual water demand fluctuates in relation to available supplies. During prolonged periods of drought, water demand can be reduced significantly through conservation measures.

Increases in California's water demand are due primarily to the increases in population. According the DWR Bulletin 160-98[56], urban water demand for 2020 is projected to increase

[56] http://www.dpla2.water.ca.gov/publications/b160/1998/esch4.pdf

from 1995 base levels by about 3.2 million acre-feet in average water years and by about 3.4 million acre-feet in drought years. However, agricultural water demand is forecast to be reduced by 2.3 million acre-feet (one acre-foot equals approximately 325,850 gallons) by 2020 due to anticipated increases in water use efficiency and reductions in irrigated agricultural acreage. Environmental water demand[57] will increase only slightly by 2020. Measures to ensure an adequate water supply include conservation programs, recycling, and increased storage facilities (SCAG, 2001).

The MWD monitors demographics in its service area using official SCAG and San Diego Association of Governments (SANDAG) growth projections. In MWD's service area, the population increased approximately seven percent from 1995 through 2000. This is an increase of about 211,000 people per year over a five-year period. Based on official SCAG and SANDAG growth projections, the population in MWD service area is expected to be 21.3 million people by 2020, reflecting an annual increase of 223,000 per year (MWD, 2002).

In 1998, 3.5 million acre-feet of water was used in the MWD service area. Of this total, 3.2 million acre-feet (91 percent) were used for municipal and industrial purposes (M&I), and 0.3 million acre-feet (nine percent) were used for agricultural purposes. Due to urbanization and market factors, including the price of water, agricultural water use has declined as the relative share of M&I water use has increased over time. Agricultural water use has declined from 14 percent in 1980 to 8.3 percent in 1997 (MWD, 2002).

Based on official SCAG and SANDAG growth projections, total water use is expected to grow from a projected 3.8 million acre-feet in 2000 to 4.8 million acre-feet in 2020. All water demand projections reflect demands under normal weather conditions. The water demand forecasts account for projected implementation of California's conservation best management practices (BMPs), water savings resulting from plumbing codes, and savings due to price effects. Per capita water demand in MWD's service area has decreased significantly since the 1980s, but is expected to remain relatively constant as rising affluence and growth in hot and dry areas dampen the effects of intense conservation efforts (MWD, 2002).

Nonresidential water use represents about 25 percent of the total M&I demand in the MWD's service area. The nonresidential sector represents water that is used by businesses, services, government, institutions (such as hospitals and schools), and industrial (or manufacturing) establishments. Within the commercial/institutional category, the top water users include schools, hospitals, hotels, amusement parks, colleges, laundries, and restaurants. In southern California, the major industrial users include electronics, aircraft, petroleum refining, beverages, food processing, and other industries that use water as a major component of the manufacturing process (MWD, 2002).

For 2009, MWD's current water demands are 2.23 million acre-feet per year. MWD's Colorado River supplies provide approximately 1.05 million acre-feet per year; therefore, MWD's SWP supplies combined with existing system storage make up the remaining 1.18 million acre-feet per year. However, the biological opinion on the Delta smelt issued by the US Fish and Wildlife Service imposed a 30 percent restriction on water deliveries which will severely affect MWD's

[57] Environmental water demand is the sum of the following: 1) dedicated flows in state and federal wild and scenic rivers; 2) Instream flow requirements established by water right permits, DFG agreements, court actions, or other administrative documents; 3) Bay-Delta outflows required by SWRCB; and, 4) Applied water demands of managed freshwater wildlife areas.

ability to deliver reliable water supplies that meet current and future water demands. For example, demand for MWD's SWP water is 1.5 million acre-feet per year, which exceeds available supplies of 0.75 million acre-feet per year in normal years. To handle the water deficit, MWD has been removing and will continue to remove water from existing storage reserves to meet demands in eight out of 10 years. MWD's storage reserves are at critically low levels, with one million acre-feet of supply in a five million acre-feet capacity system, with MWD drawing 350,000 acre-feet per year. Thus, shrinking supplies due to drought and the Delta smelt combined with increased demand due to regional growth has caused MWD to cut deliveries to Los Angeles by 10 percent.

Proposed Project

Much of the urbanized areas in Los Angeles County, where the majority of the facilities affected by the proposed project are located, is serviced by two large POTWs operating on the coast as follows: the City of Los Angeles Bureau of Sanitation Hyperion Facility and the Joint Outfall System of the Los Angeles County Sanitation District (LACSD). Each of these facilities discharges an average of over 250 MMgal/day.

The City of Colton, where one facility (CPCC) affected by the proposed project is located[58], owns, operates and maintains a wastewater collection, pumping and treatment system referred to as the Colton Water Reclamation Facility (CWRF). The CWRF also serves the City of Grand Terrace and unincorporated County areas. The plant utilizes a conventional and extended aeration secondary treatment process to product-treated effluent in compliance with RWQCB regulations. In addition, a regional tertiary treatment plant serving both the Cities of Colton and San Bernardino treats the effluent from the wastewater treatment plant and returns the water to the Santa Ana River. The average daily flows at the CWRF are approximately 5.6 MMgal/day.

The following discussion describes the existing water demand and wastewater setting for each of the affected facilities (six refineries, two sulfuric acid manufacturing plants, one petroleum coke calcining plant, one container glass manufacturing plant, and one Portland cement manufacturing plant) that are potentially affected by the proposed project. Unless otherwise noted, the data was provided by the facility operators:

1. BP Carson Refinery

The baseline water use at the BP Carson Refinery is approximately 12.5 MMgal/day. Operators of the BP Carson Refinery purchase approximately 5.8 MMgal/day of potable water and 2.8 MMgal/day of recycled water from the California Water Service (CWS). The CWS is a retailer that purchases water at wholesale rates from the West Basin Municipal Water District (WBMWD). In addition, operators of the BP Carson Refinery currently pump approximately 3.9 MMgal/day from their three onsite groundwater wells and their permit allows pumping up to 4.7 MMgal/day. The BP Carson Refinery is not limited to an amount of water it can purchase.

The BP Carson Refinery operates a wastewater treatment system that has a maximum capacity of 8,000 gallons per minute (gpm) or 11.5 MMgal/day, but discharges an average of 4,000 gpm or 5.76 MMgal/day. However, during wet weather, the discharge limit is 5,200 gpm or 7.49 MMgal/day. The Los Angeles County Sanitation District (LACSD) permit allows the BP Carson Refinery to discharge wastewater into the Dominguez Channel.

[58] The facility that is located in Riverside County, CPCC, does not discharge wastewater offsite.

2. ConocoPhillips Wilmington Refinery

The baseline water use at the ConocoPhillips Wilmington Refinery is approximately 7.85 MMgal/day. Operators of the ConocoPhillips Wilmington Refinery purchase approximately 5.47 MMgal/day of potable water from the LADWP. In addition, operators of the ConocoPhillips Wilmington Refinery currently pump approximately 2.38 MMgal/day from their one onsite groundwater well. This facility does not currently have access to recycled water. The ConocoPhillips Wilmington Refinery is not limited to an amount of water it can purchase.

The ConocoPhillips Wilmington Refinery operates a wastewater treatment system that discharges approximately of 2.69 MMgal/day. The Los Angeles City Bureau of Sanitation District (LACBS) permit allows the ConocoPhillips Wilmington Refinery to discharge wastewater into the city's sewer system which drains to LACBS's Terminal Island Water Reclamation Plant for treatment.

3. Chevron Refinery

The baseline water use by the Chevron Refinery is approximately 10.75 MMgal/day (2.6 million gallons of potable water and 8.15 million gallons of recycled water). Operators of the Chevron Refinery currently purchase their water from the City of El Segundo (a retailer). The City of El Segundo is a retailer that purchases water at wholesale rates from the WBMWD. Chevron also receives: 1) boiler feed water from secondary-treated effluent from the Hyperion Wastewater Treatment plant that has been further processed by filtration, chlorination, and demineralization by reverse osmosis; and 2) cooling tower water from secondary–treated effluent from the Hyperion Wastewater Treatment Plant that has been further processed by filtration, chlorination, and de-nitrification. Improvements as part of their ongoing Project Reliability and Optimization Project at WBMWD, located nearby, include increasing reverse osmosis and de-nitrification water production facilities. Chevron is not limited to an amount of water it can purchase. Further, Chevron does not have any groundwater well sources.

The Chevron Refinery operates two wastewater treatment systems. The first system operates at a flow rate of 5,000 gpm or 7.2 MMgal/day and the second system has a flow rate limit of 2,000 gpm or 2.88 MMgal/day and operates at an average flow rate of 1,800 gpm or 2.59 MMgal/day. The Chevron Refinery discharges an average of 7.2 MMgal/day of wastewater and is permitted to discharge 8.8 MMgal/day when weather conditions are dry and up to 23 MMgal/day during wet weather. Their National Pollutant Discharge Elimination System (NPDES) permit allows Chevron to discharge into the Santa Monica Bay.

4. ExxonMobil Refinery

The baseline water use at the ExxonMobil Refinery is approximately 10.32 MMgal/day. Operators of the ExxonMobil Refinery purchase approximately 3.19 MMgal/day of potable water and 6.0 MMgal/day of recycled water from the City of Torrance. The City of Torrance, the water purveyor, purchases recycled water at wholesale rates from the WBMWD. The ExxonMobil Refinery is not limited to an amount of water it can purchase. In addition, operators of the ExxonMobil Refinery currently pump approximately 1.13 MMgal/day of non-potable water from their six onsite groundwater wells and their permit allows pumping up to 2.39 MMgal/day.

The ExxonMobil Refinery operates one wastewater treatment system with a maximum capacity of 3,500 gpm or 5.04 MMgal/day but currently discharges at an average flow rate of 3,000 gpm or 4.32 MMgal/day. ExxonMobil's LACSD permit limits the discharge at 10,000 gpm or 14.4 MMgal/day during dry weather and 5,300 gpm or 7.63 MMgal/day during wet weather. The

LACSD permit allows the ExxonMobil Refinery to discharge wastewater into the Dominguez Channel.

5. Ultramar/Valero Refinery

The baseline water use at the Ultramar/Valero Refinery is approximately 2.57 MMgal/day. The majority of the water purchased by the operators of the Ultramar/Valero Refinery is potable water supplied by the LADWP with a small amount (e.g., 0.75 MMgal/day) of reverse osmosis (RO) water supplied by the Air Products Company. The Ultramar/Valero Refinery does not have any groundwater wells. This facility does not currently have access to recycled water. The Ultramar/Valero Refinery is not limited to an amount of water it can purchase.

The Ultramar/Valero Refinery does not have wastewater treatment facility. Two discharge permits, one from LACSB and one from LACSD, contain the same wastewater discharge limit of 1.14 MMgal/day. The wastewater discharges to LACSB's pipe which is connected to LACSD's mainline. Ultramar/Valero's LACSD permit limits the discharge at 2,000 gpm and 1,000 gpm during wet weather.

6. Tesoro Refinery

The baseline water use at Tesoro is approximately 5.76 MMgal/day. Operators of the Tesoro Refinery purchase approximately 1.3 MMgal/day of potable water from the LADWP. The Tesoro Refinery is not limited to an amount of water it can purchase. In addition, operators of the Tesoro Refinery currently pump approximately 4.46 MMgal/day from their three onsite groundwater wells (two wells are located at the refinery and one well is located at the sulfur plant). Because Tesoro's groundwater pumping permit only allows pumping up to 3.06 MMgal/day, Tesoro operators obtain permission to pump the additional 1.4 MMgal/day through lease agreements. This facility does not purchase recycled water.

The Tesoro Refinery operates one wastewater treatment system with a maximum capacity of 6,000 gpm or 8.64 MMgal/day but currently discharges at an average flow rate of 2,215 gpm or 3.19 MMgal/day in dry weather and 2,260 gpm or 3.25 MMgal/day in wet weather. Tesoro's LACSD permit limits the discharge at 10,000 gpm or 14.4 MMgal/day during dry weather and 5,300 gpm or 7.63 MMgal/day during wet weather. The LACSD permit allows the Tesoro Refinery to discharge wastewater into the LACSD Carson Treatment Plant.

7. Rhodia Inc.

The baseline water use at Rhodia is approximately 0.73 MMgal/day. Rhodia purchases approximately 0.58 MMgal/day from CWS with 85 percent going to cooling towers and 15 percent to other water users. The CWS is a retailer that purchases water at wholesale rates from the WBMWD. Rhodia is not limited to an amount of water it can purchase. However, this facility does not purchase recycled water. Rhodia has one groundwater well with water pumping rights of 521 acre-feet per year (169.7 million gallons per year or 0.47 MMgal/day). In Fiscal Year 2008-2009, Rhodia pumped 0.15 MMgal/day of non-potable water from its wells.

Rhodia has an on-site elementary neutralization unit where all wastewater from the facility is pumped into above-ground agitated tanks and sodium hydroxide is added to elevate the pH to above 6.0. This system is jointly regulated by the LACSD and the Los Angeles County Department of Public Works (LADPW) and the wastewater permit is jointly issued by both agencies. For the fiscal year ending June 30, 2008 the peak flow wastewater discharge rate was 387 gpm and the average flow rate was 175 gpm. The wastewater is discharged to the LACSD's sewerage system.

8. ConocoPhillips Carson Plant

The baseline water use at the ConocoPhillips Carson Plant is approximately 2.88 MMgal/day. Operators of the ConocoPhillips Carson plant can pump up to 2.59 MMgal/day from their one operational onsite groundwater well which provides non-potable water[59]. Operators of the ConocoPhillips Carson Plant purchase approximately 0.3 MMgal/day of potable water from the CWS. The CWS is a retailer that purchases water at wholesale rates from the WBMWD. This facility does not purchase recycled water. The ConocoPhillips Carson Plant is not limited to an amount of water it can purchase.

The ConocoPhillips Carson Plant operates a wastewater treatment system that discharges an average of 2.88 MMgal/day. The LACSD permit allows the ConocoPhillips Carson Plant to discharge wastewater to LACSD's sewerage system.

9. BP Wilmington Calciner Plant

The BP Wilmington Calciner Plant purchases approximately 1.08 MMgal/day from the Port of Long Beach. There is no limit on the amount of water the operators of the BP Wilmington Calciner Plant can purchase. The BP Wilmington Calciner Plant has no groundwater wells. This facility does not have access to recycled water.

The BP Wilmington Calciner Plant has an on-site basin to adjust the pH of the wastewater stream. The peak flow wastewater discharge permit limit is 125 gpm and the average flow rate is approximately 93,775 gallons per day. The wastewater is discharged to the LACSB and LACSD's sewerage systems.

10. CPCC Plant

The baseline water use at the CPCC plant is approximately 3.29 MMgal/day. The potable water purchased by the operators of CPCC is supplied by the Riverside Highland Water Company. CPCC is not limited to an amount of water it can purchase. In addition, CPCC has five groundwater wells that pump industrial-use groundwater (non-potable) at a rate of approximately 1.9 MMgal/day. This facility does not have access to recycled water.

CPCC does not have a wastewater treatment plant. Potable waste water is untreated and discharged to septic tank systems on site. Process industrial wastewater is untreated and discharged to percolation ponds on site. The RWQCB for the Santa Ana Region is the wastewater regulator for CPCC. CPCC's wastewater discharge permit allows: 1) 1.05 MMgal/day of cooling water wastes discharged to percolation ponds; 2) 0.45 MMgal/day of slurry wastes to evaporation ponds; and, 3) 8,000 gallons per day of sanitary wastes to subsurface disposal systems (septic tanks).

11. Owens-Brockway Glass Container Inc.

The baseline water use at the Owens-Brockway Glass Container Inc. (Owens-Brockway) is approximately 126,000 gallons per day. The water purchased by the operators of Owens-Brockway is supplied by the City of Vernon. Owens-Brockway does not have any groundwater wells. Owens-Brockway is not limited to an amount of water it can purchase. This facility does not have access to recycled water. Owens-Brockway treats their wastewater by passing it through skimmers to eliminate excess oil. The wastewater discharges to LACSD via the sanitary sewer line under a joint permit issued by the City of Vernon and LACSD. The current wastewater discharge rate is approximately 250 gpm or 360,000 gallons per day.

[59] There are two other non-operational wells at this facility.

Tables 3-10 and 3-11 summarize the water supply sources and wastewater processing data, respectively for each of the affected facilities.

Table 3-10
Facility-Specific Existing Setting Summary for Water Demand

Facility Name	Purchased Water Supplier	Total Baseline Water Use[1] (MMgal/day)	Potable Water Use (MMgal/day)	Recycled Water Use (MMgal/day)	Groundwater Use (MMgal/day)	Groundwater Pumping Permit Allows? (MMgal/day)
BP Carson Refinery[2]	CWS (retailer); WBMWD (wholesaler)	12.5	5.8	2.8	3.9	4.74
ConocoPhillips Wilmington Refinery[3]	LADWP	7.85	5.47	0 (No current access)	2.38	Not provided by the facility
Chevron Refinery	City of El Segundo (retailer); WBMWD (wholesaler)	10.75	2.6	8.15	0 (No wells)	Not applicable
ExxonMobil Refinery[4]	City of Torrance (purveyor); WBMWD (recycled wholesaler)	10.32	3.19	6.0	1.13 (non-potable treated prior to use)	2.29
Ultramar/ Valero Refinery[5]	LADWP (potable); Air Products Company (RO water[6])	2.5	1.75	0.75 (No current access but purchases non-pipelined recycled water)	0 (No wells)	Not applicable
Tesoro Refinery	LADWP	5.76	1.3	0 (No current access)	4.46 (non-potable)	3.06 [7]
Rhodia Inc.	CWS (retailer); WBMWD (wholesaler)	0.73	0.58	0 (No current access)	0.15 (non-potable)	0.47
ConocoPhillips Carson Plant	CWS (retailer); WBMWD (wholesaler)	2.88	0.30	0 (No current access)	2.59 (non-potable treated prior to use)	Not provided by the facility
BP Wilmington Calciner Plant	Port of Long Beach	1.08	1.08	0 (No access)	0 (No wells)	Not applicable
CPCC	Riverside Highland Water Co (potable)	3.29	1.39	0 (No access)	1.9 (industrial, non-potable)	No limit
Owens-Brockway Glass Container Inc.	City of Vernon	0.13	0.13	0 (No access)	0 (No wells)	Not applicable

[1] Total Baseline Water Use = Potable Water Use + Recycled Water Use + Groundwater Use. Baseline data provided by facility operators, unless otherwise noted.

[2] Rhodia is also subject to a 425 gallon per minute (gpm) five-minute peak limit.

TRANSPORTION AND TRAFFIC

The transportation system in Southern California is a complex intermodal network designed to carry both people and goods. It consists of roads and highways, public transit, paratransit, bus and rail, freight railroads, airports, seaports and intermodal terminals. The regional highway system consists of an interconnected network of local streets, arterial streets, freeways, carpool lanes and toll roads. This highway network allows for the operation of private autos, carpools, private and public buses, and trucks. Non-motorized transportation modes, such as bicycles share many of these facilities. The regional public transit system includes local shuttles, municipal and area-wide public bus operations, rail rapid transit operations, regional commuter rail services, and inter-regional passenger rail service. The freight railroad network includes an extensive system of private railroads and several publicly owned freight rail lines serving industrial cargo and goods. The airport system consists of commercial, general, and military aviation facilities serving passenger, freight, business, recreational, and defense needs. The region's seaports support substantial international and interregional freight movement and tourist travel. Intermodal terminals consisting of freight processing facilities serve the function of transfer, storage and distribution of goods. The transportation system supports the region's economic needs as well as the demand for personal travel.

The regional transportation system is currently at capacity operations during peak periods. The highway system shows substantial freeway congestion in the morning and evening peak period, with random episodes of incident-related (i.e. accident) congestion throughout the day. The transit system is experiencing substantial overcrowding on a number of core urban bus routes with significant excess capacity on most off-peak and peripheral routes. Rail transit is very close to capacity during peak hours on the Metro Blue Line, Metro Red Line, and Metro Gold Line, while the Metro Green Line generally has some capacity available. Commuter rail service is at or near capacity during peak periods as the routes approach Union Station in downtown Los Angeles, but suburb-to-suburb capacity is available on most lines.

A state statute requires a Congestion Management Program (CMP) to be developed, adopted, and updated biennially for every county that includes an urbanized area, and shall include every city and the county government within that county. A CMP links transportation, land use, and air quality decisions for one of the most complex urban areas in the country. A CMP also addresses the impact of local growth on the regional transportation system. Elements of the CMP include Highway and Roadway System monitoring, multi-modal system performance analysis, the Transportation Demand Management program, the Land Use Analysis program, and local conformance for all the county's jurisdictions.

In the SCAG region, the CMP is comprised of the combined activities of the Regional Transportation Plan (RTP), the CMP and the Regional Transportation Improvement Program (RTIP). Under California law, CMPs are prepared and maintained by the Congestion Management Agencies (CMAs). The Los Angeles County Metropolitan Transportation Authority (Metro), Orange County Transportation Authority (OCTA), Riverside County Transportation Commission (RCTC), and San Bernardino Associated Governments (SANBAG), are the designated CMAs of each county in the District and are subject to state requirements.

In addition to SCAG's RTP and RTIP, the key elements of the federal Congestion Management Process are addressed through the counties CMPs. Because the magnitude of congestion and degree of urbanization differ among the counties, each CMP differs in form and local procedure. By state law, all CMPs perform the monitoring and management functions shown below which also fulfill the federal CMP requirements.

- Highway Performance – Each CMA monitors the performance of an identified highway system. This monitoring allows each county to track how their system, and its individual components, is performing against established standards, and how performance changes over time.
- Multi-Modal Performance – In addition to highway performance, each CMP contains an element to evaluate the performance of other transportation modes including transit.
- Transportation Demand Management (TDM) – Each CMP contains a TDM component geared at reducing travel demand and promoting alternative transportation methods.

The magnitude of traffic volumes on a particular street represents but one element of hierarchy in an overall circulation system. The system provides a balanced linkage between high traffic corridors and low volume streets. Traffic circulation systems typically consist of local streets, collector streets, secondary arterials, major arterials and freeways. There are a myriad of other categories or names for the components of a circulation system. However, it should be recognized that the classification is not as important as the function to be fulfilled.

The functions of the street categories are as follows:

- **Local Streets** principally provide vehicular, pedestrian, and bicycle access to property abutting the public right-of-way with movement of traffic acting only as a secondary function.
- **Collector Streets** are intended to serve as the intermediate route to handle traffic between local streets and arterials. In addition, collector streets provide access to abutting property.
- **Major and Secondary Arterials** function to connect traffic from collectors to the major freeway system. They move large volumes of automobiles, trucks and buses, and link the principal elements within a city to other adjacent regions.
- **Freeways** are controlled access, high speed roadways with grade separated interchanges intended to expedite movement between distant areas in a metropolitan community or region.

The basic principles of network circulation, using these various functional street types, is important because it establishes the rationale by which the existing circulation systems are evaluated, and by which new proposals should be evaluated in the future. The variety of street types is designed for a specific function to provide adequate service to the community.

In addition to the desired function within the circulation system, the differing roadway classifications should be designed to carry differing amounts of traffic volumes. The capacity of a specific roadway section will be affected by a number of factors, including street width, number of travel lanes, number of crossing arterials and collectors, the number and type of signals, amount of parking, and the number of driveways.

Most of the facilities affected by the proposed project are located within Los Angeles County in the cities of Carson, El Segundo, Torrance, Vernon, and Los Angeles (in the Wilmington district) while one facility is located within San Bernardino County in the City of Colton. In cooperation with these county's CMPs, the individual cities where the affected facilities are located can also establish specific objectives and goals for traffic management.

The following contains a brief description of the existing roadways setting for each of the cities where the affected facilities are located.

City of Carson[60]

The City of Carson is served by the existing network of roadways which is essentially a modified grid system of north/south and east/west roadways. The primary north/south roadways are Figueroa Street, Broadway, Main Street, Avalon Boulevard, Central Avenue, Wilmington Avenue, Alameda Street, and Santa Fe Avenue. The primary east/west streets are Alondra Boulevard, Gardena Boulevard, Artesia Boulevard, Albertoni Street, Walnut Street, Victoria Street, University Drive, Del Amo Boulevard, Carson Street, 223rd Street, Sepulveda Boulevard and Lomita Boulevard. The Artesia Freeway, also referred to as State Route (SR) 91 to the north, the Long Beach Freeway (I-710) to the east, the Harbor Freeway (I-110) to the west and the San Diego Freeway (I-405) provide regional access to the City of Carson. Access to the freeways is provided via an extensive freeway ramp system connecting the City of Carson's major arterials to the freeways.

While the majority of roadways in the City of Carson operate at level of service (LOS) "D" or better, the following three roadway segments currently operate at LOS E or F:

- Wilmington Avenue from 223rd Street to I-405 Freeway (AM/PM Peak);
- Wilmington Avenue from Carson Street to 213th Street (AM Peak);
- 223rd Street from Wilmington Avenue to Alameda Street (PM Peak).

City of Colton[61, 62]

The City of Colton is primarily served by the following two freeways:

- San Bernardino Freeway (I-10) – The San Bernardino Freeway travels east-west across the southern edge of Valley Region in San Bernardino County. This facility provides access to Los Angeles to the west and Arizona and beyond to the east.
- Interstate 215 (I-215) – Interstate 215 provides an alternative route to I-15 through San Bernardino County by splitting from I-15 near Devore and reconnecting south in Riverside County.

The majority of roadways in the City of Colton operate at LOS "D" or better, though there are some roadway segments that currently operate at LOS E or F. The City of Colton is primarily served by the following roadways. The LOS is identified in the AM/PM format.

- Agua Mansa Road – This secondary arterial travels through the southern portion of the City of Colton and provides a connection into Riverside County. (LOS A/A-D)
- Burton Road / Washington Street / Brookside Avenue / Citrus Avenue – This corridor begins at La Cadena Drive in the city of Grand Terrace and continues eastward along the border between the cities of Colton and San Bernardino, where its name is changed to Washington Street. (LOS B-C/C-F)

[60] City of Carson, 2004. City of Carson General Plan Update, Chapter 4 – Transportation and Infrastructure Element. October 11, 2004. http://ci.carson.ca.us/content/files/pdfs/GenPlan/Chapter04.Transportation.pdf

[61] City of Colton, 1993. City of Colton, General Plan, Circulation Element, January, 1993. http://www.ci.colton.ca.us/Documents/Community%20Development/GP%203.0%20Circulation%20Element.pdf

[62] County of San Bernardino, 2007. San Bernardino County 2076 General Plan Program, Final Environmental Impact Report, SCH# 2005101038. http://www.co.san-bernardino.ca.us/landuseservices/General%20Plan%20Update/Environmental%20Review/FEIR.pdf

- Colton Avenue / Inland Center Drive – This primary arterial is located between the cities of San Bernardino and Colton. (LOS B/C)
- San Bernardino Avenue / 4th Street – This roadway extends across a large portion of San Bernardino County and travels through the cities of Montclair, Ontario (as 4th Street), Rancho Cucamonga, unincorporated San Bernardino County, Fontana and Rialto before ending in the City of Colton. (LOS A-D/B-D)
- Valley Boulevard – This facility is a primary arterial that runs parallel to the I-10 Freeway to the north. Beginning just east of Etiwanda Avenue, this roadway continues east through unincorporated San Bernardino County and the Cities of Fontana and Rialto before terminating at Mount Vernon Avenue in the City of Colton. (LOS C-F/C-F)
- La Cadena Drive – La Cadena Drive splits from Mount Vernon Avenue in the City of Colton and continues south to I-10. From I-10, this roadway continues southwest until merging with I-215 at the Riverside County Line. (LOS B-C/C-D)
- Mount Vernon Avenue – Mount Vernon Avenue begins as a secondary arterial at Highland Avenue and travels south through the cities of San Bernardino, Colton and Grand Terrace before entering Riverside County. (LOS A-C/A-D)
- Pepper Avenue – Pepper Avenue begins Baseline Street as a minor arterial in the City of San Bernardino and continues south to Foothill Boulevard where it becomes a secondary arterial. This classification holds for its entire remaining length to Slover Avenue in the City of Colton. (LOS B-D/B-D)
- Reche Canyon Road – This secondary arterial extends southeast from Barton Road in the City of Colton into Riverside County. (LOS F/F)

There are two Class I freight railroads that operate lines in San Bernardino County and that serve the City of Colton as follows: 1) the BNSF Railway (owned by the Burlington Northern Santa Fe Corporation); and, 2) the Union Pacific (UP) Railroad. In addition, there are two Class III railroads are currently operating in San Bernardino County: 1) the Trona Railway; and 2) Arizona & California Railroad. Traffic along the Trona Railway covers over 31 total miles of track, operates near the Town of Trona in the northwestern portion of San Bernardino County. The Arizona & California Railroad covers 134 miles of track and operates along a branch line from the main BNSF Railway line that carries cargo to the Phoenix metropolitan area.

City of El Segundo[63]

The City of El Segundo is served by the existing network of roadways which is essentially a grid system of north/south and east/west roadways. The primary north/south roadways are Aviation Boulevard, Douglas Street, Nash Street, Sepulveda Boulevard, Center Street, Main Street, and Vista Del Mar. The primary east/west streets are Imperial Highway, Imperial Avenue, Maple Avenue, Mariposa Avenue, Grand Avenue, El Segundo Boulevard, and Rosecrans Avenue.

Daily operating conditions of El Segundo's street network were analyzed on each of the arterials designated on the City's Master Plan of Roadways by comparing the average daily traffic volume for each arterial to the estimated daily capacity and developing a corresponding LOS estimate of operating conditions. Most roadways in the City of El Segundo operate at LOS "C" or better while several roadway links operate at LOS "D," which is considered marginally acceptable. These are:

- Aviation Boulevard between Hawaii Street and Rosecrans Avenue

[63] City of El Segundo, 1992. El Segundo General Plan, Chapter - Circulation Element, 2004. http://www.elsegundo.org/civica/filebank/blobdload.asp?BlobID=3023

- Imperial Highway between Main Street and California Street
- Sepulveda Boulevard between El Segundo Boulevard and Rosecrans Avenue
- Sepulveda Boulevard between Mariposa Avenue and Grand Avenue

The following roadway segments operate at LOS "E," which is considered unacceptable:

- Sepulveda Boulevard between Imperial Avenue and Mariposa Avenue
- Rosecrans Avenue between Douglas Street and Aviation Boulevard

While no traffic volumes on any of the roadways in the City of El Segundo exceed LOS E traffic volume thresholds, portions of Rosecrans Avenue and Sepulveda Boulevard carry traffic volumes very close to the threshold.

In addition, several intersections within the City of El Segundo currently operate at unacceptable Levels of Service (LOS). The following intersections currently operate at LOS "E" or "F" during the AM or PM peak hour:

- Sepulveda Boulevard at Imperial Highway (LOS E AM Peak only)
- Sepulveda Boulevard at Mariposa Avenue (LOS E in AM Peak only)
- Sepulveda Boulevard at Grand Avenue (LOS E in both AM and PM Peak)
- Sepulveda Boulevard at El Segundo Boulevard (LOS E in AM Peak, LOS F in PM Peak)
- Sepulveda Boulevard at Rosecrans Avenue (LOS F in PM Peak only)
- Rosecrans Avenue at Aviation Boulevard (LOS E in AM Peak, LOS F in PM Peak)
- Aviation Boulevard at El Segundo Boulevard (LOS E in AM and PM Peak)

During the AM and PM peak hours, at least one movement carries higher volumes than the available capacity at the unsignalized intersection of Douglas Street at Utah Avenue.

City of Los Angeles – Wilmington District

The Wilmington district, based on its established boundaries when incorporated into the City of Los Angeles, is bounded by Lomita Boulevard, the City of Long Beach, the Port of Los Angeles, Gaffey Street and Normandie Avenue. A major freeway in the Wilmington district is the Harbor Interstate 110 Freeway which runs north-south and carries approximately 84,000 vehicles per day. The Harbor Interstate 110 Freeway also provides access to other major freeways including the San Diego Interstate 405 Freeway, the Riverside 91 Freeway, the Santa Ana Interstate 5 Freeway, and the Santa Monica Interstate 10 Freeway. Major streets in the Wilmington district area include Anaheim Street, Pacific Coast Highway, Sepulveda Boulevard and Alameda Street. Alameda Street has been upgraded, expanded and modified to provide a dedicated roadway system for trucks and railcars leaving the Port of Los Angeles and the Port of Long Beach to provide more efficient movement of goods and materials into and out of the port areas. In addition to the freeway system, railroad facilities service the Wilmington district. The area is served by the Union Pacific, and Atchison, Topeka, and Santa Fe Railroads.

The City of Los Angeles prepared a Transportation Improvement and Mitigation Program (TIMP) for the Wilmington-Harbor City Community Plan through an analysis of the land use impacts on transportation. The TIMP establishes a program of specific measures, which are recommended to be undertaken during the life of the Community Plan. The Wilmington-Harbor City Community Plan provides specific objectives and goals for traffic in the area. The City of Los Angeles has a policy that the traffic LOS on the street system in the community should not exceed LOS E and most of the Wilmington-Harbor City's major street intersections are in compliance with this policy. The City of Los Angeles has also prepared a Transportation Demand Management (TDM) program for the Wilmington area that includes: 1) encouragement

of the formation of Transportation Management Associations in order to assist employers in creating and managing trip reduction programs; 2) participation in local and regional TDM programs; 3) continued implementation of the Wilmington-Harbor City TDM which calls for several measures to be taken in developments to achieve trip reduction targets; 4) implementation of the recommendations in the Master Plan for bikeways for the area; 5) encouragement of telecommuting to minimize traffic; 6) encouragement of the development of pedestrian oriented areas; and, 7) development of a parking management strategy[64].

City of Torrance[65]

There are ten CMP intersections in Torrance: Artesia Boulevard at Crenshaw Boulevard and Hawthorne Boulevard, Hawthorne Boulevard at 190th Street and Sepulveda Boulevard, Pacific Coast Highway at Crenshaw Boulevard, Hawthorne Boulevard, and Palos Verdes Boulevard, and Western Avenue at 190th Street, Carson Street, and Sepulveda Boulevard.

The City of Torrance prepared a citywide traffic study and determined that 122 of the 171 study intersections operate at or are forecast to operate at an acceptable LOS D or better during weekend and weekday morning, mid-day and evening peak hours. For intersections that are operated at or are forecast to operate at a deficient LOS, recommended improvements to achieve acceptable LOS are included a part of the City of Torrance's Circulation and Infrastructure Element Implementation Program.

City of Vernon[66]

The City of Vernon lies two miles southeast of the industrial areas of downtown Los Angeles, and both the local roadway and freeway systems directly connect the industrial businesses in Vernon with industrial development in adjacent communities. Key connections include:

- Downtown Los Angeles, via Alameda Street and Santa Fe Avenue;
- The Boyle Heights district of the City of Los Angeles, via Soto Street, Washington Boulevard, and Downey Road;
- The City of Commerce, via Washington Boulevard, Interstate 710, and Atlantic Boulevard;
- The City of Bell, via Bandini Boulevard and Interstate 710;
- The City of Maywood, via Atlantic Boulevard;
- The City of Huntington Park, via Slauson Avenue, Soto Street, Pacific Boulevard, Santa Fe Avenue, and Alameda Street;
- Portions of the City of Los Angeles south of downtown, connected by many streets across the shared boundary of Alameda Street, including Vernon Avenue and Santa Fe Avenue.

Interstate 710 provides a direct connection from the City of Vernon to the ports of Long Beach and Los Angeles. Although less than half a mile of this freeway traverses Vernon, that portion contains the very busy Atlantic Boulevard/Bandini Boulevard interchange. This frequently congested interchange carries a substantial amount of truck traffic from Vernon, particularly from the adjacent Hobart Rail Yard.

CHAPTER 4

ENVIRONMENTAL IMPACTS

INTRODUCTION

The CEQA Guidelines require environmental documents to identify significant environmental effects that may result from a proposed project [CEQA Guidelines §15126.2(a)]. Direct and indirect significant effects of a project on the environment should be identified and described, with consideration given to both short- and long-term impacts. The discussion of environmental impacts may include, but is not limited to: the resources involved; physical changes; alterations of ecological systems; health and safety problems caused by physical changes; and other aspects of the resource base, including water, scenic quality, and public services. If significant adverse environmental impacts are identified, the CEQA Guidelines require a discussion of measures that could either avoid or substantially reduce any adverse environmental impacts to the greatest extent feasible [CEQA Guidelines §15126.4].

CEQA Guidelines indicate that the degree of specificity required in a CEQA document depends on the type of project being proposed [CEQA Guidelines §15146]. The detail of the environmental analysis for certain types of projects cannot be as great as for others. For example, the environmental document for projects, such as the adoption or amendment of a comprehensive zoning ordinance or a local general plan, should focus on the secondary effects that can be expected to follow from the adoption or amendment, but the analysis need not be as detailed as the analysis of the specific construction projects that might follow. As a result, this ~~Draft~~ Final PEA analyzes impacts on a regional level and impacts on the level of individual industries or individual facilities only where feasible.

The categories of environmental impacts to be studied in a CEQA document are established by CEQA [Public Resources Code, §21000 et seq.], and the CEQA Guidelines, as promulgated by the State of California Secretary of Resources. Under the CEQA Guidelines, there are approximately 17 environmental categories in which potential adverse impacts from a project are evaluated. Projects are evaluated against the environmental categories in an Environmental Checklist and those environmental categories that may be adversely affected by the proposed project are further analyzed in the appropriate CEQA document.

POTENTIAL ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Pursuant to CEQA, an Initial Study, including an environmental checklist, was prepared for this project (see Appendix C). Of the 17 potential environmental impact categories, six (aesthetics, air quality, energy, hydrology and water quality, hazards and hazardous materials, and transportation/traffic) were identified as being potentially adversely affected by the proposed project. Three comment letters were received on the Initial Study. These comment letters and responses to the comments can be found in Appendix D of this document.

The six environmental impact areas that were identified as potentially significant in the Initial Study are further evaluated in detail in this ~~Draft~~ Final PEA. The environmental impact analysis for each environmental topic incorporates a "worst-case" approach. This approach entails the premise that whenever the analysis requires that assumptions be made, those assumptions that result in the greatest adverse impacts are typically chosen. This method ensures that all potential effects of the proposed project are documented for the decision-makers and the public. Accordingly, the following analyses use a conservative "worst-case" approach for analyzing the potentially significant adverse environmental impacts associated with the implementation of the proposed project.

While the proposed project is based on reducing SOx RTC holdings from most SOx RECLAIM facilities, the likely possibility is that the affected source categories will reduce actual SOx emissions via physical modifications to FCCUs, SRU/TGUs, sulfuric acid plants, coke calciners, glass melting furnaces, cement manufacturers, and refinery boilers and heaters. SOx controls for FCCUs, SRU/TGUs, refinery boilers and heaters, sulfuric acid manufacturing process, container glass manufacturing process, coke calcining and, cement manufacturing are expected to involve physical changes associated with installing new or modifying existing SOx control equipment at the top 11 SOx-emitting RECLAIM facilities to reduce SOx emissions. These physical changes may cause potentially significant adverse impacts on aesthetics, air quality, energy, hazards and hazardous materials, hydrology and water quality, and transportation/traffic.

Table 4-1 summarizes the equipment/source categories at the affected facilities and shows the proposed SOx emission reductions as they correspond to the proposed BARCT and SOx emission limits in PAR 2002.

Table 4-1
Summary of Key Components in PAR 2002

Equipment/ Source Category	**BARCT**	**Proposed SOx Limit**	**Potential SOx Emission Reductions** (tons/day)
FCCU	WGS or SOx Reducing Additive	5 ppm SOx (3.25 lbs SOx/1000 bbl)	2.88[67]
SRU/TGU	WGS or Selective Oxidation Catalyst	5 ppm SOx (combusted tail gas) & 10 ppm H2S / 300 ppm non-H2S (non-combusted tail gas) (5.28 lbs SOx/hr)	0.73[68]
Sulfuric Acid Mfg.	WGS or Cansolv Unit Upgrade	10 ppm SOx (0.14 lbs SOx/ton acid)	1.03
Coke Calciner	WGS	10 ppm SOx (0.07 lbs SOx/ton coke)	0.28
Glass Melting Furnace	WGS	5 ppm SOx (0.03 lbs SOx/ton glass)	0.19
Cement Kiln	DGS (Limestone Absorber)	5 ppm SOx (0.04 lbs SOx/ton clinker)	0.25
Coal-fired Boiler	DGS (Limestone Absorber)	5 ppm SOx	0[69]
Refinery Boilers/ Heaters	FGT	40 ppm SOx (6.76 lbs SOx/mmscf)	0.85
Total Potential SOx Emission Reductions			**6.21**

Key: WGS = Wet Gas Scrubber; DGS = Dry Gas Scrubber; FGT = Fuel Gas Treatment

[67] The estimated amount of SOx potentially reduced excludes the data for Facility D because installing a WGS is not cost-effective for this facility. However, the estimated amount of SOx potentially reduced includes the data for Facility C because a WGS is already installed.

[68] The estimated amount of SOx potentially reduced excludes the data for Facility E and Facility G because installing a WGS or Selective Oxidation Catalyst system is not cost-effective for these facilities.

[69] This equipment is currently not operating at Facility K.

As shown in Table 4-1, implementation of PAR 2002 is expected to contribute to the overall improvement of air quality in the region by reducing SOx emissions by approximately 6.21 tons per day from affected sources. With the affected sources meeting the requirements of PAR 2002, the proposed project will be consistent with the overall goals and objectives of the 2007 Final AQMP to improve air quality in the Basin and satisfy specific reduction commitments in Control Measure CMB-02: Further SOx Reduction for RECLAIM (CM #2007CMB-02). Therefore, PAR 2002 will contribute to the emission reduction goals of the AQMP and will assist the Basin in maintaining the state and national ambient air quality standards for SO2 and sulfates (SOx) and attaining the state and national ambient air quality standards for PM10 and PM2.5.

There are multiple source categories with multiple approaches to reducing SOx. With so many possibilities or permutations of how operators of SOx RECLAIM facilities could achieve actual SOx reductions, there is no way to predict what each facility operator will do. For this reason, the proposed project analysis is bifurcated into two options to illustrate the worst-case effects of applying the various SOx control technologies along with demonstrating the flexibility that is provided by the RECLAIM program to facility operators when it comes to choosing the methods for reducing SOx emissions. Both options focus on the installation and operation of SOx control technologies for FCCUs, SRU/TGUs, sulfuric acid plants, coke calciners, glass melting furnaces, cement manufacturers, and refinery boilers and heaters. The main differences between Option 1 and Option 2 are: 1) the type of SOx control technique that may be applied to the FCCU source category; and, 2) the environmental impacts that may result from having different SOx control techniques applied to the FCCU source category. However, the type of SOx controls and associated environmental impacts for the remaining source categories will be the same for both Option 1 and Option 2.

The type of emission reduction projects that may be undertaken to comply with PAR 2002 are the main focus of the analysis in this ~~Draft~~ Final PEA. Table 4-2 summarizes the potential SOx control technologies by facility and equipment/source category. It also identifies the facilities and technologies that have been excluded from the proposed project. The types of control equipment (new and modified) considered for each affected source category and facility (referred to by Facility ID number as Facilities A through K) have been compiled based on the facility-specific SOx control engineering studies and analyses conducted by two contracted consultants (ETS Inc. and Nexidea Inc.) as part of the SOx RECLAIM rule development process[70].

[70] On July 11, 2008, the SCAQMD Governing Board approved release of a Request for Proposal to obtain proposals from qualified contractors with technical expertise and experience in SOx emissions control technologies. Two qualified contractors, ETS Inc. and Nexidea Inc., were selected to conduct engineering evaluations and cost estimates on existing commercially viable control technologies to further reduce SOx emissions from 11 SOx RECLAIM facilities. These evaluations resulted in facility-specific information that assisted staff in identifying potential BARCT to be implemented to help the Basin attain the PM2.5 ambient air quality standards.

Table 4-2
Potential SOx Control Technology By Equipment/Source Category

	Included in Proposed Project		Excluded From Proposed Project	
Equipment/ Source Category	**No. of Included Facilities** (Facility ID)	**Number & Type of Potential SOx Control Technologies to be Installed or Modified**	**No. of Excluded Facilities** (Facility ID)	**Reason for Exclusion**
FCCUs (Option 1)	4 (A, B, E & F)	WGSs (4 New)	2 (C & D)	1. Facility C already meets the proposed 5 ppm SOx limit; 2. It is not cost effective to install a WGS at Facility D
FCCUs (Option 2)	5 (A, B, D, E & F)	SOx Reducing Additive (1 new hopper and 4 modified hoppers)	1 (C)	1. Facility C already meets the proposed 5 ppm SOx limit.
SRU/TGUs	3 (A, B, & D)	WGSs (3 New) & Selective Oxidation Catalyst (1 New)	4 (E, F, & G)	1. It is not cost effective to install a Selective Oxidation Catalyst system at Facility E; 2. Facility F currently meets the proposed 5 ppm SOx limit; 3. It is not cost effective to install a WGS at Facility G.
Refinery Boilers/Heaters	6 (A, C, D, E, F, & G)	FGT by Sulfinol Conversion (3 Existing) FGT by Merox Treatment (2 Existing) FGT by Amine Additive (1 Existing)	1 (B)	FGT by Sulfinol Conversion is not cost-effective for Facility B.
Coke Calciner	1 (H)	WGS (1 New)	0	N/A
Glass Melting Furnaces	1 (I)	WGSs (2 New)	0	N/A
Sulfuric Acid Manufacturing	2 (C & J)	WGS (1 New) Cansolv Upgrade (1 Existing)	0	N/A
Cement Kilns	1 (K)	DGS (2) (Limestone Absorber)	0	N/A
Coal-fired Boiler	0	N/A	1 (K)	The coal-fired boiler is not in operation at Facility K.

Table 4-3 summarizes the potential SOx control technologies per source category for each option and Table 4-4 summarizes the potential SOx control technologies per facility for each option.

Table 4-3
Potential SOx Control Technology per Source-Category

Equipment/ Source Category	Proposed Project: Option 1	Proposed Project: Option 2
FCCU	• 4 WGSs for 4 facilities (new)	• SOx Reducing Additives for 5 facilities (1 new and 4 modified)
SRU/TGU	• 3 WGSs for 2 facilities (new) • 1 Selective Oxidation Catalyst system for 1 facility (new)	• 3 WGSs for 2 facilities (new) • 1 Selective Oxidation Catalyst system for 1 facility (new)
Sulfuric Acid Mfg.	• 1 WGS for 1 facility (new) • 1 Upgrade to Existing Cansolv Unit for 1 facility (modified)	• 1 WGS for 1 facility (new) • 1 Upgrade to Existing Cansolv Unit for 1 facility (modified)
Coke Calciner	• 1 WGS for 1 facility (new)	• 1 WGS for 1 facility (new)
Glass Melting Furnace	• 2 WGSs for 1 facility (new)	• 2 WGSs for 1 facility (new)
Cement Kiln	• 2 DGS (Limestone Absorber) for 1 facility (new)	• 2 DGS (Limestone Absorber) for 1 facility (new)
Coal-fired Boiler	Not Applicable	Not Applicable
Refinery Boilers/ Heaters	• 3 FGTs by Sulfinol Conversion for 3 facilities (modified) • 2 FGTs by Merox Treatment Upgrades for 2 facilities (modified) • 1 FGT by Amine Additive for 1 facility (modified)	• 3 FGTs by Sulfinol Conversion for 3 facilities (modified) • 2 FGTs by Merox Treatment Upgrades for 2 facilities (modified) • 1 FGT by Amine Additive for 1 facility (modified)
	• **NEW:** 11 WGSs, 2 DGSs, & 1 Selective Oxidation Catalyst system • **MODIFIED**: 1 Cansolv Unit, 3 FGTs by Sulfinol Conversion, 2 FGTs by Merox Treatment Upgrades, and 1 FGT by Amine Additive	• **NEW:** 7 WGSs, 2 DGSs, 1 SOx Reducing Additive Hopper, & 1 Selective Oxidation Catalyst system • **MODIFIED**: 4 SOx Reducing Additive Hoppers, 1 Cansolv Unit, 3 FGTs by Sulfinol Conversion, 2 FGTs by Merox Treatment Upgrades, and 1 FGT by Amine Additive

Key: WGS = Wet Gas Scrubber; DGS = Dry Gas Scrubber; FGT = Fuel Gas Treatment

Table 4-4
Potential SOx Control Technology per Facility

Facility ID	Proposed Project: Option 1	Proposed Project: Option 2
A	• 1 WGS for FCCU (new) • 1 Selective Oxidation Catalyst system for SRU/TGU (new) • 1 FGT by Sulfinol Conversion (modified)	• 1 SOx Reducing Additive Hopper for FCCU (modified) • 1 Selective Oxidation Catalyst system for SRU/TGU (new) • 1 FGT by Sulfinol Conversion (modified)
B	• 1 WGS for FCCU (new) • 2 WGSs for SRU/TGU (new)	• 1 SOx Reducing Additive Hopper for FCCU (modified) • 2 WGSs for SRU/TGU (new)
C	• 1 FGT by Sulfinol Conversion (modified) • 1 Upgrade to Existing Cansolv Unit for 1 facility	• 1 FGT by Sulfinol Conversion (modified) • 1 Upgrade to Existing Cansolv Unit for 1 facility
D	• 1 WGS for SRU/TGU (new) • 1 FGT by Merox Treatment Upgrade (modified)	• 1 SOx Reducing Additive Hopper for FCCU (new) • 1 WGS for SRU/TGU (new) • 1 FGT by Merox Treatment Upgrade (modified)
E	• 1 WGS for FCCU (new) • 1 FGT by Sulfinol Conversion (modified)	• 1 SOx Reducing Additive Hopper for FCCU (modified) • 1 FGT by Sulfinol Conversion (modified)
F	• 1 WGS for FCCU (new) • 1 FGT by Amine Additive (modified)	• 1 SOx Reducing Additive Hopper for FCCU (modified) • 1 FGT by Amine Additive (modified)
G	• 1 FGT by Merox Treatment Upgrade (modified)	• 1 FGT by Merox Treatment Upgrade (modified)
H	• 1 WGS for calciner (new)	• 1 WGS for calciner (new)
I	• 2 WGSs for glass melting furnaces (new)	• 2 WGSs for glass melting furnaces (new)
J	• 1 WGS for sulfuric acid unit (new)	• 1 WGS for sulfuric acid unit (new)
K	• 2 DGSs for cement kilns (new)	• 2 DGSs for cement kilns (new)
TOTAL: 11 facilities	• **NEW:** 11 WGSs, 2 DGSs, & 1 Selective Oxidation Catalyst system • **MODIFIED**: 1 Cansolv Unit, 3 FGTs by Sulfinol Conversion, 2 FGTs by Merox Treatment Upgrades, and 1 FGT by Amine Additive	• **NEW:** 7 WGSs, 2 DGSs, 1 SOx Reducing Additive Hopper, & 1 Selective Oxidation Catalyst system • **MODIFIED**: 4 SOx Reducing Additive Hoppers, 1 Cansolv Unit, 3 FGTs by Sulfinol Conversion, 2 FGTs by Merox Treatment Upgrades, and 1 FGT by Amine Additive

AESTHETICS

Significance Criteria

The proposed project impacts on aesthetics will be considered significant if:

- The project will block views from a scenic highway or corridor.
- The project will adversely affect the visual continuity of the surrounding area.
- The impacts on light and glare will be considered significant if the project adds lighting which would add glare to residential areas or sensitive receptors.

Project-Specific Construction Impacts: Implementation of the proposed project is expected to result in construction activities at all of the 11 affected facilities, which are complex industrial facilities. The physical changes that are expected focus on the installation of new or the modification of existing control equipment at the following stationary sources of SOx: petroleum coke calciner, cement kilns, container glass melting furnaces, FCCUs, refinery boilers and process heaters, SRU/TGUs, and sulfuric acid manufacturing facilities. As previously summarized in Table 4-2, Option 1 of the proposed project is expected to result in the installation of the following new SOx air pollution control equipment: 11 WGSs, two DGSs, and one Selective Oxidation Catalyst system. In addition, Option 1 of the proposed project is expected to result in the modification of the following existing SOx air pollution control equipment: one Cansolv unit, three FGTs by Sulfinol conversion, two FGTs by Merox treatment upgrades, and one FGT by amine additive. Option 2 of the proposed project is expected to result in the installation of the following new SOx air pollution control equipment: seven WGSs, two DGSs, one SOx reducing additive hopper, and one Selective Oxidation Catalyst system. In addition, Option 2 of the proposed project is expected to result in the modification of the following existing SOx air pollution control equipment: four SOx reducing additive hoppers, one Cansolv unit, three FGTs by Sulfinol conversion, two FGTs by Merox treatment upgrades, and one FGT by amine additive.

Due to the large size profiles of the affected equipment involved for both Options 1 and 2, the construction activities that may be associated with installing new or modifying existing SOx control equipment are expected to require the use of heavy-duty construction equipment, such as cranes, which may be visible to the surrounding areas and temporarily change the skyline of the affected facilities, depending on where they are located within each facility's property. Except for the use of cranes, the majority of the construction equipment is expected to be low in height and not substantially visible to the surrounding area due to existing fencing along the property lines and existing structures currently within the facilities that would buffer the views of the construction activities.

Because each affected facility is located in heavy industrial areas, the construction equipment is not expected to be substantially discernable from what exists on-site for routine operations and maintenance activities. Further, the construction activities are not expected to adversely impact views and aesthetics resources since most of the heavy equipment and activities are expected to occur within the confines of each existing facility and are expected to introduce only minor visual changes to areas outside each facility, if at all, depending on the location of the construction activities within the facility.

Lastly, the construction activities are expected to be temporary in nature and will cease following completion of the equipment installation or modifications. All construction equipment will be removed following completion of the proposed project. For these reasons, the construction

activities are not expected to affect the visual continuity of the surrounding areas. Thus, adverse visual continuity aesthetics impacts during construction are expected to be less than significant.

There are no components in the proposed project that would require construction activities to occur at night. Therefore, no additional lighting at the affected facilities would be required as a result of complying with the proposed project. However, if facility operators determine that the construction schedule requires nighttime activities, temporary lighting may be required. Nonetheless, since construction of the proposed project would be completely located within the boundaries of each affected facility, additional temporary lighting is not expected to be discernable from the existing permanent night lighting. Therefore, less than significant impacts to light and glare during construction are expected from the proposed project.

Overall, the aesthetics impacts are expected to be less than significant during construction for the proposed project.

Project-Specific Operation Impacts: Of the technologies proposed as BARCT for SOx control, only WGSs were identified as having the potential to generate adverse aesthetic operational impacts. WGS technology is potentially BARCT for four FCCUs under Option 1 but not for Option 2 which relies on SOx reducing additives. For both Options 1 and 2, WGS technology is also potentially BARCT for three SRU/TGUs, one sulfuric acid manufacturing plant, one coke calciner plant, and one container glass manufacturing plant. Under Option 1 of the proposed project, a maximum of 11 new WGSs could potentially be installed. Similarly, under Option 2, of the proposed project, a maximum of seven new WGSs could potentially be installed.

DGSs, FGTs, SOx reducing additives, and selective oxidation catalyst injection systems that, if installed (or modified) and operated, would be expected to blend in with the existing industrial profile at the affected facilities. However, operation of one WGS is expected to generate a substantial, continuous steam plume that is white in appearance. A steam plume is generated as the result of using water to reduce particulate emissions in the WGS, and consists of water vapor and clean, but warm flue gas in the exit stream of the scrubber. As a result of atmospheric changes in temperature and humidity, the vapor plume is expected to be smaller on warm, dry days and larger on cool, damp days. Under certain atmospheric conditions, the steam plume from a WGS could extend as much as 1,500 feet in length from a relatively high flue gas stack at approximately 200 feet above grade. As the vapor travels away from the stack, the plume will eventually evaporate and become clear.

As a point of comparison, other equipment operating at these industrial facilities routinely generates steam plumes on a similar scale as part of their day-to-day operations (e.g., cooling towers, cogeneration plants, etc.). In addition, the refineries, the coke calciner and the sulfuric acid plants are located near the Ports of Los Angeles and Long Beach whose facilities, such as the Harbor Cogeneration Plant and the Long Beach SERRF, routinely generate multiple steam plumes. If any WGS is installed as part of the proposed project under Option 1 or Option 2 at any of the affected facilities, the steam plume, though visible, is not expected to significantly adversely affect the visual continuity of the surrounding area of each affected facility because no scenic highways or corridors exist within the areas of the refineries, the coke calciner, the sulfuric acid plants and the glass melting plant. Further, the visual continuity of the surrounding area is not expected to be adversely impacted because each WGS, if constructed, will be built within the confines of industrial areas and would be visually consistent with the profiles of the

existing affected facilities. Thus, even if each WGS could be visible, depending on the location within each property boundary, the aesthetic significance criteria would not be exceeded.

Additional permanent light sources may be installed on any installation of new equipment, to provide illumination for operations personnel at night, in accordance with applicable safety standards. Similarly, any existing equipment that would be modified as part of the proposed project are located in existing structures or areas that already have lighting systems in place for the same reasons. These additional light sources are not expected to create an impact because each component of the proposed project will be located within an existing industrial facility that operates up to 24 hours per day and the equipment is not restricted to operate during a specific time of day. The proposed project contains no provisions that would require the affected equipment to operate differently during existing daytime or nighttime operations. Further, any new lighting that will be installed on the proposed equipment will be consistent in intensity and type with the existing lighting on equipment and other structures within each affected facility. While residential areas are located near some of the affected facilities, any additional lighting will be placed by and focused on the new equipment. For the aforementioned reasons, the proposed project is not expected to create a new source of substantial light or glare that would adversely affect day or nighttime views in the area. Therefore, less than significant impacts to light and glare during operation are expected from the proposed project.

Overall, the aesthetics impacts are expected to be less than significant during operation for the proposed project.

Project-Specific Mitigation: No significant adverse impacts associated with aesthetics are expected from the proposed project during construction or operation, so no mitigation measures are required.

Level of Significance After Mitigation: The analysis concluded that the aesthetic impacts from implementing the proposed project are considered to be adverse, but not significant because even though they may be visible to the surrounding community depending on their location, the new WGSs structures and corresponding steam plume will be consistent with the heavy industrial surroundings and profile at each of the affected facilities.

Cumulative Aesthetics Impacts: Because the project-specific aesthetic impacts do not exceed any applicable significance thresholds, they are not considered to be cumulatively considerable pursuant to CEQA Guidelines §15064 (h)(1) and therefore, do not generate significant adverse cumulative aesthetics impacts.
Cumulative Mitigation Measures: None required.

AIR QUALITY

Significance Criteria

To determine whether air quality impacts from adopting and implementing the proposed project are significant, impacts will be evaluated and compared to the following criteria. If impacts exceed any of the significance thresholds in Table 4-5, they will be considered significant. All feasible mitigation measures will be identified and implemented to reduce significant impacts to the maximum extent feasible. The proposed project will be considered to have significant adverse air quality impacts if any one of the thresholds in Table 4-5 are equaled or exceeded.

The SCAQMD makes significance determinations for construction impacts based on the maximum or peak daily emissions during the construction period, which provides a "worst-case" analysis of the construction emissions. Similarly, significance determinations for operational emissions are based on the maximum or peak daily allowable emissions during the operational phase.

Air Quality Impacts

While the proposed project is based on reducing SOx RTC holdings from most SOx RECLAIM facilities, the possibility that the affected source categories may reduce actual SOx emissions via physical modifications to FCCUs, SRU/TGUs, sulfuric acid plants, coke calciners, glass melting furnaces, cement manufacturers, and refinery boilers and heaters must also be considered. Thus, the portion of the proposed project that is the main focus of this analysis is bifurcated into two options, with both options primarily focusing on the installation and operation of SOx control technologies for FCCUs, SRU/TGUs, sulfuric acid plants, coke calciners, glass melting furnaces, cement manufacturers, and refinery boilers and heaters. The main difference between Option 1 and Option 2 is the type of SOx control that may be applied to the FCCU source category. The remaining source categories and the type of SOx controls will be the same for both Option 1 and Option 2. Tables 4-3 and 4-4 summarize the potential SOx control technologies per source category and per facility, respectively, for each option.

Potentially significant impacts that may result from implementing the proposed project are related to the construction activities associated with installing the SOx controls for these equipment/source categories. Specifically, the physical changes involved with the type of construction activities that may occur focus mainly on the modification of existing equipment by installing new SOx controls or modifying existing SOx controls. Under Option 1 of the proposed project, 11 new WGSs, two new DGSs, and one new selective oxidation catalyst system could be installed and seven existing SOx control systems by converting existing FGT amine absorbers to using Sulfinol, treating coker gas with Merox, supplementing existing amine additives with other proprietary amines, or upgrading an existing Cansolv unit could be modified.

Similarly, under Option 2 of the proposed project, seven new WGSs, two new DGSs, one new SOx reducing additive hopper, and one new selective oxidation catalyst system could be installed. In addition, Option 2 of the proposed project could result in the modification of four SOx reducing additive hoppers. Lastly, as is the case under Option 1, the following existing SOx air pollution control equipment will be modified under Option 2 of the proposed project: one Cansolv unit, three FGTs by Sulfinol conversion, two FGTs by Merox treatment upgrades, and one FGT by amine additive.

Table 4-5
SCAQMD Air Quality Significance Thresholds[71]

Mass Daily Thresholds		
Pollutant	**Construction**	**Operation**
NOx	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM10	150 lbs/day	150 lbs/day
PM2.5	55 lbs/day	55 lbs/day
SOx	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Lead	3 lbs/day	3 lbs/day
Toxic Air Contaminants and Odor Thresholds		
Toxic Air Contaminants (TACs) Accidental Release of Acutely Hazardous Materials (AHMs)	MICR $\geq$ 10 in 1 million ; HI $\geq$ 1.0 (project increment) CAA §112(r) threshold quantities	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	
Ambient Air Quality for Criteria Pollutants [(a)]		
NO2 1-hour average annual average	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.25 ppm (state) 0.053 ppm (federal)	
PM10 24-hour average annual geometric average annual arithmetic mean	10.4 $\mu g/m^3$ (construction)[(b)] & 2.5 $\mu g/m^3$ (operation) 1.0 $\mu g/m^3$ 20 $\mu g/m^3$	
PM2.5 24-hour average	10.4 $\mu g/m^3$ (construction)[(b)] & 2.5 $\mu g/m^3$ (operation)	
Sulfate 24-hour average	1 ug/m^3	
CO 1-hour average 8-hour average	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 20 ppm (state) 9.0 ppm (state/federal)	

(a) Ambient air quality thresholds for criteria pollutants based on SCAQMD Rule 1303, Table A-2 unless otherwise stated.

(b) Ambient air quality threshold based on SCAQMD Rule 403.

KEY: MICR = maximum individual cancer risk; HI = Hazard Index; ug/m^3 = microgram per cubic meter; ppm = parts per million; AHM = acutely hazardous material; TAC = toxic air contaminant

[71] CEQA Air Quality Handbook, SCAQMD, November 1993.

Of the differing control equipment likely to be installed or modified, preliminary analysis showed that WGS installation had the greatest potential for generating potentially significant adverse impacts for an individual project. Thus, construction of a WGS is considered the worst-case scenario and is the primary focus of construction analysis in this ~~Draft~~ Final PEA.

Based on the proposed SOx emission limits as outlined in Table 4-1 and the facility-specific data in Table 4-4, either Option 1 or Option 2 of the proposed project could potentially reduce up to 6.21 tons per day of SOx emissions from four FCCUs via Option 1 or five FCCUs via Option 2; three SRU/TGUs; one sulfuric acid plant; one coke calciner; two glass melting furnaces; and, 15 refinery boilers and heaters. In order to achieve the overall net air quality benefit from implementing the proposed project, some of the affected facility operators may choose to modify existing equipment by retrofitting with air pollution control equipment or modifying existing control equipment in order to comply with the SOx emission standards.

Consequently, reducing SOx emissions from the affected facilities will provide an air quality benefit in the near- and long-term. Direct air quality impacts from the proposed project are expected to result in a reduction of SOx at the affected facilities, which will provide air quality and human health benefits to the public.

The environmental analysis assumes that installation of SOx control technologies for the affected sources will reduce SOx emissions overall, but construction activities associated with both the installation of new control devices and the modification of existing control devices will create secondary air quality impacts (e.g., emissions), which can adversely affect local and regional air quality. A project generates emissions both during the period of its construction and through ongoing daily operations. During installation or modification of add-on air pollution control devices, emissions may be generated by onsite construction equipment and by offsite vehicles used for worker commuting. After construction activities are completed, emissions may be generated by the operation of the add-on air pollution control devices (as greenhouse gases) and offsite vehicles used for delivering fresh materials needed for operations (e.g., fresh catalyst, caustic, amine, etc.) and hauling away solid waste for disposal or recycling (e.g., spent catalyst).

The air quality analysis in this document focuses on the installation of new WGS equipment as most of the affected facilities are expected to install WGSs (11 new units are assumed under Option 1 and seven are assumed under Option 2). Also, when compared to the other potential control technologies that may be employed (DGS, FGT, SOx reducing catalyst, or selective oxidation catalyst), WGS installation is expected to result in the greatest amount of construction emissions for an individual project. To estimate the "worst-case" construction- and operational-related emissions associated with installing WGSs in order to implement the proposed project, assumptions were made that are mostly based on one local refinery's experience with installing a WGS on its FCCU, to estimate combustion emissions from construction emissions onsite, off-site on-road emissions from worker trips and deliveries, on-site fugitive dust emissions, and operational emissions[72]. Refer to Appendix B for the assumptions used to estimate secondary construction- and operational-related air quality impacts.

Implementation of the proposed project is expected to result in direct air quality benefits from the anticipated SOx emission reductions of approximately 6.21 tons per day by 2019. In order to

[72] ConocoPhillips Los Angeles Refinery PM10 and NOx Reduction Projects, Final Environmental Impact Report, SCH No. 2006111138, April 2007.

achieve these benefits, construction associated with the installation of new SOx control equipment or the modifications of existing SOx control equipment would be expected to occur anytime between the adoption of the proposed project in 2010 and January 1, 2019. From a construction point of view, the installation of a WGS is a rather complex process. If a facility operator chooses to install a WGS, 18 months will be needed for pre-construction/advance planning activities such as engineering analysis of the affected equipment, engineering design of the potential control equipment, contracting with a vendor, securing financing, ordering and purchasing the equipment, obtaining permits and clearances, and lining up contractors and workers.

To physically build a WGS, an additional 18 months would be needed. Depending on where the new WGS will be sited will determine if any demolition activities would be required. For this analysis, to be conservative, one month of demolition activities is assumed to occur at each affected facility and an additional 17 months is assumed for site preparation, assembly and installation of the unit and ancillary support equipment, preparation of the affected unit for a turnaround/shutdown, and tying-in the new WGS to the affected equipment.

The decision when construction would commence between 2010 and 2019 is also dependent upon the turnaround schedule of the affected equipment; once construction of the control equipment is completed, it will need to be "tied-in" to the main equipment prior to start-up which typically occurs during a scheduled turnaround period.

The overall objective of the proposed project is to reduce SOx emissions. However, in consideration of the complexity involved with operating FCCUs, SRU/TGUs, refinery boilers and heaters, sulfuric acid manufacturing, container glass manufacturing process, coke calcining, and, portland cement manufacturing, the equipment operators utilize a combination of various emission control equipment and techniques to control not only SOx, but NOx, CO, PM10, PM2.5, and ammonia slip, as applicable, while maintaining overall efficiency. As there is no way to fully predict on a case-by-case basis what each facility operator will do to comply with the proposed project, the estimates in this analysis will be based on the estimates provided by the consultant reports prepared for each affected facility combined with the assumptions applied to the ConocoPhillips WGS project because controlling SOx emissions via a WGS has been shown to result in the greatest amount of construction and operational emissions and, thus, represents the "worst-case." Further, if a particular technology was identified as having a cost that exceeds $50,000 per ton for a particular facility, this CEQA analysis excluded the emission estimates for that facility.

For any facility operator that plans to undergo construction to install SOx control equipment, and prior to receiving any permit to construct from the SCAQMD, a site-specific CEQA analysis in addition to this ~~Draft~~ Final PEA may also be necessary depending on how much the construction (i.e., demolition, site grading, etc.) would be involved and if the analysis varies from the assumptions in this document. For these reasons, the timing of constructing four WGSs is conservatively estimated to occur over the same 18-month period, at the earliest in 2012. This means that any on-road or off-road emission factors applied to calculate construction and operational impacts will be for fleet year 2012.

However, since it is difficult to predict what each facility owner/operator will do, in reality, the actual number of SOx control equipment installed for the entire project may be less. Each facility operator will need to conduct a case-by-case analysis to determine the best approach for

their facility and affected equipment. Further, the potential for installing new equipment will depend on available space, location of the affected equipment and the proximity to the proposed control equipment and utilities distribution infrastructure. Lastly, facility operators will need to take into account the turnaround schedule of each affected equipment to appropriately time construction and operational tie-in activities. Ultimately, the action taken and type of SOx control equipment to be installed in response to the proposed project will depend on each facility's individual operational needs.

To conduct a conservative "worst-case" analysis, this document examines the possibility that the affected facility operators will install SOx control equipment, including but not limited to exhaust stacks, cooling units, injection support equipment for catalyst, amine, or sorbents including the associated storage vessels, associated piping designs, pumps, plus other ancillary equipment, as applicable. As a practical matter, construction activities that are anticipated to occur as a result of implementing the proposed project would likely occur prior to a scheduled maintenance (e.g., turnaround) of the affected unit.

Typically construction projects have staggered construction schedules which take into account design and engineering, ordering, purchasing and delivery of equipment, permitting and environmental review, availability of construction crews, budgeting, and any other construction projects on site. However, due to the lengthy construction time necessary to build one WGS (18 months), the construction activities of other WGSs at other affected facilities could overlap. However, because of widely varying turnaround schedules of affected equipment within any given facility and based on past construction projects involving major construction equipment where the SCAQMD was the lead agency, the analysis in this PEA includes a conservative assumption that up to four WGSs could be installed within the same 18-month timeframe.

Assumptions

As part of installing a WGS, heavy-duty construction activities or equipment, major construction activities and operational maintenance requirements are anticipated. To estimate what the impacts would be for installing a WGS, the following general assumptions were made to determine the peak daily construction emissions:

- Under Option 1, 11 units may be retrofitted with one WGS each at eight facilities by December 31, 2018.
- Under Option 2, seven units may be retrofitted with one WGS each at five facilities by December 31, 2018
- Two units may be retrofitted with two DGSs at one facility by December 31, 2018. (For the construction air quality analysis, the assumptions relied upon for WGSs will also be applied to DGSs.)
- Under Option 1, one facility may have a maximum of three WGSs installed and two facilities may have a maximum of two WGSs installed at each facility.
- Under Option 2, two facilities may have a maximum of two WGSs installed at each facility.
- Installation of one WGS is estimated to take 18 months (one month for demolition plus 17 months for construction).
- For a "worst-case" analysis, four WGSs will be installed within in the same 18-month timeframe.

- For all other construction activities associated with installing a new selective oxidation catalyst system, modifying an existing Cansolv system, or modifying FGTs by Sulfinol, Merox or amine upgrades, the peak daily construction emissions associated with each these individual activities or overlapping are assumed to be less than the peak daily construction emissions associated with installing four WGS during the same 18-month period.
- As a practical matter, the earliest construction could begin would be approximately 18 months after adoption of the proposed project, in construction year 2012. Therefore, for a conservative construction analysis, the on-road and off-road emission factors will be based on the 2012 fleet year.

In addition, based on past experience with construction and operational data from previously analyzed projects, the following assumptions were made for the construction and operational phases:

Assumptions for Phase I – Demolition

The site where the new SOx control equipment may be located could be occupied by other equipment on-site. To remove any existing equipment or structures and prepare the site for the new equipment, the following assumptions are made with regard to demolition activities:

- Demolition activities are assumed to take approximately one month (five days per week at 10 hours per day) with a crew of 50 workers.
- Demolition activities are assumed to require the use of: one crane, one front-end loader, one forklift, one demolition hammer, one water truck, and one medium-duty flatbed truck.
- To provide a "worst-case" analysis, it is assumed that each facility will have its own demolition crew and equipment.

Assumptions for Phase II – Construction of One WGS

- Construction activities are assumed to take approximately 17 months (five days per week at 10 hours per day) with a crew of 175 workers. This construction schedule also includes the time needed for installing ancillary support equipment.
- The construction of each WGS is assumed to require the use of: one backhoe, two cranes, three manlifts, one forklift, one generator, three diesel welding machines, one medium-duty flatbed truck, one medium-duty dump truck, and one cement mixer.
- To provide a "worst-case" analysis, it is assumed that each facility will have its own construction crew and equipment.
- In addition to the WGS, the following ancillary equipment will also be installed: one 10,000 gallon caustic storage tank, one 9,000 gallon clarifier tank, one 11,000 gallon oxidation tank, one 8,000 gallon wet fines tank, one 100 gallon sump, and multiple pumps and piping connections.

Assumptions for Phase III – Operation of One New WGS

- The WGS will need a turnaround once every five years.
- The caustic tank will need refilling one truck load per week. The capacity of one caustic tank truck is approximately 6,000 gallons per delivery. The caustic is 50 percent aqueous and arrives as a pre-mixed liquid.

- Wet solids collected from the wet fines tank will be off-loaded into a vacuum truck that will be emptied twice a week. The collected wet solids will be sent either to a cement plant for recycling or a Class III landfill for disposal.
- Dry solids will be collected in roll-off bins that will be emptied once a week. The collected dry solids will either be sent to a cement plant for recycling or a Class III landfill for disposal.

Construction Emissions

Construction-related emissions can be distinguished as either onsite or offsite. Onsite emissions generated during construction principally consist of exhaust emissions (NOx, SOx, CO, VOC, PM2.5 and PM10) from heavy-duty construction equipment operation, fugitive dust (primarily as PM10) from disturbed soil, and VOC emissions from asphaltic paving and painting. Offsite emissions during the construction phase normally consist of exhaust emissions and entrained paved road dust (primarily as PM10) from worker commute trips, material delivery trips, and haul truck material trips to and from the construction site.

In general, limited construction emissions from site preparation activities, which may include earthmoving/grading, are anticipated because the sites, typically, have already been graded and paved. Further, operators at each affected facility who construct a new caustic storage tank will need to build a containment berm large enough to hold 110 percent of the tank capacity in the event of an accidental release. Because of space limitations within each affected facility, installation of a new WGS is likely to occupy the space of previous equipment. Therefore, demolition activities would be expected prior to the installation of the WGS to remove any existing equipment or structures (as applicable), remove the old piping and electrical connections, and break up the old foundation with a demolition hammer. For these reasons, digging, earthmoving, grading, slab pouring, or paving activities are anticipated.

The type of construction-related activities attributable to installing a new WGS would consist predominantly of deliveries of steel, piping, wiring, caustic solution, and other materials, maneuvering the materials within the site via a crane, forklift or truck, and welding. If a new foundation is not needed, to establish footings or structure supports, some concrete cutting and digging may be necessary in order to re-pour new footings prior to building above the existing foundation.

PROJECT-SPECIFIC CONSTRUCTION IMPACTS: The implementation of the proposed project is anticipated to trigger construction activities associated with the installation of new WGSs. Construction activities associated with the proposed project would result in emissions of VOC, NOx, SOx, CO PM10, and PM2.5. Significance determinations are based on the maximum peak daily emissions during the construction period for four WGSs being built within the same 18-month period, which provides a "worst-case" analysis of the anticipated construction emissions. Construction emissions are expected from the following equipment and processes:

Construction equipment (i.e., fork lifts, man lifts, cranes, front end loaders, generators, backhoes, cement trucks, jack hammers and welders, etc.)
Equipment delivery and on-site travel (includes fugitive dust associated with travel on paved roads)
Heavy-duty diesel trucks
Construction workers commuting
Fugitive dust associated with building caustic containment berms

Using a 1.0 average vehicle ridership, the construction worker labor force would be approximately 50 workers for demolition and 175 workers for construction activities associated with the installation of one WGS. Each worker would generate two one-way vehicle trips per day. Construction worker's travel emissions are based on assuming an estimated 30-mile round trip each day per vehicle (two start-ups per day). The total peak daily emissions that would be attributed to all construction-related activities for the installation of one WGS are approximately 22 pounds of VOC, 115 pounds of CO, 116 pounds of NOx, 40 pounds of PM10, and 13 pounds of PM2.5 (see Table 4-6). These numbers include the truck emissions associated with delivering the 50 percent caustic solution to initially fill the storage tank. Peak construction emissions from the proposed project are calculated based on on-road and off-road vehicle fleet year 2012 because this is the earliest possible year construction could occur when taking into consideration the timing of adopting the proposed project combined with the substantial lead time necessary to engineer the design of a WGS for an affected facility. Should construction occur in later years, the emission factors will not be as conservative as would be for year 2012, since newer fleets are expected to have reduced emissions when compared to older fleets.

Table 4-6 presents the results of the SCAQMD staff's construction air quality analysis and lists the total daily construction emissions from construction worker trips and use of equipment for the installation of one WGS and the overlapping construction of four WGSs, respectively. For the installation of one WGS, the calculations show the total daily construction emissions exceed the SCAQMD's CEQA air quality significance threshold of 100 pounds of NOx per day. For the simultaneous construction of four WGSs, the calculations show the total daily construction emissions exceed the SCAQMD's CEQA air quality significance thresholds of 100 pounds of NOx per day, 75 pounds of VOC per day, and 150 pounds of PM10 per day. Appendix B contains the spreadsheets with the results, assumptions, and methodologies used by the SCAQMD staff for this analysis.

Table 4-6
Peak Daily "Worst-Case" Construction Emissions
from the Installation of WGS Technology in 2012 or later

Peak Construction Activity	VOC (lbs/day)	CO (lbs/day)	NOx (lbs/day)	SOx (lbs/day)	PM10[1] (lbs/day)	PM2.5[1] (lbs/day)

[1] The fugitive dust analysis for PM10 and PM2.5 assumes watering disturbed sites two times per day to comply with SCAQMD Rule 403 – Fugitive Dust.

PROJECT-SPECIFIC CONSTRUCTION MITIGATION: The VOC, NOx, and PM10 emissions exceed the applicable significance thresholds during construction. As a result, the proposed project is expected to have significant adverse construction air quality impacts. If significant adverse environmental impacts are identified in a CEQA document, the CEQA document shall describe feasible measures that could minimize the significant adverse impacts (CEQA Guidelines §15126.4). Mitigation measures focus on the construction emissions of VOC, NOx, and PM10 emissions. Therefore, feasible mitigation measures to reduce emissions associated with construction activities at the affected facilities are necessary to control emissions from heavy construction equipment and worker travel. The following construction mitigation measures are required for each of the affected facilities.

<u>On-Road Mobile Sources</u>

AQ-1 Develop a Construction Emission Management Plan for each affected facility to minimize emissions from vehicles including, but not limited to: consolidating truck deliveries; scheduling deliveries to avoid peak hour traffic conditions; describing truck routing; describing deliveries including logging delivery times; describing entry/exit points; identifying locations of parking; identifying construction schedule; and prohibiting truck idling in excess of five consecutive minutes or another time-frame as allowed by the California Code of Regulations, Title 13 §2485 - CARB's Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling.

Off-Road Mobile Sources

AQ-2 Suspend all construction activities that generate air pollutant emissions during first stage smog alerts.

AQ-3 Prohibit construction equipment from idling longer than five minutes.

AQ-4 Use electricity or alternate fuels for on-site mobile equipment instead of diesel equipment to the extent feasible.

AQ-5 Tune-up construction equipment and maintain a two- to four-degree retard diesel engine timing, to the extent feasible.

AQ-6 Use electric welders to avoid emissions from gasoline or diesel welders in portions of the project sites where electricity is available.

AQ-7 Use on-site electricity rather than temporary power generators in portions of the project sites where electricity is available.

AQ-8 Prior to use in construction, each project applicant will evaluate the feasibility of retrofitting the large off-road construction equipment that will be operating for substantial periods. Retrofit technologies such as particulate traps, selective catalytic reduction, oxidation catalysts, air enhancement technologies, etc., will be included in the evaluation. These technologies will be required if they are certified by CARB and/or USEPA and are commercially available and can feasibly be retrofitted onto construction equipment.

Operational Emissions

PROJECT-SPECIFIC OPERATIONAL IMPACTS: The objective of the proposed project is to reduce SOx emissions from equipment operated by the top RECLAIM emitters. The benefits of full implementation of the proposed project (i.e., after construction activities are completed) are the decrease of SOx emissions by approximately 6.21 tons per day by the year 2019. Implementation is expected to be achieved by either installing new SOx control equipment (e.g., WGS, DGS, or a selective oxidation catalyst system) or modifying existing equipment (e.g., Cansolv unit and existing FGT systems).

The operational-related activities are simultaneously expected to reduce SOx emissions while generating emissions from specific mobile sources and stationary source equipment. As no additional employees are anticipated to be needed to operate any new or modified SOx control equipment, the existing work force per affected facility is expected to be sufficient. As such, no workers' travel emissions are anticipated for the operation of the new or modified SOx control equipment. However, there will be haul truck emissions associated with hauling away solid waste (i.e., collected wet fines) and delivering supplies (i.e., fresh catalyst and caustic solution to refill the storage tanks) on a regular basis.

The offsite truck hauling and deliveries principally consist of exhaust emissions (NOx, SOx, CO, VOC, PM10, and PM2.5) from the operation of hauling and delivery vehicles to and from each affected facility. Once constructed, all of the affected facilities will have some sort of

operational truck trips associated with hauling additional solid waste away, or delivering additional supplies. For example, truck trips would be needed to have additional fresh catalyst delivered, wet fines hauled for disposal or recycling, and caustic storage tanks refilled. The worst-case annual mileage has been estimated based on the consultants' projections of solid waste disposal and the varying fresh supply needs for each facility and converted to peak daily values.

The proposed project will result in an increase of VOC, CO, NOx, PM10 and PM2.5 operational emissions produced from additional truck hauling and deliveries necessary to accommodate the additional solid waste generation and increased use of supplies such as catalyst and caustic. Table 4-7 summarizes the increase in peak operational emissions due to the anticipated increase in truck hauling and deliveries as a result of implementing either Option 1 or Option 2 of the proposed project. Based on the assumption that the earliest construction can occur would be in 2012 and with 18 months needed for construction, the peak operational emission increases are assumed to occur in 2013 at the earliest and all operational emission increases are expected to occur by the end of year 2018 because the compliance date of the proposed project is January 1, 2019.

The total daily operational emissions do not exceed any of SCAQMD's CEQA air quality operation emissions significance thresholds. In addition, based on the fact that the proposed project overall is expected to generate a net reduction in SOx emissions during operation, less than significant adverse air quality impacts are expected as a result of implementing the proposed project. Appendix B contains the spreadsheets for the proposed project with the results based on the assumptions used by the SCAQMD staff for this analysis.

Table 4-7
Summary of Peak Daily "Worst-Case" Operational Emissions for Options 1 and 2

Operational Activity	VOC (lbs/day)	CO (lbs/day)	NOx (lbs/day)	SOx (lbs/day)	PM10 (lbs/day)	PM2.5 (lbs/day)
OPTION 1: Offsite Truck Delivery of Fresh Supplies & Removal of Solid Waste	1	5	15	0	1	1
SIGNIFICANCE THRESHOLD	55	550	55	150	150	55
SIGNIFICANT?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**
OPTION 2: Offsite Truck Delivery of Fresh Supplies & Removal of Solid Waste	**1**	**4**	**13**	**0**	**1**	**1**
SIGNIFICANCE THRESHOLD	**55**	**550**	**55**	**150**	**150**	**55**
SIGNIFICANT?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**

Emission sources associated with the operational-related activities as a result of implementing the proposed project may emit toxic air contaminants. For example, caustic is used in the operation of a WGS and some FGT applications. With the potential for the installation of 11 WGSs plus two FGT modifications under Option 1 and seven WGSs plus two FGT modifications under Option 2, that means a maximum of 13 caustic storage tanks under Option 1

and nine caustic storage tanks under Option 2 may be installed. There are several types of caustic solutions that can be used in WGS operations, but sodium hydroxide (NaOH) is the most commonly used. NaOH is a toxic air contaminant (TAC) that is a non-cancerous but acutely hazardous substance. For "worst-case" operations, 13.24 tons per day of NaOH (50 percent solution, by weight) is estimated to be needed to operate eight of the 11 total WGSs plus two FGTs for Option 1 and 8.79 tons per day of NaOH is estimated to be needed to operate four of the seven total WGSs plus two FGTs for Option 2. Three of the 11 WGSs under Option 1 and there of the seven WGSs under Option 2 are expected to use a caustic solution other than NaOH.

Even though the facilities that may be affected by the proposed project may already use NaOH elsewhere in their facilities, for the purpose of conducting a "worst-case" construction analysis, one 10,000 gallon storage tank for caustic solution was assumed to be constructed for every WGS installed. However, of the 11 facilities affected by the proposed project overall, only nine facilities were projected to have an increased demand in NaOH use for WGS operations or FGT modifications under Option 1 and only five facilities were projected to have an increased demand in NaOH use for WGS operations or FGT modifications under Option 2. The remaining facilities were projected to have an increased demand in caustic that is made of sodium carbonate (Na2CO3) which is commonly known as soda ash, a non-toxic, non-cancerous, and non-hazardous substance. As summarized in Tables 4-8 and 4-9, for each facility that was projected to increase the use in the acutely hazardous substance NaOH under Options 1 and 2, respectively, the filling loss and the working loss of each NaOH tank were calculated, added together, and that sum was compared to the most stringent Rule 1401 Screening Emission Level for NaOH (0.004 pounds per hour at the nearest receptor distance of 25 meters). None of the total hourly loss projections exceeded the acute screening level for NaOH for any of the affected facilities for either option. It is important to note that the toxics analysis is a localized analysis and because of the distances between the affected facility locations, the NaOH emission impacts would not overlap. Thus, because the screening level for NaOH was not exceeded for any of the affected facilities for either option, no significant air quality operational impacts with respect to toxics are expected from the proposed project. NaOH is not classified as a carcinogen, so a cancer risk analysis was not performed.

As indicated in the analyses of potentially overlapping construction and operational air quality impacts, even though the proposed project will cause a temporary increase in emissions during construction, the net effect overall is a reduction in SOx emissions.

ODOR IMPACTS

Implementation of both Options 1 and 2 of the proposed project is designed to reduce SOx emissions by 6.21 tons per day and the majority of the SOx reductions would be achieved by WGSs. Under normal operating and permitted conditions for a WGS, the absorbent used in WGS operations captures sulfur dioxide (SO2) and sulfuric acid mist (H2SO4) and converts it to sodium bisulfate (NaHSO3), sodium sulfite (Na2SO3), and sodium sulfate (Na2SO4). Sulfur dioxide is nonflammable, colorless gas with a very strong, pungent odor. Most people can smell sulfur dioxide at levels of 0.3 to 1.0 ppm. The odor threshold is five times lower than the OSHA permissible exposure limit (PEL) of 5 ppm. Similarly, sulfuric acid is a clear, colorless, oily liquid that is very corrosive. An odor threshold of sulfuric acid in air has been reported to be one milligram per cubic meter of air (mg/m^3). If you are exposed to concentrated sulfuric acid in air, your nose will be irritated and it may seem like sulfuric acid has a pungent odor.

While sulfur dioxide, sodium bisulfate and sulfuric acid may have a pungent odor, sodium sulfite, and sodium sulfate are mostly odorless. Overall, based on the chemical composition and the odor thresholds of the resulting products when compared to the odor thresholds of sulfur dioxide and sulfuric acid, the overall SOx reductions that may result from the proposed project may also have the potential to reduce odor emissions.

In addition, some of the main equipment units affected by the proposed project such as sulfur recovery units are by design intended to capture sulfur compounds, including and especially malodorous H2S, and convert them into less odorous, elemental sulfur. Thus, any additional improvements (i.e. switching amine solutions) that may be implemented to reduce SOx emissions further from these units will only improve the ability to capture SOx (especially H2S) and reduce sulfur-based odors beyond what is being currently achieved. For these reasons, implementation of the proposed project is expected to reduce odor emissions from sulfurous compounds. Thus, odor impacts are expected to be less than significant.

PROJECT-SPECIFIC OPERATIONAL MITIGATION: The analysis indicates that there will be an overall reduction in SOx emissions during the operational phase of the proposed project. Further, no pollutant emissions exceed the applicable significance thresholds during operation for the proposed project. Thus, there are no adverse significant air quality impacts with the operational phase of the proposed project and as such, no mitigation measures are required.

REMAINING AIR QUALITY IMPACTS: The air quality analysis concluded that significant adverse construction air quality impacts could be created by the proposed project because the construction activities will produce emissions that would exceed the SCAQMD's significance thresholds of 75 pounds per day of VOC, 100 pounds per day of NOx, and 150 pounds per day of PM10. To minimize the significant air quality impacts associated with the aforementioned construction activities, feasible construction mitigation measures are required to control emissions from heavy construction equipment and worker travel (e.g., off-road and on-road mobile sources. While these mitigation measures may reduce emissions associated with construction activities at the affected facilities to the maximum extent feasible, none are mitigation measures that will avoid the significant impact or reduce the impact to less than significant.

The analysis also indicates that there will be an overall reduction in SOx emissions and slight increases in VOC, CO, NOx, PM10 and PM2.5 emissions during the operational phase of the

proposed project. None of these pollutants exceed the SCAQMD's significance thresholds for operation. Therefore, no operational mitigation measures are required.

It is concluded that the proposed project overall has the potential to generate significant adverse air quality impacts for construction. As a result, a Statement of Findings and a Statement of Overriding Considerations will be prepared for the Governing Board's consideration and approval prior to the public hearing for the proposed project.

CUMULATIVE AIR QUALITY IMPACTS: In general, the preceding analysis concluded that air quality impacts from any construction activities would be significant from implementing the proposed project because the SCAQMD's significance thresholds for construction will be exceeded for VOC, NOx, and PM10. Thus, the air quality impacts due to construction are considered to be cumulatively considerable pursuant to CEQA Guidelines §15064 (h)(1) and therefore, generate significant adverse cumulative air quality impacts. It should be noted, however, that the air quality analysis is a conservative, "worst-case" analysis so the actual construction impacts are not expected to be as great as estimated here. Further, the construction activities are temporary when compared to the permanent projected emission reductions of SOx as a result of the proposed project.
